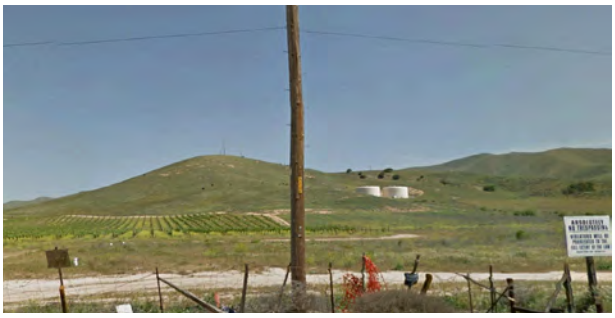
LU – 3 Provide a range of land uses and facilities that meet the needs of plan area residents, that are economically beneficial to the city, and can be developed into an integrated and cohesive residential and recreation-oriented community centered around parks, trails, schools, and shopping and embracing and connecting to the hillside open spaces to the east.

LU – 4 Create new, attractive residential neighborhoods that are in close proximity to parks, open spaces, schools, and neighborhood commercial, and provide a variety of housing types and densities within low, medium, and high density neighborhoods to serve a range of housing needs and income levels, including low income levels, of the broader Soledad community and region.

LU – 5 Provide adequate open space, parks and recreational facilities that are centrally located and linked throughout the plan area, to meet the needs of the plan area residents and the community.



LU – 6 Include land uses that serve the local population and provide employment opportunities for residents of the plan area and immediate surrounding communities. And locate shopping, employment centers, recreation, and parks within walking distance from the homes that use these specific plan components.

LU – 7 Provide public facilities, infrastructure, and services commensurate with new development so as to adequately meet the needs of all development and future residents in the plan area in a manner that is financially self-supporting.

LU – 8 Provide an integrated storm drainage and open space system that incorporates best management practices to adequately control storm flooding problems, protect water quality, and provide park space.

LU – 9 Protect the scenic vistas of the hills above Soledad through careful siting and design standards that minimize grading and visibility of new hillside development, and keep development, unless otherwise specified herein, below the 400-foot elevation contour.

Land Use Policies

LU – A Utilize the development potential of the Mirrasou Specific Plan Area and reduce the development potential of the Northwest Expansion Area by 525 units.

LU – B Apply to LAFCO for inclusion in the city's sphere of influence and annex land in anticipation of development.

LU – C Incorporate affordable housing within the plan area, including housing for senior citizens, agricultural workers, and low and very low income households. Consistent with the Inclusionary Ordinance, provide at least six percent of units for very low income households, six percent for low income households, and eight percent for moderate income households. Of the total affordable units proposed for the plan area, 39 percent should be affordable to very low income households, 19 percent to low income households, and 42 percent to moderate income households; and 30 percent of medium density housing units should be available as rentals.

LU – D Commercial buildings should be placed at or near the front setback and oriented toward the street to define and enliven the street. Commercial buildings and multifamily residential buildings should be oriented towards streets and where possible should not back onto parks, trails, plazas, or other public spaces. The "front" facade and building entrances and windows should wrap around all public elevations of the buildings. Where buildings do back onto public spaces, care must be taken to present a finished

architectural design, and utilities, loading areas, trash receptacles, service doors, and similar must be integrated or screened in these areas.

LU – E Garages and parking lots should be de-emphasized and moved back from the street and/or out of direct view.

LU – F Climatic factors, such as prevailing winds, shade trees, window and door orientation, and the positioning of buildings on the site should all be coordinated to maximize energy conservation.

LU – G Landscaping should be installed between the street and the sidewalk buffering the sidewalk from traffic and providing a pedestrian scale to walkways and a landscaped parkway along the street edge. Breaks should be provided to allow pedestrian access from on-street parking spaces. Ample street trees should be provided.

LU – H Major and minor gateways should be

designed to provide a consistent feel of arrival. Use of water, stone, and living landscape materials, along with signs and public art will provide for dynamic gateways within the plan area. Each residential neighborhood should be distinct, with neighborhood gateways that are unique to the neighborhood, but consistent with the overall specific plan character.

LU – I Residential buildings should provide an attractive architecture that emphasizes welcoming facades on all street- and public-facing elevations. Architecture and landscape should combine for a unified character within each neighborhood.

LU – J Concurrent with recordation of a final subdivision map, developers shall provide compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses using one of four methods, at the discretion of the city:

a) provide the in-kind direct purchase/acquisition of an agricultural mitigation easement at a 1:1 ratio and dedicate the easement to an agricultural land trust or other qualifying entity; and/or

b) if available, purchase agricultural banked mitigation credits at a 1:1 ratio from a qualifying entity; and/or

c) pay an in-lieu mitigation fee, which amount shall be determined by the city prior to project approval. The amount of the fee should reasonably be expected to lead to the reservation of agricultural land. Said fee shall be kept by the city in a fund established specifically for agricultural land mitigation purposes; and/or

d) implement other innovative approaches as approved by the city that results in the preservation of agricultural land within areas targeted by the city.

2.2 LAFCO Boundary Amendments

As of adoption of the specific plan, the plan area is not within the city's sphere of influence boundary nor is it within the city limits. The plan area is within the urban growth boundary,

and development of the area is anticipated by the city's general plan and in a memorandum of understanding between Monterey County (county) and the city. LAFCO approval will be required to amend these boundaries prior to development. Figure 2-1, City of Soledad Existing and Proposed City Limits and Figure 2-2, City of Soledad Existing and Proposed Sphere of Influence, shows the existing and specific plan-proposed sphere of influence and city limit lines in the vicinity of the plan area.

Cortese Knox Hertzberg Act

The Cortese Knox Hertzberg Local Government Reorganization Act of 2000 establishes procedures for local government changes of organization, including city incorporations, annexations to a city or special district, and city and special district consolidations. Upon application by petition or city council resolution, approval of boundary changes is considered by local agency formation commissions.

Monterey County Local Agency Formation Commission

Monterey County LAFCO is the agency that oversees boundary changes within Monterey County. LAFCO's mission is to encourage orderly growth of local government agencies, preserve agricultural lands and open space, and discourage urban sprawl. The city will submit an application to LAFCO for amendment of the city's sphere of influence boundary and annexation of territory to include the plan area boundary.

Government Code Section 56300 requires that LAFCO establish written policies and procedures and exercise its powers consistent with these policies and procedures. The State Legislature's intent is for these policies and procedures to encourage planned, well-ordered, efficient urban development patterns with appropriate consideration of preserving open-space and agricultural lands within those patterns.

Sphere of Influence Policies

LAFCO will generally apply the following policy guidelines in consideration of sphere of influence determinations with consideration given to the particular local conditions and circumstances of each agency and community (refer also to Monterey County/City of Soledad Memorandum of Understanding, included as Appendix B and incorporated into the specific plan by reference). Note that policy guidelines deemed less-relevant to the plan area have been omitted from this presentation.

LAFCO Sphere of Influence Policy	Specific Plan Consistency
II-1. LAFCO intends that its Sphere of Influence determination will serve as a master plan for the future organization of local government within the county. The spheres shall be used to discourage urban sprawl; limit proliferation of local governmental agencies; encourage efficiency, economy and orderly changes in local government; promote compact, community centered urban development; and minimize adverse impacts on lands classified as prime agriculture.	The proposed sphere of influence boundary is consistent with the geographic development limits established by the memorandum of understanding between the city and Monterey County. Therefore the proposed sphere of influence accomplishes the stated purposes of this policy and is consistent with this policy.
II-2. The Sphere of Influence lines shall be a declaration of policy which shall be a primary guide to LAFCO in the decision on any proposal under its jurisdiction. Every determination made by LAFCO shall be consistent with the Spheres of Influence of the agencies affected by those determinations.	The specific plan's sphere of influence will set the geographic limits within which the city will apply to the LAFCO for annexations, consistent with this policy (see Specific Plan Land Use Goal LU-1).

LAFCO Sphere of Influence Policy	Specific Plan Consistency
II-3. Any proposal which is inconsistent with an agency's adopted Sphere of Influence shall not be approved until LAFCO, at a noticed public hearing, has considered an amendment or revision to that agency's Sphere of Influence.	The specific plan's sphere of influence will set the geographic limits within which the city will apply to the LAFCO for annexations, consistent with this policy (see Specific Plan Land Use Goal LU-1).
II-4. Inclusion within an agency's Sphere of Influence does not assure annexation to that agency. LAFCO shall evaluate boundary change proposals as they relate to all of the relevant factors listed in the [Cortese Knox Hertzberg] Act.	The specific plan's sphere of influence will set the geographic limits within which the city will apply to the LAFCO for annexations, consistent with this policy (see Specific Plan Land Use Goal LU-1). The city will phase annexations and development within the plan area consistent with the phasing parameters presented in Section 6.4, Phasing. The phased annexation is consistent with this policy.
II-7. The adopted Sphere of Influence shall reflect city and county General Plans, plans of regional agencies, growth management policies, annexation policies, resource management policies, and any other policies related to ultimate boundary or service area of an affected agency unless those plans or policies conflict with the legislative intent of the [Cortese Knox Hertzberg] Act. Where inconsistencies between plans exist, LAFCO shall rely upon that plan which most closely follows the Legislature's directive to discourage urban sprawl, direct development away from prime agricultural land and open-space lands, and encourage the orderly formation and development of local governmental agencies based upon local conditions and circumstances.	The proposed sphere of influence boundary is consistent with the geographic development limits established by the memorandum of understanding between the city and Monterey County. The Memorandum of Understanding acknowledges the need for development to occur beyond the present city limits, and directs that growth to those areas where that growth will have the least adverse impact on agricultural lands. The proposed sphere of influence boundary is consistent with the geographic development limits established by the Memorandum of Understanding, and therefore, the specific plan is consistent with this policy.
III-1. LAFCO will designate a Sphere of Influence for each local agency representing the agency's probable physical boundary within a zero to twenty year period.	The geographic limits for the city's ultimate sphere of influence are established in the memorandum of understanding, and the specific plan sphere of influence boundaries are consistent with those limits.
III-3. LAFCO may establish urban transition areas within adopted Spheres of Influence to discourage premature pressure for development. Transition areas consist of the residual lands between designated urban service areas and the ultimate Sphere of Influence boundary. This land will most likely be used for urban expansion within approximately five (5) to twenty (20) years. Territory included within urban transition areas, but not within urban service areas, generally will not be considered eligible for annexation to receive urban services within five years.	Although there are no urban transition areas included within the specific plan, the city will phase annexations and development within the plan area consistent with the parameters presented in Section 6.4, Phasing. This approach will result in the gradual and orderly conversion of land to urban uses, consistent with this policy.
III-5. Territory not in need of urban services, including open space, agriculture, recreational, rural lands or residential rural areas, shall not be assigned to an agency's Sphere of Influence unless the area's exclusion would impede the planned, orderly and efficient development of an area.	This policy is applicable to the Hillside Open Space. The specific plan includes the Hillside Open Space within the proposed sphere of influence, and anticipate eventual annexation, so that the city or an assigned entity can provide maintenance of the designated trail system, provide alternative energy, provide other recreational activities, locate infrastructure to serve the plan area (e.g. water tank), conduct fire fuel reduction as needed, and provide efficient emergency response services within the area. The area is to be placed under a conservation easement with land uses limited to those specified by this plan or further activated in a development agreement.
IV-14. For annexations and Sphere of Influence applications, Monterey County LAFCO shall consider as part of its decision whether the proposal mitigates its regional traffic impacts by, for example, monetary contribution to a regional transportation improvement fund as established by the Transportation Agency for Monterey County or otherwise.	Development within the plan area would pay the Transportation Agency for Monterey County regional traffic impact fee, and therefore is consistent with this policy.

LAFCO Sphere of Influence Policy	Specific Plan Consistency
IV-15. For annexations and Sphere of Influence applications, Monterey County LAFCO shall consider as part of its decision whether the city in which the annexation or Sphere of Influence amendment is proposed has included certain goals, policies, and objectives into its General Plan that encourage mixed uses, mixed densities, and development patterns that will result in increased efficiency of land use, and that encourages and provides planned, well-ordered, efficient urban development patterns.	Consistent with the city's general plan, which identifies the plan area as part of the Mirrasou Specific Plan Area, the specific plan includes numerous densities and types of residential units, including more than 40 percent medium and high density (up to about 23 units per acre) units, which will provide for an efficient land use development pattern. The specific plan includes more units within its boundaries than were planned for the overall Mirrasou Specific Plan Area, and includes elimination of the remaining Mirrasou Specific Plan Area as a future urban development area. The specific plan is consistent with this policy

Annexation Policies

LAFCO will generally apply the following policy guidelines in consideration of annexation determinations with consideration given to the particular local conditions and circumstances of each agency and community (refer also to Monterey County/City of Soledad Memorandum of Understanding, included as Appendix B and incorporated into the specific plan by reference). Note that policy guidelines deemed less-relevant to the plan area have been omitted.

Preservation of Open Space and Agricultural Land

Pursuant to Government Code Section 56301, one of the primary focuses of LAFCO policy is the preservation of open space and agricultural lands located outside city boundaries. Most of the land within the plan area is designated as Prime Farmland on the Important Farmlands Map. Monterey County LAFCO uses the agricultural and open space policies presented below in assessing boundary change applications that include Prime Farmland. The Memorandum of Understanding, presented in the next section, has specific requirements regarding the conversion of agricultural land to urban uses.

Housing and Jobs

Monterey County LAFCO considers the following housing and jobs policy when making determinations on boundary amendments.

Monterey County/City of Soledad Memorandum of Understanding

The city entered into a memorandum of understanding with Monterey County on March 15, 2016. The Memorandum of Understanding is included in Appendix B and incorporated into the specific plan by reference. The Memorandum of Understanding binds the city to the following principals related to growth beyond the current sphere of influence.

The Memorandum of Understanding further requires that timing of annexation applications submitted for consideration by LAFCO will be based upon the approval by the city of a specific plan, which includes a phasing plan, a plan for services and public facilities and financing plans that demonstrate compliance with LAFCO standards. A specific plan must address development phasing and sequence of improvements. The phasing programs shall ensure that adequate supporting public services, retail, parks, schools, and other uses are in place to support residential, institutional, and commercial uses. The specific plan includes a phasing program in Section 6.4, Phasing.

City of Soledad Existing and Proposed Sphere of Influence

Miramonte Specific Plan

This side intentionally left blank.

LAFCO Annexation Policy	Specific Plan Consistency
II-2. To the greatest possible extent, boundaries should follow existing political boundaries and natural or man-made features such as rivers, lakes, railroad tracks, and freeways. Where boundaries do not meet this standard, the proponent shall justify the reasons for non-conformance.	Exact annexation boundaries are not proposed within the specific plan, although a set of parameters are included to focus the order of land development. Boundaries are likely to follow the linear park and collector streets within the specific plan. These features will provide an interim buffer between urban development and the remaining agricultural lands. This guidance within the specific plan will ensure orderly annexation and consistency with this policy.
II-4. Whenever practicable, boundary lines of areas proposed to be annexed to cities and/or districts shall be located so that all streets and rights-of-way will be placed within the same jurisdiction as the properties which abut thereon and/or for the benefit of which such streets and rights-of-way are intended.	The plan area is bordered on the west by and served by San Vicente Road, an arterial street that provides traffic circulation to and from U.S. Highway 101. The portion of San Vicente Road adjacent to the plan area will be included in annexations, as will a strip of land to the south of the plan area necessary for ultimate expansion of San Vicente Road to four lanes. The specific plan is consistent with this policy
II-7. The following guidelines related to road right-of-way apply to all proposals submitted to LAFCO. a. The following should not be allowed: (1) City limits which include a portion of the road right-of-way. (2) Road islands of county maintained roads. (3) Islands of road caused by annexation on both sides. (4) Strip annexation roads. c. The following should be annexed to the city. These roads would have direct access to the annexing property and would serve the residents of the property: (1) Minor or local roads. (2) When the street will be used for the city sewer lines, water lines, or storm drains. (3) Piece-meal development by developer causing difficult coordination between two or more agencies. (4) Where the annexation will complicate drainage or traffic control.	The proposed sphere of influence includes the entirety of the right-of-way necessary for development of San Vicente Road, which borders the plan area to the west and provides access from the south. The specific plan boundary includes all of the local roads and utility easements necessary to serve future development within the plan area. The specific plan is consistent with this policy.
II-10. Boundaries should reasonably include all territory which would reasonably benefit from agency services.	The proposed boundaries encompass all of the areas that would need to receive services from the City of Soledad.
IV-1. Each proposal should be consistent with the appropriate city or county general and specific plans. Where the proposal does not abide by these plans, the proponent shall specify the reasons for plan non-conformance.	The specific plan includes additional residential units than proposed for the area in the General Plan. Therefore, the specific plan includes a General Plan amendment to transfer the additional units from other plan areas within the General Plan, so that overall General Plan build-out remains the same. Therefore the specific plan will be consistent with the General Plan and consistent with this policy.
VII-1. LAFCO shall discourage proposals that would have adverse financial impacts on the provision of governmental services or would create a relatively low revenue base in relationship to the cost of affected services. Applications shall describe related service and financial impacts (including revenues and expenditures) on the county, cities, and/or special districts and provide feasible measures which would mitigate such adverse impacts.	The specific plan would not have an adverse fiscal impact on the Soledad General Fund. Further, the specific plan requires the development to participate in special financing districts to fund maintenance of streets, storm drains, and parks providing a funding source outside of the Soledad General Fund in.

LAFCO Annexation Policy	Specific Plan Consistency
VII-3. Applications must indicate that the affected agencies have the capability to provide service. Territory shall be annexed to a city or special district only if such agency has or soon will have the capability to provide service.	The specific plan includes provision of a new fire station, a police substation, and parks that would facilitate cost effective provision of these services. The cost of these services is not anticipated to be substantially in excess of costs currently borne by development within the boundaries of the City of Soledad. The specific plan includes stipulations that the Miramonte development will participate in impact fee programs and special financing districts necessary to provide funding for the construction and operation of these facilities.
VII-6. LAFCO discourages proposals which will facilitate development that is not in the public interest due to topography, isolation from existing developments, premature intrusion of urban-type developments into a predominantly agricultural area, or other pertinent economic or social reason.	The plan area is contiguous to existing development on the south, and provides three street connections to the existing developed parts of the city. Urban development, excepting water tanks and trails, is kept below the 400-foot elevation contour in accordance to General Plan policies. The specific plan includes a set of phasing parameters that are designed to prevent premature conversion of agricultural land. The specific plan is consistent with this policy.
VIII-3. Proposals which contain territory which is not within a city or district's adopted urban service area and have an expected build-out extending beyond a five- to seven-year period may be considered appropriate for phasing. For the purpose of this policy, "phasing" shall be defined as a planned incremental approval of a project and "buildingout" shall be interpreted as 70 to 80 percent developed. When an exception from this policy is desired, the proponent shall justify to LAFCO the reasons why phasing is not appropriate. Included within the justification for exception, the proponent shall demonstrate the jurisdiction's ability to provide necessary public services.	The plan area is currently outside the city's sphere of influence and urban service area. Build-out of the specific plan is expected to take more than seven years. The specific plan includes a set of phasing parameters that are designed to facilitate efficient provision of services, provide for adequate circulation, and prevent premature conversion of agricultural land. Because the specific plan includes a phasing program, it is consistent with this policy.
XIII-1. For annexations and Sphere of Influence applications, Monterey County LAFCO shall consider as part of its decision whether the city in which the annexation or Sphere of Influence amendment is proposed has included certain goals, policies, and objectives into its General Plan that encourage mixed uses, mixed densities, and development patterns that will result in increased efficiency of land use, and that encourages and provides planned, well-ordered, efficient urban development patterns.	Consistent with the city's general plan, which identifies the plan area as part of the Mirrasou Specific Plan Area, the specific plan includes numerous types of residential units, including more than 40 percent medium and high density (up to about 23 units per acre) units, which will provide for an efficient land use development pattern. The specific plan includes a mixed use overlay on several parcels. The Miramonte Specific Plan represents the full residential buildout potential for the Mirrasou Specific Plan Area as well as 525 units of the identified residential potential of the Northwest Expansion Area. The specific plan effectively consolidates growth into a smaller geographic area, effectively preserving agricultural land and open space. For consistency, a general plan amendment is required to identify a reduced development potential of 525 units in the Northwest Expansion Area. The specific plan is consistent with this policy.

LAFCO Agricultural and Open Space Policy	Specific Plan Consistency
II-1 . A Proposal must discuss how it balances the state interest in the preservation of open space and prime agricultural lands against the need for orderly development. (Government Code section 56001.) Proposals that fail to discuss this balance, in the opinion of the executive officer, will be deemed incomplete. Proposals may be denied if they fail to demonstrate to the satisfaction of LAFCO that the need for orderly development is balanced against the preservation of open space and prime agricultural lands.	The Memorandum of Understanding acknowledges the need for development to occur beyond the present city limits, and directs that growth to those areas where that growth will have the least adverse impact on agricultural lands. The proposed sphere of influence boundary is consistent with the geographic development limits established by the Memorandum of Understanding. The specific plan includes a set of phasing parameters that are designed to prevent premature conversion of agricultural land. Annexation boundaries are likely to follow the linear park and collector streets within the specific plan. These features will provide an interim buffer between urban development and the remaining agricultural lands.
	The Miramonte Specific Plan represents the full residential buildout potential for the Mirrasou Specific Plan Area as well as 525 units of the identified residential potential of the Northwest Expansion Area. The specific plan effectively consolidates growth into a smaller geographic area, effectively preserving agricultural land and open space. For consistency, a general plan amendment is required to identify a reduced development potential of 525 units in the Northwest Expansion Area. The intensification of development within the plan area will preserve the agricultural land within the remaining Mirrasou Specific Plan, estimated to be about 30 acres, as well as additional open space below the 400-foot contour, estimated to be about 90 acres. Within the plan area, about 150 acres of hillside land above the 400-foot contour will be preserved as open space, consistent with the city's general plan. The specific plan preserves agricultural land and open space and is consistent with this policy.
II-2. A Proposal must discuss its effect on maintaining the physical and economic integrity of agricultural lands. (Government Code section 56668 (a).) Proposals that fail to discuss their effect, in the opinion of the executive officer, will be deemed incomplete. Proposals may be denied if they fail to demonstrate to the satisfaction of LAFCO that the physical and economic integrity of agricultural lands is maintained.	The specific plan will result in the preservation of about 30 acres of agricultural land to the north of the plan area by way of consolidating residential units into the plan area. On an interim basis, the phased annexation of land will include broad buffers in the form of the linear parkway and collector streets to maintain agricultural lands separate from urban uses as development occurs within the plan area. Remaining agricultural land, whether interim or permanent, will be contiguous to other agricultural land, to facilitate efficient ongoing use for agriculture. With these measures built into the specific plan, the specific plan will be consistent with this policy.
II-3. A Proposal must discuss whether it could reasonably be expected to induce, facilitate, or lead to the conversion of existing open-space land to uses other than open-space uses. (Government Code section 56377.) Proposals that fail to discuss potential conversion, in the opinion of the executive officer, will be deemed incomplete. Proposals may be denied if they fail to demonstrate to the satisfaction of LAFCO that: a) they guide development or use of land for other than open-space uses away from existing prime agricultural lands in open-space use and toward areas containing nonprime agricultural lands (Government Code section 56377 (a)); and b) development of existing vacant or nonprime agricultural lands for urban uses within the existing jurisdiction of a local agency or within the Sphere of Influence of a local agency will occur prior to the development of existing open-space lands for non-open-space uses which are outside of the existing jurisdiction of the local agency or outside of the existing Sphere of Influence of the local agency (Government Code section 56377 (b)).	The specific plan will convert the agricultural land within the plan area to urban uses. This is consistent with the Memorandum of Understanding which establishes geographic development limits to direct growth to locations that will have the least adverse impact on agricultural lands. The specific plan includes a set of phasing parameters that are designed to prevent premature conversion of agricultural land. The specific plan will also permanently preserve 150 acres of hillside open space, located above the 400-foot elevation contour. The specific plan includes means of preserving agricultural land on an interim basis and permanently preserves open space land, and is consistent with this policy.

LAFCO Agricultural and Open Space Policy	Specific Plan Consistency
II-4. A Proposal must, if applicable, provide for pre-zoning (Government Code section 56375 (a)), and must demonstrate that it is consistent with the General Plans and Specific Plans of the existing local agency and any immediately adjacent local agency (Government Code sections 56375 (a) and 56668 (g)). Proposals may be denied if they are not consistent with such plans, or, if not pre-zoned, if the Proposal does not demonstrate to the satisfaction of LAFCO that the existing development entitlements are consistent with the local agency's plans.	The specific plan includes provisions for pre-zoning of land in conjunction with annexation applications, and therefore, is consistent with this Policy.

LAFCO Housing and Jobs Policy	Specific Plan Consistency
II-1. It is the policy of LAFCO that, consistent with section 56300 (a) of the Act, Proposals must demonstrate through both quantitative and qualitative methods the relationship between the Proposal and the surplus or deficiency of local and county-wide housing supply and demand, and employment availability and creation. Additionally, the Proposal must demonstrate how its pattern of land use and transportation complements local and regional objectives and goals for the improvement of air quality and reduction of greenhouse gas (GHG) emissions and local vehicle miles traveled (VMT). These factors and their impacts, if any, shall be considered by the Commission in acting upon the Proposal.	The Association of Monterey Bay Area Governments assigned the city a Regional Housing Needs Assessment housing target of 191 units for the 2014 – 2023 time period. The specific plan includes 2,392 housing units, which more than meets this target. The specific plan also includes housing for lower income households, seniors, and farmworkers. Development of the specific plan commercial uses and public services (e.g. schools, parks, public safety, etc.) and the increase in population resulting from new residential units creating demand, will result in the establishment of new jobs within the plan area and in the community of Soledad. The specific plan is designed to promote walking and bicycling, with an integrated trail system that connects every neighborhood to each other and to the schools and commercial area. The land use and circulation pattern will promote reduced vehicle miles for shopping and school trips. The specific plan provides much needed housing, additional job opportunities, and a trail system to reduce automobile trips. The specific plan is consistent with this policy.

Memorandum of Understanding Provision	Specific Plan Consistency
a) To limit future long-term development within the area shown on Exhibit 'A' [see Appendix B] and designated as "Urban Growth Boundary" (the "UGB"). The purpose of the UGB is to bound and enclose the land intended for development within the 2005 Soledad General Plan.	The plan area falls within the area that the Memorandum of Understanding identifies for future growth. The specific plan is consistent with this provision of the Memorandum of Understanding.
b) To manage development of land within the UGB utilizing the best available "sustainable" practices. The intent of the city is supported by city's General Plan Policy L-2, which partially reads as follows: "Further annexations to the city may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources..."	The specific plan includes about 150 acres of open space, about 35 acres of parkland, and two school sites. Scenic vistas are preserved by the provision of open space land above the 400-foot elevation contour. The specific plan is consistent with this provision of the Memorandum of Understanding.
c) To encourage proposals for infill development on vacant or underutilized sites within the existing city limits east of Highway 101 whenever possible, to avoid urban sprawl and postpone the conversion of agricultural land to urban uses.	Most of the annexed portion of the Miravale II Expansion Area is built out at this time, and will be further built out by the time the specific plan is adopted and entitlements are approved. The specific plan would provide additional land for future growth. The specific plan is consistent with this provision of the Memorandum of Understanding.

Memorandum of Understanding Provision	Specific Plan Consistency
d) To require specific plans to include residential densities that ensure a compact urban form that helps protect agricultural land from premature conversion.	The specific plan includes several densities and types of residential units, including more than 40 percent medium and high density (up to about 23 units per acre) units, which will provide for an efficient land use development pattern. The Miramonte Specific Plan represents the full residential buildout potential for the Mirrasou Specific Plan Area as well as 525 units of the identified residential potential of the Northwest Expansion Area. The specific plan effectively consolidates growth into a smaller geographic area, effectively preserving agricultural land and open space. The intensification of development within the plan area will preserve the agricultural land within the remaining Mirrasou Specific Plan Area, estimated to be about 30 acres, as well as additional open space below the 400-foot contour, estimated to be about 90 acres. Within the plan area, about 150 acres of hillside land above the 400-foot contour will be preserved as open space, consistent with the city's general plan. The specific plan is consistent with this provision of the Memorandum of Understanding.
e) To establish a Permanent Agricultural Edge for the purpose of maintaining a clearly defined northwest and southeast boundary between the urbanized incorporated areas of city and the agricultural areas within the unincorporated County as shown on Exhibit 'A' and identified as "Permanent Agricultural Edge" [see Appendix B]. A "Temporary Agricultural Edge" is hereby established east of Bryant Canyon Road, as specifically shown on Exhibit 'A'. The Temporary Agricultural Edge may be eliminated through an amendment to this Agreement.	The Permanent Agricultural Edge identified in the Memorandum of Understanding is not located within or adjacent to the plan area. No Permanent Agricultural Edge, as defined in the Memorandum of Understanding is required in the plan area. The specific plan is consistent with this provision of the Memorandum of Understanding.
f) To utilize agricultural buffers within the UGB to address the compatibility between the development of urban land uses and existing or planned agricultural uses. The city's General Plan requires development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses. The county requires an agricultural buffer as typically 200 feet in width and includes other vegetation, walls, or other screening deemed necessary to ensure that property owners on both sides of the buffer may enjoy full and unencumbered use of their property for its designated use without experiencing significant deleterious effect from neighboring use.	The Farmers' Village is the only specific plan component that is immediately adjacent to cultivated agricultural lands outside the plan area. No specific buffer is included because the Farmers' Village site is large enough to accommodate a buffer during the site planning process. On the east side and the remainder of the north side, a buffer to the ranchland is provided by the Hillside Open Space, the dirt roadway, and rear building setbacks of the adjacent houses in Neighborhood 1. On the west side, a buffer to the cultivated farmland is provided by San Vicente Road and rear building setbacks in Neighborhoods 10 and 11, the drainage basin/park, and landscape areas. The specific plan is consistent with this provision of the Memorandum of Understanding.
g) To actively participate with the county, LAFCO and other cities within the Salinas Valley to develop a Valley-wide Agricultural Land Mitigation Program to address the loss of agricultural land due to development and conversion to urban uses.	The plan area includes Prime Farmland that would be converted to urban uses. Four options for compensation for the loss of agricultural land are provided in the Memorandum of Understanding, as described in the section following this table. Development within the specific plan will participate in the established mitigation program, consistent with this provision of the Memorandum of Understanding.
h) To utilize permanent agricultural buffers along the UGB to ensure compatibility between the development of urban land uses and agricultural uses in the unincorporated area. The city agrees to actively participate with the county, LAFCO and other cities in the Salinas Valley to develop a Valley-wide Agricultural Buffer Program to ensure compatibility of urban land use with agricultural uses in the unincorporated area.	The Permanent Agricultural Edge identified in the Memorandum of Understanding is not located within or adjacent to the plan area. No Permanent Agricultural Edge is required in the plan area. The specific plan is consistent with this provision of the Memorandum of Understanding.

Compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses is required by the Memorandum of Understanding, using one of four methods, at the discretion of city to coincide with the time of the recordation of a final subdivision map (refer to Policy LU-J):

a) provide the in-kind direct purchase/acquisition of an agricultural mitigation easement at a 1:1 ratio and dedicate the easement to an agricultural land trust or other qualifying entity; and/or

b) if available, purchase agricultural banked mitigation credits at a 1:1 ratio from a qualifying entity; and/or

c) pay an in-lieu mitigation fee, which amount shall be determined by the city prior to project approval. The amount of the fee should reasonably be expected to lead to the reservation of agricultural land. Said fee shall be kept by the city in a fund established specifically for agricultural land mitigation purposes; and/or

d) implement other innovative approaches as approved by the city that results in the preservation of agricultural land within areas targeted by the city.

City Requests of LAFCO

The city will request, through a City Council resolution, an amendment to its sphere of influence to include the plan area, and a request for annexation of the territory. The city will submit the LAFCO reorganization application along with the specific plan, approving resolutions, pre-zone ordinance, and supporting documentation, including the plan for services, fiscal analysis, and California Environmental Quality Act compliance document. Together, these submittals will provide the city's justification for the reorganization request.

2.3 Land Use Concept

Development within the plan area should create inviting pedestrian-oriented neighborhoods through a safe and efficient circulation system and the provision of parks, schools, and neighborhood commercial uses that are readily accessible to residents. The site layout is an important component of realizing this goal. Streets and sidewalks within the core area should be lined with retail shops in the retail areas and welcoming front porches should be a primary feature in the residential areas. Parking lots and garages should be tucked behind buildings. In the low density residential areas, front porches and street connectivity should be emphasized over driveways and garages. The following overall design policies are designed to enhance the overall site layout to achieve the pedestrian oriented vision for the Miramonte Specific Plan Area.

The specific plan Land Use Plan sets forth the areas and configurations of each land use designation within the plan area: Low Density Residential, Medium Density Residential; High Density Residential; Neighborhood Commercial, Public Facilities, and Open Space. Each designation is consistent with the land use designations of the Soledad General Plan. The relationship of land uses within the plan area is illustrated in Figure 1-4, Miramonte Specific Plan Land Use Diagram. The land use diagram, along with

the lotting program, illustrated in Figure 2-3, Miramonte Specific Plan Land Use Diagram and Conceptual Lotting Program will guide the implementation and development of the plan area. The land use diagram and lotting program may be varied slightly to accommodate the more precise design of the final subdivision mapping, but the street, lot, and land use arrangements must be essentially the same as shown. City staff shall make findings that final tract maps are substantially consistent with Figure 1-4, Miramonte Specific Plan Land Use Diagram, and Figure 2-3, Miramonte Specific Plan Land Use Diagram and Conceptual Lotting Program.

Table 2-1, Land Use Data, summarizes the land use designations, identifies the approximate acreage of the land use distribution within the plan area, and presents the residential density and maximum lot yield for residential development. A detailed description of the specific plan's allowable land uses are provided below.

Table 2-1 Land Use Data

Land Use	Zoning District	Acreage	Residential	Commercial
Low Density Residential	MMSP-R-1	295.3	1,353 dwelling units	---
Medium Density Residential and Affordable Housing	MMSP-R-V	31.3	507 dwelling units	---
Senior Housing	MMSP-R-V	6.6	132 dwelling units	---
Farmers Village	MMSP-R-V MMSP-MU (overlay)	42.6	400 dwelling units	0 to 20,000 square feet
Village Commercial	MMSP-C-V MMSP-MU (overlay)	9.0	---	75,000 to100,000 square feet
Police & Fire Department	PF	2.0		
Elementary School	PF	8.0		
Middle School	PF	16.5		
Parks and Recreation	OS	39.2		
Open Space (Hillside)	OS	150.4		
Water Tank	PF	2.2		
Collector Streets ROW		29.8		
San Vicente Road ROW		14.1		
Total		647.0	2,392 dwelling units	75,000 to 120.000 square feet

Source: EMC Planning Group 2017

NOTE: Acreages are based on the Land Use Diagram and are approximate.
Low Density Residential includes the local streets, neighborhood parks, and connecting paths.
Zoning districts prefaced with MMSP are specific to the Specific Plan

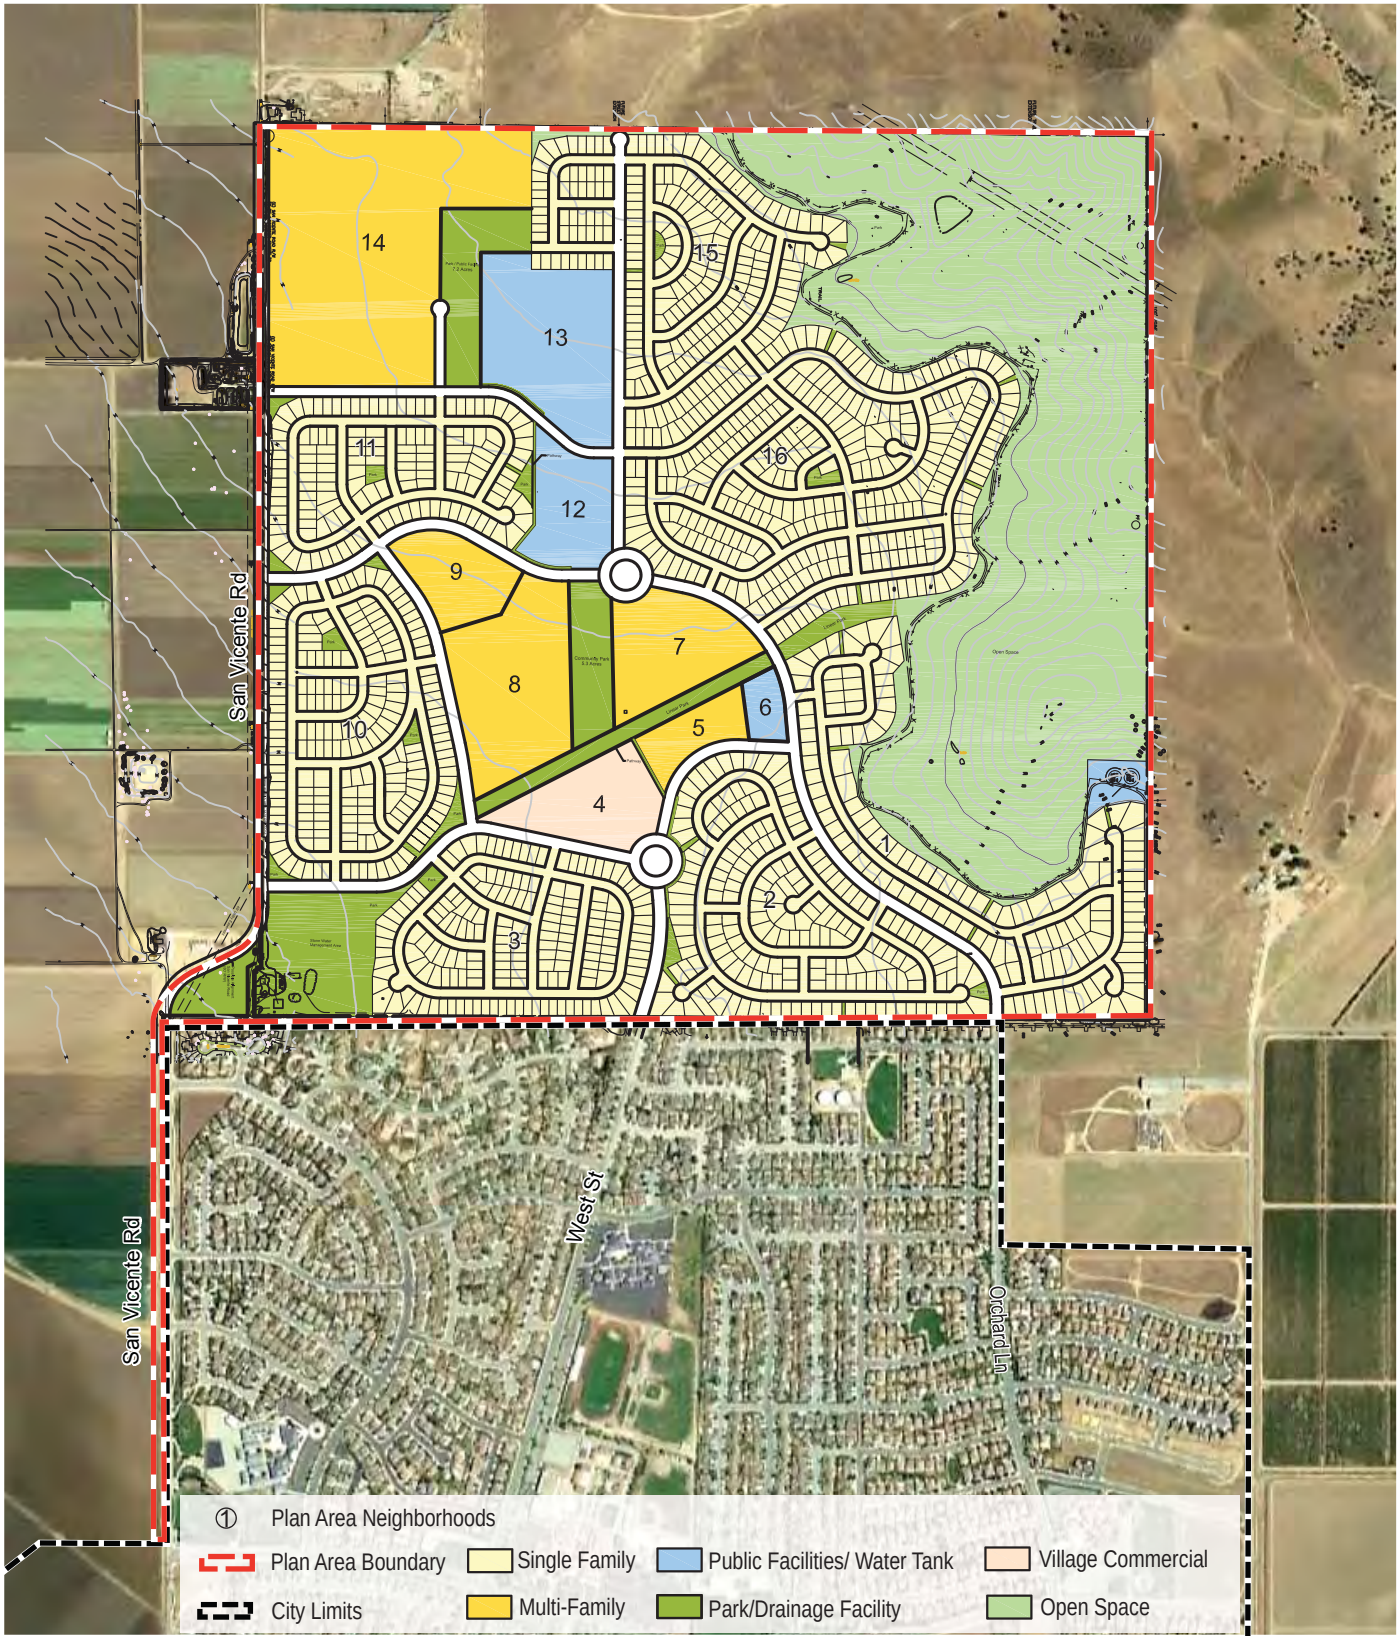
This section provides an overview of land uses within the specific plan. Detailed land use and development standard information is presented in Section 2.3 Zoning Districts and Development Standards.

Residential

Approximately 2,392 residential units are planned to be located within the approximately 387.1 acres dedicated to residential uses in the plan area. The specific plan includes low, medium, and high density housing. The average overall gross density at buildout within the residential areas will be about 6.4 units per acre. The residential neighborhoods will contain a variety of housing types and lot sizes enhanced by ample open space and recreational amenities. Pedestrian and bicycle access pathways connecting residential streets with parks, schools, and/or commercial areas are included within the residential designation to allow flexibility in their location.

Low Density Residential

Low Density Residential neighborhoods provide a conventional residential approach characterized by detached low density homes and pedestrian friendly tree-lined streets. A variety of housing styles and elevations are encouraged, giving each neighborhood a distinctive character. Neighborhoods emphasize connections to parks and open space, schools, and trails by incorporating landscaped pedestrian paths and open ended cul-de-sacs. Flexibility is encouraged in setbacks, garage location, and home orientation to reduce monotony along the streetscape.



Low density residential neighborhoods on standard size lots (minimum lot size of 5,000 square feet and averaging about 6,000 square feet) are the predominant residential use, comprising just under half the total housing units. Lots in the hillier eastern edge of the plan area would be larger than average. Lots near San Vicente Road, as well as other lots throughout the designation, would be smaller than average, and provide a more affordable low density family detached housing opportunity. Duplexes and duets may also be constructed in this designation. Gross density will vary depending on incorporation of non-residential amenities; net density will be between six and ten units per acre, with a typical density of about seven units per acre.

Medium Density Residential

Medium Density Residential homes (10 - 23 units per net acre) will be located within the plan area core and at the northwestern corner of the plan area within the Farmers' Village. This designation provides for attached low density homes, duplex homes, triplex homes, apartments, cohousing, and single room occupancy housing. The sites are within walking distance to neighborhood parks, schools, and/or commercial areas. The Farmers' Village may be developed with a mixed use or integrated commercial component to provide convenient services to residents and neighbors. A senior housing or assisted living facility is designated for a 6.6-acre site within this designation. Many of these units will be affordable, as described in the following section.

Affordable Housing

The city's Housing Element and Inclusionary Ordinance include requirements for affordable housing in new developments. The specific plan will provide much needed affordable housing for Soledad, including housing in the "very low," "low," and "moderate" categories. It is also a

0 1,200 feet

Source: Google Earth 2017

Figure 2-3

Miramonte Specific Plan Land Use Diagram and Conceptual Lotting Program

This side intentionally left blank.

specific plan goal to provide workforce housing which will include smaller units that are more affordable by design. Specific details of how the affordable housing will be managed, such as sales price/rental limitations for restricted affordable housing and qualifying incomes of families, will be worked out through an affordable housing agreement between the developer and city. In general, housing developed at a density of up to 19 units per acre is expected to be affordable to households of moderate income, and housing developed at a density of 20 units per acre or greater is expected to be affordable to low or very low income households. Housing units built at a density of 20 units or more per acre automatically qualify as affordable under the State's housing guidance.

Housing Element Requirements

The city's Housing Element was adopted in 2009 for the 2009-2014 planning period, and the State Housing and Community Development Department lists it as in compliance with state requirements. The current planning period for jurisdictions in Monterey County is 2014-2023. Soledad's citywide Regional Housing Needs Assessment target for the 2014-2023 planning period is 46 very low, 30 low, 35 moderate, and 80 above-moderate housing units (191 total units). The specific plan will help the city achieve these housing targets.

The following Soledad Housing Element policies and programs are pertinent, but will be superseded when the next housing element is certified by the state. In particular, note that Policy 2.1 is not aligned with current Regional Housing Needs Assessment numbers, and will require revision next time the Housing Element is updated. In addition, the specific plan will add to the supply of areas within the city that have zoning appropriate to the provision of affordable housing.

a. Program 1.1.1: Amend the Sphere of Influence and adopt specific plans to guide development.

b. Program 1.2.1: Enter into development agreements that prescribe the proportion of very low-, low-, and moderate-income housing to be built in a project consistent with the city's Inclusionary Ordinance and Housing Element. Units shall be constructed concurrently with any above moderate-income housing. Alternative densities and housing types can satisfy the requirement if superior in design.

c. Program 1.2.4: Require specific plans for growth areas to incorporate a higher density residential designation and corresponding zone district that allows at least 30 units per acre on sites close to commercial services and existing or planned public transportation.

d. Policy 2.1: In specific plan areas, provide an integrated mix of housing types and affordability levels that closely approximate the city's 2007–2014 "fair share" housing allocation as follows:

   - 39 percent of units affordable to households of lower income (very low- and low-income)
   - 19 percent of units affordable to households with moderate incomes,
   - 42 percent of units affordable to households with above moderate incomes.

e. Program 2.1.1: Development agreements shall link housing affordability to housing type, design, and development density. A minimum density of 20 dwelling units per net acre, consisting of multi-family, housing above commercial use, and single-room occupancy (SRO) units is required for the very low- and low-income persons or families. A minimum density of 12 dwelling units per net acre is required for the moderate-income category. Exceptions apply for housing restricted by sales price or rent and income eligibility.

f. Program 2.1.2: 30 percent of units in each neighborhood shall be designed to accommodate rental households, including medium and higher density housing and second dwelling units and meeting these guidelines:

- Minimum average density of seven dwelling units per gross residential acre (not counting accessory dwelling units);
- Up to 10 percent being a second dwelling unit on the same lot (accessory units, duplex, etc.);
- At least 20 percent of units in new residential neighborhoods should be comprised of duplexes, tri-plexes, four-plexes and smaller multi-family housing (townhomes, apartments, etc.) of approximately 20 or fewer units and integrated within specific plan neighborhoods. Multi-family housing shall be integrated with low density residential development in form, scale, and architectural character.
- Promote rental availability, especially in multi-family apartments.

Inclusionary Ordinance Requirements

The inclusionary ordinance requires 20 percent of the affordable units to be restricted affordable units pursuant to execution of an Affordable Housing Agreement between the developer and city. Inclusionary units must, be affordable to the target income categories in the following proportions: eight percent—moderate income, six percent---low income and six percent—very low income. The ordinance establishes several development principles for development of inclusionary units. Section 17.41.050 A-5 states that "Inclusionary units should be similar in size and design to market rate units within the development." Section 17.41.140 reads "(1) The development shall provide for the dispersal of inclusionary units to the maximum extent feasible. (2) Multi-family buildings may contain any proportion of inclusionary units, but no inclusionary units should be located to or in the immediate vicinity of another inclusionary housing development." Affordable housing projects are not subject to these requirements.

Affordable Housing Compliance

The specific plan is a requirement under Housing Element Policy 1.1. The specific plan will provide approximately 2,392 attached and detached residential units over a 10 to 20 year timespan, potentially through about 2038. Depending on build-out pace, the 2014-2023 housing element planning period covers the first one-half to one third of that timespan.

Compliance under Current Regional Housing Needs Assessment. Based on the current Regional Housing Needs Assessment, the city needs to accommodate about 28 affordable units per year. Therefore the specific plan could, on its own, meet the city's affordable housing requirement by providing 280 affordable units over a 10-year

period or 560 affordable units over a 20-year period. The specific plan includes about 1,049 units that would be affordable due to deed restrictions (169 units) or a minimum density meeting the default density value of 20 units per acre for which affordability is assumed (481 units). Affordable units will be provided specifically as farmworker housing in the Farmers Village (400 units).

Compliance under Policy 2.1. Under the Policy 2.1 requirements for 560 required affordable units, 39 percent (218 units) need to be affordable to households in the very low category, 19 percent (106 units) in the low income category, and 42 percent (235 units), in the moderate income category. The specific plan provides enough affordable units in each category.

A summary of compliance with the Housing Element and Inclusionary Ordinance is presented in Table 2-2, Affordable Housing Compliance Summary.

Affordable Housing Integration. The specific plan ensures integration of affordable housing both through design and location. The designated affordable housing is located in the specific plan core area adjacent to a park, the elementary school, senior housing, commercial uses, and low density residential. The housing that meets the minimum 20 unit per acre standard is likewise located in the specific plan core area. Because it is envisioned to include resident-specific services and require all units in close proximity, the Farmers Village worker housing is located in a corner of the plan area, though adjacent to the middle school and low density residential. Other inclusionary units would be distributed throughout the plan area. The design guidelines ensure that affordable housing will blend visually with market rate housing. Locating duets or duplexes on corner lots with building massing consistent within the neighborhood and one garage accessed off each street will give the appearance of low density family homes.

Table 2-2 Affordable Housing Compliance Summary

Requirement		Compliance
HE Program 1.1.1	SOI Amendment and Specific Plan	The Specific Plan fulfills this requirement.
HE Program 1.2.1	DA to prescribe percentage of affordable units.	Development agreements will be prepared for development entitlements.
	Concurrent construction of affordable units	The Specific Plan phasing integrates higher density housing within the middle phases of the development.
HE Program 1.2.4	Allow up to 30 units per acre	The highest density within the plan area is 23 units per acre.
HE Policy 2.1	Prescribed percentages	Current HE: 18 additional affordable units needed. Current RHNA: surplus of affordable units included.
HE Program 2.1.1	DA density requirements of 20 units/acre and 12 units/acre	The Specific Plan includes these densities.
HE Program 2.1.2:	30 percent available for rentals	A Specific Plan policy addresses this requirement.
	Average gross residential density of 7 units/acre	Average net density 6.4 due in part to larger hill lots and inclusion of parks and trails.
	20 percent of rentals under 20 units/building	A Specific Plan policy addresses this requirement.
Inclusionary Ordinance	6 percent very low; 6 percent low; 8 percent moderate	A Specific Plan policy addresses this requirement.

SOURCE: City of Soledad 2008

Workforce / Entry Level Housing. Workforce / entry level housing is defined for the specific plan as housing units/lots that are smaller in size therefore more affordable by design. It is the intent to provide workforce housing which will be affordable by design but not restricted in price or rent. Workforce / entry level housing includes products such as duplexes, triplexes, townhouses, and condominiums, and the units at the Farmers' Village.

Neighborhood Commercial

A nine-acre neighborhood commercial site is designated in the specific plan core area adjacent to the West Street roundabout. Centrally located to serve primarily plan area and neighboring residents, commercial uses on this site are anticipated to include retail, office, and personal services. With a floor-area ratio of about 0.2, the shopping center would include about 75,000 to 100,000 square feet of commercial floor space, which could accommodate a medium-sized grocery store and half a dozen smaller spaces.

Mixed Use Opportunities

Mixed use development is encouraged in the specific plan core area and the Farmers Village. The mixed use may consist of office above retail commercial, residential above commercial, or adjacent commercial, residential, and/or office space. Although commercial is designated at the West Street round-about site, commercial uses may also be integrated into the adjacent portions of the medium and high density housing site, and high density housing may be integrated into the commercial site. Commercial development in these areas should be directly integrated with the main commercial area. Development of commercial space up to a total of 100,000 square feet is allowed in the core area. If residential uses are developed within the commercial area, no additional units are allowed and units must be transferred from the capacity of adjacent residential areas.

Commercial uses may also be integrated within the Farmers Village. Intended to serve primarily Farmers Village residents and immediate neighbors, uses may include personal services and convenience retail, with a total square footage up to 20,000 square feet.

Public/Institutional

This land use is intended to designate those sites that will be improved with public facilities required to support and serve project residents and businesses. It is applied to two school sites (one elementary school and one middle school), a public safety station, and utility facilities. Both school sites abut designated park sites, providing opportunities for joint use of these facilities. Although not designated as such, and not credited toward the specific plan's park dedication requirement, approximately half of the middle school site is intended for development and use as a community sports complex to enable joint school and community use. Joint use of school facilities administered by the Soledad Unified School District and the parks managed by the city would be guided by a joint use agreement between these entities.

Open Space and Parks

Designations are provided for open space and parks, including hillside open space, village park, linear park, soccer park, and drainage basin/park. The open space and park system is designed to integrate and connect the neighborhoods within the plan area to each other and to the core area and the schools.

The Parks and Recreation designation includes improved public parks and recreation (excluding the shared recreational use at the middle school), the linear park, and landscaped park connections. Parks will be open to the public and park improvements may include paths and trails, picnic areas and benches, par course, playgrounds, turf areas, play fields and courts, swimming pool, clubhouse or locker room, community room or center, community garden, and similar uses. Although the Parks and Recreation designation is intended to be primarily without structures, small structures as identified above are allowed with no set limit on square footage. Overhead lighting and sound amplification are limited, and subject to city approval, so as not to disturb neighboring residences. Utility uses are allowed but should not exclude recreational uses. The southwestern corner of the plan area is designated for storm water retention, and should be developed with compatible recreational uses.

The Open Space designation includes hillside areas to be retained as passive parkland for purposes of recreation and view preservation. Development and improvements in this area are limited to passive recreation, a gathering place (e.g. clubhouse), alternative energy, and utilities required for the plan area or the city. Examples of passive recreational uses include recreational foot trails, interpretive or educational signage, benches, picnic tables, and a par course. Public facilities could include additional water storage tanks, emergency access road, access fencing and signs, fire breaks, and other facilities needed by the city.

2.4 Zoning Districts and Development Standards

The specific plan utilizes base zoning districts consistent with Soledad Municipal Code Title 17. The zoning districts are prefaced with MMSP, to indicate their specific applicability within the specific plan, shown in Figure 2-4, Miramonte Specific Plan Zoning Map, and as summarized in Table 2-1, presented earlier.

The specific plan's zoning districts are regulated by the design guidelines and development standards contained in this section, which have been adopted by ordinance and provide development regulations that control the subdivision and improvement of land within the plan area. The intent of the community design guidelines and standards is to provide additional flexibility and creativity, as well as foster quality design solutions. Table 2-3 provides a list of the specific plan zoning districts.

Low Density Residential (MMSP-R-1)

Intent

The MMSP-R-1 District provides for traditional low density attached housing in neighborhoods with attractive, high quality architecture and landscaping. Residents can conveniently walk or bicycle within the neighborhoods and to nearby schools, parks, and shopping. A range of densities is allowed and density is expected to be greater near the core of the plan area and lower near the open space areas that adjoin the MMSP-R-1 District.

Table 2-3 Zoning Districts

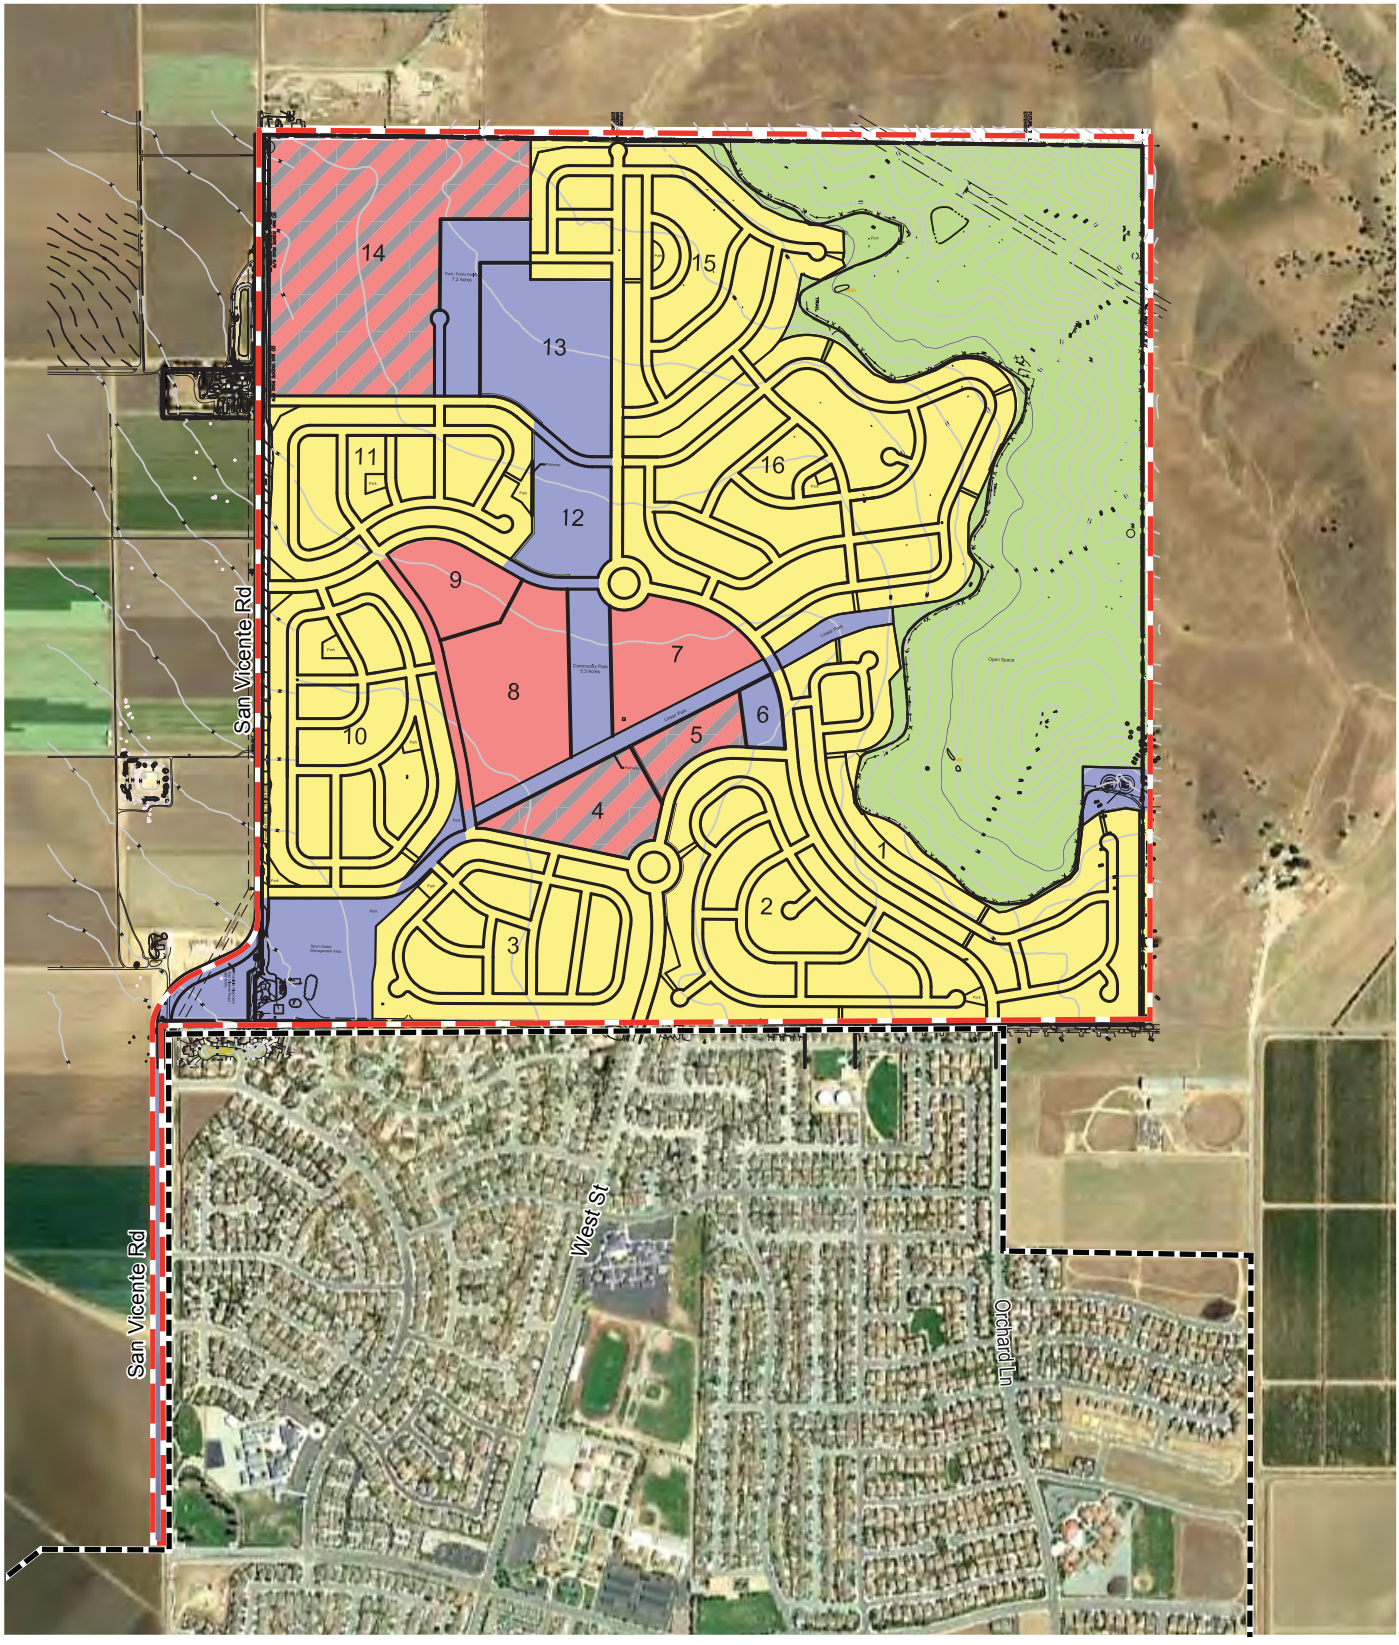
Zoning District	Description
MMSP-R-1	Low Density Residential
MMSP-R-V	Village Residential (Medium Density)
MMSP-C-V	Village Commercial
MMSP–MU (overlay zone)	Mixed Use Opportunity
PF	Public Facility (Including Park Lands)
OS	Hillside Open Space

Design Guidelines

Design of low density residential areas shall conform to the city's Community Design Guidelines and Standards for Single Family Residential, and the following guidelines. In the event of a conflict, the following design guidelines shall apply.

a. Architecture should be varied, but this should not preclude a consistent architectural style or set of architectural styles within a neighborhood.

b. Design of structures should create variety and interest. Differences in the massing and composition (not just finish materials) of each adjacent house should be accomplished. One identical design should not be repeated more frequently than each sixth house.



c. To avoid a repetitive street scene, the front façade on buildings should have varied materials and building forms.

d. When a row of residential lots backs onto a collector street, a lot arrangement with front entries facing the collector, and parking accessed from the local street is encouraged to prevent a walled in streetscape on the collector street.

e. At least two different roof lines and two different pitches should be used, i.e. gable, hipped, dormers, if the selected architectural style allows. To the extent feasible, at least one roof surface should face south to facilitate solar panels.

f. Houses adjacent at their sides to parks, open space, and pedestrian paths should be oriented toward those areas. Side fences adjacent to pedestrian paths should be kept at a low height for as great a distance from the street as possible to avoid a closed in tunnel and to maximize visibility into the pathway from adjacent yards and houses.

g. Neighborhoods shall be interconnected with streets and pedestrian paths.

Source: Google Earth 2017

Figure 2-4

Miramonte Specific Plan Zoning Map

This side intentionally left blank.

h. Encourage a varied streetscape appearance by varying front building lines by a minimum of two feet, and/or incorporating covered porches, projections, or other building features that differentiate each building.

i. Building elevations adjacent to the schools, parks, or visible from any other public space should be articulated with varied wall planes and roof forms consistent with the design of the front façade.

j. Garages shall be located behind habitable portions of structures or recessed from the front façade a minimum of four feet.

k. Residential developments should offer an optional design accessible to physically disabled persons.

l. Landscaping should relate to the architectural style and be consistent within each neighborhood. Design landscaping to provide summer shade and winter sun for houses and sidewalks.

m. Sidewalk planter strips of at least three feet in depth shall be provided, with a widened strip where trees are planted.

Development Standards

The development standards presented Table 2-4, MMSP-R-1 Development Standards, represent minimums unless otherwise noted. For regulations not covered in this code, refer to City of Soledad Title 17 Zoning code.

Table 2-4 MMSP-R-1 Development Standards

Category	Regulation	Interpretation and Notes
Zoning District Density Range	6 to 10 units per net acre	This zone is primarily for a density of about 7 units per net acre. Density up to 10 units per net acre is allowed in order to accommodate affordable small lot detached, duet, and duplex units.
Permitted Uses		
The following uses shall be permitted in the R-1 district:		Home occupations, subject to Section 17.38.140 of the Municipal Code Mobile home on a permanent foundation, subject to Section 17.38.210 of the Municipal Code Swimming pools subject to Section 17.38.320 of the Municipal Code.
Residential and public/quasi-public.	Single family dwellings, duets, duplexes and accessory buildings (including garage). Accessory and junior accessory dwelling units, small day nurseries, group homes, and similar uses in accordance with state law.	
Lot Configuration		
Lot Area	5,000 square feet minimum	
Corner Lot	6,000 square feet minimum	
Width		
Interior Lot	50 feet minimum	
Corner Lot	60 feet minimum	
Curved / Cul-de-sac	40 feet minimum	
Depth		
Local Street frontage	100 feet minimum	
Collector Street frontage	100 feet minimum	

Building Massing		
Lot Coverage	40 percent maximum	Roof overhangs, patio overhangs, unenclosed shade structures and the like are exempt from the building coverage calculation.
Building Height	2 stories and 30 feet maximum	
Accessory Building*	14 feet maximum	
	**Accessory structures contingent on appropriate design as defined in the CC&R's.*	
Setbacks		
Front Yard		
Living Space	15 feet minimum	Architectural features may extend up to 2.5 feet into the adjacent setback. Fireplace and fireplace/ media centers may extend 2 feet into side yards.
Porch	9 feet minimum	
Garage	20 feet minimum	Duel access front yard shall be measured from the collector street, and assumes landscape buffer within right-of-way
Front Yard Dual Access Lots		
Living Space	10 feet minimum	
Porch	4 feet minimum	Measured from the side property line
Garage	30 feet minimum	
Side Yards		A minimum of 1,000 square feet open space/yard shall be provided to the side or rear of the main dwelling or in an "L" or "U" design.
Interior	5 feet minimum	
Exterior	10 feet minimum	
Side Loaded Garage	25 feet minimum	
Porch	3 feet minimum	
Rear Yard		
Primary Building	10 feet minimum	
Porch	4 feet minimum	
Accessory Building	5 feet minimum	
Rear Yard Dual Access Lots	Same as for Front Yard	
Open Space (un-irrigated and undeveloped)	100 feet low fire risk area to be provided behind rear fences within the open space area	
Fencing - Refer to Section 17 .36 .01 0 of the Municipal Code		
Fencing adjacent to park/neighborhood connection corridors should be kept to three feet tall to the greatest extent possible. Fences on dual access residential lots should be no greater than three feet tall within ten feet of either street frontage.		
Off Street Parking		
Parking Requirements	2 spaces/ unit minimum	Minimum two covered spaces within a garage

Village Residential – (MMSP–R-V)

The Village Residential (MMSP–R-V) designation allows a variety of detached and attached medium and high density housing types within an area characterized by inviting building facades, shady streets, and landscaping. Garages will be recessed or accessed off of parking courts. A variety of housing styles and unit configurations connected by landscaped trails and parks will give these areas a distinctive character. Creative

lot designs including 'duet' lots, shallow-wide lots, and angled lots are permitted as well as apartment complexes, townhouses, triplexes, and condominiums. Careful attention to detail and architectural design will ensure these residences share the same character and quality of larger lot homes. Density is a minimum of 10 units and maximum of 30 units per gross acre, consistent with the density designation of the land use concept map.

Design Guidelines

Design of medium and high density residential areas shall conform to the city's Community Design Guidelines and Standards for Multifamily Residential, and the following guidelines. In the event of a conflict, the following design guidelines shall apply.

Site Design and Character

a. Provide variety in architectural detail while maintaining a consistent architectural style. Use of varied lot sizes, details and color selections, and diversity in building elevations within developments and neighborhoods is encouraged.

b. Where side yards are adjacent to public amenities such as parks and plazas, the homes shall face those amenities to the extent possible.

c. Interconnect Village Residential neighborhoods with low density residential neighborhoods, commercial centers, and parks and open space through the use of pedestrian pathways where streets do not provide direct connections.

d. The variety of housing types, including small lot detached, attached, zero lot line, townhouses, and garden apartments, should be arranged to provide an overall garden character.

e. Multi-family structures such as apartments are limited to 50 units maximum per building to ensure effective onsite management and security. At least 20 percent of multi-family units shall be provided in buildings with 20 or fewer units

per building. Buildings shall be interspersed with landscaping and common yard space for tenants, and present a welcoming public facade that conveys a feeling of lower density through the use of entry plazas, courtyards, porches, balconies, and/or other features.

f. The orientation or placement of residential structures should be strategically planned to be energy efficient and improve the streetscape with front doors and porches facing the street and garages and parking pulled behind the buildings to reduce their dominance.

g. Garages, carports, and parking spaces should be located at the rear of the lot to the extent feasible.

h. Surface parking in multi-family developments should be minimized to maximize available common open space and reduce visual effects. Below-grade parking facilities are preferred.

i. When surface parking is provided, it should be dispersed around the site, to avoid large paved expanses. Parking visible from public streets or parks should be screened with berms and landscaping not exceeding 3 ½ feet in height, with the exception of trees. Where a separate row of carports or garages are used, incorporate roof-top solar panels.

Building Form and Design

a. Building form and massing on multi-family buildings should be designed to create interesting architecture that relates to the pedestrian and minimizes the appearance of garage doors and large box-like buildings.

b. Minimize blank walls on elevations visible to the public. Change in wall plane on all facades visible from a public street or park should occur at a minimum of 40’ intervals.

c. Articulate individual units or clusters of units by varied height and setback.

d. Avoid large monolithic structures. Clusters or pods of smaller buildings are preferred over large building forms.

e. To divide the building mass into smaller scale components, buildings over 40 feet long should reduce the perceived mass and bulk by one or more of the following:

- change of roof or wall plane;
- projecting or recessed elements, such as trellises, balconies, openings, etc. Such elements should be repeated at intervals of approximately 30 feet;
- varying cornice or rooflines; or
- other similar means.

f. Roof forms should be used to distinguish various building forms, create an interesting roof line, and help break up the building massing. Roof forms should reflect a residential appearance through pitch and use of materials.

g. Roof forms typical of residential buildings, such as gable, hip or shed roof combinations, are strongly encouraged. If parapet roofs are used they should include detailing typical of residential character and design.

h. Avoid long horizontal roof lines. The maximum unbroken roof line should be limited to a 40-foot length.

i. Multi-form roof combinations are encouraged to emphasize the individual dwelling units, and break up the massing of the building.

j. All roof-mounted equipment should be effectively and attractively screened through the use of various architectural detailing including, but not limited to, roof form, decorative parapets, or cornices.

k. Multi family structures should be well articulated on all sides visible from public streets and spaces. Though the highest level of articulation will occur on the front façade, buildings should be designed to incorporate 360-degree architecture. 360-degree architecture is articulation on every building elevation. This includes variation in massing, roof forms, and wall planes, as well as surface articulation.

l. Homes should be designed to give individuals maximum privacy within and outside homes. Site layout techniques for privacy include alternating the placement of windows, rear yard outdoor patio areas and entrances.

m. Residential developments should offer an optional design accessible to physically disabled persons.

Architectural Detail

a. Architectural elements that add visual interest, scale, and character such as projecting balconies, trellises, recessed windows, and window and door detailing, should be incorporated to create shadow patterns and help articulate facades and blank walls.

b. The main building entrance should be distinguished from the rest of the building and easily recognizable.

c. Each unit's entry should be easily identifiable, distinguishable, and oriented toward the street whenever possible.

d. Entry design should incorporate two or more of the following methods:

- front porch
- decorative detailing or placement of art;
- a projecting element above the entrance;
- changes in the roofline, a tower, or
- a change in the wall plane

e. Window and door type, material, shape, and proportion should complement the architectural style of the building.

f. Windows should be articulated with accent trim, sills, kickers, shutters, window flower boxes, balconies, awnings, or trellises authentic to the architectural style of the building.

g. Faux shutters should be proportionate to the adjacent windows to create the appearance of a real and functional shutter.

h. Deep roof overhangs are encouraged to create shadow and add depth to facades. Where applicable to the architectural style, roof eves should extend a minimum of 24" from primary wall surface to enhance shadow lines and articulation of surfaces.

i. Exposed structural elements (beams, rafter tails, etc.) are encouraged as roof overhang details. Exposed rafter tails should not extend beyond the roof overhangs to prevent rot damage.

j. Multi-family structures should appear to be made of high quality, authentic, and timeless materials. In addition, the use of durable materials requiring low maintenance is strongly encouraged.

k. Where appropriate to the architectural style, materials and textures should vary between the base and body of a building to break up large wall planes and add visual base to the building. Heavier materials and darker colors should be used lower on the building elevation to form the building base.

l. Materials and colors should be used to enhance different parts of a building's façade and be consistent with the desired architectural style.

m. Material changes should occur at intersecting planes, preferably at inside corners of changing wall planes or where architectural elements intersect such as a chimney, pilaster, projection, or fence line.

n. Colors used on exterior facades should be harmonious. Contrasting colors are encouraged to accentuate details such as trim, windows, doors, and key architectural elements.

Garages and Ancillary Structures

a. Carports, garages, and other ancillary structures should be designed as an integral part of the development and should not dominate the street scene.

b. Garages and ancillary structures should incorporate similar or complementary roof forms, materials, and pitches as the main buildings within the project.

c. Garages doors should not face public streets. Garage doors facing a private street or drive aisle should be set back from the face of the main house to help reduce visual dominance of garage doors.

d. Garage doors should be recessed a minimum of six inches from the face of the exterior wall plane.

e. Garage doors should incorporate panels and/or windows to articulate these large planes.

f. No more than four garage doors should be within the same wall plane.

g. Where garage doors are visible from public streets or spaces, roof forms, trellises, and balconies should be located directly above the garage door to help minimize the impact of garage doors on the street scene.

h. Common mailbox enclosures should be designed similar or complementary in form, material, and color to the surrounding residential buildings.

i. Trash and Mechanical enclosures should be designed early in the building process, rather than an afterthought at the construction document phase.

j. Trash enclosures and loading areas provided in the parking areas should be screened with landscaping and wall materials.

k. Trash enclosures should be separated from adjacent parking stalls by minimum 3-foot wide planters with low-growing plant materials to ensure that adequate space is available for passengers to access a vehicle in an adjacent parking space.

l. The trash and recycle enclosure should be consistent with the design of the project and building architecture. The same or similar materials should be used on the enclosure as the buildings. Architecturally designed roof structures should be used to create a finished looking structure.

Development Standards

The development standards presented in Table 2-5, MMSP-R-V Development Standards, represent minimums unless otherwise noted. For regulations not covered in this code, refer to City of Soledad Title 17 Zoning code.

Table 2-5 MMSP-R-V Development Standards

MMSP-R-V Development Standards		
Category	**Restriction**	**Interpretation and Notes**
Land Use		
Zoning	Medium Density Residential (R-V)	Gross density shall conform with the stated range within each medium density housing area identified on the Land Use Diagram.
Density Range	10-30 dwelling units / gross acre	
Permitted Uses		
Small lot low density dwellings, duplexes, triplexes, apartments, clustered "pack" style homes, townhouses, condominiums, accessory buildings		
Lo t Configuration		
Lot Area	2,000 square foot minimum 6,000 square foot minimum for buildings of four or more units	Lot area may be reduced up to 10 percent in constrained locations provided all setback and usable yard area requirements are met.
Width	35 feet minimum	Measured at property line. May have a lot frontage less than specified provided all setback and rear yard area requirements are met.
Interior Lot Exterior Lot	40 feet minimum	
Depth	65 feet minimum	
Curve / Cul-De-S ac Frontage	30 feet minimum	

Building Massing		
Lot Coverage	65 percent of lot maximum	Roof overhangs, patio covers, unenclosed shade structures and the like are exempt from the building coverage calculation.
Height	3 stories maximum	
First 50 feet of lot adjacent to R-1	2 stories maximum	
Setbacks, Front	10 feet minimum	Architectural features may extend up to 2.5 feet into the adjacent setback. Fireplace and fireplace/ media centers may extend 2 feet into side yards.
Living Space Porch	5 feet minimum	
Garage	20 feet minimum	
Setbacks, Side	5 feet minimum	
Porch	3 feet minimum	
Adjacent to Street	10 feet minimum	Front/Rear setbacks can be varied up to 2 feet with combined setback of at least 20 feet.
Adjacent to R-1	10 feet minimum	
Zero lot line, duet, etc.	No setback required	Side setbacks can be varied up to 2 feet with a minimum of 3 feet and combined setback of at least 10 feet
Setbacks, Rear	10 feet minimum	
Adjacent to R-1	15 feet minimum	
Rear attached garage	5feet minimum	
Accessory Structure	5 feet minimum per story	
Distance Between Buildings	10 feet minimum	
Residential Buildings Accessory Structures	6 feet minimum	

Fencing Refer to Section 17 .36 .01 0 of the Municipal Cod e
Fencing adjacent to parks and pathways shall be no more than three feet tall and provide pedestrian access.

Landscaping & Open Space		
Private/Common Usable O pen Space for Townhomes, Condominiums and Apartments	Structures with more than 4 units: 300 square feet minimum for studio 350 square feet minimum for 1 bedroom 50 square feet additional per bedroom over 1 bedroom For 4 or fewer units, usable open space can be private or common in any combination.	Structures with more than 4 units: A portion of the required usable open space shall be outdoor private space; otherwise it shall be shared in common space. Private outdoor open space is accessible to just the unit served, and includes: patios, porches, balconies, terraces, and decks. A minimum of 48 square feet of private space shall be provided for each unit. Half of common space may be provided as indoor rooms, such as lounges, fitness centers, etc.
All developments	Provide a landscaped 4foot wide minimum strip along the periphery of the project site. The front yard setback shall contain a landscaped strip varying in width from 6 feet wide to 10 feet wide.	

Parking Refer to Section 17.36.020 of the Municipal Code
Street parking fronting on the parcel may be counted toward ½ space required for units with more than two bedrooms.

Signage Refer to Section 17.36.030 of the Municipal Code

Village Commercial (MMSP–C–V)

Intent

The Village Commercial district provides centrally located neighborhood retail shops, outdoor gathering areas, restaurants, services and/or business-professional uses to support the daily needs of residents of the plan area, within walking distance of a variety of housing areas. Potential neighborhood serving uses at the Village Commercial district include a market, pharmacy, restaurants, shops, banking, an ice-cream parlor, laundry / cleaners, café / deli, offices, and other similar types of uses.

The Village Commercial district may include a civic component and a common open space area in the form of a plaza and green space within close proximity to provide a place for people to relax, play, and interact. The Village Commercial district is well connected to the surrounding residential neighborhoods through pedestrian and vehicular paths, including a landscaped parkway that runs adjacent to the Village Commercial district.

Design Guidelines

Design of commercial areas shall conform to the city's Community Design Guidelines and Standards for Community Commercial, and the following guidelines. In the event of a conflict, the following design guidelines shall apply.

Site Design and Character

a. Provide clearly defined pedestrian walkways between residential neighborhoods as an integral component of the overall commercial site design, including a direct pedestrian access from the adjacent linear park and community park.

b. Avoid "strip commercial" by designing a single cohesive commercial center.

c. Provide for public amenities to enhance the visitor and shopper experience such as small plazas or gathering places, toddler playground, fountains, art, outdoor dining, etc.

d. A significant building with prominent architectural features should be located near the roundabout.

e. Other than curb parking on the fronting street, parking areas should be provided away from the street edge, behind buildings, underground, or within parking structures.

f. Portions of buildings may be set back from the sidewalk creating alcoves for plazas, entry nooks, and outdoor cafe seating.

g. Incorporate design elements to minimize the visual and noise impact where commercial development is adjacent to residential neighborhoods.

h. Loading areas, delivery service areas, and trash enclosures should be screened with decorative walls, trellises and vines, berming with heavy

landscaping, dense trees, or a combination of these treatments. Where through pedestrian traffic is expected past loading areas, a crossing shall be provided.

i. Loading areas and driveways, delivery service areas, and trash enclosures shall not be located in required street setback areas or any setback area adjacent to a residential district.

j. Loading areas, delivery service areas, and trash enclosures shall be designed to accommodate truck access from within the site without having to back onto or otherwise use the adjoining street.

Building Form and Design

a. Architecture should embrace the streets and sidewalks creating inviting places for people to walk, dine, and shop.

b. Avoid large box-like buildings. Building forms and massing should be designed to create interesting architecture that relates to the pedestrian scale, and creates the desired character.

c. Building form and massing should prevent blank walls on elevations visible from public streets and gathering spaces. There should be a change in wall planes on facades visible from a public street or space.

d. To divide the building mass into smaller scale components, buildings over 50 feet long should reduce the perceived mass and bulk by using one or more of the following:

- change in roof heights or wall plane;
- projecting or recessed elements;
- varying cornice or rooflines; or
- other similar means.

e. At least 60 percent of the total street frontage ground floor length of any building shall be differentiated architecturally by recessed windows and entries, display windows, offset surfaces, differentiated piers and columns, offset planes, textured materials, awnings, and compatible landscaping, or other details which are of interest to pedestrians, with at least half that total requirement being glazing.

f. Human scale should be created through the use of building forms such as arches, walls, trellises, awnings, arbors, and pergolas.

g. Roof forms should be used to distinguish various building forms, create an interesting roof line, and help to break up the building massing.

h. Variation in roof form is encouraged to create visual interest and lessen the appearance of the building mass.

i. Roof elements should continue all the way around the building and not just be used in the most visible locations.

j. All roof-mounted equipment should be effectively and attractively screened through the use of various architectural detailing including, but not limited to, roof form, decorative parapets, or cornices.

k. If the interior side of a parapet is visible from pedestrian view, it should be finished with the same materials and a similar level of detail as the front façade.

Architectural Detail

a. Though the highest level of articulation will occur on the front façade, building designs should incorporate 360-degree architecture, where they are visible from the public right-of-way. 360-degree architecture is the articulation on every building elevation. This includes variation in massing, roof forms, and wall planes, as well as surface articulation.

b. Architectural elements that add visual interest, scale, and character such as projecting balconies, trellises, recessed windows, and window and door detailing, should be incorporated to create shadow patterns and help articulate facades and blank walls. It is most important to articulate building facades that are visible from public view.

c. Architectural details and materials should be incorporated on the lower part of the building facade to relate to human scale. These pedestrian scale elements can include awnings, trellises, windows, building base articulation, and changes in materials, textures, and colors.

d. The design of rear entrances should be well articulated and appropriate to their surroundings and should respond to the need for identification signs, storage, and display areas.

e. Well-designed storefronts, including windows, doors, wall composition, colors, and materials, are very important to create a sense of entry and pedestrian scale. The main building entrance should be distinguished from the rest of the building and easily recognizable.

f. Entry design should incorporate two or more of the following methods:

   - change in wall / window plane;
   - a projecting element above the entrance;
   - a change in material or detailing;
   - integration of architectural elements such as flanked columns or decorative fixtures;
   - recessed doors, archways, or cased openings; or
   - changes in the roofline or a tower feature

g. Windows should be articulated with accent trim, sills, trim, kickers, shutters, window flower boxes, balconies, awnings, or trellises authentic to the architectural style of the building and in scale with the window.

h. Architectural and site design cues should be used to guide visitors from parking areas to commercial building entrances, since building entrances may not be directly visible from parking areas.

i. Buildings should be constructed with high quality, authentic, and timeless materials. In addition, the use of durable materials requiring low maintenance is strongly encouraged.

j. Material changes should occur at intersecting planes, preferably at the inside corners of changing wall planes or where architectural elements intersect, such as a pilaster, projection, or similar articulation.

k. Materials and colors should be consistent with the desired architectural style.

l. The use of materials and color should convey a sense of quality architecture and permanence.

m. Heavier materials and darker colors should be used lower on the elevation to form the building base.

n. Materials that are highly resistant to damage, defacing, and general wear and tear, such as precast concrete, stone masonry, brick, and commercial grade ceramic tile, should be used at the base of the building.

o. Colors used on exterior façades should be harmonious. Contrasting colors are encouraged to accentuate details such as trim, window and door mullions, and key architectural elements.

Lighting and Signage

a. All building entrances should be well-lit.

b. Security lighting fixtures should not project above the fascia or roofline of the building and should not be substituted for parking lot or walkway lighting fixtures.

c. If project elements, such as signs, walls, and trees are lit, down-lighting is encouraged over up-lighting.

d. Lighting sources should be hidden unless the sources are an integral part of the design.

e. Exterior lighting shall be located and designed to avoid shining directly onto nearby residential properties, and shall minimize offsite glare.

f. Building signs should enhance the building façade. All signs should be consistent with the City of Soledad's Zoning Ordinance, except where otherwise provided herein. A master sign program shall be approved for each development that includes commercial components.

g. Signs reflecting the type of business through design, shape, or graphic form are encouraged.

h. The method of sign attachment to the building should be integrated into the overall sign and building design.

i. Signs should be designed to coordinate with the building design, materials, color, size, and placement.

j. Sign variety is encouraged among different users.

k. Lighting of all exterior signs should be directional to illuminate the sign without producing glare on pedestrians, autos, or adjacent residential units.

l. Signs should align with others on the same building facade so as to maintain a consistent pattern.

m. Neon lighting is discouraged; however innovative use of neon may be appropriate at the discretion of the Community Development Director.

n. Hanging signs attached to buildings that project perpendicular to the building are encouraged in pedestrian areas. These signs should be a minimum of 8' from ground level to the bottom of the sign.

o. Plastic, internally illuminated sign cabinets are strongly discouraged. Externally illuminated lettering or awning signs could be an effective alternative if implemented successfully.

p. Quality directional signs and pavement markings should be provided at all parking, loading and receiving, and other special areas.

Development Standards

The development standards presented in Table 2-6, MMSP-C-V Development Standards, represent minimums unless otherwise noted. For regulations not covered in this code, refer to City of Soledad Title 17 Zoning code. Commercial developments within the plan area are subject to the master site plan approval procedures of the Zoning Code. Refer to Sections 17.22.020 to 17.22.080 and 17.22.140.

Table 2-6 MMSP-C-V Development Standards

Category	Restriction	Interpretation and Notes
Land Use	Commercial (C)	
Zoning	(M3-C-V)	Village Commercial
Permitted Uses		
Village Commercial (C-V) Bakery goods, barbershop, beauty shop, bicycle shop, books, clothing store, deli, department store, drug store, dry cleaner, florist shop, furniture store, garden supplies, gift shops, grocery store, hardware store, health foods, hobby shops, ice cream, laundromats, meat market, music store, newspaper stand, pet shop, photographic supplies, electronic stores, restaurants, shoe repair store, sporting goods, stationary store, toy store, any other use which the Planning Commission finds to be consistent with the purposes of this section		
Conditional Uses		
Banks and other financial institutions, buildings with more than 50,000 square feet of gross floor area, bowling alleys, cocktail lounges, liquor products, pool and billiards, any use the Planning Commission determines consistent with the provisions of this section.		
Prohibited Uses		
Liquor stores as a principal use, bars, automobile body and paint shop, exclusive automobile repair; sheet metal shop; fortune tellers, adult entertainment; gambling; pawn shops, thrift shops, and flea markets. Drive through lanes are prohibited in Village Commercial.		
Lot Configuration		
Landscape Area Coverage	10% of lot minimum	Area between front/street side property line and the building, excluding driveways, shall be landscaped. Parking lot areas shall be planted to reduce the impact of large paving areas.
Building Massing		
Lot Coverage	No limitation	
Height	3 stories maximum	
Setbacks	0 to 10 feet	
Street or Park	0 feet minimum	
Interior sidewalk	0 feet minimum	
Rear	20 feet minimum	
Adjacent to Residential	10 feet minimum	
Distance Between Buildings		
Parking - Refer to Section 17.36.020 of the Municipal Code		
Street parking fronting on the parcel may be counted toward commercial parking requirements.		
Signage - Refer to Section 17.36.030 of the Municipal Code		

Mixed Use Opportunity Overlay (MMSP-MU)

Intent

The Mixed Use Opportunity Overlay is intended to encourage blending of commercial and medium to high density residential in the specific plan core area and the Farmers' Village. The mixed uses are intended to provide residents with convenient access to services, and to enliven both commercial and residential areas without imposing undue noise or nuisance on residents. Under this overlay, limited commercial uses may be constructed within residential areas, and limited residential uses may be constructed within commercial areas. In the Farmers' Village area, this designation is intended to allow for office space, social services, and fixed and mobile convenience and personal services and retail to serve residents and immediate neighbors.

Design Guidelines

a. Incorporate design elements to minimize the visual and noise impact at residential units.

b. Loading areas and driveways, delivery service areas, trash enclosures, and commercial parking lots shall not be located closer than 30 feet from a residential unit.

c. Exterior lighting shall be located and designed to avoid shining directly into residential units.

d. Residential parking shall be clearly differentiated from commercial parking, unless intended for shared use.

e. In the Farmers' Village, commercial parking requirements shall be reduced to two spaces per 1,000 square feet.

Open Space and Public Facilities (OS and PF)

Intent

The OS Open Space and PF Public Facilities are designations for lands that will be kept lightly developed with public or quasi-public uses.

Allowed uses in the PF District include utilities, parks, schools, and fire/police stations. Except as otherwise noted herein, uses and standards for the areas zoned OS Open Space shall be as provided in Chapter 17.32 of the Soledad Zoning Code, and uses and standards for the areas zoned PF Public Facilities shall be as provided in Chapter 17.34_ of the Soledad Zoning Code, except as otherwise noted in this specific plan.

Design Guidelines

OS District

Landscape planting shall consist exclusively of plant material native to the Salinas Valley region and its foothills.

Permanent irrigation is prohibited.

A buffer of low-growing and low fire fuel load vegetation shall be maintained within 100 feet of residential properties.

Pathways shall be natural dirt or surfaced with permeable material, such as gravel.

Signs shall not exceed six feet in height, 16 square feet in area, and shall be unlit.

Fencing shall allow wildlife movement within the open space area.

PF District

Vegetative screening shall be provided for utility structures such as water tanks and electrical substations.

Landscaping shall be provided adjacent to structures and public sides of fences.

Architecture shall be compatible with adjacent structures.

2.5 Visual Elements

Design shall conform to the city's Community Design Guidelines and Standards and the following guidelines. In the event of a conflict, the following design guidelines shall apply.

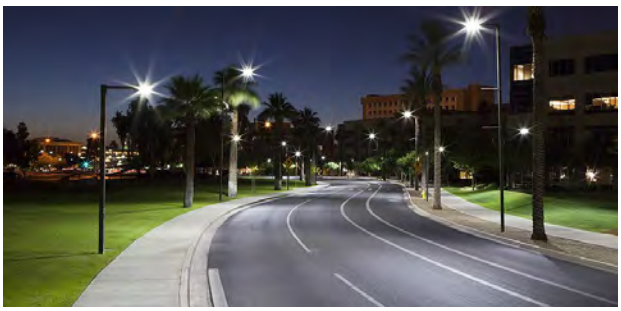
Gateways

Gateways establish the overall first impression of the plan area and its neighborhoods, indicating to the resident and/or visitor the character and quality of the community. An attractive gateway is crucial for creating a desired residential atmosphere. Figure 2-5 Miramonte Specific Plan Gateways, shows where the plan area gateways are located: at the northwest corner of the storm water basin along San Vicente Road, at the southwest corner of the Farmers Village parcel along San Vicente Road, at Orchard Lane and San Vicente Road in the traffic circle on West Street, in the traffic circle on Orchard Lane in the middle of the plan area,, and at the plan area entry on Orchard Lane. The gateway leading to the commercial area from San Vicente Road should incorporate a sign identifying the commercial area and the stores and services located there, as a subordinate element to the main gateway signage.

Gateways should announce entry to the plan area by incorporating specific elements that create a "gateway scene." The composition should function as a visual anchor and provide a sense of arrival, reaffirm direction, and reinforce the plan area character. The design for each of the defined gateways may vary, although the elements comprising the "gateway scene" should be repeated to reinforce the concept of entry and overall plan area character.

Major gateways announce the plan area's three main arrival locations: the first two entry points from San Vicente Road, and the traffic circle near the commercial area. Major Gateways will have prominent monuments, signs, and enhanced landscape features. Minor gateways are secondary points entering the plan area, such as from the existing neighborhoods to the south, the traffic circle near the school, and the final entry point from San Vicente Road.

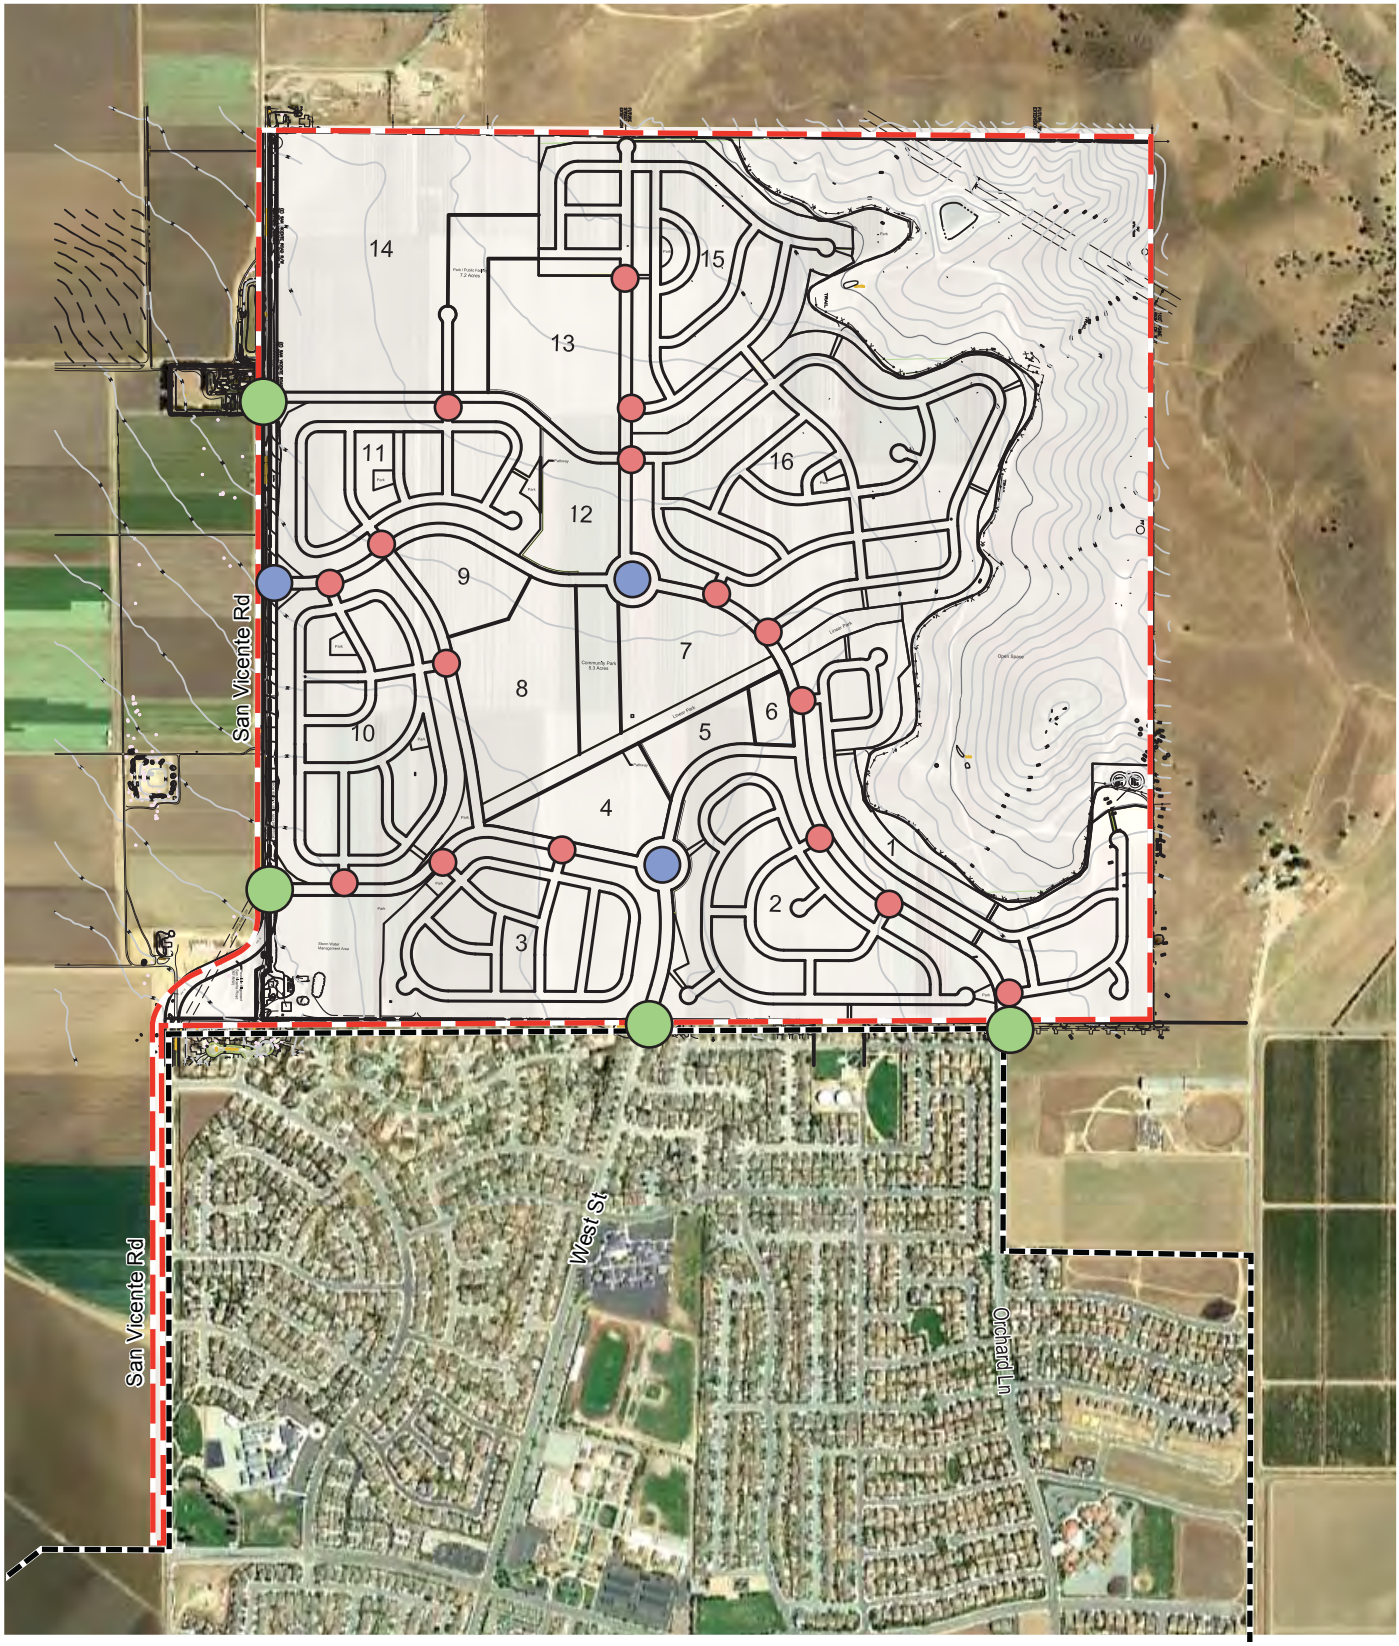
Minor gateway monuments and signs will be scaled down, and landscaping may be slightly enhanced from that found along the edge of the streets. Neighborhood gateways are located at each point where a collector street provides entry into a neighborhood, and feature a modest monument and could include a sign identifying the neighborhood. The following policies shall be implemented in gateway design:



Gateway Guidelines

Each plan area gateway should be prominently marked with signage, accent paving, lighting, landscaping, accent trees, and monument features. Monuments and signage shall reflect the plan area's agricultural heritage. The design of gateways shall be coordinated with any adjoining lighting, landscaping, walls, or fencing elements. Gateway entry features should include gateway monumentation, walls and/or fencing, vineyard planting clusters, and seasonal interest plants where feasible. Coordinate the design of the West Street circle gateway with the commercial development to the north, so that the two together provide a cohesive visual statement. The gateway within the storm water basin should be designed to align with the eventual configuration of San Vicente Road. Vehicle and pedestrian entries to the commercial area should be designed with signage, walls, landscaping, and accent features consistent, complimentary, and compatible with the rest of the commercial site.

Landscape islands and roundabouts may be used within the plan area to provide accent landscape elements to local roads. Residential neighborhood gateways and pedestrian gateways can be marked by smaller monuments, colored/textured sidewalks and crosswalks, and/or decorative walls.



Lighting

Effective lighting provides safety and direction for vehicles and pedestrians, while enhancing architectural building and landscape details. In order to uniformly incorporate a pedestrian-friendly experience, ornamental lighting fixtures and pole specifications have been identified that are consistent with the fixtures found in downtown Soledad.

Lighting Guidelines

The use of city standard galvanized light fixtures shall be limited to collector streets within the plan area. All street lights shall shine downward and provide an even spectral distribution of

Source: Google Earth 2017

Figure 2-5

Miramonte Specific Plan Gateways

This side intentionally left blank.

light. Street lights shall be on poles no taller than 20 feet. Avoid high intensity street lights in residential neighborhoods. Design quality street poles shall be used within the plan area.

Lit pedestrian pathways (paths between homes and the linear park) in residential neighborhoods shall incorporate cut-off style lighting on poles no taller than 10 feet. No lighting shall be permitted along the hillside trail. Lighting shall not cause glare or intrusion at residential properties.

Exterior building lights should be used to wash walls or provide light immediately adjacent to the building, and not to illuminate large areas. Exterior lighting color shall not exceed 3,000 on the Kelvin scale.

Signage

Signs and monuments within neighborhoods provide a cohesive character and identity. Proper design and application of signs and monuments orient future residents and visitors. Signage also serves as wayfinding mechanisms directing drivers and pedestrians to desired locations. Signage improves circulation efficiency and access to important neighborhood designation points, enhancing one's overall experience. Temporary project-specific signs (such as billboards, human signs, and sidewalk signs) and marketing logos shall not be permitted as these signs create a sense of separation from the larger community. Most signage will be related to commercial uses and for identifying multifamily developments.

Signage Guidelines

All sign elements shall reinforce and coordinate with the character of the plan area and its surroundings. Signage, including monuments, shall incorporate like materials, colors, and shapes that reflect the plan area and city. Signs and/or monuments shall be constructed with high quality, low maintenance, and long-lasting materials. Sign and/or monument design shall coordinate with any adjoining walls or fences. Signs and/or monuments shall be used to identify uses such as various residential developments, open space paths, and parks. Street signs and directional signs shall have a common design theme.

Landscaping

Plants should be selected to provide opportunity for shade, protection from wind, ease of maintenance, and climate compatible planting. The landscaping should establish visual integrity for the area and promote pedestrian and vehicular safety by clearly distinguishing walkways and access points. Landscape water use should be minimized to the extent feasible, unless recycled water or captured rainwater can be used for irrigation.

Street Trees

Street trees are large trees generally selected for their ability to form dense, round canopies, grow well under paving areas and produce limited debris. Suitable street trees include:

Madrone	*Arbutus menziesii*
Western Hackberry	*Celtis reticulata*
European Hackberry	*Celtis australis*
Red Ironbark	*Eucalyptus sideroxylon*
Silver Dollar Tree	*Eucalyptus polyanthemos*
Raywood Ash	*Fraxinums oxycarpa* Raywood
Australian Willow	*Geijera Parviflora*
Maidenhair Tree	*Ginkgo biloba* Autumn Gold or Fairmount
Golden Rain Tree	*Koelrueuteria paniculata*
Glossy Privet	*Ligustrum lucidum*
Sweet Gum	*Liquidambar styraciflua*
Prickly Melaleuca	*Melaleuca styphelloides*
Pacific Wax Myrtle	*Myrica californica*
Chinese Pistache	*Pistacia chinensis*
Catalina Cherry	*Prunus illicifolia 'Lyonii'*
Chantecleer Pear	*Pyrus calleryana* Chanticleer
Holly Oak	*Quercus ilex*

Street trees should be planted in locations where there is at least a five-foot wide planting strip available. The sidewalk may be curved to provide adequate width. Trees on the accent tree list are generally smaller, but can also be suitable street trees in some situations.

Accent Trees

Accent trees are generally smaller than standard street trees and are used to accentuate key locations. Accent trees are selected for the foliage color or flowers, but close attention is also given to their ability to perform well under various soil and water conditions. Suitable trees include:

Silk Tree	*Albizia julibrissin*
Strawberry Tree	*Arbutus unedo*
California Lilac	*Ceanothus* Concha and *thyrsifloris* Skylark
Western Redbud	*Cercis occientallis*
Smoke Tree	*Cotinus coggygria*
Coast Silktassel	*Garry elliptica*
Toyon	*Heteromeles arbutifolia*
Jacaranda	*Jacaranda mimosifolia*
Crepe Myrtle	*Lagerstroemia indica*
Australian Tea Tree	*Leptosporum laevigatum*
Crabapple	*Malus* spp.
Star Magnolia	*Magnolia stellata*
Coffeeberry	*Rhamnus californica*

Park Focal Point Trees

Park areas, roundabouts, the linear parkway, and potentially wider street medians, provide an opportunity for large trees that will provide shade and wind protection for many years. These trees

will become plan area landmarks as they mature. Since these trees grow tall, they should be kept at least 30 feet back from adjoining residential properties to prevent inadvertent yard shading or tree litter issues. Suitable trees include:

Camphor Tree	*Cinnamomum camphora*
Red Gum	*Eucalyptus camaldulensis*
European Beech	*Fagus sylvatica*
Locust	*Gleditsia triacanthos*
Sweet Gum	*Liquidambar styraciflua*
Chinese Pistache	*Pistacia chinensis*
London Plane	*Platanus acerifolia*
California Sycamore	*Platanus racemosa*
Coast Live Oak	*Quescus agrifolia*
Scarlet Oak	*Quercus coccinea*
Blue Oak	*Quescus douglasii*
Valley Oak	*Quercus lobata*
Red Oak	*Quercus rubra*
Cork Oak	*Quercus suber*
Sawtooth Zelcova	*Zelcova serrata*

California sycamore is suggested specifically for the edges of the detention basin/park, due to its tolerance of seasonally wet soils.

Native Plantings in Open Space Areas

Many of the open space areas provide a transition to natural areas in the hillsides to the east of the plan area. Plantings within these areas are restricted to trees and shrubs that are native to the Salinas Valley and surrounding hills. The transition area is not considered especially sensitive, so no sourcing requirements are mandated, and commercial named cultivars may be used. Minimal planting is anticipated in these areas unless needed to replace invasive plants or provide erosion protection.

Drought Tolerance and Irrigation

Landscapes should be designed to minimize the need for irrigation by utilizing plants that thrive with little or no water, and irrigation systems that conserve water and operate only when necessary. Turf should be reserved for use in active play fields only.

Landscaping along Arterial or Collector Streets

Where fences or walls front on an arterial or collector street, a minimum of three feet of landscaping shall be provided between the street and the sidewalk, and a minimum of four feet of landscaping shall be provided between the sidewalk and fence or wall. Street trees shall be planted between 25 and 30 feet on center. Shrubs shall be selected to attain a height between three and five feet, and not encroach into the sidewalk when mature. The sidewalk should connect through the landscaping to the street at locations where pedestrian crossings are needed.

Landscaping in Parking Lots

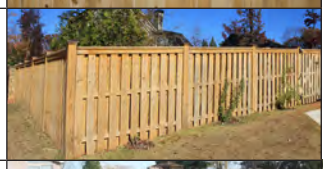
Parking areas should be landscaped to minimize sun glare and heat buildup and to reduce the negative visual impact associated with large areas of paving. Accent landscaping should be used to

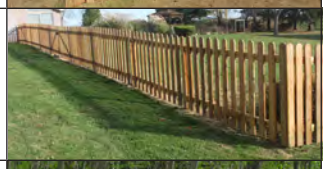
enhance/identify entry drives and delineate drive aisle locations. Landscaping within parking areas should be protected from encroaching vehicles by concrete curbing. The curbs should have breaks to allow entry of storm water run-off. If used, landscape islands should be a minimum of 5 feet in width to allow for tree growth and to avoid tree trunks from being damaged by cars. Plants near corners shall be selected for a mature height of no more than three feet to permit good visibility. Trees may be selected from the street tree and accent tree lists.

Fences and Walls

Residential Fences

Fences can provide a setting for entryway landscaping and treatments that differentiate and define the neighborhoods, and assist in defining a sense of place. Fences also provide separation between residential units for individual privacy, safety, and security. All fencing will be installed by the developer(s) and shall coordinate with landscape treatments.





Fence and Wall Design Guidelines

Fence and wall styles shall be coordinated throughout the plan area. Fences and walls shall incorporate materials, colors, and shapes that reflect the character of the plan area and its surroundings. Fences and walls shall be constructed of high quality, long lasting, low maintenance, and graffiti resistant materials. Fences and walls shall be designed to minimize policing problems, indefensible spaces, and hiding spots, and shall not diminish public or private views. Along pedestrian pathways, fencing should be kept at three feet within the front yard, and within the side yard for the greatest length feasible to provide visibility into the pathway.

Residential yard fences shall not exceed six feet in height (as per city standards), shall be constructed from construction heart redwood or comparable, durable material. Residential walls backing to a street may be decorative masonry. Open fencing used in front yard setbacks shall not exceed three feet in height, be of decorative material (i.e. wood pickets, split rail, etc.), maintaining a minimum transparency of 50 percent.

Edge fencing along the open space conservation areas shall not exceed three feet in height and shall be of decorative material (i.e. wood pickets, split rail, etc.). The design shall permit passage of wildlife. This requirement does not apply to residential fences backing up to open space areas. Landscape improvements shall complement the character of the fence (see Landscaping Standards). Chain-link fencing is prohibited. Fencing guidelines are presented in Table 2-7, Fencing Guidelines.

Table 2-7 Fencing Guidelines

Fence Type	Height Limit (feet)	Permitted Application	Image
Wood: Wood Fence with wood posts	6' Setbacks A minimum of 5' behind the leading edge of the house along rear and side property lines.	Rear and side yard of residential lots	
Good Neighbor: Wood fence with wood posts and a decorative cap. Cap should be a semi-transparent panel.	7' Setbacks A minimum of 5' behind the leading edge of the house along rear and side property lines	Rear & side yard of residential lots when visible from public view.	
Picket: Picket Fence with wood posts	3' Setbacks Must be 2' minimum behind property line and a minimum 50% transparent	Front yard of residential lots, and along side yard property lines to the front façade of the house. Rear yards adjacent to the golf course.	
Split Rail: Split rail fencing that reflects the agrarian character of the area.	4' Setbacks A minimum of 5' behind the leading edge of the house along rear and side property lines.	Front yard of hillside residential lots, along side yard property lines to the front façade of the house; Open ended cul-de-sacs leading to open space; May also be used in conjunction with neighborhood entries. (Min. 50% transparency). Rear yards adjacent to the golf course.	
Split Rail with Mesh: Split rail fencing that reflects the agrarian character of the area.	4' Setbacks A minimum of 5' behind the leading edge of the house along rear and side property lines.	Rear yard adjacent to the golf course.	
Wrought Iron: Wrought iron fence with wrought iron posts.	6' Setbacks A minimum of 5' behind the leading edge of the house along rear and side property lines.	Rear and side yards adjacent to the golf course.	

This side intentionally left blank.

3.0

CIRCULATION

The specific plan's circulation system is designed to provide a functional and efficient transportation network for automobiles, transit, bicyclists, and pedestrians. The street system is comprised of a network of arterial, collector, and local residential streets designed to accommodate traffic generated by plan area residents. All streets are public with the exception of the private driveways that may be developed within the commercial and medium density residential areas. Figure 3-1, Miramonte Specific Plan Circulation Diagram, has been incorporated into this plan consistent with Section 65451(a)(2) of the State Government Code.

Section 3.0 is organized into the following subsections:

3.1 Circulation Goals and Policies

3.2 Circulation Concept

3.3 Circulation Elements

3.1 Circulation Goals and Policies

The following Circulation Goal and Policies establish the implementation framework for the Plan's Circulation Diagram.

Circulation Goals

C – 1 Provide the necessary circulation system and infrastructure to create a safe and efficient circulation network for motor vehicles, pedestrians, physically disabled persons, and alternative forms of transportation with an emphasis on creating a pedestrian friendly, walkable community.

C – 2 Provide a comprehensive bicycle and pedestrian network separate from street rights-of-way to facilitate quick and convenient non-motorized access.

C – 3 Provide seamless connections to adjacent areas, but encourage most automobile and all truck traffic to use San Vicente Road, rather than Orchard Lane or West Street.

Circulation Policies

C – A The general plan circulation concept should be adapted to the plan area in recognition of development limitations related to the 400-foot elevation contour and future traffic demands in the northwest quadrant of the city.

C – B All streets and circulation routes shall be consistent with Figure 3-1, Miramonte Specific Plan Circulation Diagram.

C – C San Vicente Road shall be connected to the plan area temporarily by way of following the existing alignment, and ultimately by large-radius curves to provide a smooth transition from the plan area south to the existing.

C – D Street widths shall be consistent with street section minimums indicated in Figures 3-2, Street Classifications Cross Sections.

C – E All street improvements shall be financed and installed by the developer. The developer may be credited by the city's Traffic Impact Fee program.

C – F All streets within the plan area shall be public and dedicated to the City of Soledad, and shall be constructed with curbs, gutters, landscape parkways, and sidewalks meeting City of Soledad Standard Plan specifications.

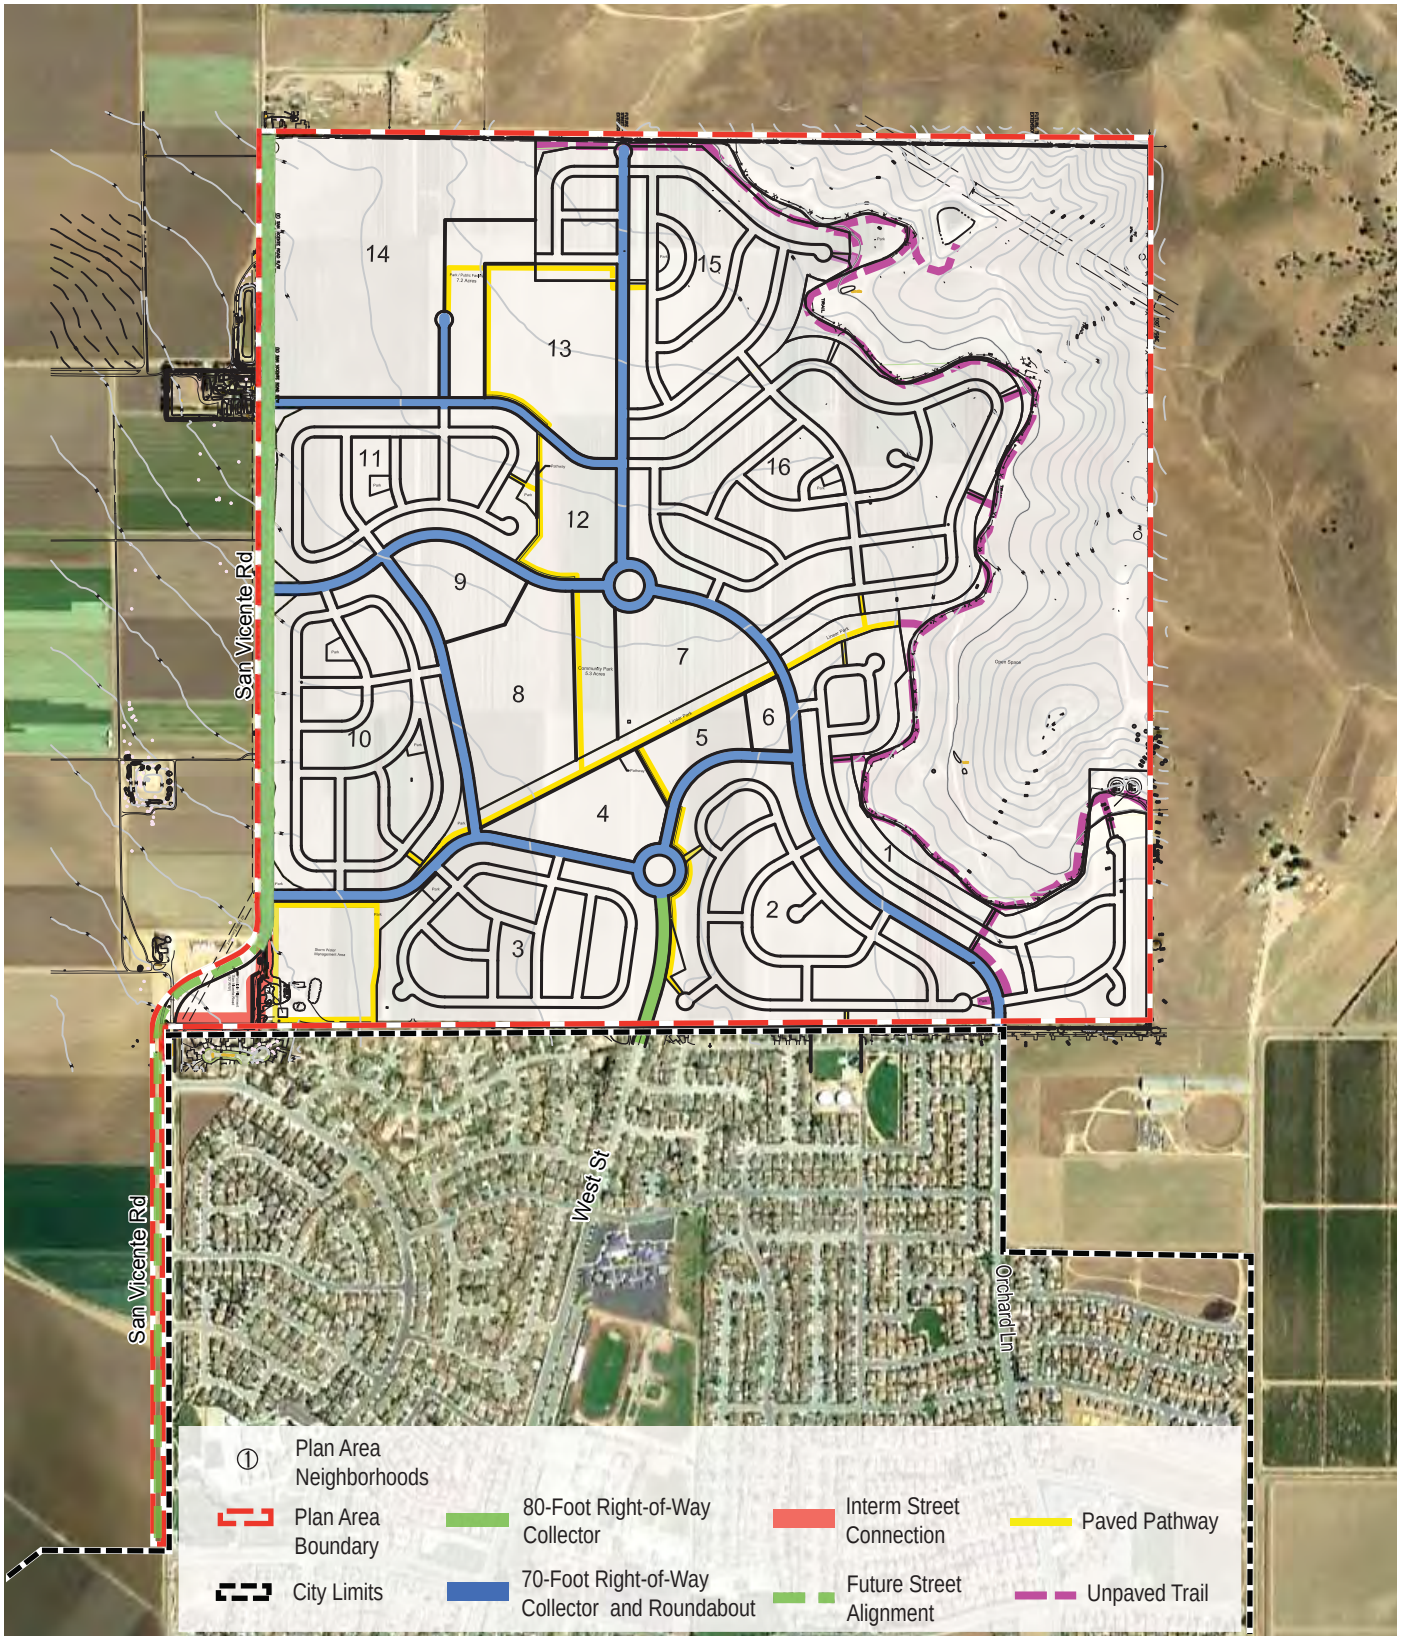
C – G City shall assume responsibility for the maintenance and repair of all street facilities with funding from a Benefits Assessment District or other appropriate funding mechanism.

C – H Funding for maintenance of lighting, street improvements, special paving surfaces, sewer, storm drain, common area landscape, open space, and hardscape shall be provided through a Public Facilities Maintenance District or a similar funding mechanism.

C – I All private streets and driveways within the plan area, such as within commercial and medium density areas, shall be maintained and paid for by the property owners for those developed areas.

C – J All streets shall include a sidewalk at least four feet in width on each side of the street.

C – K Sidewalks adjacent to schools, commercial areas, and village residential areas (external road frontages only) shall be a minimum of eight feet wide, and may replace planting strip and landscaping included in the street sections with interspersed landscaping blocks.



C – L Sheltered bus stops including bus turnouts, meeting MST (Monterey-Salinas Transit) specifications, shall be provided at appropriate locations within the plan area. The developer will develop these bus stops for use by the on-call service or future fixed route service.

C – M Bike lanes and paths shall be designed and maintained to improve bicycling safety and convenience, achieve integration with the street network, and encourage people to use bicycles to commute to work or school.

C – N New development shall provide bike lanes and paths, secure bicycle storage, and parking facilities.

C – O Bicycle parking should be provided in locations near building entrances or outdoor use areas with good public visibility.

C – P A minimum of two ingress/ egress will be provided for each neighborhood area. Access should be aligned with intersecting streets where possible.

Figure 3-2

Street Classifications Cross Sections

Miramonte Specific Plan

This side intentionally left blank.

3.2 Circulation Concept

The plan area streets and pathways are designed to accommodate a variety of transportation modes. Streets will create a logical network which will accommodate cars, bicycles, and pedestrians. Sidewalks, street trees, landscaping, and building placement shall be considered in order to create inviting public spaces. The use of internal local streets feeding into collector streets will keep traffic volumes low in residential neighborhoods, while a separate network of pathways will provide additional circulation options for pedestrians and bicyclists. Refer to Figure 3-1, Miramonte Specific Plan Circulation Diagram, for the circulation plan.

Street Classifications

Collector streets serving the plan area are San Vicente Road, Orchard Lane from the southern plan area boundary to San Vicente Road, Orchard Lane through the roundabout to San Vicente Road, West Street from the southern plan area boundary through the roundabout to Orchard Lane, Crest Street, the street west of the schools, and the street south of the Farmers' Village. Collector streets will be within a right-of-way that is either 80 feet wide (San Vicente Road and the southern leg of West Street) or 70 feet wide (all other collector streets). Other streets within the plan area will be local streets within 56-foot rights-of-way. Figure 3-2, Street Classifications-Cross Sections, illustrates the various classifications of streets.

On-street Bicycle and Pedestrian Facilities

Pedestrian sidewalks provide excellent opportunities for leisure and recreation as well as an alternative means of transportation. Pedestrian sidewalks are provided on all plan area streets. Plan area sidewalks consist mostly of a five-foot wide sidewalk area separated from the adjacent

street by a landscaped planting strip. A landscaped area is also provided between the sidewalk and adjacent walls or fences.

Class II bicycle lanes are provided on all collector streets within the plan area. Bicycle lanes will be a minimum five feet wide and will be separated from the vehicle travel lane by a painted stripe, generally solid, but dashed approaching intersections.

Bicycle and Pedestrian Pathways

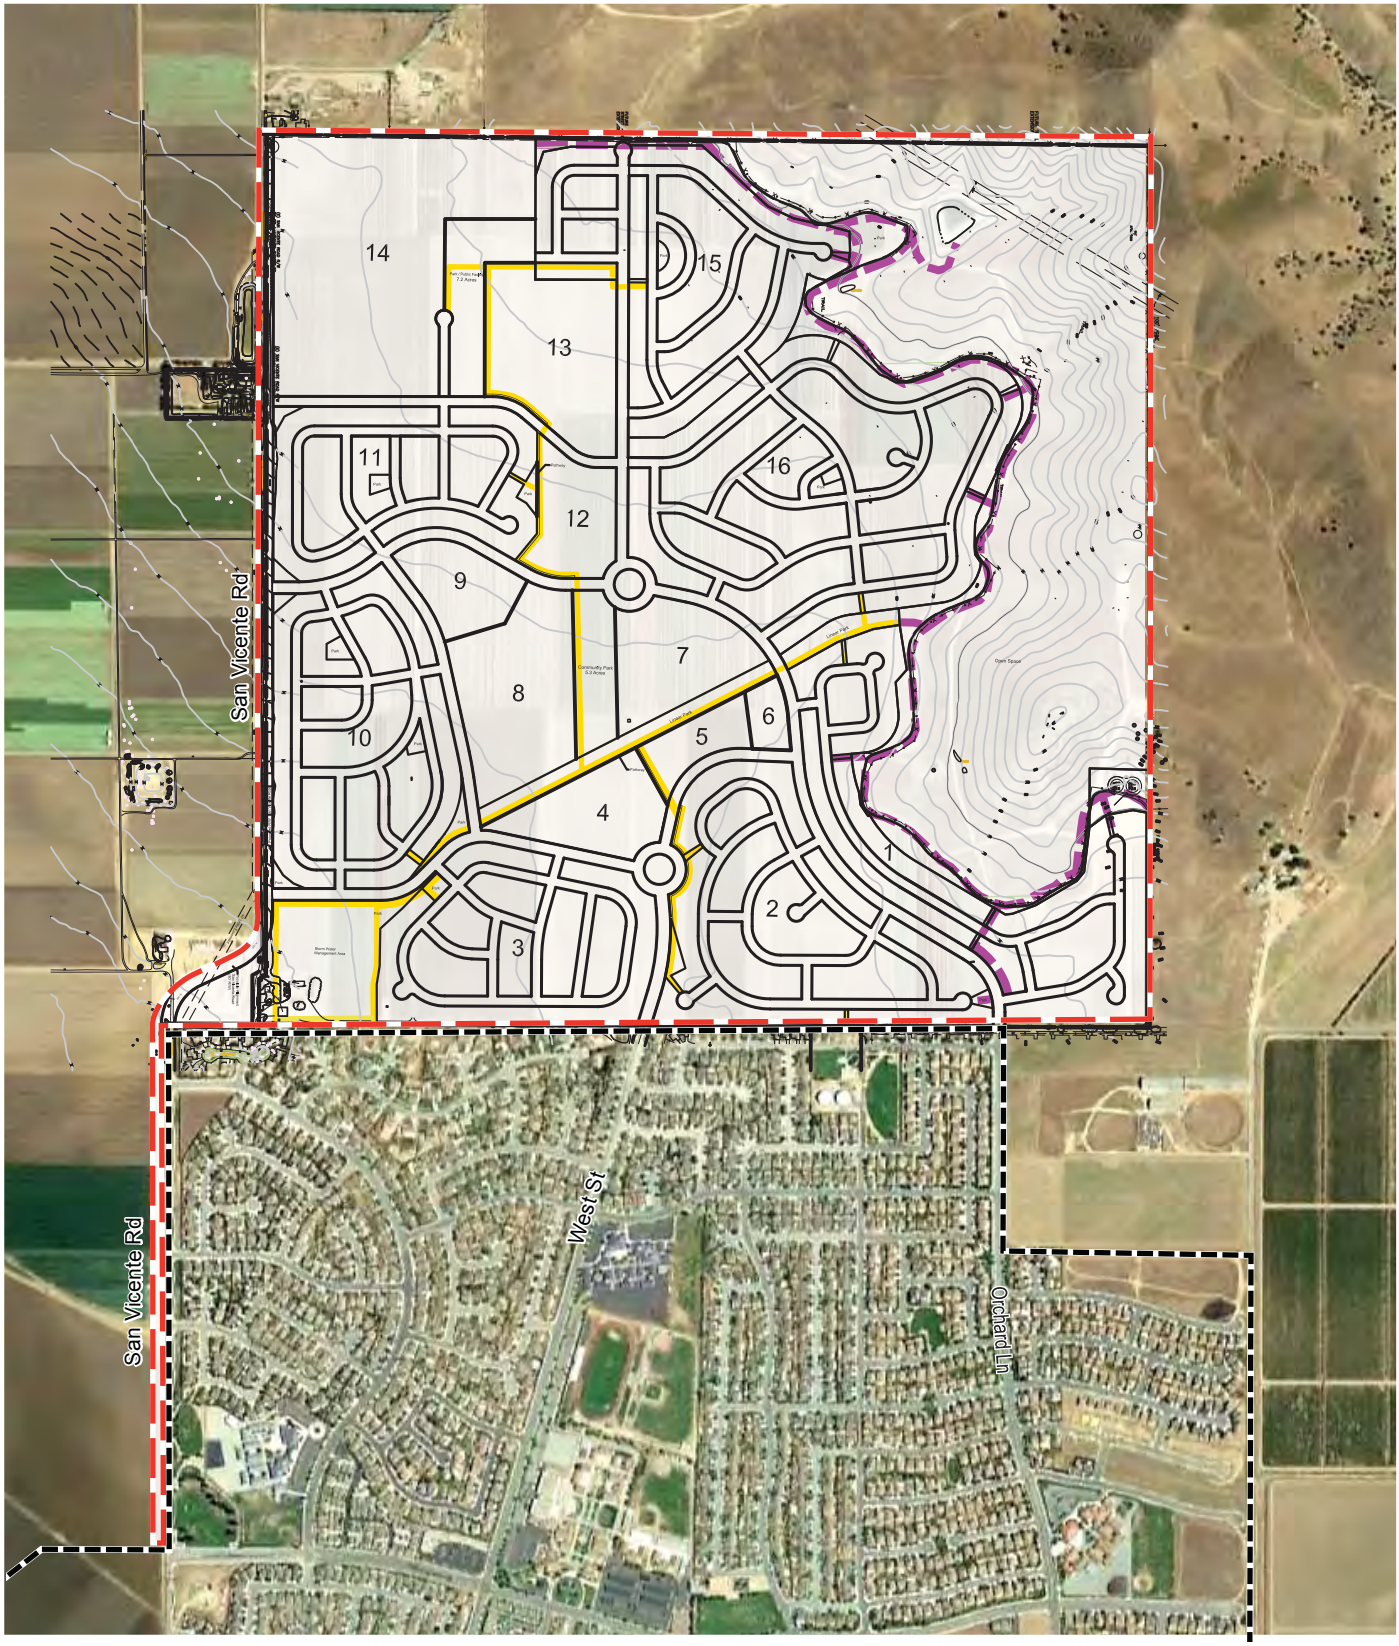
A network of pathways is integrated into the specific plan. Two major pathway spines cross the plan area. The linear park connects from San Vicente Road northeastward to the residential areas north of Orchard Lane, and a second spine pathway begins at the linear park and extends northward to the Farmers' Village. These two spines serve all of the medium and high density residential areas, the commercial area, both schools, the Farmer's Village, and park areas. Numerous short connecting pathways provide connections between the low density residential neighborhoods and these two spines or to schools

or adjacent streets. These pathways within the developed portions of the plan area will be paved or constructed with another type of hard surface material, and will serve both utilitarian and recreational purposes. A trail in the open space area will utilize the existing dirt road and serve primarily recreational purposes. Figure 3-3, Pathway System, shows the location of off-street pathways for bicycles and pedestrians.

The hard-surfaced pathways will be within minimum 20-foot-wide rights-of-way, to allow enough room for emergency ingress/egress if needed. The pathway surface will be eight feet wide to meet Caltrans bikeway design standards. Where the pathway provides the only secondary access, the right-of-way will be 20 feet with a 12-foot wide paved pathway. At least three feet of low landscaping will be provided on each side of the pathways. Figure 3-4, Pathway Cross Section, shows typical pathway standards. Signage may be provided throughout the plan area to guide bicyclists toward trails, parks, and other points of interest.

Public Transit

Monterey Salinas Transit (MST) operates five routes servicing the City of Soledad: Seaside-King City; King City-San Jose Airport; Monterey-Paso Robles; Soledad-Paso Robles; and Salinas-King City. All of these routes stop on Hector de la Rosa Street, about two miles from the southern boundary of the plan area, and one route (Salinas-King City) also stops at Front Street and San Vicente Road, about one mile from the southwest corner of the plan area. MST also operates local door-to-door transit service on an on-call basis within the cities of Soledad, Gonzales, Greenfield, and King City. This service can be used to connect to the fixed routes that serve Soledad, and would serve the plan area when the plan area is within the city limits.



The specific plan includes a policy to include bus stop locations, and the looped nature of the street layout facilitates future fixed route bus service through the plan area. Two potential transit loops are identified in Figure 3-5, Potential Transit Loops.

Rail Service

A commuter train station has been proposed at the intersection of Main Street and Front Street, one and one-half miles from the southern boundary of the plan area. The station could provide a connection for Amtrak, Caltrain, or a new commuter rail line at some point in the future; Caltrain currently provides service from San Francisco to San Jose, with limited service as far south as Gilroy. Planning is underway for extension of Caltrain service to Salinas, but there are no current proposals for commuter rail to the southern Salinas Valley. Amtrak's Coast Starlight passes through Soledad, but the nearest stops are in Salinas and Paso Robles.

Street Design

All streets will be designed to meet the city's Standard Plan specifications. Every street will include one traffic lane in each direction, gutter, storm drains, curb, planting strip, and sidewalk. Street cross-sections are shown in Figure 3-2, Street Classifications Cross Sections.

Figure 3-5

Potential Transit Loops

Miramonte Specific Plan

E M C

This side intentionally left blank.

80-foot Collector Street Design

San Vicente Road and West Street south of the roundabout will be designed with 80-foot wide rights-of-way.

West Street will have a landscaped median of between 12 and 18 feet in width, two 12-foot travel lanes, two five-foot bicycle lanes, two five-foot sidewalks, and the remaining 18 to 24 feet will be landscaped areas to the sides of the street. No parking will be permitted on West Street.

San Vicente Road will have two 12-foot travel lanes, two five-foot bicycle lanes, two five-foot sidewalks, a landscaped median of 15 to 18 feet, and the remaining 18 to 21 feet will be landscaped areas to the sides of the street. Twelve-foot turn lanes will be provided within the median where needed, leaving a three- to six-foot landscaped median area adjacent to the turn lane. No parking will be permitted on San Vicente Road.

On San Vicente Road between the north end of the storm water basin parcel and the northern boundary of the plan area, the specific plan developer will construct all of the east-side improvements, as well as southbound turn lanes and adjacent median where needed to serve the plan area, the eastern half of the median including curb and landscaping (except in locations where a northbound turn lane will be needed, and a temporary asphalt curb should be provided), and the southbound travel lane in its ultimate position. Between the north end of the storm water basin parcel and the point about 300 feet north of Vista del Soledad, the specific plan developer will upgrade San Vicente Road on the existing alignment to a pair of 13-foot lanes with two-foot shoulders for temporary use until a final wide-radius curve connection can be completed on adjacent land by the developer of that land. In lieu of the temporary connection, the specific plan developer may construct the wide-radius curve connection on the adjacent land.

70-foot Collector Street Design

Most of the collector streets within the plan area will be within 70-foot rights-of-way. These streets will have two 11-foot travel lanes, two five-foot bicycle lanes, two five-foot sidewalks, an eight-foot parking lane on one side, and the remaining 20 feet will be landscaped areas to the sides of the street.

A parking lane will be provided on the side of the street on which development fronts, such as in front of the commercial area, the schools, and the medium density housing areas. No parking will be provided on the side of a street fronted by a wall. In locations where there are walls on both sides, parking will only be provided in the vicinity of a park or trail entrance, and for the remainder of the street, the extra width will be dedicated to landscaping at the side of the street, or a landscaped median. Parking may be provided on both sides where the collector runs between the two schools, and to reduce congestion and improve crossing visibility, no parking will be provided on Orchard Lane between the roundabout and the senior housing. No parking will be allowed within 50 feet of any of the roundabouts, and a bulb-out will be provided to mark the point where parking ends. Parking spaces will not be delineated by paint marks. In places where houses are arranged to front onto a collector street, garage access will be provided from the local street, but parking may be included along the street.

56-foot Local Street Design

The 56-foot local streets will provide access within residential neighborhoods. Each street will have two 10-foot travel lanes, two seven-foot parking lanes, a five-foot planting strip, and a five-foot sidewalk. Houses will front on most local streets. In some situations, where a row of lots is situated between an collector and a local street, garage access may be off the local street, while the house fronts on the collector street.

Roundabouts

Two 180-foot diameter roundabouts, located within a 300-foot diameter right-of-way, are proposed to accommodate collector street traffic flow without the need for signal lights or stop signs. One of the traffic circles is located where West Street reaches the commercial area. This roundabout will provide options for northbound traffic to proceed to the northern neighborhood or to the commercial area, senior housing, or southern residential areas. Another roundabout will be located where the street east of the schools meets Orchard Lane. Traffic entering the project site from San Vicente Road will have an option to reach the northern neighborhoods, the fire station, or either of the schools.

The roundabouts will include single 20-foot travel lanes shared with bicycles, the central island, a five-foot sidewalk, and landscaping. The central island would measure about 80 feet in diameter, including a 5 to 10-foot wide oversized vehicle/fire engine apron and landscaping. Optional bicycle routing will be provided via the sidewalks. The West Street roundabout will also accommodate a Class I pathway along the eastern edge to connect the north-south pathway spine to residential areas.

Parking Lots and Driveways

On-site circulation systems should be designed to reduce conflicts between vehicular and pedestrian traffic, provide adequate maneuvering and stacking areas, and consider emergency vehicle access. Adequate parking within the project area is necessary for a successful project; however, it should be located and designed to minimize the visual impact of paved lots.

Parking Guidelines

- low screen walls;
- landscaping;
- changes in elevation (i.e. recessed from street level).

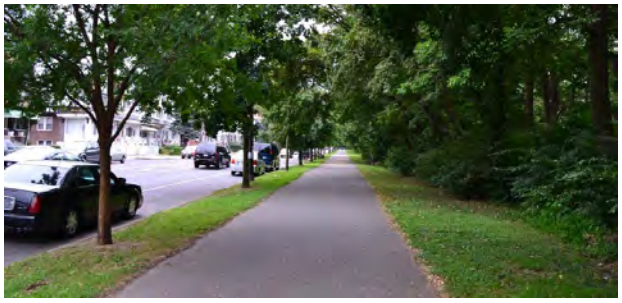
Parking areas should be designed so that the paths of travel for cars and pedestrians are separated to the extent possible. Parking areas should include shade trees, landscaping, lighting, and pedestrian/vehicular circulation areas. Accent paving should be used to delineate locations where a pedestrian travel route crosses the vehicular route. Bicycle parking shall be provided adjacent to commercial parking lots at a ratio of one bicycle space for each ten automobile space.

Driveways to parking lots should be located as far from street intersections as possible so that adequate stacking room along the street is maintained (25-foot minimum from curb return). The primary entry drive to parking lots should be designed with enhanced paving, landscaping, and architectural features. Parking lot entrances should align with street intersections to minimize entry and exit locations along collector streets. Parking lots shall provide adequate turning and backing space to safely accommodate garbage trucks, delivery trucks, and emergency vehicles.

Traffic Calming and Street Crossings

Traffic calming is important to creating a safe and enjoyable neighborhood. Traffic calming devices can control traffic volumes and speeds to promote a safe neighborhood feel within the plan area.

The curvilinear street design will naturally reduce speeds by preventing long straight streets where traffic can increase its speed. Speed limits are expected to be set at 25 miles per hour on all streets internal to the plan area. Traffic will also be slowed as it flows into the roundabouts, with a typical speed of about 15 miles per hour.



The low density residential lots are on interior streets that will not carry through traffic or large volumes of traffic.

Intersection and mid-block bulb-outs reduce the paved surface width of a street to serve two purposes: control traffic movements and provide safer pedestrian crossings as driving speeds tend to decrease as a street narrows, and the pedestrian's crossing distance is reduced. Intersection and mid-block bulb-outs will be built at the intersection between the two schools, the intersection near the senior housing, and at the four major pathway/street crossings, as well as the point where the trail system transitions onto West Street. These bulb-outs should include special paving and landscaping that does not decrease driver sight lines at intersections. Refer to Figures 3-6, Traffic Calming Locations and Figure 3-7, Traffic Calming Details.

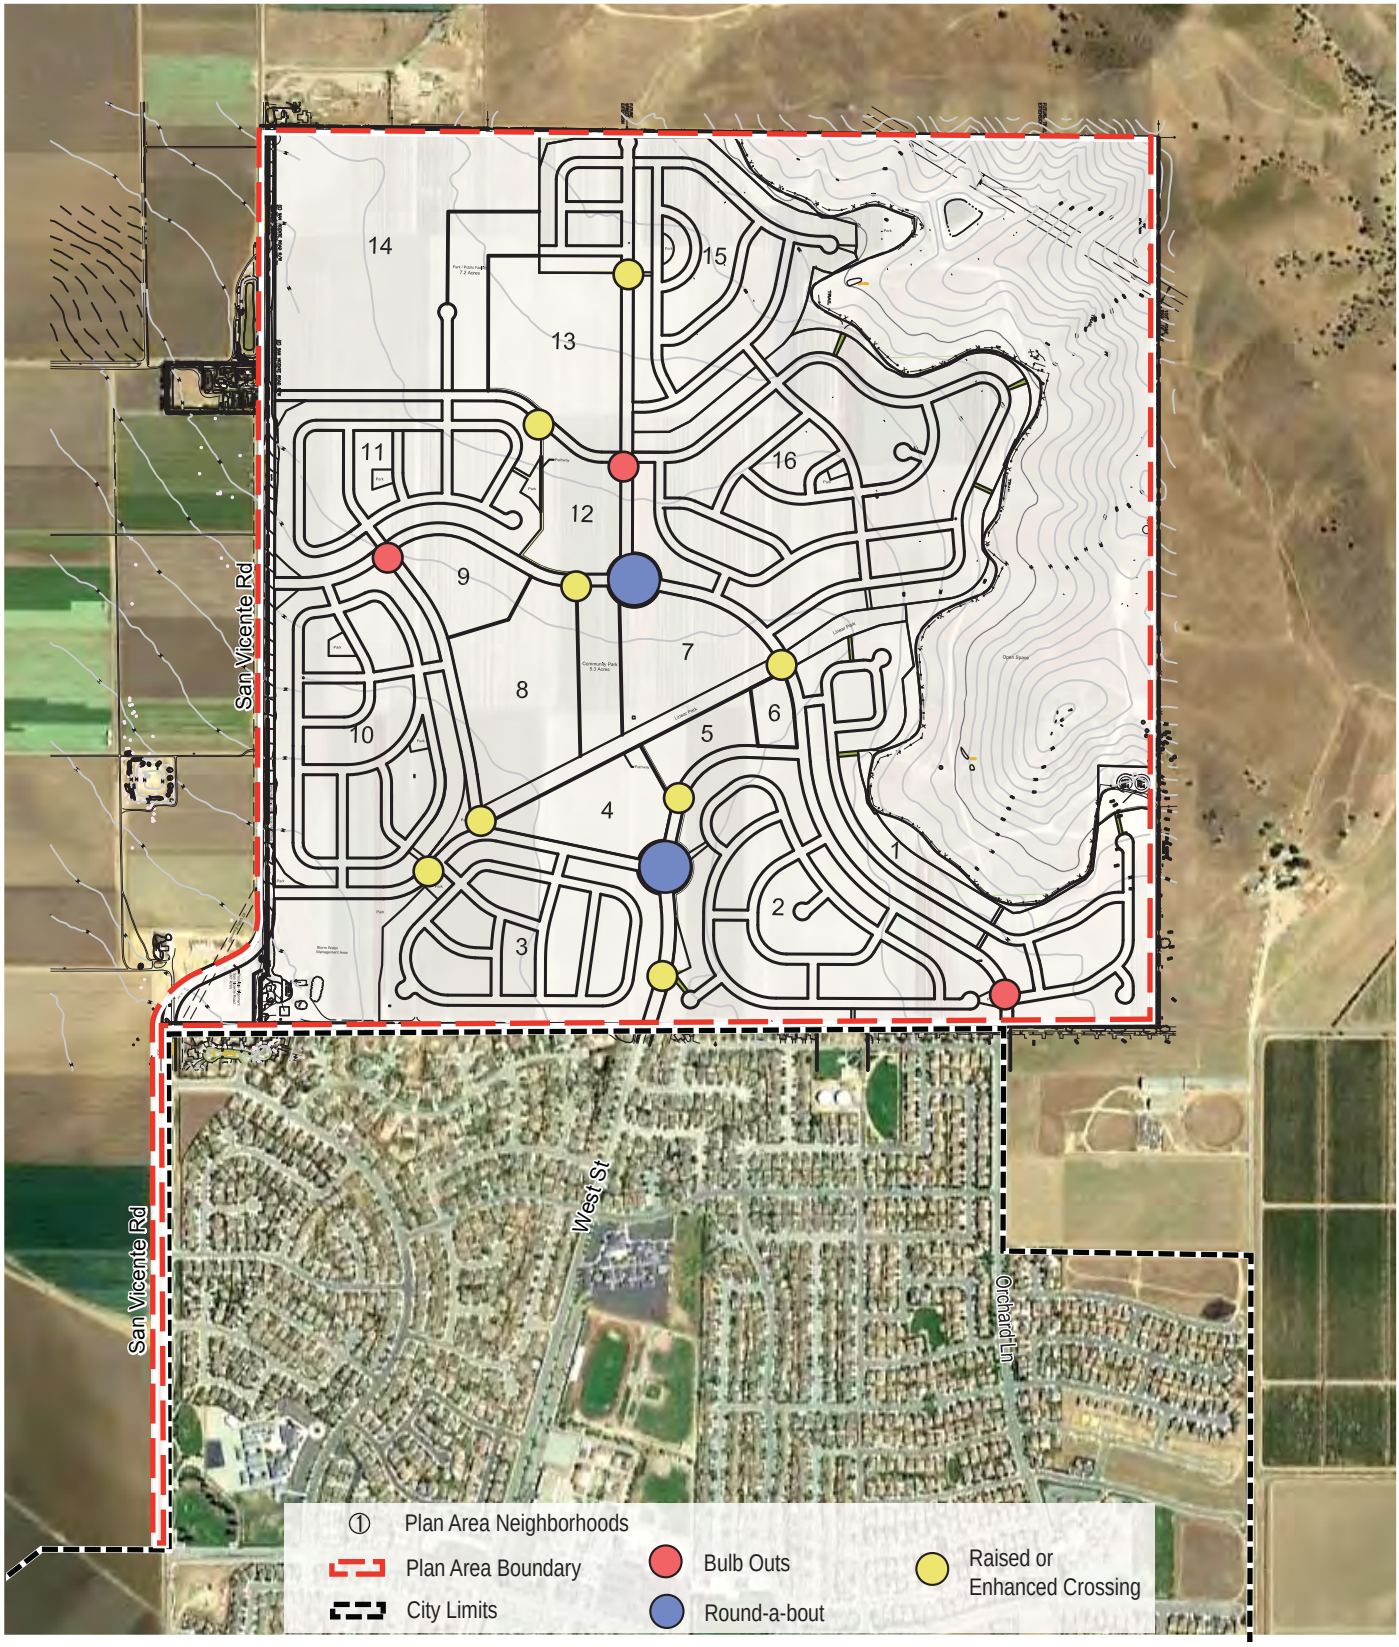
Painted lines or differentiated paving will be used to mark crosswalks across collector streets at intersections. Crossings with bulb-outs will be marked with differentiated pavement that will span across the street. The mid-block trail crossings will be raised to sidewalk level on speed tables as a further traffic calming measure.

Surfaced Pathways

Surfaced pathways will be constructed of concrete, impervious concrete, or asphalt. The pathways will be eight feet wide with two feet maintained clear on each side, in conformance with Caltrans standards. Where the pathways intersect with streets, a ramp will be provided. At intersections with collector streets a stop sign for the path will be posted, and at intersections with local streets a yield sign for the path will be posted. Parking will be prohibited within 10 feet of a path intersection with a street. Where pathways parallel streets, a five-foot landscape buffer will be provided.

The pathways will include spurs to provide access to the commercial area, low density residential areas, multifamily residential areas, senior housing, and parks. Lighting may be provided as needed. The surfaced paths will meet Americans with Disabilities standards.

Unsurfaced Pathways



The unsurfaced pathways are intended as unimproved trails within semi-natural areas that are transitioning to natural areas. The paths may be surfaced with gravel if necessary for all-weather use. No lighting will be provided. The unsurfaced paths will not necessarily meet Americans with Disability Act standards, but at the location where a surfaced pathway is concurrent, there will be accessibility and a viewing area will be provided.

Bus Stops

Bus stops will be provided at locations with the highest demand. The bus stops will be constructed to MST design specifications including parking pad, curbs, shelter, and bench. Each stop will bear a name plate identifying its location, visible on the approach from either direction. The bus pull-out will take the place of the planting strip and/or the parking lane, depending on the side of the street and space requirements for the pull-out. No adjacent landscaping is required at the bus stop if space does not permit.

4.0

PARKS, RECREATION, AND OPEN SPACE

The specific plan provides several open space and recreational opportunities, including various parks, paved trails, and unimproved open space trails. The park and open space areas are arranged within the plan area to connect neighborhoods and to protect the hillside area from development.

Section 4.0 is organized into the following subsections:

4.1 Parks, Recreation, and Open Space Goals and Policies

4.2 Parks, Recreation, and Open Space Concept

4.3 Description of Park and Open Space Improvements

4.1 Parks, Recreation, and Open Space Goals and Policies

Parks, Recreation, and Open Space Goals

P – 1 Ensure that the provision of adequate park, open space, and recreational facilities meets the varied needs of the plan area residents.

P – 2 Protect the visual and natural resource values of the hillside open space lands.

P – 3 Utilize park lands to link neighborhoods.

Parks, Recreation, and Open Space Policies

P – A Provide a variety of semi-active and passive recreational features that meet the needs of residents' abilities and interests.

P – B Each phase of development shall provide enough parkland to meet the needs of project residents in that phase or neighborhood being constructed.

P – C Parkland minimum requirements shall be determined at three acres per 1,000 residents (per General Plan policy PR-1(a)). With an estimated population of 9,833 residents, the parkland requirement is about 29.5 acres. Parkland and open space combined shall be required at a ratio of five acres per 1,000 residents, or a minimum of about 50 acres.

P – D Design and landscape parks for easy maintenance, water efficiency, wind protection, and shade. Utilize native plants when suitable selections are available.

P – E Interconnect parks, open space, schools, commercial areas, and the neighborhoods with sidewalks and/or trails.

P – F Include multi-functional spaces and facilities in the parks.

P – G Parks, open spaces, and recreation facilities should be designed to eliminate or avoid hidden and difficult-access areas where security problems would be likely to occur.

P – H Each of the neighborhood parks will include a small children's play area.

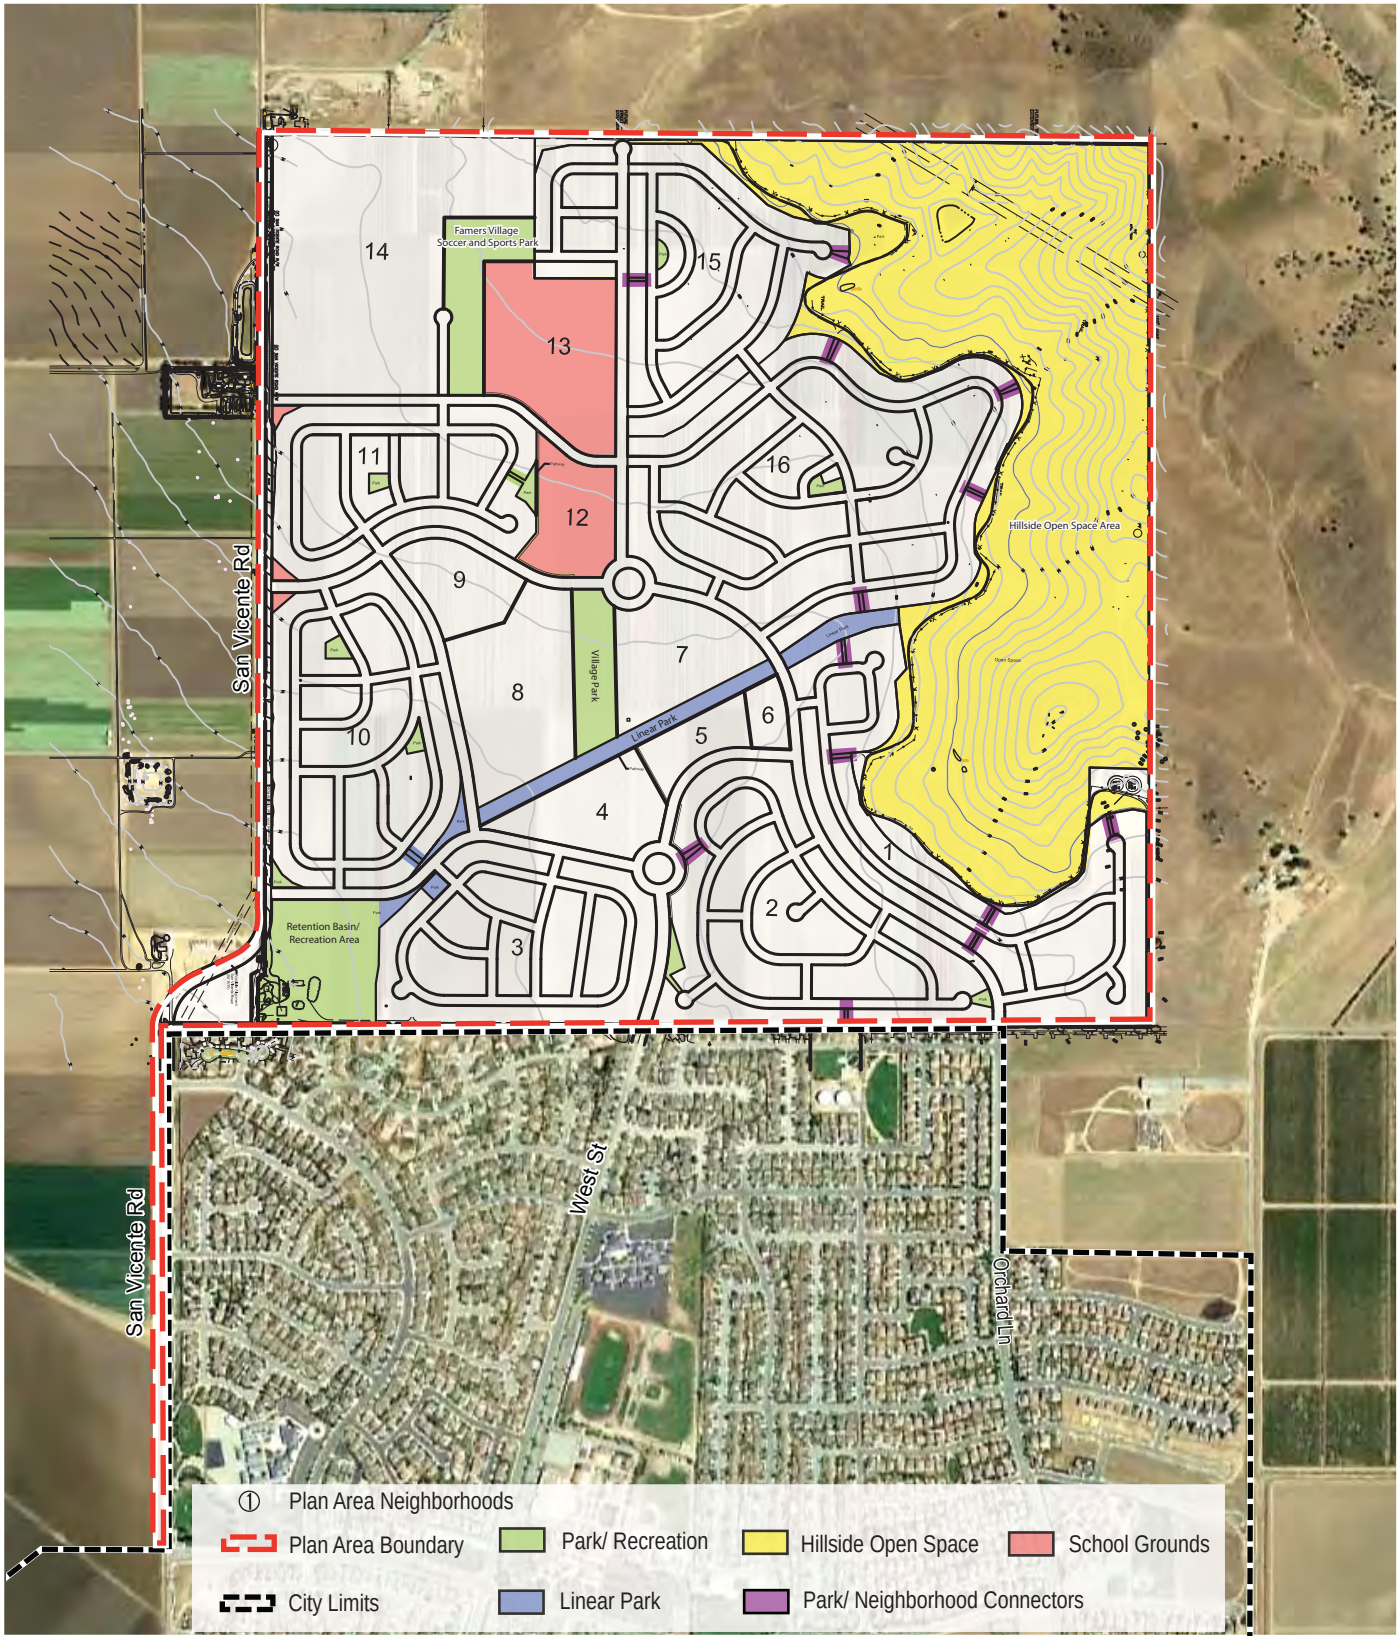
P – I Children's play areas and other appropriate park areas should have adequate shade, seating, and wind protection provided through landscaping and/or constructed elements, and if located near collector streets, a three- to four-foot fence to separate the play area from the street.

P – J The storm water basin will be a dual-purpose area with sport and recreation fields.

P – K A recreational field should be located near the middle school.

P – L Parks should be located and designed to minimize noise and activity conflicts with residential areas.

P – M A 100 foot wide low growing and low fuel vegetated buffer should be provided between residential lots and the larger hillside open space area. This 100-foot buffer will be located within the open space area, and will be maintained to keep fuel load low.



P – N Landscaping in the open space area, if needed to supplement existing vegetation, should utilize native plant materials that are both fire resistant and non-invasive.

4.2 Parks, Recreation, and Open Space Concept

The specific plan envisions a network of parks and pathways that form a comprehensive and thoroughly interconnected system. This system will provide recreational opportunities near each home in the plan area, and a system for non-motorized circulation within the plan area. A range of recreational options will be provided, including soccer, baseball, or other sports fields, picnic areas, playgrounds, and trails. The park areas will provide space for large trees that can provide shade and reduce winds.

Nearly one third of the 647-acre plan area is devoted to active or passive parks, open space, and recreation. This includes public parks, trails, and natural hillside open space, as well as landscaped areas along collector streets. The un-built portions of the schools provide additional open space. Nine neighborhood parks, two community parks, linear park, and an open space trail system are available to serve plan area residents. Approximately 150.4 acres of passive open space have been designated to preserve viewsheds and provide a recreational trail system. The specific plan provides a variety of passive and active recreational and open space amenities, while respecting the natural features within the plan area. Figure 4-1, Parks and Open Space, provides a diagram of the plan's parks and open spaces.

Source: Google Earth 2017

Figure 4-1

Parks and Open Space

Miramonte Specific Plan

This side intentionally left blank.

In addition to public park and open space, the multifamily, senior, affordable housing areas and the Farmers' Village will include private recreational amenities to serve those residents. The specifics of these amenities will be designed in conjunction with these areas.

Parks, Recreation, and Open Space Requirements

The city's general plan establishes a goal of five acres of park land for every 1,000 residents. Policy PR-1a of the general plan requires the dedication of three acres of park land for every 1,000 residents anticipated within a development.

Parks, Recreation, and Open Space Provided

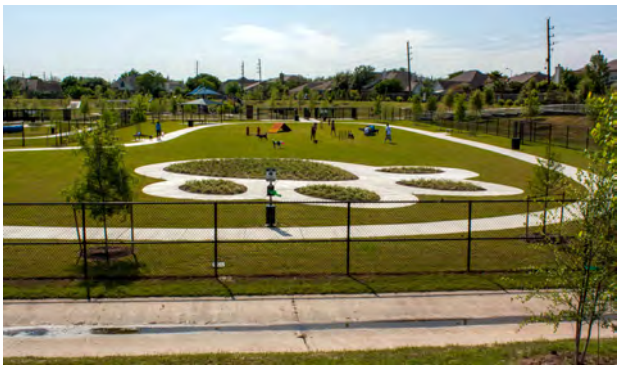
Table 4-1, Specific Plan Parkland breaks down the acres of parkland provided in the specific plan. The anticipated population with buildout of the specific plan is 9,833 residents. To meet the general plan parkland requirement of three acres of parkland for every 1,000 residents, the specific plan would need to provide 29.5 acres of parkland. To meet the general plan goal of five acres of parkland for every 1,000 residents, the specific plan would need to provide 49.17 acres of parkland. The specific plan exceeds the 29.5-acre requirement through allocation of active park use alone (39.2 acres). With the addition of 150.4 acres of passive recreation, for a total of 189.6 acres of parkland, the specific plan far exceeds the city's general plan requirement of 29.5 acres as well as the city's general plan goal of 49.17 acres.

Table 4-1 Specific Plan Parkland

Active Use Park	Acres Provided
Village Park	5.3 acres
Detention Basin/Recreation Area	15.1 acres*
Farmers' Village Soccer/Sports Park	7.2 acres
Linear Park	7.3 acres
Neighborhood Parks	3.3 acres
Neighborhood Connection Trails	0.9 acres
Active Use Park Total	**39.2 acres**
Passive Use Open Space	**Acres Provided**
Hillside Open Space	150.4 acres
Passive Use Open Space Total	**150.4 acres**
Total Park and Open Space	**189.6 acres**

* This is for dual use, storm water retention and recreational park space. This area includes excess park space that is connected to the retention basin area.

4.3 Description of Park and Open Space Improvements



Parks

Parks are public developed park lands for active and passive pursuits. Each of the major types of park within the plan area is described below.

Village Park

The Village Park is central to the plan area and forms the core of a parkway spine that extends north through the schools, and extends east and west along the Linear Park. The Village Park comprises 5.3 acres adjacent to medium density residential uses on its east side and affordable housing on its west side. The Village Park is a key part of the north-south trail system.

Park uses could include turf areas for recreation, tennis or basketball courts, picnic and sitting areas, a dog park, a community

garden, a water play area, a playground, or a community center. A restroom building and parking will be provided.

Retention Basin/Recreation Area

The retention basin/recreation area is a 15.1 acre area located at the lowest elevation within the plan area, and will collect storm water run-off during periods of rain. The basin will be designed with gently sloping sides, and low fencing will prevent accidental entry while providing ample access during the times when the area is usable for recreational activity. The retention basin/recreation area is the largest area for active use in the plan area and will provide a large turf area for formal and informal sports. The slopes of the basin can be used for informal seating for games, and bleachers could also be constructed for certain sports fields. Trails will run along the perimeter of the basin and be open year-round. Picnic areas and restrooms will be provided. Depending on ultimate use and demand, a concession building could be provided. Parking will be provided.

Farmer's Village Soccer and Sports Park

This park will be about 7.2 acres, and extend the open space of the middle school into the Farmers' Village area. The focus of this park will be to provide additional parkland adjacent to the school to expand recreational facilities, if need, and provide recreational opportunities adjacent to the Farmers' Village in the form of soccer or other sports fields. Depending on ultimate use and demand, and the type of services provided in the Farmers' Village, this park could include a restroom and concession building. Limited parking will be provided, and may be provided along the entry street.

Linear Park

A 7.3 acre linear park crosses roughly east-west through the core of the plan area. This park connects the northern and southern residential neighborhoods, and runs adjacent to the medium density residential areas and the commercial area. The linear parkway includes a Class 1 bicycle/pedestrian trail as its main feature, and provides opportunities for activities such as Frisbee, a dog run, informal turf areas, a playground and picnic areas. At its eastern terminus the Class I trail provides entry to the Hillside Open Space, and there is an opportunity to provide handicapped access to a Hillside Open Space viewing area. The linear park may include amenities such as benches and lighting. The linear park is 100 feet wide in most places, and may also be designed to accommodate surface storm water flows and provide storm water treatment. Bicycle and pedestrian access will be provided from three adjacent neighborhoods, collector street crossings, the Village Park, and the north-south trail.

Neighborhood Parks

Residents of each neighborhood will have access to a park within or immediately adjacent to the neighborhood. A total of nine neighborhood

parks are included, comprising about 3.3 acres. These parks may be pocket parks, expanded neighborhood/park connector corridors, portions of larger parks, or portions of the linear parkway that include neighborhood park features. The focus of these parks will be on providing convenient playgrounds, sitting areas, and other gathering opportunities for neighborhood residents.

Trails and Neighborhood Connection Corridors

Two paved trail systems have been designed within the plan area to encourage walking and bicycling. One runs through the Linear Park, described above. The other runs along the edges of the two schools, through the Village Park, and between the commercial and multifamily area. There are numerous connecting paths between neighborhoods, parks, and schools. Additional landscaping will be planted along the entry ways and roundabouts of the plan area. Trail amenities may include drinking fountains, par course stations, benches, trail lighting, and signage.

The park and neighborhood connector corridors provide local connections to trails, parks, and schools, and add about one acre to the parkland within the plan area. Amenities such as concrete, asphalt, or decomposed granite walking paths; lighting for safety (four-foot high fixture maximum - lighting levels shall not reasonably interfere with adjacent residences), bollards; low growing shrubs and groundcover; and accent trees. Amenities that promote loitering, such as benches, are prohibited.

Adjacent residential units are encouraged to provide open fencing abutting the landscaped pedestrian corridor to create a distinctive separation between private and public property, while providing visibility into the corridor. The corridors will be at least 20-feet wide to give them a safe and open feeling. See Figure 3-4, Pathway Cross Section for the design of these connections.

An unpaved trail is also provided and is described as part of the Hillside Open Space.

Open Space Areas

Open space areas include the hillside area, landscape areas along collector streets, and unbuilt portions of the school sites. These areas serve as secondary recreational use areas. Each of the major types of open space within the plan area is described below.

Hillside Open Space

Approximately 150.4 acres of open space have been provided within the plan area, representing approximately one-quarter of the plan area. Open space lands encompass the natural hillsides above the 400-foot elevation. The Hillside Open Space area is intended to be preserved under a conservation easement, and could remain essentially in its natural state. However, other allowed uses within the conservation easement are passive recreation, a gathering area (e.g. clubhouse or community center), alternative energy, and public facilities. The existing unpaved ranch road will be retained and used as a trail. Connections to the trail from adjacent neighborhoods will be provided at about seven locations as identified on Figure 1-4, Miramonte Specific Plan Land Use Diagram. Only small

extensions and additions to the hiking trail system will be made beyond the existing ranch road. Native vegetation may be restored, if necessary, for erosion control or habitat establishment. Fuel reduction may take place to reduce fire risk. Small signs for educational and navigational purposes may be installed. Lighting on the hillside trail is prohibited.

Collector Street and Roundabouts Landscape

The collector streets, while not counted toward park land dedication requirements, have been designed to include landscaping on both sides, with additional landscaping where a fence or wall backs to the street. The roundabouts will also feature landscaping to provide significant focal points within the plan area. In several locations, deeper landscape pockets are provided, such as at the plan area entries from San Vicente Road.

School Grounds

The school grounds at the elementary school and the middle school, while not counted toward park land dedication requirements; do provide additional open areas and the potential for additional recreational opportunities.

5.0

PUBLIC SERVICES AND FACILITIES

The provision of adequate public facilities and services to the plan area is a primary goal of the specific plan. The plan area is served by an extension of the City of Soledad's existing public facilities and public safety services consistent with the provisions of the General Plan. This section describes at a conceptual level how and where services shall be extended/ provided to serve the plan area.

Section 5.0 is organized into the following subsections:

5.1 Public Facility Goals and Policies

5.2 Public Facility Improvements

5.3 Public Services

5.1 Public Facility Goals and Policies

Public Services and Facilities Goals

PSF – 1 Provide an efficient, self-sustaining system of public facilities that accommodates the needs of the residents and businesses within the plan area through buildout.

PSF – 2 Provide adequate and reliable services and utilities to residents and business and ensure adequate maintenance of these utilities and services.

Wastewater Policies

PSF – A Minimize wastewater flows through water conservation efforts.

PSF – B Design and construct the wastewater treatment system in accordance with applicable requirements of the Soledad Urban Water Management Plan and Long-Term Wastewater Management Plan.

PSF – C Wastewater lines shall be sized in anticipation of development in the remaining Mirrasou Specific Plan Area to the north.

Water Policies

PSF – D Design and construct the specific plan water supply and distribution system to expand upon and integrate with the city's water distribution system to meet the needs of future plan area developments consistent with the Soledad Urban Water Management Plan and 2005 Water Master Plan.

PSF – E Reduce potable water consumption throughout the specific plan area through the use of recycled water for irrigation, emphasis on

drought- tolerant plant materials for landscaping, and the incorporation of state-of- the art low water/high efficiency use fixtures and appliances in all new private development and public facility construction, including schools.

PSF – F Water lines extending to the north boundary of the plan area shall be sized in anticipation of development in the remaining Mirrasou Specific Plan Area.

Storm Water Policies

PSF – G Ensure provision and sizing of adequate storm water facilities to accommodate the plan area and provide for water retention sufficient to limit peak flows to predevelopment levels.

PSF – H Design, fund, and construct a storm water collection and retention system, including an appropriately sized retention basin, that adequately retains peak storm flows onsite, avoids aggravating or causing storm water flow capacity problems offsite downstream from the plan area, ensures separation of storm water drainage from recycled water generated within the plan area, and is consistent with the city's Storm Drain Master Plan, the city's Storm Water Management Plan, and the City of Soledad Storm Water Ordinance No. 617.

PSF – I Limit the development of impervious surfaces, to the extent practical in order to reduce post-project runoff volumes.

PSF – J Require appropriate runoff control measures as part of development to minimize discharge of urban pollutants (such as oil and grease) into drainage areas, and design, fund, and construct a bio swale for the length of the linear park that connects to the retention basin in the plan area.

PSF – K Construction and grading activities shall comply with Best Management Practices and Storm Water Pollution Prevention Plan policies per applicable controls, standards and Regional Water Quality Control Board.

Energy and Communication Policies

PSF – L The city shall ensure that energy and communications services are provided, either through direct city provision, contract, or franchise.

PSF – M Electrical and gas services shall be provided by Pacific Gas & Electric (PG&E) or other authorized service providers.

PSF – N Telephone service shall be provided by AT&T or other authorized service providers.

PSF – O Cable television shall be provided by Charter Communications or other authorized service providers.

PSF – P No roof mounted or aerial antennas or receiver dishes shall be installed that are visible from beyond a parcel's property lines.

PSF – Q All utilities shall be installed underground.

PSF – R Provide new communication technologies such as fiber optics, which will provide future benefit to residents and businesses within the plan area.

PSF – S New development should include the provision of an I-net system, linking all city facilities, as a part of public improvements.

PSF – T Promote energy sources that will ensure reliability during high energy demands.

PSF – U Promote the use of solar energy devices and encourage solar orientation of residential and business buildings to facilitate passive and active solar systems and reduce the use of fossil fuels.

PSF – V Promote recycling of consumer and business waste to reduce landfill requirements and lengthen the service life of existing landfills.

School Policies

PSF – W New elementary and middle school facilities, or improvements to existing schools, shall be in place as needed to serve each phase of specific development prior to occupancy. Prior to approval of the first Final Map, an agreement shall be established between Developer and/or successors in interest and the Soledad Unified School District that establishes the timing of school construction or improvements and financing obligations. The applicant and/or developer(s) will provide an offer to dedicate the designated school sites. The school sites shall be dedicated to the Soledad Unified School District within sixty (60) days of city approval and recordation of the first final map.

PSF – X New school facilities shall be located and designed in accordance with Soledad Unified School District and/or State Department of Education sitting and design criteria.

PSF – Y Approval of final map(s) and improvement plans shall be predicated upon evaluation and findings by the City Council that adequate public services and infrastructure, including schools, are available to serve additional housing and residents.

PSF – Z New development shall provide stub-out utilities for schools so that new public improvements are not disturbed or removed during school construction.

Law Enforcement and Fire Protection/ Medical Services Policies

PSF – AA Expand police and fire protection services and facilities as needed to adequately meet the needs of project residents. To serve build-out of the specific plan area, a 1.3 acre site has been centrally located and designated for development of a public safety facility.

PSF – BB Provide adequate lighting, visual corridors, and vehicle access along streets and nature trails to the extent feasible.

PSF – CC Select and maintain landscaping features and plant materials to minimize hiding spaces and other indefensible spaces.

PSF – DD Landscape, design and/or protect walls, fences and other publicly accessible flat surfaces to minimize areas that attract graffiti.

PSF – EE Design streets to City of Soledad Fire Department/Emergency Response standards, including fire hydrants, turn-outs, and cul-de-sac radii.

PSF – FF New development shall provide fire flow, emergency access, and hydrants consistent with Fire Department Requirements.

PSF – GG The plan area should include site planning which helps reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department.

PSF – HH Police and Fire Services will be maintained with funding from a Public Safety Benefit Assessment District or similar funding mechanism.

5.2 Public Facility Improvements

Wastewater Infrastructure

The plan area is not currently connected to the existing wastewater collection system. The city's

existing collection system will be extended by the project applicant or subsequent developer in order to provide services to the plan area. The Miramonte Specific Plan Area development will be connected from new wastewater infrastructure built in the plan area to the municipal sewer main located on San Vicente Road. Construction of an offsite 18-inch sewer main from the southwest corner of the plan area south along San Vicente Road to Gabilan Drive will be required to transport wastewater from the plan area to the city's municipal reclamation facility. The on-site wastewater conveyance system is gravity-fed and will be collected and conveyed by a network of 8-inch or larger pipes throughout the site before discharging from the site through the new 18-inch sewer main extension. The preliminary design of the new wastewater system within the limits of the plan area is shown conceptually on Figure 5-1 Conceptual Wastewater Plan.

The city's Water Reclamation Facility (WRF) has sufficient capacity to accommodate the addition of the plan area's wastewater because the WRF upgrade was originally designed to accommodate developments outside of the current city limits. Since the upgrade, little or no development has occurred outside of the current city limits creating an abundance of capacity available for the plan area (AKEL Engineering 2016) plan area will be 1.5 million gallons per day (mgd). When adding the city's current wastewater flow of 2.4 mgd to the projected

flow from the plan area of 1.5 mgd, the total wastewater flow to the plant of 3.9 mgd is well under the total facility treatment capacity of 5.7 mgd. The City of Soledad *Plan for Providing Services, Miramonte Specific Plan* (EMC Planning Group 2017) (plan for services) was prepared as a separate stand-alone document, and provides further detail on the city's existing and planned wastewater infrastructure. The plan for services is incorporated herein by reference.

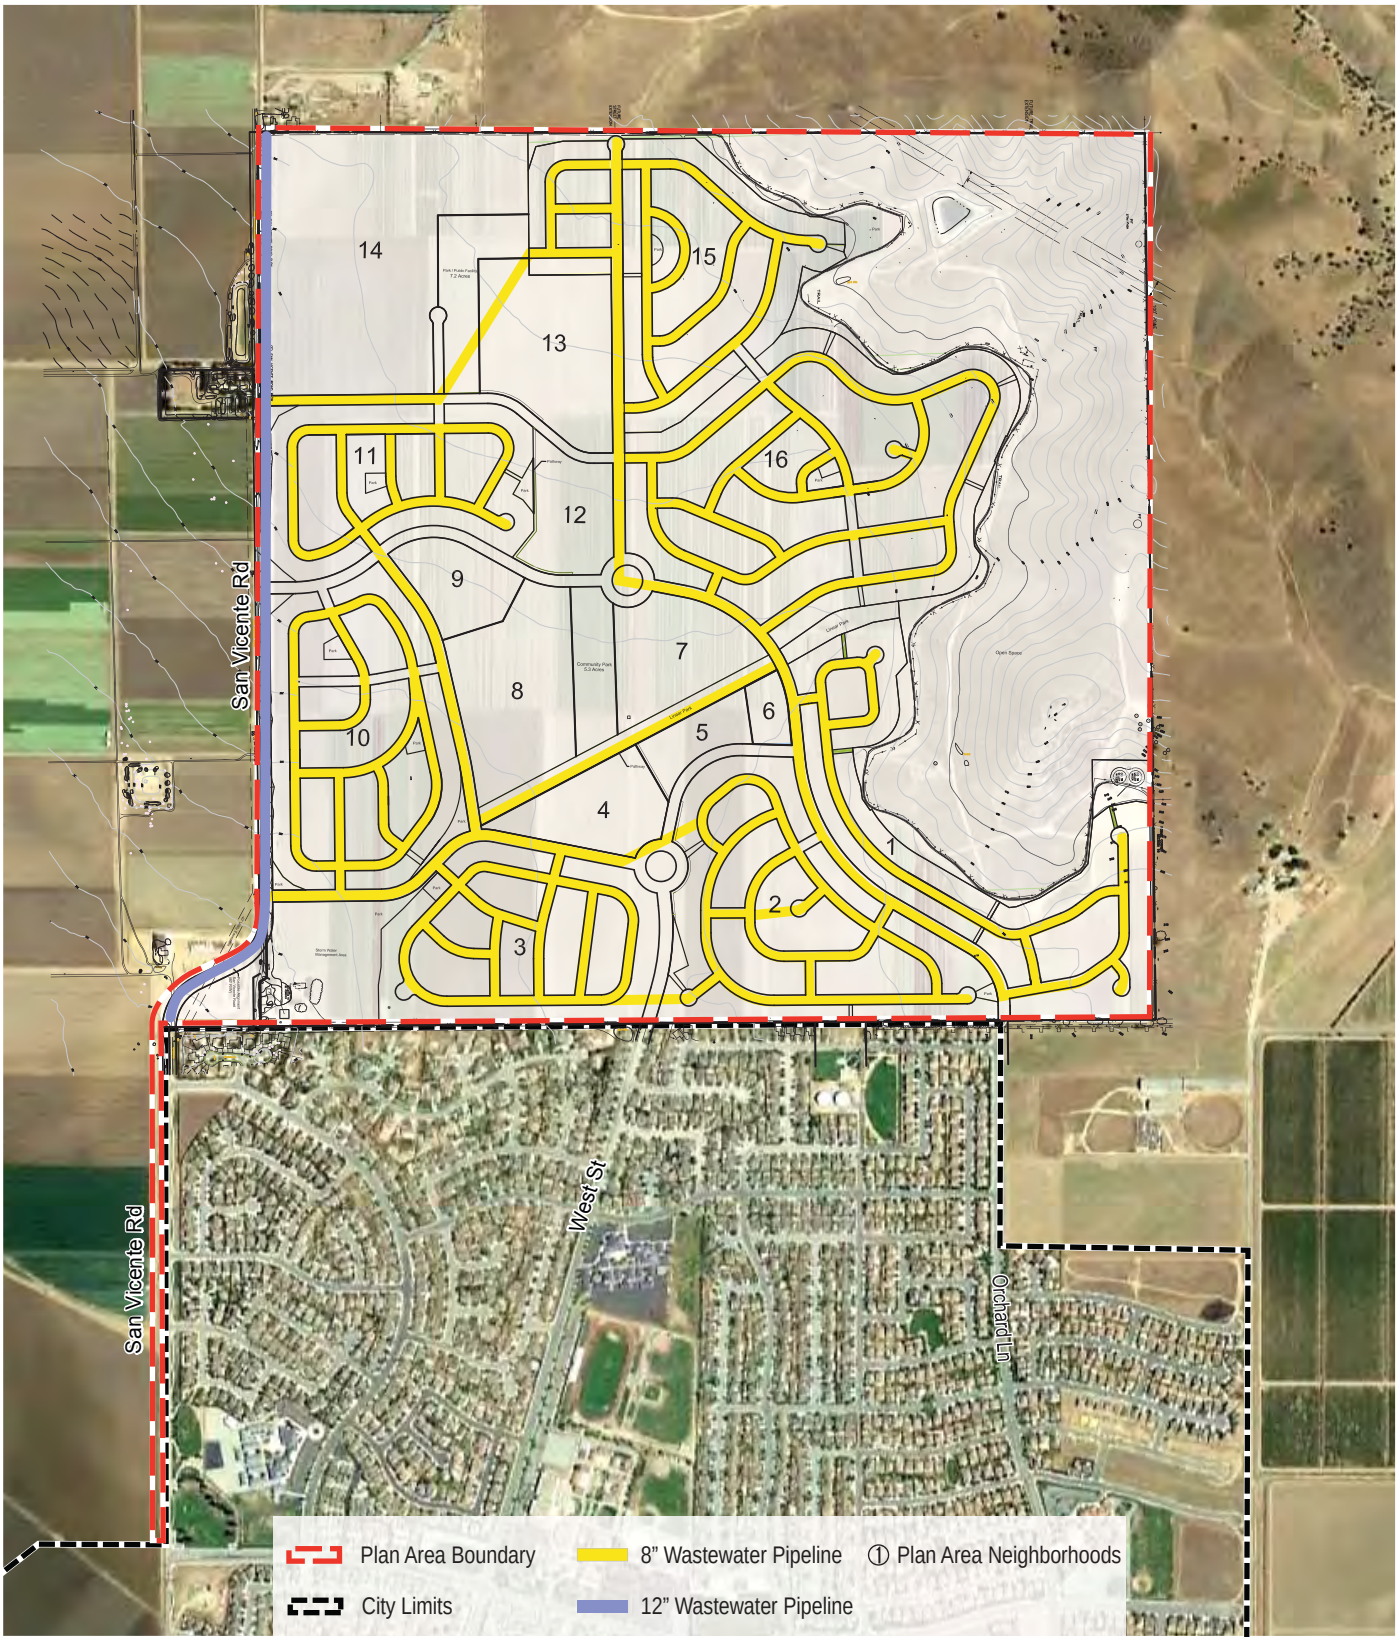
The project developers will design, finance, and construct backbone wastewater infrastructure, necessary for connection to the city's system, in the first phase of development. Additionally, the developers will construct and finance the collector wastewater infrastructure in each neighborhood by phase as the development proceeds. All infrastructure will be constructed by the developer(s) in accordance with city standards, unless an exception is made by the City Engineer, and would be in place prior to issuance of building permits for any structures. Where site conditions require deviation from city design standards to meet performance thresholds, the applicant shall provide engineered site-specific plans demonstrating that performance standards are met. These plans shall be provided for review and approval by the City Engineer prior to issuance of any grading permit. The applicant shall be responsible for the payment of required development impact fees for new facility construction and may participate in a reimbursement program per Municipal Code Chapter 14.06 for the new sewer main and upgrades to the existing sewer main on San Vicente Road. All sanitary sewer system improvements will be dedicated to the city. Ongoing facility maintenance costs will be financed by the formation of or annexation into a Mello-Roos Community Facilities District or some other form of maintenance district.

Water Infrastructure

The development within the plan area will be required by the city to provide all of the water production, storage, and distribution to adequately serve the project demand. The water system design for the plan area shall be to develop potable water production from Zone B, utilize and expand existing storage, as necessary, within the specific plan area, and connect back to the existing city distribution system. The applicant proposing development within the plan area has committed to drilling new domestic water wells in the plan area, which is in Zone B, sufficient to meet the projected demand of the plan area at buildout. Treatment of water from the new domestic wells may be required. Appropriate permitting and well tests observed by the Monterey County Environmental Health Department will be required.

The *Soledad Water Master Plan* (City of Soledad 2005a) (water master plan) assumed the project site will develop as a combination of medium density residential, public facility, and open space land use types. According to the *City of Soledad Water Supply Assessment for Miramonte Specific Plan* (water supply assessment) prepared by prepared for the specific plan, the water demand for the plan area will be 938 acre feet per year (afy). This amount is 57 afy greater than the water demand identified in the city's 2005 water master plan for a similarly-sized use using 2005 water demand coefficients, and 630 afy less than the approximately 1,568 afy water demand for the

existing agricultural use of the site (AKEL Engineering Group 2017). Based on the *City of Soledad 2015 Urban Water Management Plan* (AKEL Engineering Group 2016) there is a total reliable supply of 148,000 afy in the Forebay Subarea. It is also mentioned that the reliable supply will serve a projected 2035 demand of 143,250 afy (AKEL Engineering Group 2016). The development of the plan area will contribute to this demand and would be accommodated by the city's supply once planned infrastructure improvements are made to connect to the current municipal distribution system. The conceptual design of the new water delivery system is shown on Figure 5-2, Conceptual Water Plan, and a more detailed explanation of the new water distribution system can be found in the plan for services (incorporated herein by reference). Therefore, the current water supply can accommodate the increase in demand generated by development within the plan area.



Storm Drain Infrastructure

The plan area includes the provision of storm drains, collection pipes, a drainage bio-swale within the linear park, a retention basin to capture post-development runoff, and other improvements to capture, retain, and percolate storm water within the plan area consistent with the requirements of the Central Coast Regional Water Quality Control Board. Plan area storm water flows will be collected in an underground piping system and directed to a bio swale within the linear park and then to the retention basin located within the southwest corner of the plan area. The basin, which will serve as a dual-use facility for recreational purposes, will be sized to accept the increase in flow due to the development and release runoff to the existing downstream storm water facilities at a rate equal to or less than the historic flow prior to development. This will ensure that there is no adverse impact to the existing storm drain system downstream of the plan area. Additionally, the proposed linear park would serve as a drainage bio-swale leading to the retention basin, and will help percolate water back to the groundwater basin and filter pollutants.

Erosion control measures including pre- and post- construction Best Management Practices will be implemented to protect the plan area from erosion and ensure that silt and sediment generated by the plan area are contained within the site and are not carried downstream. The conceptual design of the new storm drain delivery system is shown on Figure 5-3, Conceptual Storm Water Plan and a more detailed explanation of the new storm drain distribution system can be found in the plan for services (incorporated herein by reference).

The project developer(s) will design, finance, and construct backbone storm water infrastructure necessary to retain all post-construction storm water runoff in the first phase of development and the storm drain infrastructure in each neighborhood by phase as development proceeds. All infrastructure will be constructed by the developer(s) in accordance with city standards and would be in place prior to issuance of building permits for any structures, including paved roadways or parking areas.

Storm Water Retention Ponds

The plan area will be completely self-supporting. Storm water from the entire developed area, as well as approximately 2,100 acres of upstream watershed, will be completely contained within the bio swale and percolation/retention pond. Flows in storms of greater intensity than approximately a 100-year return period may be discharged to the downstream city storm drainage facilities consistent with the 2015 Storm Drain Master Plan Update.

Energy and Communications

All new public energy and communications lines and equipment (excepting solar panels) within the plan area shall be placed underground pursuant to the standards and requirements of the city and/or appropriate State or Federal regulatory agencies. Planning and design of the new underground infrastructure, including phasing of the improvements will be coordinated with the local agency for each utility. The requirements for undergrounding of existing utilities and/or relocation of existing utilities will also be coordinated with the local utility agencies. Construction of the improvements within the plan area will be funded by the developer. It is anticipated that the following companies will be providing services to the plan area.

Natural gas lines and facilities	PG&E
Electricity	PG&E
Cable Television	Charter Communication
Telephone Land Line	AT&T

5. 3 Public Services

Schools

The plan area is served by Soledad Unified School District (SUSD) for grades K-12. At buildout, the specific plan is projected to generate a total of 1,063 students for grades K-6, 317 students for grades 7-8, and 460 students for grades 9-12 (a total of 1,840 students). Student generation estimates, as shown in Table 5-1, Student Generation below are based on the Miramonte Specific Plan land uses and the SUSD student generation estimates.

Table 5-1 Student Generation

Land Use Designation	Dwelling Units (DU)	K-6 Factor per DU	K-6 Students	7-8 Factor per DU	7-8 Students	9-12 HS Factor per DU	HS Students	Total Student Generation
Low Density Residential	1,353	0.47	636	0.14	190	0.203	275	1, 101
Medium Density and High Density Residential and *	507	0.47	239	0.14	71	0.203	103	413
Total	**1,860***		**875**		**261**		**378**	**1,514**

*The proposed 132 Senior dwelling units and the 400 farmworker housing units have been removed from total dwelling units.

The specific plan provides two school sites to serve the educational needs of plan area students. The middle school may also serve students from beyond the plan area. The elementary school site is 8.0 acres and the middle school site is 16.5 acres. Refer to Figure 1-4, Miramonte Specific Plan Land Use Diagram, for proposed site locations.

The applicant and/or developer(s) will provide an offer to dedicate the designated school sites. In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions.

Law Enforcement and Fire Protection/ Medical Services

The Soledad Police Department, the California Highway Patrol (CHP), and the Monterey County Sheriff's Department serve the plan area. The Sheriff's Department provides general law enforcement services and traffic related enforcement services are provided by the CHP. The Soledad Police Department, which currently holds 18 sworn officers and 4 non-sworn personnel (Damon Wasson, telephone interview, June 1, 2017), is located at 236 Main Street. Services include animal control, parking enforcement, vehicle abatement, traffic control and criminal investigations. A new substation will be centrally located within the plan area to help serve and reduce response time to those future residents. This substation will be located approximately 1.6 miles north of the current city police station in downtown Soledad.

The Soledad Fire Department will serve the entire plan area, but continue the current mutual aid agreements in place with the California Department of Forestry and Fire Protection (CAL FIRE) and the Mission Soledad Fire Protection District. Current response averages are 2.6 firefighters per alarm or an equivalent of 0.5 firefighters on duty per 1,000 residents. The Soledad Fire Department is located in the fire station at 525 Monterey Street. This station is approximately 1.3 miles from the West Street entrance to the southern portion of the plan area and 1.7 miles to the Orchard Street entrance. The approximate response time to the West Street entrance of the plan area is 5 ½ minutes and the response time to the Orchard Street entrance is 6 ½ minutes. These times include dispatch, get-away and travel time.

A new police/fire sub-station site will be provided within the plan area, which will provide much shorter response times than from the existing police/fire sub-station. The police/fire sub-station site is central to the plan area, along the extension to Orchard Lane. This station location will also reduce the response time for future development west of in San Vicente Road and the remainder of the Mirrasou Specific Plan Area to the north.

Emergency Medical Services (EMS) are provided by the City of Soledad Fire Department. Fire personnel responding to a medical emergency

operate within the guidelines set forth by the Monterey County Emergency Services Agency.

The developer(s) of the plan area will be required to participate in a financing district to provide funds to build, operate, and maintain a police/fire sub-station on the dedicated site within the plan area. Finally, all development impact fees applicable at the time of issuance of a building permit can be offset by capital improvements designed, funded, and constructed by the developer(s).

Solid Waste Collection

Solid waste collection services will be provided by the Salinas Valley Solid Waste Authority. The Authority will utilize the Johnson Canyon Landfill, Marina Landfill, and the Foothill Sanitary Landfill for disposal purposes. The City of Soledad, however, primarily uses the Johnson Canyon facility located approximately 12 miles northeast of the city.

According to the information recorded in 2012 by CalRecycle, the current population of Soledad produces an average of 1.9 pounds of solid waste per person per day (PPD) (CalRecycle 2017). Future development of the plan area will consist of 2,392 residential units in total, with an approximate population of 9,833 people. This increase in population would generate about 18,682.7 pounds per day, or 3, 409.6 tons per year of solid waste from the plan area. When combining the maximum amount of 185,000 tons of solid waste received annually at the Johnson Canyon facility (Cesar Zuñiga, email message, July 19, 2017) with the 3,409.6 tons of solid waste projected to annually be generated by the plan area, the total solid waste the Johnson Canyon facility will receive annually at buildout is approximately 188,409.6 tons. With the current capacity of 13,871,250 tons, the Johnson Canyon Landfill will have the availability to serve the disposal needs of the plan area. For more detail on the existing and future solid waste collection of the city and the plan area, see the plan for services (incorporated herein by reference).

The City of Soledad promotes reuse of solid waste by providing programs for source reduction, recycling, composting and environmentally safe transformation of wastes. Soledad provides residential curbside greenwaste and recycling service, as well as commercial recyclable pickup.

Libraries

The Monterey County Free Libraries network supports Soledad residents with a branch at 401 Gabilan Drive, approximately ¼ mile south of the plan area. The funding is primarily from a share of the property tax collected within the county service area. The County also operates a books by mail program, tutoring, and a service called "Branchlet" within the current city limits (Monterey County Free Libraries 2017). The branchlet program involves mailboxes located in multiple locations where people can select a book for free and replace it with a book of their own (Jayanti Addleman, telephone interview, June 5, 2017). In Soledad, these branchlets are located at: CHISPA Market Street Townhomes (110 Market Street) and Monterey County Behavioral Health Clinic (359 Gabilan Drive). There are, however, other branchlets in the Salinas Valley. These branchlet locations in Monterey County can be found at http://www.co.monterey.ca.us/library/branchlets.html.

Upon annexation of the plan area to the city, development and growth in population would result in an increase in service demand on the county library services. Funding for library facilities will continue to come primarily from a share of the property tax collected. As a result of the current depletion of staffing levels, the city will be required to provide support for the county library facilities and services in the form of funding mechanisms (e.g. Community Facilities District, Assessment District, etc.) to provide staffing as well as additional capital facilities, on-going operations, and maintenance.

It may be appropriate to provide County library services at or near the two designated school sites and/or the commercial site within the plan area. Another potential location is to place a library within the Village Park, where it could also serve as a community center. Consideration should also be given to providing library services directly to the Farmers' Village. These options should be considered by the city as a part of a development agreement, improvement plans, and prior to approving final map(s), along with funding mechanisms to provide additional capital facilities, on-going operations, and maintenance.

6.0

IMPLEMENTATION

To realize the vision contained within this specific plan, implementation must be carefully addressed. This section addresses the components of a successful implementation plan, including existing conditions, procedural implementation of the plan, public facility improvements, phasing, and financing.

Section 6.0 is organized into the following subsections:

6.1 Existing Conditions

6.2 Procedural Implementation of Plan

6.3 Public Facility Improvements

6.4 Phasing

6.5 Financing

6.1 Existing Conditions

There is one residential unit located in the plan area, along with associated outbuildings. This existing development is located in the southwest corner of the plan area, where storm drainage facilities will be constructed, and will be removed early in the development phasing of the specific plan. The plan area also contains two existing agricultural wells owned by the property owner, two one million (each) domestic storage tanks owned by the city, a number of easements and unpaved farm access roads. The existing easements in the plan area will need to be removed or relocated as a part of the final subdivision map(s) and map(s) recordation. The two existing wells will be required to be contained in separate well parcels or in a public easement for ownership, use as an irrigation supply, and for on-going maintenance when the final map is prepared, adopted, and recorded.

Realignment of San Vicente Road

San Vicente Road currently makes a pair of 90 degree turns as it approaches the plan area. As an interim condition, this section of San Vicente Road will be widened as necessary to accommodate additional traffic. However, eventually the ultimate alignment with wide radius curves, will be required for smooth traffic operations. The land on which the realignment will occur is outside of the plan area and not owned by the current plan area property owner. This adjacent land will need to be obtained through fee simple title, or an agreement made with the

adjacent landowner to place an easement over the land prior to realignment. The specific plan phasing parameters includes triggers at which time the realignment must be completed.

Agriculture Interface

New residential units will about the existing Urban Expansion and Agriculture zones. Within a small portion of the east side of the plan area and on portions of the north and west boundaries some agricultural operations may take place. It is the declared policy of the County of Monterey, the governing jurisdiction to these parcels, to conserve, enhance, and encourage agricultural operations within the county, and to minimize potential conflict between agricultural and non- agricultural land uses within the county.

The Monterey County Code Chapter 16.40 - Protection of Agricultural Activity states:

> Where non-agricultural land uses, especially residential development, extend into agricultural lands or are located in the vicinity of agricultural lands, Agricultural Operations may be the subject of complaints. Such complaints may cause the curtailment of Agricultural Operations and discourage investments for the improvement of agricultural land to the detriment of the economic viability of the agricultural industry of the County. It is the purpose and intent of this Chapter (16.40) to prevent the loss to the County of its agricultural resources by limiting the circumstances under which Agricultural Operations may be considered a nuisance. This policy can best be implemented by educating residents about the laws protecting Agricultural Operations and Farm Operations from conflicts with non-agricultural uses, and by notifying residential users of property adjacent to or near Agricultural Operations and Farm Operations of circumstances relative to agricultural activities which may be objectionable to owners and/or users of non-agricultural properties. These potentially objectionable circumstances may include, but are not limited to, the noises, odors, dust, chemicals, smoke, and extended hours of operation that may accompany Agricultural Operations.

The plan area developer(s) shall disclose potential agricultural activities that may occur on the north, west, and eastern edges of the plan area, as well as in the open space designated lands, to future owners in keeping with the intention of the Monterey County code. An open space buffer, including a trail, will be constructed along the northern boundary of the plan area and San Vicente Road will provide a buffer along the western boundary of the specific plan edge to separate residences from agriculture uses.

It is anticipated that current agricultural operations within the plan area will continue in portions of the plan area that have not yet been developed. Buffers may be necessary, on an interim basis, to protect remaining farmland within the plan area. The linear park will provide a buffer in the early phases of development. In later phases, an undeveloped strip of land, a collector street, or other open space area will need to be identified by the developer(s) and the city to provide a buffer adequate to separate residential and agricultural uses.

6.2 Procedural Implementation of Plan

This specific plan identifies the following procedural implementation measures for development of the plan area to occur:

- The City Council must amend the General Plan concurrently with the adoption of the specific plan and certification of the Addendum to the previously certified Environmental Impact Report (EIR) to incorporate the land use designations and provisions of the specific plan.
- The City Council must approve sphere of influence and annexation requests and pre-zone the territory requested for annexation. Any related detachments will be requested concurrently.
- The City Council must adopt the water supply assessment, plan for services and fiscal analysis, and forward them to LAFCO of Monterey County along with the sphere of influence and annexation request.
- The City Council must adopt the vesting tentative map, subject to:
    - Changes proposed in and consistent with the specific plan;
    - Mitigations in the certified EIR, and the EIR Addendum;
    - Conditions of approval; and
    - Subject to LAFCO action on the requested sphere of influence change and reorganization.
- The city must file and obtain approval for a Sphere of Influence Amendment and subsequent annexations from LAFCO of Monterey County.
- Upon completion of annexation, the city must amend the Zoning Ordinance to rezone the property within the plan area consistent with Figure 2-2, Miramonte Specific Plan Zoning Map contained herein.
- The master developer/individual developer(s) shall prepare a final map(s), and improvement plans that reflect the development of the plan area pursuant to and consist with this specific plan. Figure 1-4, Miramonte Specific Plan Land Use Diagram, will dictate the approved land use and circulation pattern, and ultimate development of the plan area must be built to substantially conform and be consistent with the design and zoning standards described in this specific plan. Individual projects shall be developed consistent with the land use designations and circulation plans shown in the specific plan's land use and circulation chapters and with the policies and implementation measures contained within this specific plan.
- Requests to amend the specific plan, such as modifications to land use types, location, or zoning standards identified herein, are subject to review and approval of the city and must be in substantial conformance with the city's goals and the goals of the specific plan.

6.3 Public Facility Improvements

Section 5 of the Miramonte Specific Plan, along with the plan for services which is incorporated herein by reference, describes the "backbone" public facilities needed to accommodate the development of the plan area. The developer will install public improvements based on the timing and location of the proposed development or as identified in a city approved phasing plan. The following is a brief description of public facilities and infrastructure projects identified as being required with the full build-out of the Miramonte Specific Plan.

Infrastructure

Water Supply

Water service will be provided to the plan area by the City of Soledad and water delivery lines will be installed within the plan area street rights-of-way by the developer(s) and will connect with the

existing water lines that serve the city. The distribution system will consist of underground water mains in all streets, ranging from a 12- inch loop reaching the commercial and medium density residential areas, to eight-inch short extensions beyond fire hydrants. The existing water system will require upgrades to the existing distribution system and construction of new facilities within the plan area which will be funded by the developer(s). Such upgrades will include, but not be limited to, an additional 1.0mg water storage tank and new pump(s) at the east side of the plan area. New pump(s) are necessary to service all development above elevation 340 with city water. Actual infrastructure needs can be determined and designed into improvement plans prior to issuance of Final Map(s) approval.

Fire hydrants will be provided at not-to-exceed 500-foot spacing, and shall provide pressures exceeding 20psi residual. Each hydrant will contain three-outlets (one pumper connection and two hose connections) to fully comply with city standards. All new water mains will be subject to an individual study to confirm required fire flow rates and pressures prior to start of any residential construction within a development phase.

Sanitary Sewer

The City of Soledad is responsible for treatment and disposal of wastewater for the plan area. The sanitary sewer collection system is also operated and maintained by the city. All new sewer mains will be eight-inch or larger, as specified in City of Soledad standards, and will be designed as a part of improvement plans prior to approval and issuance of Final Map(s). Sanitary sewer lines will be located within the proposed street rights-of-way and connect to the existing sanitary sewer lines that serve the city. All sanitary collection system improvements will be designed, funded, and installed, per city standards, by the developer(s) at the time of each phase of development.

Storm Water Drainage

The Miramonte Plan Area storm drainage system will be designed to be completely self-supporting, with the implementation of a new storm drainage system. Storm water flows generated by the development will be collected in an underground piping system, bio-swales, and a retention basin. Storm water runoff will be directed to a large percolation/retention pond located adjacent to the existing San Vicente Road and in the extreme southwest corner of the plan area. The purpose of the bio-swales and retention basin is to capture all post development runoff on-site and percolate the runoff water into the groundwater basin. The only proposed connection to current city public storm drains is a relief line at the San Vicente Road retention basin, designed to not function until retained pond water has risen to near overflow level. Flows in storms of greater intensity than approximately a 100-year return period may be discharged to the city system at San Vicente Road. Both upstream runoff from outside the plan area and increased plan area runoff caused by development will be intercepted, percolated, and stored, so the ultimate runoff downstream of the plan area will be substantially reduced from its pre-project natural volumes. The developer(s) will design, fund, and construct all storm water drainage improvements within the plan area. Any storm water drainage improvements designed, funded, and constructed outside the plan area or if upstream runoff from outside the plan area and 100 percent of all storm water runoff from the plan area is captured on-site to a 100-year storm capacity, this may off-set normal city development impact fees for drainage.

Energy and Communications

All new public utilities and equipment within the plan area will be placed underground and will be designed, funded, and constructed by the developer(s) and reflected on improvement plans at the time of each development phase. All existing overhead utilities shall be converted to underground, with the exception of the existing steel tower structures and wires. It is anticipated that the following utility services will be provided for the project: 1) natural gas lines and facilities – PG&E; 2) electricity – PG&E; 3) cable television – Charter Communications; and 4) telephone – AT&T.

Parks and Open Space

By design, the Miramonte Specific Plan provides for a significant amount of public parkland and open space in the form of neighborhood pocket parks, a linear park, two community parks (one in the center of the development that connects the school sites to the core of the plan area, and one adjacent to San Vicente Road which will be a dual park and storm retention basin), additional parkland connected to the two school sites, park connectors (e.g. sidewalks, pathways, trails, etc.), landscaped buffers, and designated walking trails. All parkland design, funding, and improvements will be the responsibility of the developer(s) as will the landscaping, irrigation, and all structures and hardscape improvements within these areas. Parkland dedication and improvements may off-set city parkland impact fees, as long as the amount of parkland dedication and improvements meets or exceeds the city standard for parkland dedication. Park maintenance will be funded through a Benefits Assessment District or some other funding district mechanism and will be the responsibility of the city.

Circulation

The circulation system within the plan area consists of several primary collector roads and numerous in tract neighborhood streets. The design, funding, and construction of the circulation system will be the primary responsibility of the developer(s) on a phase by phase or neighborhood tract by tract basis. Street maintenance will be the responsibility of the city. Maintenance of common landscape, specialty hardscape and street trees will be funded by a Benefits Assessment District or some other District funding mechanism.

Public Safety Services

Fire Protection

An ancillary fire station site (along with a police sub-station) is designated within the plan area, located approximately 1.6 miles north of the present fire facilities in downtown Soledad. Once constructed and operational, this ancillary fire station should reduce response time for emergency fire department and/or ambulance response by three to four minutes.

Law Enforcement

A site for a City of Soledad police sub-station (along with an ancillary fire station) is designated within this plan, located approximately 1.6 miles (or three minutes normal driving time) north of the present police facilities on Main Street in downtown Soledad. This location is at the approximate center of the Miramonte Specific Plan and should greatly reduce emergency response time.

The land for the ancillary fire station and police sub-station will be dedicated by the developer(s) and the fire and police sub-station construction is a city responsibility.

Public Schools

Miramonte Specific Plan designates sites for one elementary school and one middle school, which will be made available to the Soledad Unified School District. Both school sites are located adjacent to collector streets and centrally located within the plan area. The applicant and/or developer(s) will provide an offer to dedicate the designated school sites. In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions.

6.4 Phasing

Development phasing that responds to market conditions, ensures adequate infrastructure and services, and serves the needs of the community, is critical for orderly development to occur. The specific plan addresses the full range of public facilities including streets, utilities, and parks. Backbone public facilities required for the development of the planning area are described in the Plan for Services (incorporated herein by reference) and within Section 5 of this document.

Phasing Parameters

The city's intention is for the development to occur from south, along the current city urbanized edge, to the north. The first phases of development are expected to occur south of the linear parking in neighborhoods 1, 2, 3, and 4.

The need for adequate infrastructure and services will drive the development phasing more so than the location of development within the plan area. The need for these facilities and the cost of improvement implementation will greatly affect the extent, location, and timing of new development. As a result, the development of non-contiguous property may be permitted if the appropriate public facilities are installed. The following parameters shall guide phasing:

- Initial development will occur south of the linear park and be contiguous to existing development within the current city limits. The storm drainage infrastructure retention basin and lower portions of the linear park bio-swale will be developed within this initial phase and access to this initial phase may be obtained via Orchard Lane and West Street.

- Subsequent phased development shall be driven by the market and the availability of infrastructure/services; however, development of one of the neighborhoods (neighborhood 5, 8, 13, 14, or 15 as illustrated on the tentative map) in the northern portion of the plan area will require one street connection to San Vicente Road; development within two of these neighborhoods will require two connections to San Vicente Road; and development within three or more of these neighborhoods will require all three connections to San Vicente Road.

- Any housing development adjacent to, or within 600 feet of, San Vicente Road shall require at least one access to San Vicente Road.

- The San Vicente Road re-alignment shall be completed at the time of the second connection to San Vicente Road.

- The city's parks to population ratio of three acres per 1,000 people shall be maintained within the plan area at all times, during the phasing process of buildout.

- After the 250th house is occupied, an overall ratio of 15 percent high density (20 units per acre or greater), farmworker, senior, or deed restricted affordable housing units shall be maintained within the plan area. Developments that do not include high density, farmworker, senior, or deed restricted

affordable housing shall contribute a fair share payment to a fund for development of such housing.

- The applicant and/or developer(s) will provide an offer to dedicate the designated school sites. School sites shall be dedicated to the Soledad Unified School District within sixty (60) days of city approval and recordation of the first Final Map.
- The Farmer's Village may be constructed at any time that adequate services can be provided to the site.
- To the extent feasible, large and contiguous tracts of farmland shall be kept intact while development occurs elsewhere in the plan area.

The city may set other phasing parameters beyond those included herein, as a part of conditions on the vesting tentative map, Final Map approval, or as part of a separate development agreement. In all cases those parameters must be either consistent with or in substantial conformance with the intent of the parameters set herein.

6.5 Financing

All public infrastructure, roadways, and parkland will be designed, funded, and constructed by the developer(s) in a phased manner and in accordance with the phasing parameters contained herein. By the time that the final map is recorded, funding mechanisms will need to be in place to enable city police protection, fire protection, public works maintenance, engineering services, community center programs, and city Administration/overhead functions (including City Council, City Manager, City Attorney, City Clerk, Finance and City Treasurer). At this time the fiscal analysis on the Miramonte Specific Plan anticipates that the project will not generate sufficient General Fund revenue to cover projected costs. The exact extent of the fiscal gap is dependent on the on the city's share of the standard one percent property tax which will ultimately be determined by negotiations between the city and the county as part of the annexation/reorganization process.

Based on an assumed 4.7 percent share of the 1once percent property tax, plus additional property tax in lieu of vehicle license fees, the project at buildout will produce sufficient revenue to support General Fund services. However, the City of Soledad funds a number of maintenance functions for streets, storm drains, and parks through special assessment district, as described below. While the project does not adversely affect General Fund service, it would need to participate in a special assessment district in order to complete funding for all required services.

Community Facilities District

The Mello-Roos Community Facilities Act of 1982 authorized cities to establish a Community Facilities District (CFD) which aids in the financing of public services and facilities through a special tax. In order to secure long term funding dedicated to the provision of public facilities such as police protection, fire protection, public works maintenance, engineering services, community center programs, and city Administration/overhead functions needed by all new development within the area, the Miramonte Specific Plan Area will be included in a CFD. The purpose of the CFD is to help fund public facilities not included in an existing city wide fee program, but that are essential to the plan area's development. The CFD will be in addition to the other city adopted development fees. A special tax will be levied annually to cover the city's fees for these public facilities. The City of Soledad can pay for these improvements

through tax revenue, or with the bond financing secured by the tax.

Development Fees

Under the California Constitution, cities have the right to exact fees from developers in exchange for their receiving the privilege to develop. Development fees are a one-time charge. If the fees recovered are insufficient to cover the costs, the city must consider alternative methods of raising the additional funds. Development fees are paid incrementally as development occurs. Also, development fees cannot be used to fund existing capital deficiencies in the area or on-going maintenance.

For improvements that cannot be easily constructed on a small scale or incremental basis, it would be necessary to finance improvements through city-backed bonds (Mello-Roos). However, these bonds would have to be backed by the general fund, since there is no guarantee as to when or how much of these fees would be recovered. Specific development impact fees may be negotiated between the city and developer(s) as a part of a future Development Agreement.

Benefits Assessment District

Assessment districts are usually formed to pay for infrastructure projects, where there is a clear benefit to properties within the district and where there is a clear public purpose. The owners contribute based only on benefits they receive directly, not for all of the project's benefits. Special assessment districts may also be formed and be charged against future residential and commercial users to pay for operations and maintenance of privately owned improvements.

A Benefit Assessment District or some other similar funding mechanism may be formed as an implementation item of the Miramonte Specific Plan. The costs for maintaining the project's on-site infrastructure will be funded by this district and thus not result in a net impact to the city's General Fund. Consistent with the city's requirements for new development projects, it is assumed that the assessments would cover the following costs:

- Street light electricity and maintenance
- Storm drain maintenance
- Parks and other public landscape (e.g. street medians, etc.)
- Maintenance of the on-site pond
- Street maintenance

The city will float bonds to pay for such improvements; the debt is paid by assessing those property owners who will be served by the improvements. An individual property owner's portion of the debt is based on the owner's proportional benefit. Any method that reasonably measures these benefits can be used to spread the debt among property owners.

Private Financing

The proposed project may also include privately held open space to be used for agricultural grazing, alternative energy, and infrastructure support facilities for the rest of the plan area. This open space area may also contain public access easements for walking, hiking, and education. This portion of the specific plan Area will be privately maintained and will, therefore, not result in any cost impacts to the city. Maintenance of the public access easements and any infrastructure within the open space area may be included in the Community Facilities District for long-term maintenance.

Miramonte Specific Plan Goals and Policies

A

APPENDIX

Miramonte Specific Plan Goals and Policies

LAND USE GOALS AND POLICIES

Land Use Goals

LU – 1 Include the plan area within the city's sphere of influence and city limits prior to the city accepting development plans (i.e. improvement plans, final maps, site plans, etc.).

LU – 2 Protect open space and agricultural areas by encouraging more dense development, reducing the geographic extent of the Mirrasou Specific Plan Area, and reducing the residential development potential of the Northwest Expansion Area.

LU – 3 Provide a range of land uses and facilities that meet the needs of plan area residents, that are economically beneficial to the city, and can be developed into an integrated and cohesive residential and recreation-oriented community centered around parks, trails, schools, and shopping and embracing and connecting to the hillside open spaces to the east.

LU – 4 Create new, attractive residential neighborhoods that are in close proximity to parks, open spaces, schools, and neighborhood commercial, and provide a variety of housing types and densities within low, medium, and high density neighborhoods to serve a range of housing needs and income levels, including low income levels, of the broader Soledad community and region.

LU – 5 Provide adequate open space, parks and recreational facilities that are centrally located and linked throughout the plan area, to meet the needs of the plan area residents and the community.

LU – 6 Include land uses that serve the local population and provide employment opportunities for residents of the plan area and immediate surrounding communities. And locate shopping, employment centers, recreation, and parks within walking distance from the homes that use these specific plan components.

LU – 7 Provide public facilities, infrastructure, and services commensurate with new development so as to adequately meet the needs of all development and future residents in the Plan Area in a manner that is financially self-supporting.

LU – 8 Provide an integrated storm drainage and open space system that incorporates best management practices to adequately control storm flooding problems, protect water quality, and provide park space.

LU – 9 Protect the scenic vistas of the hills above Soledad through careful siting and design standards that minimize grading and visibility of new hillside development, and keep development, unless otherwise specified herein, below the 400-foot elevation contour.

Land Use Policies

LU – A Utilize the development potential of the Mirrasou Specific Plan Area and reduce the development potential of the Northwest Expansion Area by 525 units.

LU – B Apply to LAFCO for inclusion in the city's sphere of influence and annex land in anticipation of development.

LU – C Incorporate affordable housing within the plan area, including housing for senior citizens, agricultural workers, and low and very low income households. Consistent with the Inclusionary Ordinance, provide at least six percent of units for very low income households, six percent for low income households, and eight percent for moderate income households. Of the total affordable units proposed for the plan area, 39 percent should be affordable to very low income households, 19 percent to low income households, and 42 percent to moderate income households; and 30 percent of multi-family housing units should be available as rentals.

LU – D Commercial buildings should be placed at or near the front setback and oriented toward the street to define and enliven the street. Commercial buildings and multifamily residential buildings should be oriented towards streets and where possible should not back onto parks, trails, plazas, or other public spaces. The "front" facade and building entrances and windows should wrap around all public elevations of the buildings. Where buildings do back onto public spaces, care must be taken to present a finished architectural design, and utilities, loading areas, trash receptacles, service doors, and similar must be integrated or screened in these areas.

LU – E Garages and parking lots should be de-emphasized and moved back from the street and/or out of direct view.

LU – F Climatic factors, such as prevailing winds, shade trees, window and door orientation, and the positioning of buildings on the site should all be coordinated to maximize energy conservation.

LU – G Landscaping should be installed between the street and the sidewalk buffering the sidewalk from traffic and providing a pedestrian scale to walkways and a landscaped parkway along the street edge. Breaks should be provided to allow pedestrian access from on-street parking spaces. Ample street trees should be provided.

LU – H Major and minor gateways should be designed to provide a consistent feel of arrival. Use of water, stone, and living landscape materials, along with signs and public art will provide for dynamic gateways within the plan area. Each residential neighborhood should be distinct, with neighborhood gateways that are unique to the neighborhood, but consistent with the overall specific plan character.

LU – I Residential buildings should provide an attractive architecture that emphasizes welcoming facades on all street- and public-facing elevations. Architecture and landscape should combine for a unified character within each neighborhood.

LU – J Concurrent with recordation of a final subdivision map, developers shall provide compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses using one of four methods, at the discretion of the city:

a) provide the in-kind direct purchase/acquisition of an agricultural mitigation easement at a 1:1 ratio and dedicate the easement to an agricultural land trust or other qualifying entity; and/or

b) if available, purchase agricultural banked mitigation credits at a 1:1 ratio from a qualifying entity; and/or

c) pay an in-lieu mitigation fee, which amount shall be determined by the city prior to project approval. The amount of the fee should reasonably be expected to lead to the reservation of agricultural land. Said fee shall be kept by the city in a fund established specifically for agricultural land mitigation purposes; and/or

d) implement other innovative approaches as approved by the city that results in the preservation of agricultural land within areas targeted by the city.

CIRCULATION GOALS AND POLICIES

Circulation Goals

C – 1 Provide the necessary circulation system and infrastructure to create a safe and efficient circulation network for motor vehicles, pedestrians, physically disabled persons, and alternative forms of transportation with an emphasis on creating a pedestrian friendly, walkable community.

C – 2 Provide a comprehensive bicycle and pedestrian network separate from street rights-of-way to facilitate quick and convenient non-motorized access.

C – 3 Provide seamless connections to adjacent areas, but encourage most automobile and all truck traffic to use San Vicente Road, rather than Orchard Lane or West Street.

Circulation Policies

C – A The general plan circulation concept should be adapted to the plan area in recognition of development limitations related to the 400-foot elevation contour and future traffic demands in the northwest quadrant of the city.

C – B All streets and circulation routes shall be consistent with Figure 3-1, Miramonte Specific Plan Circulation Diagram.

C – C San Vicente Road shall be connected to the plan area temporarily by way of following the existing alignment, and ultimately by large-radius curves to provide a smooth transition from the plan area south to the existing.

C – D Street widths shall be consistent with street section minimums indicated in Figures 3-2, Street Classifications Cross Sections.

C – E All street improvements shall be financed and installed by the developer. The developer may be credited by the city's Traffic Impact Fee program.

C – F All streets within the plan area shall be public and dedicated to the City of Soledad, and shall be constructed with curbs, gutters, landscape parkways, and sidewalks meeting City of Soledad Standard Plan specifications.

C – G City shall assume responsibility for the maintenance and repair of all street facilities with funding from a Benefits Assessment District or other appropriate funding mechanism.

C – H Funding for maintenance of lighting, street improvements, special paving surfaces, sewer, storm drain, common area landscape, open space, and hardscape shall be provided through a Public Facilities Maintenance District or a similar funding mechanism.

C – I All private streets and driveways within the plan area, such as within commercial and multi-family areas, shall be maintained and paid for by the property owners for those developed areas.

C – J All streets shall include a sidewalk at least four feet in width on each side of the street.

C – K Sidewalks adjacent to schools, commercial areas, and village residential areas (external road frontages only) shall be a minimum of eight feet wide, and may replace planting strip and landscaping included in the street sections with interspersed landscaping blocks.

C – L Sheltered bus stops including bus turn-outs, meeting MST (Monterey-Salinas Transit) specifications, shall be provided at appropriate locations within the plan area. The developer will develop these bus stops for use by the on-call service or future fixed route service.

C – M Bike lanes and paths shall be designed and maintained to improve bicycling safety and convenience, achieve integration with the street network, and encourage people to use bicycles to commute to work or school.

C – N New development shall provide bike lanes and paths, secure bicycle storage, and parking facilities.

C – O Bicycle parking should be provided in locations near building entrances or outdoor use areas with good public visibility.

C – P A minimum of two ingress/ egress will be provided for each neighborhood area. Access should be aligned with intersecting streets where possible.

PARKS, RECREATION, AND OPEN SPACE GOALS AND POLICIES

Parks, Recreation and Open Space Goals

P – 1 Ensure that the provision of adequate park, open space, and recreational facilities meets the varied needs of the plan area residents.

P – 2 Protect the visual and natural resource values of the hillside open space lands.

P – 3 Utilize park lands to link neighborhoods.

PARKS, RECREATION AND OPEN SPACE POLICIES

P – A Provide a variety of semi-active and passive recreational features that meet the needs of residents' abilities and interests.

P – B Each phase of development shall provide enough parkland to meet the needs of project residents in that phase or neighborhood being constructed.

P – C Parkland minimum requirements shall be determined at three acres per 1,000 residents (per General Plan policy PR-1(a)). With an estimated population of 9,833 residents, the parkland requirement is about 29.5 acres. Parkland and open space combined shall be required at a ratio of five acres per 1,000 residents, or a minimum of about 50 acres.

P – D Design and landscape parks for easy maintenance, water efficiency, wind protection, and shade. Utilize native plants when suitable selections are available.

P – E Interconnect parks, open space, schools, commercial areas, and the neighborhoods with sidewalks and/or trails.

P – F Include multi-functional spaces and facilities in the parks.

P – G Parks, open spaces, and recreation facilities should be designed to eliminate or avoid hidden and difficult-access areas where security problems would be likely to occur.

P – H Each of the neighborhood parks will include a small children's play area.

P – I Children's play areas and other appropriate park areas should have adequate shade, seating, and wind protection provided through landscaping and/or constructed elements, and if located near collector streets, a three- to four-foot fence to separate the play area from the street.

P – J The storm water basin will be a dual-purpose area with sport and recreation fields.

P – K A recreational field should be located near the middle school.

P – L Parks should be located and designed to minimize noise and activity conflicts with residential areas.

P – M A 100 foot wide low growing and low fuel vegetated buffer should be provided between residential lots and the larger hillside open space area. This 100-foot buffer will be located within the open space area, and will be maintained to keep fuel load low.

P – N Landscaping in the open space area, if needed to supplement existing vegetation, should utilize native plant materials that are both fire resistant and non-invasive.

PUBLIC SERVICES AND FACILITIES GOALS AND POLICIES

Public Services and Facilities Goals

PSF – 1 Provide an efficient, self-sustaining system of public facilities that accommodates the needs of the residents and businesses within the plan area through buildout.

PSF – 2 Provide adequate and reliable services and utilities to residents and business and ensure adequate maintenance of these utilities and services.

Public Services and Facilities Policies

Wastewater Policies

PSF – A Minimize wastewater flows through water conservation efforts.

PSF – B Design and construct the wastewater treatment system in accordance with applicable requirements of the Soledad Urban Water Management Plan and Long-Term Wastewater Management Plan.

PSF – C Wastewater lines shall be sized in anticipation of development in the remaining Mirrasou planning area to the north.

Water Policies

PSF – D Design and construct the specific plan water supply and distribution system to expand upon and integrate with the city's water distribution system to meet the needs of future plan area developments consistent with the Soledad Urban Water Management Plan and 2005 Water Master Plan.

PSF – E Reduce potable water consumption throughout the specific plan area through the use of recycled water for irrigation, emphasis on drought- tolerant plant materials for landscaping, and the incorporation of state-of- the art low water/high efficiency use fixtures and appliances in all new private development and public facility construction, including schools.

PSF – F Water lines extending to the north boundary of the plan area shall be sized in anticipation of development in the remaining Mirrasou Planning Area.

Storm Water Policies

PSF – G Ensure provision and sizing of adequate storm water facilities to accommodate the plan area and provide for water retention sufficient to limit peak flows to predevelopment levels.

PSF – H Design, fund, and construct a storm water collection and retention system, including an appropriately sized retention basin, that adequately retains peak storm flows onsite, avoids aggravating or causing storm water flow capacity problems offsite downstream from the plan area, ensures separation of storm water drainage from recycled water generated within the plan area, and is consistent with the city's Storm Drain Master Plan, the city's Storm Water Management Plan, and the City of Soledad Storm Water Ordinance No. 617.

PSF – I Limit the development of impervious surfaces, to the extent practical in order to reduce post-project runoff volumes.

PSF – J Require appropriate runoff control measures as part of development to minimize discharge of urban pollutants (such as oil and grease) into drainage areas, and design, fund, and construct a bio swale for the length of the linear park that connects to the retention basin in the plan area.

PSF – K Construction and grading activities shall comply with Best Management Practices and Storm Water Pollution Prevention Plan policies per applicable controls, standards and Regional Water Quality Control Board.

Energy and Communication Policies

PSF – L The city shall ensure that energy and communications services are provided, either through direct city provision, contract, or franchise.

PSF – M Electrical and gas services shall be provided by Pacific Gas & Electric (PG&E) or other authorized service providers.

PSF – N Telephone service shall be provided by AT&T or other authorized service providers.

PSF – O Cable television shall be provided by Charter Communications or other authorized service providers.

PSF – P No roof mounted or aerial antennas or receiver dishes shall be installed that are visible from beyond a parcel's property lines.

PSF – Q All utilities shall be installed underground.

PSF – R Provide new communication technologies such as fiber optics, which will provide future benefit to residents and businesses within the plan area.

PSF – S New development should include the provision of an I-net system, linking all city facilities, as a part of public improvements.

PSF – T Promote energy sources that will ensure reliability during high energy demands.

PSF – U Promote the use of solar energy devices and encourage solar orientation of residential and business buildings to facilitate passive and active solar systems and reduce the use of fossil fuels.

PSF – V Promote recycling of consumer and business waste to reduce landfill requirements and lengthen the service life of existing landfills.

School Policies

PSF – W New elementary and middle school facilities, or improvements to existing schools, shall be in place as needed to serve each phase of specific development prior to occupancy. Prior to approval of the first Final Map, an agreement shall be established between Developer and/or successors in interest and the Soledad Unified School District that establishes the timing of school construction or improvements and financing obligations. The applicant and/or developer(s) will provide an offer to dedicate the designated school sites. The school sites shall be dedicated to the Soledad Unified School District within sixty (60) days of city approval and recordation of the first final map.

PSF – X New school facilities shall be located and designed in accordance with Soledad Unified School District and/or State Department of Education sitting and design criteria.

PSF – Y Approval of final map(s) and improvement plans shall be predicated upon evaluation and findings by the City Council that adequate public services and infrastructure, including schools, are available to serve additional housing and residents.

PSF – Z New development shall provide stub-out utilities for schools so that new public improvements are not disturbed or removed during school construction.

Law Enforcement and Fire Protection/Medical Services Policies

PSF – AA Expand police and fire protection services and facilities as needed to adequately meet the needs of project residents. To serve build-out of the specific plan area, a 1.3 acre site has been centrally located and designated for development of a public safety facility.

PSF – BB Provide adequate lighting, visual corridors, and vehicle access along streets and nature trails to the extent feasible.

PSF – CC Select and maintain landscaping features and plant materials to minimize hiding spaces and other indefensible spaces.

PSF – DD Landscape, design and/or protect walls, fences and other publicly accessible flat surfaces to minimize areas that attract graffiti.

PSF – EE Design streets to City of Soledad Fire Department/Emergency Response standards, including fire hydrants, turn-outs, and cul-de-sac radii.

PSF – FF New development shall provide fire flow, emergency access, and hydrants consistent with Fire Department Requirements.

PSF – GG The plan area should include site planning which helps reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department.

PSF – HH Police and Fire Services will be maintained with funding from a Public Safety Benefit Assessment District or similar funding mechanism.

Memorandum of Understanding

APPENDIX B

MEMORANDUM OF AGREEMENT BETWEEN THE CITY OF SOLEDAD AND THE COUNTY OF MONTEREY REGARDING WORKING COOPERATIVELY ON COMMON PLANNING, GROWTH AND DEVELOPMENT ISSUES IN ORDER TO BE AS EFFECTIVE AS POSSIBLE IN THE IMPLEMENTATION OF THEIR RESPECTIVE GENERAL PLANS

This Memorandum of Agreement, hereinafter referred to as ("Agreement"), is entered into on this ____ day of _____ 2016 (the "Effective Date") by and between the City of Soledad, a Municipal Corporation hereinafter referred to as ("City"), and County of Monterey, a political subdivision of the State of California, hereinafter referred to as ("County"), and together hereinafter referred to as the "Parties".

RECITALS

WHEREAS, the Parties declare that it is in their mutual interest to work cooperatively on issues of planning, growth, and development in order to provide more certainty regarding the future direction, extent, and conditions of urban development, to reduce unnecessary conflicts and to reduce costs for future development including affordable housing, to provide for the long term protection of valuable agricultural lands, and to be as effective as possible in the implementation of their respective General Plans; and

WHEREAS, as an expression of the intent to work cooperatively on common issues pertaining to planning, growth and development, the Parties have prepared this Memorandum of Agreement ("Agreement"), which serves to fulfill the requirements of California Government Code Section 56425(b), as an Agreement by and between the Parties regarding the expansion of the boundaries of the City's Sphere of Influence (SOI), and the establishment of planning principles by both Parties to promote logical and orderly development for purposes of the City's application to the Monterey County Local Agency Formation Commission (LAFCO) to update its Sphere of Influence; and

WHEREAS, the Parties recognize, pursuant to California Government Code Section 56425(c) that this Agreement itself does not commit the Parties to any particular form or pattern of development, but rather, if LAFCO's final determination is consistent with this Agreement, then the Agreement would need to be considered for approval by both the City and County after noticed public hearing. Once the Agreement has been adopted by the Parties and their respective general plans reflect the Agreement, then any development approved by the County within the adopted sphere shall be consistent with the terms of the Agreement; and

WHEREAS, this Agreement is not subject to environmental review under the California Environmental Quality Act (CEQA) because numerous actions must be taken pursuant to State and local laws and regulations before such policies can be implemented. Such actions include, in some instances, the need to complete financial nexus studies, comply with the California Environmental Quality Act (CEQA), the need to hold public hearings and/or otherwise seek public input before reaching binding decisions, and the need to obtain approvals from other agencies such as the Local Agency Formation Commission of Monterey County (LAFCO). For all such provisions, the MOA shall be understood to constitute tentative policy commitments that can only become fully binding after all such legal prerequisites have been satisfied; and

WHEREAS, the Parties recognize and understand that individually each has its own growth plans, priorities and approaches; however, it is of mutual benefit to enter into this Agreement to acknowledge their cooperation in a variety of key policy areas.

NOW THEREFORE BE IT RESOLVED, that the Parties find that establishment of this Agreement is an effective and beneficial means of reaching basic agreement regarding future planning, growth and development issues in and around the City of Soledad.

BE IT FURTHER RESOLVED that the Parties declare and agree as follows:

Section 1. Logical & Orderly Development.

1.1 The City has adopted the 2005 Soledad General Plan, which establishes a long range development plan for the City that identifies the "ultimate" City area that will enable the City to plan for efficient provision of public facilities and the delivery of services, provide clarity for property owners about the direction of future development and its extent, and direct development away from the best agricultural land.

1.2 The County recognizes that the City's long-range plan, as interpreted by the policy commitments found in this document, serves the mutual goal of conserving agricultural lands, by limiting urban development and its impacts on agricultural operations to a defined area. The City General Plan provides certainty for farmers and ranchers outside of the growth area that they can invest in and continue farming on a secure basis, without future pressure to convert their lands for urban development.

1.3 The County desires to implement its policies regarding City-Centered Growth (General Plan Policies LU – 2.14 through LU – 2.19) as discussed in the adopted 2010 County General

Plan, and reinforced by City General Plan Policies L-1 – L-9. The County recognizes that a commitment to City-Centered Growth principles implies long-term reliance on the City to accommodate housing and other urban needs, and relies on the City to be able to designate adequate land for its needs while developing in a logical, compact and orderly manner.

Section 2. Direction of Future Development.

2.1 The City agrees as follows:

a) To limit future long-term development within the area shown on Exhibit 'A' and designated as "Urban Growth Boundary" (the "**UGB**"). The purpose of the UGB is to bound and enclose the land intended for development within the 2005 Soledad General Plan.

b) To manage development of land within the UGB utilizing the best available "sustainable" practices. The intent of the City is supported by City's General Plan Policy L-2, which partially reads as follows:

> Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources…

c) To encourage proposals for infill development on vacant or underutilized sites within the existing City limits east of Highway 101 whenever possible, to avoid urban sprawl and postpone the conversion of agricultural land to urban uses.

d) To require Specific Plans to include residential densities that ensure a compact urban form that helps protect agricultural land from premature conversion.

e) To establish a permanent agricultural edge for the purpose of maintaining a clearly defined northwest and southeast boundary between the urbanized incorporated areas of City and the agricultural areas within the unincorporated County as shown on Exhibit 'A' and identified as "Permanent Agricultural Edge". A "Temporary Agricultural Edge" is hereby established east of Bryant Canyon Road, as specifically shown on Exhibit 'A'. The Temporary Agricultural Edge may be eliminated through an amendment to this Agreement.

f) To utilize agricultural buffers within the UGB to address the compatibility between the development of urban land uses and existing or planned agricultural uses. The City's General Plan requires development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses. The County requires an agricultural buffer as typically 200 feet in width and includes other vegetation, walls, or other screening deemed necessary to ensure that property owners on both sides of the buffer may enjoy full and unencumbered use of

their property for its designated use without experiencing significant deleterious effect from neighboring use.

g) To actively participate with the County, LAFCO and other cities within the Salinas Valley to develop a Valley-wide Agricultural Land Mitigation Program to address the loss of agricultural land due to development and conversion to urban uses.

h) To utilize permanent agricultural buffers along the UGB to ensure compatibility between the development of urban land uses and agricultural uses in the unincorporated area. The City agrees to actively participate with the County, LAFCO and other cities in the Salinas Valley to develop a Valley-wide Agricultural Buffer Program to ensure compatibility of urban land use with agricultural uses in the unincorporated area.

2.2 The County agrees as follows:

a) Consistent with County General Plan Policy LU – 2.14, mutually work with the City to support the City's proposals to manage its growth and gradually develop within UGB of the City General Plan in accordance with the approval of future Specific Plans that are prepared to implement a logical, orderly development pattern that matches the City's ability to provide urban services.

b) To consult with the City on development projects that are proposed within a Referral Area as illustrated on Exhibit 'B'. This obligation and agreement to consult shall not apply to structures or other improvements on agricultural land located in the Referral Area which are incidental to existing farming operations, including by way of example only, barns, storage sheds, shops, ranch administrative offices, ingress and egress, and irrigation and pumping facilities. The intent of the County is supported by the County's General Plan Policy LU – 2.19, which County intends to implement by 1) minimizing potentially competing development within the City's Planning Area Boundary (See Figure II-1, Soledad General Plan), 2) limiting approval of new agricultural-industrial or commercial projects and by directing such development to the City's agricultural business parks and/or light industrial areas, and 3) referring any discretionary development proposals within the City's Planning Area Boundary to the City for comment and, for larger projects, potential annexation.

c) To promote long-term conservation of commercial agriculture outside of the Soledad General Plan UGB (Exhibit 'A') and the area outside the development area described in section 2.1(e), above, for the purposes of regional economic stability and to maintain physical separation from other communities in the area, including Greenfield, the state prisons, and Gonzales. The intent of the County is expressed in the County's General Plan Policy LU – 2.17.

d) To not support the inclusion of land into a Williamson Act contract within the City's UGB.

Section 3. Specific Planning Actions.

3.1 During the negotiation of this Agreement, the Parties identified and discussed specific planning actions that the Parties intend to implement if the Sphere of Influence Amendment as proposed by the City is approved by LAFCO and if this Agreement is subsequently adopted following noticed public hearing, subject to all legal prerequisites as set forth in section 9.1 below. Each of those specific planning actions is described below.

a) Dole/Camphora Services. The Parties agree that, prior to any future connections of city infrastructure to unincorporated areas northwest of the current city limits, the Parties will discuss entering into an agreement setting appropriate fees for such service.

b) Adobe Site at Arroyo Seco Interchange (Los Coches Adobe site). The Parties agree to cooperatively identify methods to allow the City to fully utilize the site of the Adobe property at the northwest corner of the Arroyo Seco Road interchange with Highway 101 if the historic structure is able to be reused for a future use and for uses that serve the visiting public, such as a campground, inn, visitor center, use that supports the agricultural industry as an informational or educational use, or supports the winery corridor as outlined in the County General Plan. If the historic adobe cannot be retained, negotiations shall occur between the Parties prior to demolition, and shall include a review by the County's Historic Resources Review Board prior to issuance of any demolition permit. The intent of the discussions and review are to attempt to identify methods that may save the historic structure. The County supports the connection of the City and the Adobe through annexation of appropriate land, including the enlargement of the Adobe property site in order to facilitate the establishment of the public visitor serving uses set forth above.

c) The Parties agree to discuss the potential for future inclusion of the Heavy Industrial area, in the unincorporated area southeast of the Soledad Correctional Facilities, in the Sphere of Influence in the future. The area shall be considered for future annexation to the City of Soledad, if growth of the City occurs to the west into the Northwest Expansion Specific Plan area.

d) Agricultural Processing Facilities. If an agricultural processing facility is proposed for construction in the unincorporated area on a parcel adjacent to the City limits or SOI, the Parties shall discuss annexation of the site to the City as part of the discretionary permit actions. The intent of this Agreement is to have the site become part of the incorporated City.

e) The inclusion of the industrial area along McCoy Road in the City Planning Area Boundary and Sphere of Influence shall be discussed between the Parties as part of any future comprehensive update to the City General Plan.

f) Maintenance of a Positive Housing and Jobs Relationship. The Parties agree that the County shall continue to direct commercial and industrial growth proposed in the vicinity of the City to vacant City parcels providing the zoning and infrastructure to accommodate such uses, with the exception of the Heavy Industrial zoned land located southeast of the Soledad Correctional Facility, where low intensity agricultural support uses may be allowed by the County so long as City infrastructure is not necessary to allow the use.

g) By signing this Agreement, the City expresses its intent to not extend urban land uses to the southeast of the new bypass road described in Section 5.4 and into the Northwest Expansion Specific Plan area. However, if the Permanent Agricultural Edge, as described in this Agreement, should ever be proposed to be eliminated to allow the future extension of urban uses, the City shall discuss the matter with the Board of Supervisors prior to any City action; and the City shall require mitigation for the loss of prime agricultural land with an agricultural conservation easement at a ratio of 3:1, with the conservation easement deeded, at the sole discretion of the City, to a nonprofit public benefit corporation organized under Internal Revenue Code section 501(c)(3), or other appropriate legal entity, operating in Monterey County for the purpose of conserving and protecting land in agricultural production. Furthermore, should the Permanent Agricultural Edge be eliminated, the City agrees that, to the extent allowed by law, all local taxes collected from annexation of the property shall not accrue to the benefit of the City. Under that scenario, to the extent allowed by law, local taxes collected from areas annexed by the City shall be distributed in a manner as if the annexed area was not part of the City.

h) Access Limitations to San Vicente Road. The City agrees to coordinate with the County and plan the arterial roadways along San Vicente Road in a manner that supports the free-flow of both automobile and truck traffic, utilizing method(s) determined by a traffic engineer to be practical, including but not limited to: utilizing the existing City road as a frontage road/by-pass road, round-abouts, directional barriers or medians, trap lanes and right-turn-in and right-turn-out intersections.

The language of this section is to be interpreted in a manner that most facilitates the movement of agricultural vehicles from agricultural fields to the highway, agricultural plants, or rail yards with little to no interference from City traffic.

Section 4. Development Phasing & Annexations.

4.1 The City's adopted 2005 General Plan focuses future urban development to the east of Highway 101 and north/northwest of the current city and provides for the phasing of development through the use of Specific Plans within the area shown on Exhibit 'A'that is

designated as UGB. The timing of annexation applications submitted for consideration by LAFCO will be based upon the approval by the City of a Specific Plan, which includes a phasing plan, a plan for services and public facilities and financing plans that demonstrate compliance with LAFCO Standards.

4.2 The City shall develop Specific Plans that specifically address development phasing and sequence of improvements. The phasing programs shall ensure that adequate supporting public services, retail, parks, schools and other uses are in place to support residential, institutional, and commercial uses.

4.3 The City shall refer proposals for the preparation of Specific Plans within the UGB to the County for informal review and comment regarding the potential impacts of the proposed project upon the adjacent unincorporated area and associated County facilities. Environmental documents associated with the Specific Plan process shall be referred to the County for formal review and comment.

Section 5. Agricultural Land Compatibility.

5.1 The City agrees to maintain agriculture as the core of the local economy by conserving and protecting agricultural lands and operations within its Planning Area Boundary, and where agricultural land is planned for eventual urbanization, to work to keep such land in production up until the time when the land is converted to urban use.

5.2 The City agrees to emphasize agricultural land compatibility by implementing the following actions as described in the City General Plan, including:

> Policy C/OS-1 – The City shall discourage "leapfrog" development and development in peninsulas extending into agricultural lands to avoid adverse effects on agricultural operations.
>
> Policy C/OS-2 – The City shall retain the agricultural land use designation on lands within its planning area until the land is needed for urban development.
>
> Policy C/OS-3 – The City shall ensure that new development and public infrastructure projects do not encourage expansion of urban uses outside the general plan area into areas designated Agriculture by the Monterey County General Plan.
>
> Policy C/OS-4 – The City shall support the agricultural economy be encouraging the location of agricultural support industries in the City…
>
> Policy C/OS-5 – The City shall require a right-to-farm condition to all future

subdivision maps adjacent to farmlands.

Policy C/OS-6 – The City shall require development within or adjacent to agricultural areas to minimize conflicts with adjacent agricultural uses.

Policy L-1 – Preserve agriculture on large lots outside the City's sphere of influence …

Policy L-2 – Further annexations to the City may occur when…a substantial portion of the development capacity within the existing city limtes has been developed…

5.3 The City agrees to implement policies that require the City to be consistent with the County of Monterey's "Right-to-Farm" Ordinance and the policies with respect to farming rights and agricultural protection/compatibility found in the County General Plan, and consider revision of the City's Zoning Ordinance to require the recordation of a Right-to-Farm Notice as a condition of discretionary approval for residential development (including lots approved as part of a new residential subdivision) within 200 feet of an established agricultural operation.

5.4 The City agrees to develop and implement a plan, in consultation with the County, to separate and re-route truck traffic, primarily associated with agricultural operations, from local traffic routes. The City and County agree to mutually work to identify and obtain a new access road from State Highway 146 on the southeast end of the City to connect to Highway 101. The City and County will seek funding sources for construction of this new road while maintaining Business Highway 146 through the City's downtown.

Section 6. Agricultural Land Conservation Program.

6.1 The City agrees to maintain agricultural open space around the City as a means of giving form and definition to the City. The County desires this protection to ensure preservation of the agricultural economy so critical to Monterey County, including its cities. To this end, the City agrees to permit urban development only within the areas designated for urban uses on the City's General Plan Land Use Diagram and as described in this Memorandum of Agreement. Land immediately beyond this boundary should remain in agricultural use utilizing permanent agricultural easements, other mitigation measures that may arise as a result of project-level CEQA review, or any other feasible methods determined by the City to be feasible to preserve agricultural lands and define the limits of urban expansion for the City.

6.2 The City agrees to establish an Agricultural Land Conservation Program. The Program includes securing the dedication of agricultural land easements, purchase of banked mitigation

credits and/or levying a mitigation fee that could be used to purchase easements on lands outside of the City's General Plan Urban Growth Boundary.

6.3 Notwithstanding participation by the City in any other adopted program, by adopting this Agreement, the City agrees to implement an Agricultural Land Conservation Program as follows until the City establishes a Program pursuant to section 6.2 or section 2.1(g):

6.3.1 To the extent as permitted by law, for the development of land within the City's UGB as shown on Exhibit 'A', which lands have been annexed to the City and are designated by the California Department of Conservation's Farmland Mapping and Monitoring Program as "Prime" or "of Statewide Importance", but excepting all lands within the area denoted as "Existing Sphere of Influence" and the area west of Bryant Canyon Road, the owner/developer/successor-in-interest shall select one or any combination of the following items:

a) provide the in-kind direct purchase/acquisition of an agricultural mitigation easement at a 1:1 ratio and dedicate the easement to an agricultural land trust or other qualifying entity; and/or

b) if available, purchase agricultural banked mitigation credits at a 1:1 ratio from a qualifying entity; and/or

c) pay an in-lieu mitigation fee, which amount shall be determined by the City prior to project approval. The amount of the fee should reasonably be expected to lead to the preservation of agricultural land. Said fee shall be kept by the City in a fund established specifically for agricultural land mitigation purposes; and/or

d) implement other innovative approaches as approved by the City that results in the preservation of agricultural land within areas targeted by the City.

6.3.2 The method for mitigating the loss of agricultural land shall be implemented at the discretion of City to coincide with the time of the recordation of a final subdivision map, except where a final map is clearly labeled as a "Large-lot Subdivision Map" and the map and associated agreement clearly specify that the creation of parcels (a) is for purposes of resale and not intended for development, or (b) does not include any entitlements which would permit development of the subject parcels without recordation of subsequent subdivisions maps or prior to the issuance of a grading permit. The City may consider receiving mitigation fees for individual projects in annual installment payments plus interest on the outstanding balance as long as the full amount is secured by a bond held by the City or other enforceable method of security, in the City's sole discretion prior to filing the final map or commencement of use.

6.3.3 The filing of a parcel map that does not result in the conversion of land zoned for agricultural purposes does not require dedication or payment of in-lieu fees.

6.3.4 It is the intent of the City to oversee, collect and manage any and all fees collected through the implementation of its Agricultural Land Conservation Program to ensure the use of the fees and the selected form of mitigation represents the best interest of the City, and that the form of mitigation is the most effective in addressing the agricultural conservation goals and objectives of the City as expressed in the City General Plan. Such intent is subject to the requirements of the California Environmental Quality Act to provide actual mitigation and to report on utilized mitigation funds.

6.3.5 In establishing its Agricultural Land Conservation Program, it is the further intent of the City to establish a Committee, which is appointed by the City Council, to plan the use of mitigation fees and to make recommendations to the City Council on the use of those funds. The Committee's composition shall be determined by the City Council, and could be structured as follows: two members of the City Council, the City's Community Development Director, a representative for Agriculture, a representative of an Agriculture Conservation/Preservation organization, a representative of the Building Industry/Development Community, a representative of the County of Monterey Agricultural Commissioner's Office, and the 3rd District County Supervisor. This section applies until the County and City have an Agricultural Land Conservation Program agreed to by both parties.

6.3.6 Any agricultural mitigation fees assessed and collected by the City pursuant to its Agricultural Land Conservation Program may, in the City's sole discretion and reasonably acceptable to the County, be applied to activities designed to preserve and promote agriculture and the agricultural industry in the Greater Soledad Area, including but not limited to:

a) Scientific research for addressing agriculture's needs (e.g. food safety). Entities applying for research funding could include universities, colleges, research think tanks, non-profits, industry/business, government and schools;

b) Increased agricultural educational programs in the Soledad Unified School District;

c) Purchase of permanent agricultural buffers to alleviate potential physical conflicts between existing or planned agricultural uses (either within or outside the UGB) and urban land uses planned within the UGB;

d) Economic programs developed to expand markets for local agricultural products;

e) Programs promoting careers in agriculture;

f) Contributions to non-profit associations dedicated to agricultural education, promotion or preservation.

g) Funds for the acquisition of agricultural easements outside the City UGB.

6.3.7 Notwithstanding all of the foregoing measures described in Section 6.3.6 above, City and County agree that the first priority use of agricultural mitigation fees is for the acquisition of permanent conservation easements adjacent to the Permanent Agricultural Edge/UGB to the east, south and west, as shown on Exhibit 'A,' through the owner/developer/successor-in-interest securing an easement, as described in Section 6.3.1(a) of this Agreement, or through the use of mitigation fee funds collected pursuant to Section 6.3.1(c) of this Agreement.

6.4 The County will consider that the City's participation in an Agricultural Land Mitigation Program, for the purpose of this agreement, has been satisfied if the City can prove to County that land immediately adjacent to the City's northwestern, southwestern and eastern boundaries have been permanently secured by the recordation of an agricultural preservation easement or through the sale or dedication of land to a private land trust.

Section 7. Traffic Mitigation Fees.

7.1 The County agrees to prepare and consider a Traffic Impact Fee that would include a Zone that includes the Greater Soledad Area within 18 months of the effective date of the adoption of the Sphere of Influence by LAFCO. Proper notice shall be provided to the City and all affected property owners of the preparation of such a fee study, when and where discussions regarding the fee will occur and when the fee will be considered for adoption. The City agrees to consider adoption of the County's impact fee program, as may be amended from time to time, to fund improvements to County roads listed in the program. Until the Impact Fee is established, the City agrees to ensure that any new development project in the incorporated area, pursuant to the City's General Plan, that causes traffic impacts on local roads in the nearby unincorporated area, will pay its pro rata fair share to the County as mitigation for impacts on County roads.

7.2 The County agrees that for any development requiring a discretionary permit that would generate traffic through the City (except, on legal lots that existed as of the date of this agreement, single family dwellings), the County will consult with the City to determine if there are traffic impacts to the City. In the event that there are traffic impacts to the City, the County will require the development to pay its pro rata fair share to the City as mitigation of impacts on

City roads. The pro rata fair share shall be determined through a formula calculation prepared along with a project's traffic impact analysis.

Section 8. Tax Sharing.

8.1 By signing this Agreement, the City and County agree to discuss the provisions of the Master Tax Sharing Agreement prior to the annexation of any territory located in the City's UGB, excepting all lands within the area denoted by LAFCO on this date as "Sphere of Influence"

8.2 Unless mutually agreed to otherwise by both parties and to the extent allowed by law, the City and County agree that all local taxes collected from annexation of property not consistent with this Agreement shall not accrue to the benefit of the City. To the extent allowed by law, local taxes collected from areas annexed by the City not consistent with this Agreement shall be distributed in a manner as if the annexed area was not part of the City.

Section 9. Environmental Review, Public Hearing & Local Decision-making.

9.1 The Parties recognize that, with respect to some of the provisions set forth herein, numerous actions must be taken pursuant to State and local laws and regulations before such policies can be implemented. Such actions include, in some instances, the need to complete financial nexus studies, comply with the California Environmental Quality Act (CEQA), the need to hold public hearings and/or otherwise seek public input before reaching binding decisions, and the need to obtain approvals from other agencies such as the Local Agency Formation Commission of Monterey County (LAFCO). For all such provisions, the MOA shall be understood to constitute tentative policy commitments that can only become fully binding after all such legal prerequisites have been satisfied.

Section 10. Amendment.

10.1 The parties may desire to amend this Agreement from time to time. Any amendment, representing an alteration, or modification of any of the terms or provisions contained herein, or any amendment adding a new term or condition, shall not be binding upon the parties hereto unless made and executed in writing by the parties hereto and approved by both the County's Board of Supervisors and the Soledad City Council.

[Signatures on a separate page]

IN WITNESS WHEREOF, the Parties hereto have caused this Agreement to be executed on the day and year first written above, and shall take effect following adoption and the placing of signatures by all Parties.

APPENDIX C

GENERAL PLAN CONSISTENCY ANALYSIS

General Plan Consistency Analysis

General Plan Policy		Consistency
Land Use		
L-2	Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council.	The general plan designates the Miramonte Specific Plan Area (Plan Area) which includes portions of the Mirassou Specific Plan Area, Northwest Expansion Area, and San Vicente West Specific Plan Expansion Area as areas for future growth. The opportunities available for residential development are limited within the existing city limit. The Miramonte Specific Plan (specific plan) preserves scenic hillsides of the site above the 400 foot elevation contour, provides public open space, and protects scenic and natural resources within this are of the site. The proposed specific plan also designates two school facility sites and sites for expansion of police and fire facilities, neither of which are available within the city limit. The project provides affordable housing, parks, revenue-generating uses and trails. A fiscal analysis has been prepared that identifies available methods and recommendations for development to achieve revenue neutrality. The fiscal analysis indicates that the specific plan would not have an adverse fiscal impact on the Soledad General Fund. Further, the specific plan requires the development to create a community facilities district to fund construction of certain public facilities and infrastructure in addition to funding operations and maintenance of public infrastructure (i.e., streets, storm drains, and parks). The financing/funding source would be outside of the Soledad General Fund. The fiscal analysis recommends the preparation of a comprehensive financing plan by the project developer. The fiscal impact on the city will be reviewed as part of the City Council consideration of the project upon recommendation by the Planning Commission, having reviewed the merits of the project and its consistency with the general plan. Refer to specific plan policies LU-A, LU-B, and LU-C. The project is consistent this policy.
L-3	A specific plan shall be required for all annexations and development of properties designated *Expansion Area*. Specific plans shall be prepared in accordance with the standards provided in Appendix B.	The specific plan has been prepared to ensure compliance with policy and in accordance with the standards provided in Appendix B of the Soledad General Plan. Se also the discussion of consistency with general plan policy L-43. Subject to review by the Planning Commission and approval by the City Council, the project is consistent with this policy.
L-4	The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services.	Development of specific plan uses will occur as identified in Chapter 6.4 of the plan. The plan for services Section 2.5 anticipates several major phases for the purpose of implementing backbone infrastructure (e.g. storm water collection system, water system, wastewater collection, roadways, etc.) that serves the larger plan area. An example would be completing all backbone infrastructure south of the linear park and adjacent to the existing city limits as an initial phase of backbone infrastructure. According to the specific plan the project developers will design, finance, and construct backbone wastewater and storm water infrastructure in the first phase of development. Additionally, the developers will construct and finance the collector wastewater infrastructure in each neighborhood as

General Plan Policy		Consistency
		the development proceeds. Additional development level parameters are identified in Section 3.14 of the Addendum to the Miravale III Specific Plan EIR related to traffic facility improvements. Refer also to specific plan policies C-A, C-C, P-B, P-E, PSF-C, PSF_D, PSF-F, PSF-Y, and PSF-Z. Subject to approval by the City Council, the project is consistent with this policy.
L-5	New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development.	The specific plan policies call for the provision of public facilities, infrastructure, and services commensurate with new development so as to adequately meet the needs of all development and future residents in the Plan Area in a manner that is financially self-supporting. The project developers will design, finance, and construct backbone water, wastewater, and storm drain infrastructure in the first phase of development. Additionally, the developers will construct and finance infrastructure improvements in each neighborhood (plan sub-area) by phase as the development proceeds. The plan for services identifies the project's effect to existing levels of service and infrastructure improvements necessary to ensure adequate provision of services. The Addendum to the Miravale III Specific Plan EIR determined that with implementation of the identified mitigation measures adequate public services are available for the project with mitigation (see Addendum Section 3.13, Public Services and Section 3.15, Utilities). The specific plan and fiscal analysis require preparation of a comprehensive financing plan, phasing, and infrastructure improvement plans that ensure development does not outpace the provision of public services. The comprehensive financing plan will provide a mechanism for identifying the costs of capital improvements and ongoing maintenance and operations of public service provision to the site and will provide a site-specific development impact fee structure to ensure that the project is revenue neutral and that adequate services can be provided to the development. Refer also to specific plan policies C-C, P-B, PSF-D,PSF-G, PSF-W, PSF-Y, and PSF-AA. The project is consistent with this policy.
L-6	New development shall pay its fair share of providing additional public services needed to accommodate such development.	See discussion of consistency with general plan policy L-5, above. Development of the project is required to submit payment of its fair share of the costs of public services needed to accommodate project development, per the Soledad Municipal Code Chapter 14.06. The comprehensive financing plan will identify the costs of capital improvements and ongoing operations and maintenance costs that will be funded by formation of a community facilities district, the payment of fair share fees, up front construction of identified infrastructure improvements subject to potential reimbursement, and the payment of development impact fees. The applicant and/or developer(s) will provide an offer to dedicate the designated school sites. In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions. The project is consistent with this policy.

General Plan Policy		Consistency
L-7	Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L3, and as determined by the City.	The specific plan and plan for services require the provision of backbone infrastructure prior to approval of final map(s). All improvements shall be designed and constructed in conformance to the city's master plans and design standards. Approval of final map(s) and improvement plans shall be predicated upon evaluation and findings by the City Council that adequate public services and infrastructure, are available to serve additional housing and residents. Refer also to specific plan policies PS–B, PSF–D, PSF–H, and PSF–Y The project is consistent with this policy.
L-8	The City shall permit only low intensity land uses in areas where natural conditions such as floodplains and steep hillsides are likely to pose a threat to public safety or produce excessive maintenance costs.	As reported in the Addendum to the Miravale III Specific Plan EIR, the specific plan does not place higher intensity uses (residential, schools, commercial, etc.) in floodplains or steep hillsides, or in other areas likely to pose a threat to public safety or produce excessive maintenance costs. The specific plan designates hillsides above the 400 foot elevation contour as open space where only low intensity uses would be allowed through a use permit process. The project is consistent with this policy.
L-10	The City shall monitor development and adjust land use designations and new residential project approvals as needed to promote a reasonable balance between employment generating land uses and housing.	Development of the specific plan commercial uses and public services (e.g. schools, parks, public safety, etc.) and the increase in population resulting from new residential units creating demand, will result in the establishment of new jobs within the plan area and in the community of Soledad. The project is consistent with this policy.
L-11	The City shall encourage large residential development projects to be phased or timed with development that will provide primary wage earner jobs.	The specific plan proposes commercial and office job opportunities, as well as new schools, police and fire facility opportunities in phases that will provide sources of employment within the project area as residential build-out occurs. Refer also to specific plan policies PSF-W and PSF-AA. The project is consistent with this policy.
L-13	The City shall require that residential projects be designed to reflect and consider the relationship of the project to surrounding uses. Residential densities and lot patterns will be determined by these and other factors. As a result, the maximum density specified by the General Plan land use designations or zoning for a given parcel of land may not be realized.	The specific plan proposes approximately 2,392 units within the Plan Area. Density is a minimum of 10 units and maximum of 30 units per gross acre, consistent with the density designation of the land use concept map. The specific plan Chapter 2.0, Land Use, identifies zone districts and development standards that reflect awareness of surrounding land uses. Only low intensity uses are allowed above the 400 foot elevation contour, and San Vicente Road improvements provide a buffer to agricultural operations to the east. Residential land use densities are similar to existing uses within the city limit south of the project site. The specific plan Chapter 2.0, Land Use, includes development standards and architectural and site design standards to ensure compatibility between uses and neighborhoods. The project is consistent with this policy.
L-14	The maximum allowable residential density for new residential subdivisions or development projects shall be computed based on the gross area of the lot before dedications for highway setbacks, parks, streets, or other requirements.	The maximum residential density for the project is 23 units per acre. Dedications for parks, streets, etc. have been considered and are part of the project. The project is consistent with this provision.

General Plan Policy		Consistency
L-15	The City shall require new subdivided lots to be adequate in size and shape for the range of primary and accessory uses designated for the area.	The project provides lots of varying size and shape for the range of primary and accessory uses per new zoning designations as provided in the Specific Plan. The Specific Plan architectural guidelines and design standards promote the use of varied lot sizes to promote visual and product diversity. The project is consistent with this policy.
L-16	The pace of new residential development should be such that new residents can be absorbed into the fabric of the town and existing residents are not overwhelmed by newcomers. This can be accomplished in part by requiring phasing of larger residential projects and by ensuring that adequate infrastructure and public improvements are in place concurrently, or in advance of new development.	The project will be constructed in phases. Development of the Specific Plan uses will occur as identified in Chapter 6.4 of the plan. The plan for services Section 2.5 anticipates several major phases for the purpose of implementing backbone infrastructure (e.g. storm water collection system, water system, wastewater collection, roadways, etc.) that serves the larger plan area. Initial development is anticipated to occur adjacent to existing development within the existing city limit. The early phases of development will integrate roadways with Orchard Lane, West Street and San Vicente Road. The Addendum to the Miravale III Specific Plan EIR also identifies development triggers for the construction of traffic improvements that are necessary to accommodate project traffic and contributions to cumulative traffic conditions and incentivize higher commuter traffic volumes on San Vicente Road, rather than existing neighborhood streets. These triggers are reflected in the fiscal analysis prepared for the project and require monitoring of development and related traffic conditions to ensure that facilities operate at acceptable levels before additional development may proceed. Consequently, development is anticipated to proceed over many years, during which adequate infrastructure and improvements would be made concurrently or prior to traffic trigger development levels identified in the Addendum to the Miravale III EIR. The project is consistent with this policy.
L-17	Major new residential development is appropriate in the areas on the east and north sides of the developed portions of the City.	The specific plan area lies north of the developed portions of the City in a portion of the Mirassou Specific Plan Area identified for development in the general plan. The project is consistent with this policy.
L-19	In general, higher densities of residential development shall be located in areas served by the widest range of urban services, and shall be preferred along collector and arterial streets, within walking distance of schools, city parks and transit stops.	The Plan provides three higher density "Village Residential" neighborhoods that are within walking distance to commercial uses, open spaces, parks and schools. The project is consistent with this policy.
L-20	The approval of new residential subdivisions shall incorporate provisions to ensure that an appropriate amount of new multifamily development is constructed concurrently, or in advance of, new single family residences.	The development agreement will include provisions that multi-family development will be constructed concurrently, or in advance of, new single family residences. Subject to approval of the development agreement by the City Council prior to acceptance of final map(s), the project is consistent with this policy.

General Plan Policy		Consistency
L-21	New commercial development shall be encouraged in Soledad near the freeway interchanges with Highway 101. Limited new neighborhood commercial development will be allowed within areas designated *Expansion Area*, and/or at specified nodes to provide for the everyday needs of the surrounding residential neighborhoods.	The project includes an approximate nine-acre neighborhood/commercial site core area adjacent to the West Street roundabout. Commercial uses may also be integrated into the adjacent portions of the medium and high density housing site, and high density housing may be integrated into the commercial site. Allowed uses refer to Specific Plan Table 2-6 include neighborhood-serving retail uses such as grocery stores, sundries, hardware, coffee shops/bakeries, restaurants, pet supplies and gift shops, and professional services such as barber/beauty shops, dentists, attorneys, accountants, veterinarians, etc. The project is consistent with this policy.
L-23	In general, new retail commercial development should provide a wider range of shopping opportunities for the community.	The Village Commercial Center would contain a variety of shopping and professional services opportunities as identified in specific plan Table 2-6 for the community. The project is consistent with this policy.
L-24	New commercial development shall be designed to encourage safe and efficient pedestrian circulation within and between commercial sites and nearby residential neighborhoods.	Design guidelines for commercial development are included in the specific plan Chapter 2.0, Land Use. The design guidelines focus on pedestrian-oriented development with clearly defined pedestrian walkways between residential neighborhoods, adjacent parks and open space, schools, and commercial areas. Refer also to specific plan policy LU-D. The project is consistent with this policy.
L-25	New commercial development shall be designed to minimize the visibility of parking areas from public roadways.	Commercial buildings should be oriented toward the street. garages and parking lots should be de-emphasized and moved back from the street and/or out of direct view. The specific plan calls for shade trees and landscaping within parking lots. Village Commercial design guidelines call for screening treatments such as earth berms, low screen walls, landscaping, changes in elevation, or combinations of the above. Refer also to specific plan policy LU-D and LU-E. the project is consistent with this policy.
L-32	The City shall designate adequate, appropriately located land for the development of City and County facilities and offices, schools, medical facilities, water facilities, and public safety facilities.	The project will provide adequate public facilities, including parks, open space, schools and a police and fire station. Small-scale medical facilities such as dentists and clinics are uses allowed in the Village Commercial zone district (refer to the specific Plan Table 2-6). The project is consistent with this policy.
L-34	When considering plans for large scale development, the City shall designate adequate, appropriately located land for the development of quasi-public land uses, such as, hospitals, churches, private schools, cemeteries, and utility uses.	Although the project does not specifically include designated sites for quasi-public facilities, these uses could be conditionally allowed in the public facility zone district in conformance to Soledad Municipal Code Section 17.34.020, which conditionally allows quasi-public uses including churches, utilities structures hospitals and medical offices and facilities including rest homes and public and private schools, subject to first obtaining use permit approval. Subject approval by the City Council, the project is consistent with this policy.

General Plan Policy		Consistency
L-35	The City shall promote the clustering of public and quasi-public uses such as schools and parks, libraries, child care facilities, and community activity centers. Joint use of public facilities shall be promoted, and agreements for sharing costs and operational responsibilities among public service providers shall be encouraged.	The specific plan promotes joint recreational and storm water management uses in the 15.1-acre storm water retention basin. Potential joint use of school district facilities and the parks managed by the city would be guided by a joint use agreement between these entities. Policies have been incorporated into the Specific Plan to promote joint use of public facilities. Refer also to specific plan policies P-J and P-K. The project is consistent with this policy.
L-36	The City shall encourage efforts to locate adequate emergency services and other types of health care facilities in Soledad to meet the present and future needs of its residents.	The plan provides a site for a potential police substation and a fire station. Dental offices and other health care services are identified as allowable uses in adjacent commercial areas. Refer also to specific plan policy PSF-AA. The project is consistent with this policy.
L-37	Health care and dental care services, including residential care facilities and senior care services, shall be expanded to meet the needs of the City's population.	Residential care facilities and group homes are permitted uses in the Specific Plan Village Residential zone district. Dental offices and other health care services are identified as allowable uses in adjacent commercial areas. The project is consistent with this policy.
L-42	The City shall use *Community Design Guidelines* as a decision-making tool to ensure that new development incorporates the qualities and character desired by Soledad residents.	The specific plan includes design guidelines for all zone districts within the plan area. The guidelines are consistent with the concepts presented in the *Community Design Guidelines*. The project is consistent with this policy.
L-43	Specific plans prepared for major expansion areas shall incorporate the standards described in Appendix B – Standards for Specific Plans. In general: a. New residential projects should be designed to integrate with existing neighborhoods to ensure that they do not destroy the established character. Subdivisions in City expansion areas should be designed so that individual, separately developed projects work together to create true neighborhoods with a sense of identity, instead of disjointed or isolated enclaves. b. Subdivision design should emphasize pedestrian connectivity within each project, and to adjacent neighborhoods, and nearby schools and parks. All streets and walkways should be designed to provide safe and pleasant conditions for pedestrians. Streets within neighborhoods should be no wider than needed to accommodate parking and two low speed travel lanes. Sidewalks should be separated from curbs by parkway strips of at least four feet in width; and the parkways should be planted with canopy street trees. c. Specific plans should provide a range of residential housing types affordable to the widest range of income groups, consistent with the goals, policies and programs of the Housing Element of the General Plan.	a. The neighborhoods adjacent to existing development propose similar residential product types along the southern portion of the Plan Area and the extension of West Street and San Vicente Road to create neighborhoods that are integrated and linked with existing residential development. b. A network of pathways is integrated into the specific plan. Two major pathway spines cross the plan area. The linear park connects San Vicente Road northeastward to residential areas north of Orchard Lane, and a second spine pathway begins at the linear park and extends northward. These two spines serve all of the medium and high density residential areas, the commercial area, both schools, and park areas. Plan area sidewalks generally consist of five-foot wide sidewalk area separated from the adjacent street by a landscaped planting strip. c. A variety of housing types are planned including single family detached, attached duplex, townhouses and for rent apartments. The provision of affordable housing is consistent with the Housing Element of the City's General Plan. d. The project design includes public open space and parks, and pedestrian and bike facilities. The project will provide adequate public facilities to meet project demand.

General Plan Policy		Consistency
	d. Subdivisions should be designed to provide usable public open spaces in the form of parks, linear bicycle and pedestrian trails, squares, and greens, as appropriate.	The specific plan has been prepared in conformance to the standards identified in Appendix B of the general plan. The project is consistent with this policy.
L-44	The City shall require that all new development be designed to complement the scale and character of existing development. Views of the surrounding hills and mountains shall be preserved through such means as design review, sign control, undergrounding of utilities, grading and tree removal standards.	Development of the project, while physically transforming a previously undeveloped project site into a new development, would complement the existing residential character of Soledad. The project preserves views of the surrounding hills and mountains because it does not include development above the 400 foot elevation contour. Development will occur on lower elevations and is subject to conformance with the specific plan design guidelines, and city standards for new utilities, grading, and tree removal. Implementation of the mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR further reduce the project's impact to the aesthetic value and visual character of Soledad. The project is consistent with this policy.
L-45	The City shall require all new development to be planned and designed in a manner which employs design, construction and maintenance techniques that: a. Avoids locating structures along ridgelines and steep slopes. b. Incorporates design and screening measures to minimize the visibility of structures and graded areas. c. Maintains the character and visual quality of the area.	Development of the uses identified in the specific plan does not include development above the 400 foot elevation contour, therefore no grading of new roads or ridgeline development would occur in the portions of the site above the 400 foot elevation contour. As noted above, Development will occur on lower elevations and is subject to conformance with the specific plan design guidelines, and city standards for new utilities, grading, and tree removal. Implementation of the mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR further reduce the project's impact to the aesthetic value and visual character of Soledad. The project is consistent with this policy.
L-46	New development on hillsides shall employ design, construction and maintenance techniques that: a. Ensure that development near or on portions of hillsides do not cause or worsen natural hazards such as erosion, sedimentation, or fire hazards. b. Minimize risk to life and property from slope failure, landslides and flooding. c. Include erosion and sediment control measures including temporary vegetation sufficient to stabilize disturbed areas. d. Maintain the character and visual quality of the hillside.	The project does not include development above the 400 foot elevation contour. Mitigation measures to reduce geologic and other hazards associated with hillside development are identified in the Miravale III Specific Plan EIR Sections 4.1, 4.6, 4.8, and 4.14, The Addendum to the Miravale III Specific Plan EIR found that the project would not increase risks greater than the risks identified and mitigated in the Miravale III Specific Plan EIR. With implementation of the mitigation measures identified in these sections the project is consistent with this policy.
L-47	The City may, where appropriate, require new development to provide pedestrian amenities along public sidewalks, such as seating and 'pocket parks'.	The specific plan includes the provision of public amenities such as benches will be provided around commercial centers and parks. Residents of each neighborhood will have access to a park within or immediately adjacent to the neighborhood. The provision of neighborhood parks is included in the Specific Plan. These parks may be pocket parks, expanded neighborhood/park connector corridors, portions of larger parks, or portions of the linear parkway that include neighborhood park features. The focus of these parks will be on providing convenient playgrounds, sitting areas, and other gathering opportunities

General Plan Policy		Consistency
		for neighborhood residents. Refer also to specific plan policy LU-G. The project is consistent with this policy.
L-49	The form, scale and character of new residential development shall emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off street parking, landscaped front yards with trees, and sidewalks.	The specific plan provides design guidelines for residential development consistent with the intent of this policy. The specific plan requires that residential buildings provide an attractive architecture that emphasizes welcoming facades on all street- and public-facing elevations. The Specific Plan promotes a unified character within each neighborhood through architecture and landscaping. Local residential streets are required to provide street trees separated by planting strips. Single family units are also required to provide adequate off street parking and landscaped front yards. Refer also to specific plan policy LU-I. The project is consistent with this policy.
L-50	Multi-family development shall include usable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood.	The design guidelines for the Village Residential areas are consistent with the intent of this policy. According to the Specific Plan, a minimum of 48 square feet of private space shall be provided for each unit. Multi-family housing will be integrated with low density residential development in form, scale, and architectural character. Refer also to specific plan policy LU-I and Table 2-5. The project is consistent with this policy.
L-51	All exterior lighting in new development shall be located and designed so as to avoid shining directly onto nearby residential properties, and shall minimize offsite glare. Proponents of commercial or industrial projects on property adjacent to residential areas shall submit a lighting plan to the City for review and approval; said plan shall incorporate features such low level, downward directed exterior lights to achieve the intent of this policy.	The Miravale III Specific Plan EIR and Addendum to the Miravale III Specific Plan EIR include a mitigation measure that requires all buildings are designed so that exterior lighting is down-lit and illuminates the intended area only. Building applications for new structures would be required to include an exterior lighting plan subject to approval of the Soledad Planning Department. The project, as mitigated, is consistent with this policy. Refer also to specific plan policy LU-D.
L-52	Historically or architecturally significant buildings shall not be demolished or substantially changed in outward appearance in a way that diminishes the historical character, unless doing so is necessary to remove a threat to health and safety and other means to avoid the threat are infeasible.	The project site contains a historically significant structure referred to as the Lorentzen house. The Miravale III EIR and Addendum to the Miravale III EIR identified mitigation measures including relocation of the house, protective measures, and repair of any inadvertent damage to ensure that the historical character of the structure would not be diminished. The project, as mitigated, is consistent with this policy.
Housing		
H-1	The City of Soledad shall promote the expansion of its LAFCO Sphere of Influence and annexation of additional land consistent with its General Plan Land Use Element to accommodate long-term demand for residential development.	The project includes expansion of the City's LAFCO Sphere of Influence, reorganization/annexation of the site to accommodate long-term demand for residential development consistent with City's regional housing needs as identified by the Association of Monterey Bay Area Governments, and buildout goals for the Mirassou Specific Plan Area and other Expansion Areas identified in the general plan. .Consistent with the city's general plan, which identifies the plan area as part of the Mirassou Specific Plan Area, the specific plan includes numerous densities and types of residential units, including more than 33 percent medium and high density (up to about 23 units per acre) units, which will

General Plan Policy		Consistency
		provide for an efficient land use development pattern. The specific plan includes more units within its boundaries than were planned for the overall Mirassou Specific Plan Area, and includes elimination of the remaining Mirassou Specific Plan Area as a future urban development area. Refer also to specific plan policy LU-B. The specific plan is consistent with this policy
H-2	The City of Soledad shall ensure adequate vacant land suitably zoned for residential development and/or redevelopment is available to meet the city's housing need as identified by the Association of Monterey Bay Area Governments.	The project includes residentially zoned property that would be developed with a variety of residential uses. This will aid the city in reaching its regional housing needs as identified by the Association of Monterey Bay Area Governments. The project is consistent with this policy.
H-3	The City of Soledad shall require new residential areas to contain a mix of housing types targeted to very low, low, moderate, and above moderate households in approximately the proportion that each of these income categories represent in the AMBAG Fair Share Housing Allocation.	Approximately 800 affordable units, including 40 units within the 35.9-acre Residential Study Area (Sub-area 13) are provided for within the Plan Area. Specific Plan Policy LU – C requires affordable housing to include at least six percent of units for very low income households, six percent for low income households, and eight percent for moderate income households. At least 30 percent of medium density housing units should be available as rentals. The affordable housing units shall be constructed concurrently with the market rate housing units. The City Council shall review specific development project consistency with the city's affordable housing requirements per the housing element and inclusionary housing ordinance in its consideration of required development agreement and housing agreements. Subject to City Council approval of these agreements, the project is consistent with this policy..
H-6	The City shall require housing developers to offer an optional design to homebuyers whose household has one or more disabled person.	The Specific Plan Design Guidelines for the Village Residential designation includes a provision for design options to homebuyers with a physical disability. The project is consistent with this policy.
H-9	The City of Soledad shall ensure that city site improvement standards, development review procedures, and development fees do not unreasonably constrain the development, conservation, and rehabilitation of housing.	The project is responsible for it fair share of costs for capital improvements and ongoing city services. The City Council will consider the timing of development, payment of applicable impact fees, construction of required infrastructure or other capital improvements and potential reimbursement program, and ongoing operational and maintenance costs for city services while reviewing the comprehensive financing plan and development agreement prior to approval of the final map(s). The project is consistent with this policy.
H-10	The City of Soledad shall ensure the availability of adequate public facilities for the expected housing need of the city.	The plan for services outlines the service demands of the project and infrastructure improvements necessary to meet demand, consistent with the City's master plans for the provision of public services. The specific plan includes an implementation plan and provides two school sites and one public facility site for potential police substation and a fire station. The City Council will consider the Plan for Services, Fiscal Analysis, and specific plan implementation plan while reviewing the applicant's development agreement

General Plan Policy		Consistency
		prior to approval of final map(s). As noted elsewhere the Miravale III Specific Plan EIR and Addendum to the Miravale III Specific Plan EIR include mitigation measure that ensure that the project, as mitigated, would be adequately served by public facilities. Refer also to specific plan policy PSF-Y. The project is consistent with this policy.
H-11	The City of Soledad shall support and initiate, where feasible, public and private energy conservation programs which will reduce the energy needs of housing in Soledad and so increase housing affordability.	The Specific Plan contains design guidelines for residential and non-residential buildings to maximize energy conservation through site and building design that considers prevailing winds, shade trees, window and door orientation, and the positioning of buildings. Additionally, Mitigation Measure 4.3-3 requires the preparation of a greenhouse gas emissions reduction plan prior to _construction that outlines emissions reducing measures that will be incorporated into all development on the site. The emissions reduction plan will likely include energy conserving measures. Refer also to specific plan policies LU-F, PSF-T and PSF-U. The project is consistent with this policy.
Circulation Element		
C-1	Level of Service "D" or better shall generally be maintained on all streets and intersections. Lower levels of service may be accepted during peak times or as a temporary condition, if improvements to address the problem are programmed to be developed. To identify potential impacts of new development on traffic service levels, the City shall require the preparation of traffic impact analyses generally at the sole expense of the developer for developments determined to be large enough to have potentially significant traffic impacts.	A traffic impact analysis was prepared for the project. The traffic analysis found that traffic generated by the project would cause levels of service to decline at a number of intersections and roadways (refer to the Addendum to the Miravale III Specific Plan EIR), and that mitigation is required to maintain or create acceptable levels of service on affected intersections. Mitigation Measures 4.13-2 – 4.13-14 are identified in the Addendum that require specific facility improvements or the payment of fees to address the project's direct impacts to facilities or contribution to cumulative impacts to facilities based on development level triggers for the provision of improvements. The project, as mitigated, is consistent with this policy.
C-2	Streets shall be dedicated, widened, extended and constructed in accordance with City standards. Dedication and improvements of full rights-of-way shall not be required in existing developed areas where the City determines such improvements are infeasible or undesirable. New development shall be responsible for improving a minimum one-half Street along the outer-boundaries of each subdivision along subdivision property where street extensions are identified. Other deviations from these standards shall be permitted upon a determination by the City Engineer that safe and adequate public access and circulation are preserved by such deviations.	All streets within the plan area will be public and dedicated to the City of Soledad, and will be constructed with curbs, gutters, landscape parkways, and sidewalks meeting City of Soledad Standard Plan specifications. Refer also to specific plan policy C-F. The project is consistent with this policy.
C-3	The City shall require that roadway rights-of-way be wide enough to accommodate the travel lanes needed to carry long-range forecasted traffic volumes, as well as any planned bikeways and required drainage, utilities, landscaping, and suitable separations.	The specific plan requires all streets and facility improvements to be constructed to City standards, including standards for right-of-way widths for each roadway category, subject to the review and approval of the Director of Public Works. Refer also to specific plan policy C-F. The project is consistent with this policy.

General Plan Policy		Consistency
C-4	On arterial roadways, intersection spacing shall be maximized. New driveways along collector and arterial roadways shall be minimized or prohibited completely.	The specific plan requires all streets and facility improvements to be constructed to City standards, including intersection spacing along collector and arterial roadways subject to the review and approval of the Director of Public Works. Refer also to specific plan policy C-F. The project is consistent with this policy.
C-5	The street system in residential neighborhoods shall provide safe and logical connections to the existing street pattern, and connectivity to the range of complementary land uses within neighborhoods (housing, schools, parks, neighborhood shopping, etc.). The use of multiple collector streets shall be favored over the use of arterials in new residential subdivisions.	Connections to the existing street pattern have been provided via the extension of Orchard Lane, West Street and San Vicente Road. New circulation alignments within the Plan Area have been designed to effectively connect residential neighborhoods to commercial and recreational areas. Sidewalks adjacent to commercial centers and schools will be wider to accommodate higher levels of pedestrian traffic. The specific plan requires all streets and facility improvements to be constructed to City standards, including the use of collector and arterial roadways subject to the review and approval of the Director of Public Works. Refer also to specific plan policy C-B. The project is consistent with this policy.
C-6	The City shall not approve new commercial or industrial development that encourages customers, employees or deliveries to use residential streets. The circulation system shall be designed so that nonresidential traffic (especially truck traffic) is confined to nonresidential areas.	Commercial development is anticipated to be constructed in the later phases of the project after improvements to San Vicente Road are made. Mitigation measures 4.13-2 - 4.13-14 include construction of required facility improvements or the payment of the project's fair share of traffic impact fees. Several of the mitigation measures are based on development level triggers beyond which no further traffic-generating development could proceed unless improvements are made. The project, as mitigated, is consistent with this policy.
C-8	The City shall manage the street network so that the standards presented in policies C1 and C12 are not exceeded. The City will require new development to mitigate the traffic impacts it causes, or the City will limit development along streets where congestion levels are unacceptable.	Mitigation measures 4.13-2 - 4.13-14 include construction of required facility improvements or the payment of the project's fair share of traffic impact fees. Several of the mitigation measures are based on development level triggers beyond which no further traffic-generating development could proceed unless improvements are made. The project, as mitigated, is consistent with this policy.
C-9	New local streets shall be developed consistent with the goals, policies and programs of the Land Use Element of the General Plan.	Local streets within the Miramonte Plan Area have been designed per City standards. The project is consistent with this policy.
C-10	Facilities that promote the use of alternate modes of transportation, including bicycle lanes, pedestrian and hiking trails, park-and-ride lots and facilities for public transit shall be incorporated into new development, and shall be encouraged in existing development.	The Specific Plan will provide the necessary circulation system and infrastructure to create a safe and efficient circulation network for motor vehicles, pedestrians, physically disabled persons, and alternative forms of transportation with an emphasis on creating a pedestrian friendly, walkable community. Trail, sidewalks, and bicycle lanes will be provided to promote alternative modes of transportation. Six Transit stops are also planned. Refer also to specific plan policy C-1, C-J through C-P. The project is consistent with this policy.
C-13	The City shall ensure through a combination of traffic impact fees and other funding mechanisms that new development pays its fair share of the costs of circulation improvements required by such development.	All street improvements will be financed and installed by the developer. The developer may be credited by the city's Traffic Impact Fee program. Mitigation measures 4.13-2–4.13-14 require either the construction of improvements or the payment of applicable traffic impact fees to mitigate project impacts to various traffic facilities to ensure that the

General Plan Policy		Consistency
		development pays its fair share of the costs of circulation improvements necessary to accommodate the project. The project, as mitigated, is consistent with this policy. Refer also to specific plan policy C-E.
C-14	The City shall prohibit the development of private streets in new residential projects, unless approved on a project specific basis where circumstances support such a use and the streets are privately maintained.	All streets in the plan area will be public. All private streets, if proposed and approved, and driveways within the plan area, such as within commercial and medium density areas, shall be maintained and paid for by the property owners for those developed areas. Refer also to specific plan policies C-F and C-I. The project is consistent with this policy.
C-15	New development shall continue the existing street pattern, where logical.	The project continues the existing street pattern with the planned extensions of Orchard Lane and West Street into the project site. Improvements to San Vicente Road and the construction of the Gabilan Drive extension to Moranda Road U.S. Highway 101 interchange will be required to reduce the project's impacts to local streets, including Front Street. Mitigation measures based on development level triggers require the project to contribute fair share costs or construct the San Vicente realignment and Gabilan Drive extension to the Moranda Road U.S. Highway 101 interchange. Development beyond the applicable triggers would not be allowed to proceed beyond the levels outlined in the mitigation measures unless the San Vicente Road is realigned and the Gabilan Drive Extension is constructed. The project is consistent with this policy.
C-16	Roundabouts will be considered as an alternative to traditional intersection controls.	Two roundabouts will accommodate collector street traffic flow without the need for signal lights or stop signs. The project is consistent with this policy.
C-17	The City shall require the provision of adequate off-street parking in conjunction with all new development. Parking shall be located convenient to new development and shall be easily accessible from the street. The adequacy and appropriateness of parking requirements in the Zoning Ordinance shall be periodically evaluated.	The specific plan includes off-street parking requirements for each land use consistent with Soledad Municipal Code Section 17.36.020, Off-street parking. Refer also to specific plan policy LU-E. The project is consistent with this policy.
C-21	Bicycle routes shall emphasize paths separate from vehicle traffic to the maximum extent feasible, but shall also include bicycle lanes within public streets.	The specific plan includes a network of pedestrian and bicycle pathways with two major pathway spines crossing the plan area (refer to the specific plan Figure 3-3). . Numerous short connecting pathways provide connections between the low density residential neighborhoods and these two spines or to schools. The linear parkway includes a Class 1 bicycle/ pedestrian trail as its main feature. The West Street roundabout will also accommodate a Class I pathway along the eastern edge to connect the north-south pathway spine to residential areas. Additionally, Class II bicycle lanes are provided on all collector streets within the plan area. Bicycle lanes will be a minimum five feet wide and will be separated from the vehicle travel lane by a painted stripe, generally solid, but dashed approaching intersections. The project is consistent with this policy.

General Plan Policy		Consistency
C-22	Bike lanes and paths shall be designed and maintained to improve bicycling safety, and convenience, and encourage people to use bicycles to commute to work or school.	Cross sections of public streets are included in the specific plan that shows the separation of pedestrian sidewalks from roadways and dimensions of bicycle facilities. All streets will be designed and constructed to city standards. The linear park pathway connects from San Vicente Road northeastward to the residential areas north of Orchard Lane, and a second spine pathway begins at the linear park and extends northward.. These two spines serve all of the medium and high density residential areas, the commercial area, both schools, and park areas. Numerous short connecting pathways provide connections between the low density residential neighborhoods and these two spines or to schools or adjacent streets. Additionally, Class III bicycle lanes will be provided on all collector streets in the plan area. Refer also to specific plan policy C-M. The project is consistent with this policy.
C-25	New development shall provide bike lanes and paths, secure bicycle storage and parking facilities.	The project includes Class I and II bike lanes within the project area. The specific plan includes policies that require future development within the commercial and village residential areas to provide additional bike facilities, including storage racks, consistent with this policy. Refer also to specific plan policy C-N.
C-27	The City shall complete a continuous network of sidewalks and separated pedestrian paths connecting housing areas with major activity centers and with trails leading into City and county open space areas.	The specific plan includes a network of pedestrian and bicycle pathways with two major pathway spines crossing the plan area. Cross sections of public streets are included in the specific plan that shows the separation of pedestrian sidewalks from roadways and dimensions of bicycle facilities. All streets will be designed and constructed to city standards. Internal circulation infrastructure plans are required prior to approval of the final map(s) and are subject to the review and approval by the Director of Public Works. Subject to review and approval by the Director of Public Works the project is consistent with this policy. Refer also to specific plan policy P-E.
C-28	New commercial development and development in Specific Plan areas shall provide sidewalks and pedestrian paths consistent with applicable State, federal and local plans, programs and standards.	Figure 3-3 of the specific plan illustrates the location of pedestrian amenities such as sidewalks and pedestrian paths. The Village Commercial Design Guidelines (refer to specific plan Chapter 2, Land Use), includes standards for the provision of pedestrian sidewalks and paths. All pedestrian infrastructure will be designed and constructed to city standards, which reflect state and federal programs and standards. Internal circulation infrastructure plans are required prior to approval of the final map(s) and are subject to the review and approval by the Director of Public Works. Subject to review and approval by the Director of Public Works, the project is consistent with this policy. Refer also to specific plan policy C-F.
C-29	Pedestrian crossings at heavily traveled intersections shall be made as safe as possible, utilizing neck-downs/bulb-outs where feasible. Crossing controls shall be installed when traffic levels warrant.	The specific plan circulation plan includes mid-block bulb-outs at the intersection between the two school sites, the intersection near the senior housing, and at the four major pathway/street crossings, as well as the point where the trail system transitions onto West Street. The project is consistent with this policy.

General Plan Policy		Consistency
Parks and Recreation		
PR-1	The City will acquire future park and recreation land and facilities by: a. Requiring park dedications from future residential subdivisions at the rate of three acres per 1,000 population anticipated in the project; b. Requiring payment of a park impact fee, or requiring the dedication of land and improvements in-lieu of fees, from all new development; c. Cooperating with Monterey County to acquire land for a new regional park in the Soledad planning area; d. Acquiring parkland near existing or potential public park or recreation sites, or near quasi-public or private sites that have a good opportunity for a joint use agreement. Acquired parkland should be contiguous to proposed or existing park and recreation facilities or provide a logical connection. e. Pursuing joint use agreements with public and private schools, other public government agencies, private park and recreation providers, and institutions with potential parkland to make existing or proposed park and recreation facilities available to the community on an extended basis.	Specific plan polices and the plan for services require each phase of development to provide enough parkland to meet the needs of project residents in that phase or neighborhood. The project, consistent with the requirements of this policy, provides public park and recreational opportunities as follows: a. The specific plan provides approximately 56 acres of parkland and approximately 140 acres of open space. The parkland is provided at a ratio that is greater than five acres per 1,000 new residents. b. The project developer(s) will be required to pay park impact fees, in addition to the dedication of land. c. Not applicable. d. Parks and recreational facilities are located throughout the proposed development and several facilities are planned adjacent to educational facilities. e. A joint use agreement may be established between the City and the School District for shared use of school recreational facilities. Refer also to specific plan policies P-B and P-C. The project is consistent with this policy.
PR-2	The City will pursue the development of parks, open space and trails in areas subject to natural or human caused hazards such as natural or developed flood channels, hillsides and sensitive resource areas.	Approximately 140.4 acres of open space have been provided within the plan area, representing approximately one-quarter of the plan area. Open space lands encompass the natural hillsides above the 400-foot elevation contour. The Hillside Open Space area is intended to be preserved in perpetuity under a conservation easement, with maintenance funded through a community facilities district. Additionally, a 15.1 acre recreation area is located at the lowest elevation within the plan area, and will collect storm water run-off during periods of rain. Refer also to specific plan policy P-J. The project is consistent with this policy.
PR-10	The City should provide a pedestrian network within the City Limits. The system should: a. Accommodate pedestrians and bicycles. b. Connect residential neighborhoods with: 1) Soledad's downtown, 2) schools, 3) City park and recreation facilities, and 4) regional trails.	The specific plan includes a network of pedestrian and bicycle pathways with two major pathway spines crossing the plan area. One runs through the Linear Park. The other runs along the edges of the two schools, through the Village Park, and between the commercial and multifamily area. These trails and sidewalks will provide connectivity to other residential neighborhoods within the City via extensions of West Street and Orchard Lane, proposed improvements to San Vicente Road, in addition to implementation of intersection improvements required by mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR. Refer also to specific plan policy P-E. The project is consistent with this policy.

General Plan Policy		Consistency
PR-15	Parks shall include adequate support facilities such as parking and restrooms.	The specific plan calls for the provision of restroom facilities, picnic areas, play fields, and parking in all parks. The proposed Village Park site uses could include turf areas for recreation, tennis or basketball courts, picnic and sitting areas, a dog park, a community garden, a water play area, a playground, or a community center, in addition to restrooms and parking. Refer also to specific plan policy P-F. The project is consistent with this policy.
PR-16	Parks shall be designed to be compatible with the neighborhoods in which they are located, and shall provide security and privacy to adjoining properties. Where necessary, buffers shall be provided between park and recreation lands and adjacent development to provide privacy and a physical separation between uses. Buffers may include setbacks, landscaping, fencing, and/or dramatic breaks or changes in topography.	The parks will be designed to minimize noise and activity conflicts with residential areas. The specific plan promotes the use of a 100-foot-wide low growing and low fuel vegetated buffer between residential lots and the larger hillside open space area. These parks will be lit to ensure security. All park improvement plans are subject to the review and approval by the City of Soledad Planning Director and Director of Public Works. Refer also to specific plan policies P-G and P-M. The project is consistent with this policy.
PR-24	New development shall be required to add to proposed or existing park and recreation projects where legally feasible. Public or private development shall provide, as appropriate and legally feasible: 1) a buffer between proposed development and existing park, recreation and/or open space parcels to minimize conflicts between development and existing facilities; and 2) gates, fences, or other deterrents when such facilities are deemed necessary to discourage prohibited or non-compatible uses from entering park, recreation or open space lands.	Where new parks are proposed fencing will be provided as a component of the residential development. The Specific Plan promotes the use of a 100 foot wide low growing and low fuel vegetated buffer between residential lots and the larger hillside open space area. All park improvement plans are subject to the review and approval by the City of Soledad Planning Director and Director of Public Works. Refer also to specific plan policy P-M. The project is consistent with this policy.
PR-25	New development shall not adversely impact adjacent park, recreation or open space lands.	The specific plan includes residential and commercial design guidelines and policies to guide development of public parks with the Plan Area, and ensure compatibility between specific plan land uses. There are no parks or designated open space or recreation lands adjacent to the Plan Area. Refer also to specific plan policy P-M. The project is consistent with this policy.
PR-33	New development shall be required where legally feasible to provide its fair share of public park and recreation opportunities. New development within the City shall be required to provide park and recreation lands or facilities consistent with this Element. Conditions placed on new development shall be reasonable and consistent with the nature and extent of such development plans. The City shall require the dedication and improvement of park land even in circumstances where the total cost to improve such parkland exceeds the value of the corresponding development impact fee.	The project includes dedication of approximately 56 acres of public parkland and will provide approximately 140.4 acres of public open space consistent with the general plan requirements for the provision of parkland. The fiscal analysis prepared for the project recommends preparation of a comprehensive financing plan that will identify project-specific development impact fees, including the project's required share of parkland dedications and/or fees. City Council approval of the comprehensive financing plan is required prior to approval of final map(s). The project is consistent with this policy,

General Plan Policy		Consistency
Public Services and Facilities		
S-1	The City shall ensure through the development review process that adequate public facilities and services are available to serve new development. New development shall not be allowed until adequate public services and facilities to serve such development are provided. Where existing facilities are inadequate, new development may only be approved when the following conditions are met: a. The developer and/or City can demonstrate that all necessary public facilities will be adequately financed and installed in time (through fees or other means); and b. The facilities improvements are consistent with applicable facility plans approved by the City or other agencies in which the City is a participant.	According to the plan for services the project would construct all required utility and roadway infrastructure improvements will be designed and constructed in conformance to the city's design criteria and performance standards. The Addendum to the Miravale III Specific Plan EIR found that adequate public services will be available as the project proceeds, with implementation of the mitigation measures identified in the Addendum Section 3.0 and 4.0 related to the provision of public services This is a required condition of project approval. Subject to City Council approval of the comprehensive financing plan and development agreement prior to approval of final map(s) necessary facilities improvements will be adequately financed and installed in time to serve the needs of the project. The project is consistent with this policy,
S-2	The City shall plan for the expansion of needed water and sewer infrastructure including, but not limited to, the expansion of water production, storage and distribution facilities, the expansion of wastewater collection and treatment capacity, and storm drainage facility expansion.	As shown in the plan for services, the water supply assessment and the Addendum to the Miravale III Specific Plan EIR, adequate public services are available to meet project demands with implementation of mitigation measures. Final infrastructure improvement plans are subject to the review and approval of the Director of Public Works prior to the recordation of the final map to insure that infrastructure design and construction conforms to the city's applicable design criteria and performance standards. The project is consistent with this policy.
S-3	Public facilities, such as wells, pumps, tanks, and yards shall be located and designed so that noise, light, odors, and appearances do not adversely affect nearby land uses.	Final infrastructure improvement plans, including the locations of any proposed wells, tanks, and/or yards are subject to the review and approval of the Planning Director and Director of Public Works prior to the recordation of the final map to insure that infrastructure design and construction conforms to the city's applicable design criteria and performance standards, and are compatible with adjacent land uses. Subject to City staff review and approval the project is consistent with this policy.
S-4	Where new development requires the construction of new public facilities, the new development shall pay its fair share of the construction. Where necessary, the City shall require the dedication of land within newly developing areas for public facilities.	The project is subject to participation in the city's development impact fee program, as modified by the comprehensive financing plan. The project also includes land dedications for fire and police facilities development, schools and parks, and includes the provision of public facilities for storm water, water supply and distribution, wastewater collection systems, and park improvements. As discussed in the Addendum to the Miravale III Specific Plan EIR Section 3.14, the project is also responsible for the payment of fair share costs of regional and local traffic facility improvements necessary to accommodate project traffic and for the construction of several intersection modifications. The project is consistent with this policy.

General Plan Policy		Consistency
S-5	The City shall require that new development pay its fair share of the cost of all existing facilities it uses based on the demand for these facilities attributable to the new development; exceptions may be made when new development provides alternative sources of funding or equipment to offset any shortfall in revenues.	Development of the project is responsible for the payment of development impact fees in effect at the time of building permit issuance. The project is consistent with this policy.
S-8	The City shall promote the efficient use of water and reduced water demand by: a. Requiring water-conserving design and equipment in new construction; b. Encouraging water-conserving landscaping and other conservation measures; c. Encouraging the retrofitting of existing fixtures with water-conserving fixtures;	The specific plan includes policies that require development to implement water conservation measures. The Addendum to the Miravale III Specific Plan EIR found that implementation of Mitigation Measure 4.3-3 requires the preparation of a greenhouse gas emissions reduction plan prior to _construction that outlines emissions reducing measures that will be incorporated into all development on the site. The emissions reduction plan will likely include additional water-conserving measures. Refer also to specific plan policy PSF-A and PSF-E. The project is consistent with this policy.
S-10	The City will manage the increase in water demand from new development to help insure groundwater resources are not over drafted. The City will work with Monterey County and public and private water entities to plan for the efficient, long term management of groundwater resources.	According to the City of Soledad Water Supply Assessment for specific plan, the city's available groundwater and recycled water supplies can accommodate the increase in demand generated by development within the plan area. Refer also to specific plan policy PSF-D. The project is consistent with this policy.
S-11	Gravity flow for sewer and water service shall be employed wherever feasible.	Gravity flow for sewer and water services will be employed where feasible. Final design of project infrastructure will be required prior to the recordation of the final map and will be subject to the review and approval of the Director of Public works. The project is consistent with this policy.
S-12	The City shall encourage the use of natural drainage systems where feasible to preserve and enhance natural features.	The proposed linear park follows a natural drainage and would serve as a drainage bio-swale leading to the retention basin, and will help percolate water back to the groundwater basin and filter pollutants. The project is consistent with this policy.
S-14	The City shall strive to improve the quality of urban storm water runoff and quality of groundwater recharge through the use of appropriate mitigation measures including, but not limited to, infiltration/sedimentation basins, oil/grit separators, and other management practices, including storm water retention.	Successful implementation of mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.9. Hydrology and Water Quality, will ensure that all storm water facilities and storm drain improvements are designed and constructed to meet City of Soledad and Central Coast Regional Water Quality control Board design criteria and performance standards for storm water retention and treatment, and other management practices. The project is consistent with this policy.
S-15	The City shall require new development to adequately mitigate increases in stormwater peak flows and/or volume. Mitigation measures shall take into consideration impacts on the adjoining properties and impacts on groundwater recharge related to existing and proposed water wells.	Successful implementation of mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.9 Hydrology and Water Quality, ensure that all storm water facilities and storm drain improvements are designed and constructed to meet City of Soledad and Central Coast Regional Water Quality control Board design criteria

General Plan Policy		Consistency
		and performance standards for peak flow and volume. The project is consistent with this policy.
S-16	The City shall encourage project designs that minimize drainage concentrations and impervious coverage and maintain, to the extent feasible, natural site drainage conditions. Drainage onto adjacent properties shall be restricted to pre-project levels minus any runoff from the area to be developed.	Successful implementation of mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.9 Hydrology and Water Quality, ensure that all storm water facilities and storm drain improvements are designed and constructed to meet City of Soledad and Central Coast Regional Water Quality control Board design criteria and performance standards for peak flow and volume. The project is consistent with this policy..
S-17	The City shall require projects to allocate land as necessary for the purpose of retaining flows and/or for the incorporation of mitigation measures for water quality and supply impacts related to urban runoff.	The project includes a 12.7-acre retention basing near the southwest corner of the project site. Successful implementation of mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.9 Hydrology and Water Quality, ensure that all storm water facilities and storm drain improvements are designed and constructed to meet City of Soledad and Central Coast Regional Water Quality control Board design criteria and performance standards for peak flow and volume. The project is consistent with this policy.
S-18	The City shall coordinate mitigation measures with responsible agencies (including California Regional Water Quality Control Board, Monterey County Environmental Health Department, and Monterey County Water Resources Department) for the control of storm drains, the monitoring of discharges and the implementation of measures to control pollutant loads in urban storm water runoff.	The specific plan includes requirements for the provision of storm water collection and conveyance and includes policy standards for design and performance of the storm drain and storm water facilities system, and for implementation of pre- and post-construction best management practices and low impact design to capture and retain flows on the site consistent with the requirements of the Central Coast Regional Water Quality Control Board. Successful implementation of mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.9 Hydrology and Water Quality, ensure that all storm water facilities and storm drain improvements are designed and constructed to meet City of Soledad and Central Coast Regional Water Quality Control Board design criteria and performance standards for peak flow and volume. The project is consistent with this policy. The project is consistent with this policy.
S-19	Engineered drainage plans shall be required for all development projects. Engineered drainage plans shall incorporate a collection and treatment system for stormwater runoff consistent with applicable federal and State laws.	As a standard condition of approval the project applicant will be required to submit an engineered drainage plan consistent with the City's adopted Storm-water Drainage Master Plan, and requirements of the Central Coast Regional Water Quality Control Board. The project is consistent with this policy.
S-20	The City will work cooperatively with the Soledad Unified School District to monitor housing, population and school enrollment trends and in planning for future school facility needs. The City shall assist the District in locating new school sites.	The specific plan requires that new elementary school facilities, or improvements to existing schools are in place as needed to serve each phase of development prior to occupancy. Prior to approval of the first final map, an agreement must be established between developer and/or successors in interest and the Soledad Unified School District that establishes the timing of school construction or improvements and financing obligations. The applicant and/or developer(s) will provide an offer to dedicate the

General Plan Policy		Consistency
		designated school sites to the Soledad Unified School District within 60 days of city approval and recordation of the first final map. The specific plan requires that new school facilities are located and designed in accordance with Soledad Unified School District and/or State Department of Education sitting and design criteria. Refer also to specific plan policies PSF-W and PSF-X. The project is consistent with this policy.
S-21	The siting of new schools shall be coordinated with the City's Circulation Element to ensure that traffic conflicts are avoided, the safety of students is addressed and roadway function is not reduced, including provisions for off street student drop-off/ pick up.	The two schools have been located along collector and local streets in order to provide safe student drop-off/pick up locations. All new school facilities provided in conjunction with the project would be required to adhere to this policy consistent with the general plan. Additionally, as noted in the discussion of consistency with general plan circulation element policies, all roadway infrastructure improvements will be designed and constructed in compliance with the City of Soledad design criteria and performance standards for new local, collector and arterial streets. All street and traffic facility improvement plans are subject to review and approval by the director of Public Works prior construction. Refer also to specific plan policy PSF-X. The project is consistent with this policy.
S-22	The City will work closely with the school district to secure adequate funding for new school facilities, and where legally feasible, shall provide a mechanism which requires development projects to mitigate the cost of providing school facilities needed to serve such development, consistent with relevant provisions of State law.	As identified in specific plan Section 5.3 Public Services, the project applicant/developer will be required to submit payment of a school impact fee for each type of development within the project area. Refer also to specific plan policy PSF-W. The project is consistent with this policy.
S-23	The City, to the extent feasible, shall ensure that new school facilities are constructed and operating prior to the occupation of residences which the schools are intended to serve.	The specific plan requires that the new elementary school facilities, or improvements to existing schools are in place as needed to serve each phase of development prior to occupancy. Prior to approval of the first final map, an agreement must be established between Developer and/or successors in interest and the Soledad Unified School District that establishes the timing of new school construction or improvements to existing schools and accompanying financing obligations. The project is consistent with this policy.
S-27	The City shall require that all new development complies with applicable provisions of the Monterey County Integrated Waste Management Plan.	Solid waste collection services will be provided by the Salinas Valley Solid Waste Authority. The specific plan promotes recycling of consumer and business waste to reduce landfill requirements and lengthen the service life of existing landfills. The specific plan requires development within the Plan Area to comply with Monterey County Integrated Waste Management Plan provisions. Refer also to specific plan policy PSF-V. The project is consistent with this policy.

General Plan Policy		Consistency
S-28	The City, to the extent feasible, will enforce the applicable provisions of the Monterey County Hazardous Waste Management Plan and all other applicable State, federal and local regulations dealing with the use, storage, disposal and transportation of hazardous materials.	The development must comply with the provisions of the Monterey County Hazardous Waste Management Plan and other applicable State, federal, and local regulations for any use, storage, disposal, and transportation of hazardous materials, in addition to implementing the necessary mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.8, Hazards and Hazardous Materials. The project is consistent with this policy.
S-29	The City shall strive to achieve and maintain a ratio of a minimum of 1 police officer per 1,000 residents.	The plan for services Chapter 8.0, states that the project population will require 10 officers to meet this policy; however, the city's Facilities Master Plan notes that additional facilities would be needed for additional employees and police operations. In addition to providing a site within the Plan Area for potential use as police substation and/or a fire station, police and fire services will be constructed and maintained with funding from a public safety benefit assessment district, community facilities district or similar funding mechanism identified in the comprehensive financing plan. City Council approval of the plan is required prior to approval of the first final map(s). . Additionally, all development impact fees applicable at the time of issuance of a building permit are required, but may be offset by capital improvements designed, funded, and constructed by the developer(s). Refer also to specific plan policy PSF-AA. The project is consistent with this policy.
S-30	The City shall strive to achieve and maintain emergency response time to a maximum of 5 minutes for police emergencies.	The Plan Area will include a new, centrally located substation to help serve and reduce response time to those future residents. This substation will be located approximately 1.6 miles north of the current city police station in downtown Soledad. The plan for services states that with implementation of the substation, response times would be reduced. Refer also to specific plan policy PSF-AA. The project is consistent with this policy.
S-32	The City shall require new development to pay its fair share of providing or funding facilities that, at a minimum, achieve and maintain the above police protection standards.	The developer(s) of the plan area will be required to participate in a financing district to provide funds to build, operate, and maintain a police sub-station on the dedicated site within the plan area. Additionally, all development impact fees applicable at the time of issuance of a building permit are required, but may be offset by capital improvements designed, funded, and constructed by the developer(s). As identified in specific plan Section 5.3 Public Services, the project applicant/developer will be required to submit payment of all applicable fees in order to maintain the police protection standards enumerated above. The project is consistent with this policy.
S-33	The City shall consider public safety issues in all aspects of commercial and residential project design, including crime prevention through design.	The Specific Plan promotes site planning which helps reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department. Refer also to specific plan policies PSF-BB, PSF-DD, PSF-DD, and PSF-GG. The project is consistent with this policy.

General Plan Policy		Consistency
S-36	The City shall strive to achieve and maintain an emergency response time of 5 minutes or less for fire emergencies over 90% of the City.	The project contains measures to provide adequate public facilities to ensure that emergency response time are within the established target range. The project includes a site for construction of both a police and fire substation within the project area to accommodate fire prevention/protection and emergency services demand from project build-out. The specific plan includes policies for design considerations that meet fire department design criteria and performance standards for access and fire flow water supplies. Refer also to specific plan policies PSF–EE and PSF–FF. The project is consistent with this policy.
S-37	The City shall require new development to pay its fair share of providing or funding facilities that, at a minimum, achieve and maintain the fire protection standards identified in Policies S35 and S36.	The developer(s) of the plan area will be required to participate in a financing district to provide funds to build, operate, and maintain a new fire station facility within the Plan Area. Additionally, all development impact fees applicable at the time of issuance of a building permit are required, but may be offset by capital improvements designed, funded, and constructed by the developer(s). As identified in specific plan Section 5.3 Public Services, the project applicant/developer will be required to submit payment of all applicable fees in order to maintain the response time standards enumerated above. The project is consistent with this policy.
S-38	The City shall ensure that all proposed developments are reviewed for compliance with fire safety standards per the Uniform Fire Code and other City standards and ordinances.	All improvement plans will be reviewed for compliance with fire safety standards per the Uniform Fire Code and city standards. The project is consistent with this policy.
S-39	New non-residential development and non-residential additions of over 100 square feet of habitable space shall provide fire sprinklers in accordance with City standards, and as determined by the Fire Marshal. New residential development shall be provided with fire sprinklers unless the developer provides studies that prove the standard identified in Policy S35 is not negatively affected.	Development of the project site is subject to compliance with the most recent version of the Uniform Fire Code and city standards for fire sprinkler systems at the time of improvement plan submittal. The project is consistent with this policy.
S-40	The City will support efforts to expand library services within Soledad.	County library services will be provided at or near the two designated school sites and/or the commercial site within the plan area. Another potential location is to place a library within the Village Park, where it could also serve as a community center. The project is consistent with this policy.
Conservation and Open Space		
C/OS-1	The City shall discourage “leapfrog” development and development in peninsulas extending into agricultural lands to avoid adverse effects on agricultural operations.	The city’s general plan EIR found that development associated with general plan buildout would result in significant impacts to agricultural resources resulting from the conversion of land within the general plan Expansion Areas. The project site is contiguous with the north and west City of Soledad city limit. The project site does not include parcels subject to Williamson Act agricultural conservation easements. Although the project would result in

General Plan Policy		Consistency
		significant impacts to agricultural resources resulting from the loss of prime farmland on the site and the eventual right-of-way acquisition for improvements to San Vicente Road. The Addendum to Miravale III Specific Plan EIR includes mitigation that would reduce the project's impacts, but not to a less-than-significant level. However, the project would not result in impacts greater than those identified and addressed in the general plan EIR. The project is consistent with this policy.
C/OS-2	The City shall retain the agricultural land use designation on lands within its planning area until the land is needed for urban development.	The project site is currently located within the County of Monterey and is zoned for agricultural use. The subject site, however, is designated within the City of Soledad General Plan as a future expansion area to accommodate projected growth as envisioned under the 2005 General Plan. Upon annexation, the subject site would be appropriately zoned for commercial and residential uses consistent with the specific plan land use concept. The project is consistent with this policy.
C/OS-3	The City shall ensure that new development and public infrastructure projects do not encourage expansion of urban uses outside the general plan area into areas designated *Agriculture* by the Monterey County General Plan.	The project site is located within the general plan expansion area boundaries as designated in the Land Use Diagram of the General Plan. The project is consistent with this policy.
C/OS-4	The City shall support the agricultural economy by encouraging the location of agricultural support industries in the City, establishing and promoting marketing of local farm products, and providing its regional fair share of adequate housing to meet the needs of agricultural labor.	The specific plan provides 800 affordable housing units to meet south Monterey County's housing needs for the city's residents, which may include individuals in the agricultural labor industry. Additionally, at least 30 percent of medium density housing units should be available as rentals. Refer also to specific plan policy LU-C. The project is consistent with this policy.
C/OS-5	The City shall require a right-to-farm condition to all future subdivision maps adjacent to farmlands.	As identified in the Addendum to the Miravale III Specific Plan EIR Mitigation Measure 4.2-5, the project is subject to compliance with the city's right to farm policies including notification to potential buyers through recorded deed restrictions. Compliance with the city's right-to-farm policies consistent with Section 5.3 of the memorandum of understanding with Monterey County is also required as a project condition of approval. The project is consistent with this policy.
C/OS-6	The City shall require development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses.	An open space buffer, including a trail, will be constructed along the northern boundary of the plan area and San Vicente Road will provide a buffer along the western boundary of the specific plan edge to separate residences from agriculture uses. A 100-foot wide buffer is required on the northern boundary of Sub-area 13. As identified in the Addendum to the Miravale III Specific Plan EIR Mitigation Measure 4.2-5, the project is subject to compliance with the city's right to farm policies consistent with Section 5.3 of the memorandum of understanding with Monterey County. Refer also to specific plan policy P-M. The project is consistent with this policy.

General Plan Policy		Consistency
C/OS-7	The City shall require new public and private development to protect scenic resources by: a. Prohibiting structures along ridgelines, steep slopes (above the 400 foot elevation contour), or in other highly visible locations unless no practical alternative is available, or such a location is necessary to protect public health and safety; b. Utilizing natural landforms and vegetation for screening structures, access roads, building foundations, and cut and fill slopes; c. Requiring landscaping which provides a landscape transition between developed areas and adjacent open space or undeveloped areas; and is compatible with the scenic resource being protected; d. Incorporating sound Soil Conservation Service practices and minimizing land alterations. Land alterations shall be minimized by: keeping cuts and fills to a minimum; limiting grading to the smallest practical area of land; limiting land exposure to the shortest practical amount of time; replanting graded areas to insure establishment of plant cover before the next rainy season; and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur; e. Designing roads, parking, and utilities to minimize visual impacts. If possible, utilities shall be underground. Roadways and parking shall fit the natural terrain; and f. Designing projects to fit the site's scale and character. Structures shall be designed and located so: they do not silhouette against ridgelines, or hilltops; roof lines and vertical architectural features blend with and do not detract from the natural background or ridge outline; residential density and massing is decreased with increased elevation where it would mar the scenic quality of the scenic resource; they fit the natural terrain, and they utilize building materials, colors, and textures that blend with the natural landscape and avoid the creation of high-contrast situations.	a. The specific plan does not include ridgeline development. Development in the Plan Area below the 400-foot elevation contour would be similar in scale and form as existing development within the city limit adjacent to the site. All development is subject to conformance with the specific plan design guidelines for each zone district. All areas above the 400 foot elevation contour are designated as open space. The specific plan includes design guidelines for low-intensity uses within the Open Space zone district that limit irrigation, pathways, signage and fencing. Unless otherwise noted in the specific plan, uses and standards for the areas zoned OS Open Space shall be as provided in Chapter 17.32 of the Soledad Zoning Code. The specific plan otherwise includes detailed design guidelines to ensure development with attractive, high quality architecture, screening methods, and landscaping. b. The specific plan includes detailed design guidelines for each zone district to ensure development with attractive, high quality architecture, screening methods, and landscaping. c. In addition to the design guidelines for each zone district, the specific plan requires buffers between adjacent open space and residential development. d. Limitations on development above the 400 foot elevation contour minimize risks associated with grading on hillside areas. Geotechnical reports are required for new development as part of the improvement plan review, prior to issuance of any grading permit. Development associated with the specific plan is subject to this requirement as a condition of specific plan approval. The Addendum to the Miravale III EIR includes mitigation measures that require compliance with recommendations contained in the geotechnical report(s) to ensure sound soil conservation practices are implemented. e. The limitations on development in highly scenic areas of the site above the 400 foot elevation contour minimize the visual impact of the project. The specific plan design guidelines encourage underground parking where feasible, requires utilities to be placed underground, requires all existing overhead utilities to be converted to underground, with the exception of existing steel tower structures and wires, and restricts the visibility of roof-mounted utility equipment. f. The limitations on development in highly scenic areas of the site above the 400 foot elevation contour minimize the visual impact of the project. The specific plan includes detailed design guidelines for each zone district to ensure development with attractive, high quality architecture, screening methods, and landscaping. Refer also to specific plan policies PSF-K, PSF-P, and PSF-Q. The project is consistent with this policy.

General Plan Policy		Consistency
C/OS-8	The City shall require public or private development to: a. The City shall designate hillside areas above the 400 foot elevation contour as *Open Space/Grazing, Public Facility* (parkland) or *Agricultur*e. b. Locate primary structures, accessory structures, paving, and grading at the base of a hill (generally that are below the 400 foot contour or 15 percent slope) unless: (1) no practicable alternative is available, (2) the location on a greater slope or at a greater elevation provides more aesthetic quality, or (3) the location is necessary to protect public health and safety. c. Utilize design, construction, and maintenance techniques that: (1) preserve and enhance the hillsides; (2) ensure that development near or on portions of a hill do not cause, or make worse natural hazards (such as erosion, sedimentation, fire, or water quality concerns); (3) include erosion and sediment control practices including temporary vegetation sufficient to stabilize disturbed areas; (4) minimize risk to life and property from slope failure, landslides, and flooding; (5) maintain the character and visual quality of the adjacent hillside. d. Incorporate recreation and public access on or near hillsides consistent with this Element.	a. Areas of the project site above the 400 foot elevation contour are identified as Hillside Open Space by the specific plan. b. The topography is comprised of a natural slope from the southwest corner of the plan area to the northeast, with steeper slopes located at the eastern boundary. The majority of the plan area ranges in elevation between approximately 180 and 600 feet above mean sea level. Mitigation Measure 4.1-7 requires the preparation and submittal of a site-specific geotechnical report for new development on hillsides in order to ensure that the development will not cause or worsen natural hazards, such as erosion and sedimentation, and will minimize risk to life and property from slope failure, landslides, and flooding. The report shall include erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas. The report is subject to review and approval by the Chief Building Official and Director of Public Works prior to issuance of a grading permit. c. Implementation of Mitigation Measure 4.1-7 ensures consistency with this policy. d. The specific plan circulation concept includes the provision of access along an existing access road above the 400 foot elevation contour and connections to adjacent neighborhoods. Refer also to specific plan policies C-A, P-A, P-F, and P-M. The project is consistent with this policy.
C/OS-9	The City shall support the preservation and enhancement of natural land forms, natural vegetation, and natural resources to the maximum extent feasible.	The project includes preservation in perpetuity of 150 acres of open space to ensure the preservation and enhancement of natural land forms. Refer also to specific plan policy LU-J. The project is consistent with this policy.
C/OS-10	The City shall support State and federal laws and policies to preserve populations of rare, threatened, and endangered species by ensuring development does not adversely affect such species in a significant way or by fully mitigating adverse effects.	The project development will be required to adhere to all applicable State and Federal requirements pertaining to biological resources within the project area. The Addendum to the Miravale III EIR includes addition mitigation measures to ensure the protection of rare, threatened, and endangered species. The project is consistent with this policy.
C/OS-11	The City shall require that significant natural, open space, and cultural resources be identified in advance of development and incorporated into site-specific development project design to the extent feasible.	The Miravale III Specific Plan EIR and its 2017 Addendum evaluated project impacts to environmental resources including aesthetic resources, parks and open space resources, cultural resources. Implementation of the mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR will be required as conditions of approval and will be incorporated into the project. The project is consistent with this policy.

General Plan Policy		Consistency
C/OS-12	The City shall require developers to use native and compatible nonnative species, especially drought-tolerant species, to the extent possible in fulfilling landscaping requirements imposed as conditions of project approvals or project mitigations.	The specific plan policies call for the use of native and drought-tolerant plant species in all development landscaping. Refer also to specific plan policies P-N and PSF-E. The project is consistent with this policy.
C/OS-13	The City will encourage the improvement of air quality in Soledad and in the region by implementing the measures described in the Monterey County Air Quality Management Plan. Such measures include, but are not limited to, measures to reduce dependence on the automobile and encourage the use of alternate modes of transportation such as buses, bicycles and walking.	The specific plan policies encourage the improvement of air quality by providing easily accessible non-motorized amenities such as pedestrian and bicycle trails, bicycle lanes, and transit stops. Refer also to specific plan policies C-K, C-L, C-M, and C-N. The project is consistent with this policy.
C/OS-14	The City shall, to the extent feasible, separate sensitive land uses from significant sources of air pollution.	The Addendum to the Miravale III Specific Plan EIR evaluated the project's contributions to emissions that affect local and regional air quality and found that implementation of mitigation measures 4.3-1 – 4.3-4 mitigate the project impacts to air quality. The project is consistent with this policy.
C/OS-16	The City shall promote and encourage the use of alternate modes of transportation by incorporating public transit, bicycle, and pedestrian modes in City transportation planning and by requiring new development to provide adequate pedestrian and bikeway facilities.	The specific plan circulation concept provides transit stops, bicycle lanes, and pedestrian amenities such as separated sidewalks and trails. The project is consistent with this policy.
C/OS-17	a. When considering the approval of activities that result in the removal of mature trees, the following factors shall be considered: The size, age, health and species of tree(s) to be removed. Whether or not the removal of the tree(s) is necessary for the reasonable development and use of the site. Whether the tree(s) to be removed is (are) a native or introduced species.	The Addendum to the Miravale III Specific Plan EIR analyzed the environmental effects of tree removal necessary to accommodate the project and determined that the project's impact is less than significant. The project is consistent with this policy.
C/OS-18	The City shall institute and promote a vigorous program of tree planting in new development areas and in older portions of the City to increase the number and density of tree cover.	Final landscaping plans will be required for development within the specific plan area. As identified in the specific plan, numerous policies have been incorporated requiring the use of street trees and accent trees. Refer also to specific plan policy LU-G. The project is consistent with this policy.
C/OS-19	When mature trees are removed to accommodate new development, they shall be replaced at a ratio of at least two new trees for every one tree removed, or such additional number and size of trees as considered appropriate by the reviewing body at the time of approval of such development.	Development of the project would result in the removal of several mature trees. Mitigation Measure 4.1-9 identified in the Addendum to the Miravale III Specific Plan EIR requires the retention of mature trees to the extent feasible and requires approval of a tree replacement plan for review and approval by the Planning Director prior to issuance of grading or building permits. The project is consistent with this policy.

General Plan Policy		Consistency
C/OS-21	Landscaping plans for new development incorporate water conservation methods and shall employ native varieties of plants that are drought tolerant.	The specific plan will reduce potable water consumption throughout the specific plan area through the use of recycled water for irrigation, emphasis on drought- tolerant plant materials for landscaping, and the incorporation of state-of- the art low water/high efficiency use fixtures and appliances in all new private development and public facility construction, including schools. Refer also to specific plan policies P-N and PSF-E. The project is consistent with this policy.
C/OS-23	If development of a site uncovers cultural resources, the recommendations of Appendix K of the Guidelines for Implementation of the California Environmental Quality Act (Public Resources Code Section 15000 et seq.) shall be followed for identification, documentation, and preservation of the resource.	This policy is included as a mitigation measure required during project construction. The project is consistent with this policy.
C/OS-24	The City shall document and record data or information relevant to prehistoric and historic cultural resources which may be impacted by proposed development. The accumulation of such data shall act as a tool to assist decision-makers in determinations of the potential development effects to prehistoric and historical resources located within the City.	A single historic structure is located on the site and mitigation measures are identified in the Addendum to the Miravale III Specific Plan EIR to ensure adequate recordation of data and protection of the resource. The house will be relocated from its current location. The project is consistent with this policy.
C/OS-26	The City and County shall discourage urban uses adjacent to State-designated regional resource deposits if such uses would be incompatible with mining operations, or would restrict future extraction of significant mineral resources.	The project site is not located adjacent to State-designated regional resource deposits. The project is consistent with this policy.
Safety		
HZ-1	The City shall promote flood control measures that maintain the drainage courses in their natural conditions within the 100-year floodplain.	As reported in the Miravale III Specific Plan EIR, the project is not located in the 100-year floodplain. The specific plan provides an integrated storm drainage and open space system that incorporates best management practices to adequately control storm flooding problems, protect water quality, and provide park space. Successful implementation of mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.9. Hydrology and Water Quality, will ensure that all storm water facilities and storm drain improvements are designed and constructed to meet City of Soledad and Central Coast Regional Water Quality control Board design criteria and performance standards for retention capacity and volume. Refer also to specific plan policy LU–8The project is consistent with this policy.
HZ-2	The City shall prohibit the construction of facilities essential for emergencies and large public assembly in the 100-year floodplain, unless the structure and access to the structure are free from flood inundation.	The project site is not located within a 100-year floodplain. The project is consistent with this policy.

General Plan Policy		Consistency
HZ-3	The City shall require flood control structures, facilities, and improvements to be designed to conserve resources, incorporate and preserve scenic values, and to incorporate opportunities for recreation, where appropriate.	The project provides an integrated storm drainage and open space system that incorporates best management practices to adequately control storm flooding problems, protect water quality, and provide park space. The project is consistent with this policy.
HZ-4	The City shall manage flood prone areas consistent with the requirements of the Federal Emergency Management Agency (FEMA) and the Monterey County Water Resources Agency.	The project is not located within an area that is prone to flooding as defined by the Federal Emergency Management Agency of the Monterey County Water Resources Agency. Successful implementation of mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.9. Hydrology and Water Quality, will ensure that all storm water facilities and storm drain improvements are designed and constructed to meet City of Soledad and Central Coast Regional Water Quality control Board design criteria and performance standards for storm water volumes to minimize the potential for localized flooding. The project is consistent with this policy.
HZ-5	All new development shall satisfy the applicable requirements of the Uniform Building Code.	Compliance with the most recent version of the uniform building code is required for all development. The project is consistent with this policy.
HZ-6	The City shall require the preparation of a soils engineering and geologic-seismic analysis prior to permitting development in areas prone to geologic or seismic hazards (i.e., ground shaking, landslides, liquefaction, expansive soils).	A soils engineering and geological/seismic analysis was prepared for the project. The final-design level plans will be developed in accordance with individual project-specific geotechnical evaluations. The project is consistent with this policy.
HZ-7	The City shall limit development in areas of steep or unstable slopes to minimize hazards by landslides or liquefaction.	The specific plan designates the hillside areas above the 400 foot elevation contour as open space and will permanently preserve 150 acres of hillside open space. A soils engineering and geological/seismic analysis was prepared for the project, which did not find areas that would be prone landslides or liquefaction. The final-design level plans will be developed in accordance with individual project-specific geotechnical evaluations. The project is consistent with this policy
HZ-8	In landslide hazard areas, the City shall prohibit alteration of land in a manner that could increase the hazard, including concentration of water through drainage or irrigation systems; removal of vegetative cover; and steepening of slopes and undercutting the bases of slopes.	See above response.
HZ-9	New development shall provide fire flow, emergency access and hydrants consistent with Fire Department requirements.	All new development shall provide fire flow, emergency, access and hydrants consistent with Fire Department Requirements. Refer also to specific plan policy PSF-FF The project is consistent with this policy.
HZ-12	The City will encourage site planning which helps reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department.	All new development shall help to reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department. Refer also to specific plan policy PSF-GG The project is consistent with this policy.

General Plan Policy		Consistency
Noise		
N-1	The City shall not allow development of new noise-sensitive land uses where existing or ambient noise levels exceed those shown on Figure X1, as measured immediately within the property line of the new development, unless effective noise mitigation measures have been incorporated into the development design to achieve the standards set by Figure X1.	Successful implementation of the noise mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.11, Noise, will achieve standards in Table 4.10-1 of the City's Noise Element. The project is consistent with this policy.
N-2	Where nonresidential land uses are likely to generate noise levels exceeding those shown on Figure X1 on adjacent or nearby existing or planned noise-sensitive uses, the City shall require preparation of an acoustical analysis as part of the environmental review process so that noise mitigation may be included in the project design.	An acoustical analysis has been prepared by Illingworth & Rodkin, Inc. for the Miravale III project and the mitigation measures identified in their report have been incorporated into Miravale III EIR and Addendum to the Miravale III EIR. Implementation of the noise mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.11, Noise, will be required as conditions of project approval for all phases. The project is consistent with this policy.
N-3	New residential development shall comply with State Noise Insulation Standards.	Development of the project will be required to comply with all applicable State Noise Insulation Standards as part of the improvement plan and building permit application process. The project is consistent with this policy.
N-4	New commercial and industrial development shall incorporate design elements to minimize the noise impact when residential neighborhoods are nearby.	The specific plan includes design guidelines for the Village Commercial district and Mixed Use Opportunity Overlay to minimize noise impacts. The project is consistent with this policy.
N-5	Where noise mitigation measures are required to achieve the standards described in Figure X2, the emphasis of such measures shall be placed on site planning and project design. The use of noise barriers shall be considered as a means of achieving the noise standards only after all other practical design-related mitigation measures have been integrated into the project.	Successful implementation of the noise mitigation measures identified in the Addendum to the Miravale III Specific Plan EIR Section 3.11, Noise, will ensure project-related noise impacts are reduced to the extent feasible. While some noise sensitive land uses would be exposed to noise in excess of applicable standards, mitigation measures emphasize site planning and project design principles, including the use of building materials to minimize noise related impacts. The project is consistent with this policy.

1. INTRODUCTION

This report is an update of "Miravale Phase III Mixed-Use Development Transportation Impact Analysis," prepared for the City of Soledad by Hexagon Transportation Consultants, May 4, 2007, herein after referred to as the "2007 TIA". The project site is located in the northern outskirts of the city generally between San Vicente Road and Orchard Lane. The currently proposed project is substantially smaller in land area and amount of development. The previous proposal, entitled "Miravale III", included 1,470 single-family homes, 2,430 multi-family units, 300 senior housing units, 120 hotel rooms, and 275,000 square feet of supporting retail. A golf course, schools, and parks were also a part of the 920-acre project. The current project will consist of 1,522 single-family homes, 338 multi-family units, 132 senior housing units, 400 farmer's community units, no hotel, and 99,000 square feet of supporting retail. Parks, will also be part of the current 634-acre site.

Access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane, which is unchanged from the previous proposal. Long term future access also will be provided via planned roadways to Camphora/Gloria Road when other development is completed several decades from now. The roadways are illustrated conceptually on Figure V-2 and long term future development areas are illustrated on Figure II-9 of the 2005 Soledad General Plan, which are included herein as **Appendix A**.

The City of Soledad certified an Environmental Impact Report (EIR) for the previous project, but the project was not approved The current reduced project, which is about 60% of the size of the previous proposal, will clearly have correspondingly less impacts. In addition, as will be discussed in detail in the following sections the Background and Cumulative development conditions will be essentially the same as those analyzed in the previous Traffic Impact Analysis (TIA). It is therefore appropriate to simply update the previous report and excerpt the sections that still apply. This report uses the format of the previous report and updates existing conditions from 2007 to 2017, adjusts the project trip generation, distribution and assignment, verifies Background and Cumulative conditions and extends the Year 2030 analysis to the Year 2035. The impacts of the project were evaluated following the standards and methodologies set forth by the City of Soledad.

The traffic analysis also includes an evaluation of peak-hour signal warrants and roadway and freeway level of service analysis. This traffic analysis is based on PM peak-hour levels of service. The AM peak hour is not analyzed because the previous study documented that the PM peak hour was the higher volume, controlling condition. In other words, no future impacts will be experienced during the AM peak hour that are not also experienced during the PM peak hour.

1.1. Scope of Study

The project site and the surrounding study area are shown on **Figure 1**. The project site plan is shown on **Figure 2**. The study facilities are identified below:

Study Intersections

1 Moranda Road and US 101 Northbound Ramps

2 Moranda Road and Front Street

3 San Vicente Road and Front Street

4 West Street and Front Street

5 Main Street and Front Street

6 East Street and Front Street

7 Front Street and Nestles Road

8 Front Street and US 101 Northbound Ramps

9 Front Street and US 101 Southbound Ramps

10 Front Street and Morisoli Road

11 San Vicente Road and Market Street

12 West Street and Market Street

13 Main Street and Market Street

14 East Street and Market Street

15 East Street and Metz Road

16 San Vicente Road and Gabilan Drive

17 West Street and Gabilan Drive

18 Main Street and Gabilan Drive

19 Andalucia Drive and Gabilan Drive

Roadway Segments

1 Front Street, between Front Street and San Vicente Road

2 Front Street, between San Vicente Road and West Street

3 Front Street, between West Street and Main Street

4 Front Street, between Main Street and East Street

5 Front Street, between East Street and Front Street

6 Gabilan Drive, between San Vicente Road and West Street

7 Gabilan Drive, between West Street and Andalucia Drive

8 San Vicente Road, between Market Street and Gabilan Drive

9 San Vicente Road, North of Gabilan Drive

10 West Street, between Market Street and Gabilan Drive

11 West Street, North of Gabilan Drive

Freeway Segments

1 US 101 between North Gonzalez and 5th Street

2 US 101 between 5th Street and Gloria Road

3 US 101 between Gloria Road and Soledad Prison

4 US 101 between Soledad Prison and Camphora

5 US 101 between Camphora and North Soledad

6 US 101 between North Soledad and South Soledad

7 US 101 between South Soledad and Arroyo Seco Road

8 US 101 between Arroyo Seco Road and North Greenfield

9 US 101 between North Greenfield and Walnut Avenue

10 US 101 between Walnut Avenue and Oak Avenue

11 US 101 between Oak Avenue and South Greenfield

In summary, the study includes an analysis of 19 intersections, 11 roadway segments, and 11 freeway segments in the vicinity of the project site. Traffic conditions at the intersections were analyzed for the weekday PM peak hour of traffic. The PM peak hour is typically between 4:00 and 6:00 PM. It is during this period that the most congested traffic conditions occur on an average day.

Traffic conditions were evaluated for the following scenarios:

Scenario 1: Existing Conditions. Existing conditions were represented by existing peak-hour traffic volumes on the existing roadway network. Existing traffic volumes were obtained from recent (May 2017 and June 2013) traffic counts. Existing counts were compared with 2006 counts and the Background scenario traffic volumes forecasted in the 2007 TIA. Traffic volumes have increased City-wide by about 24.3% since 2006.

Scenario 2: Background Conditions. Background conditions were represented by future background traffic volumes on the near-term roadway network. Background traffic volumes were estimated by adding to existing peak-hour volumes the projected volumes from approved but not yet completed developments. The latter component was developed based on a list of approved projects provided by the City of Soledad.

Scenario 3: Background With Project Conditions. Background With Project conditions were represented by future traffic volumes, with the project, on the near-term future roadway network. Future traffic volumes with the project (hereafter called project traffic volumes) were estimated by adding to background traffic volumes the additional traffic generated by the project. Background With Project conditions were evaluated relative to background conditions with improvements in order to determine potential project impacts.

Scenario 4: Cumulative Growth No Project Conditions. Traffic volumes for cumulative conditions without the project were estimated by adding traffic associated with pending developments in the City of Soledad to background traffic volumes. The analysis of cumulative growth conditions was conducted at the request of the City of Soledad.

Scenario 5: Cumulative Growth With Project Conditions. Cumulative traffic volumes with the project were estimated by adding to cumulative no project traffic volumes the additional traffic generated by the project.

Scenario 6: Year 2035 traffic volumes on the Soledad street system are assumed to be equal with the 2030 forecasts in the 2007 TIA. This is valid because development is occurring at a much slower rate than anticipated in 2007.

US 101 volumes were developed by adding five years of straight line growth of 1% per year (5% total) in through traffic volumes on US 101 to recent 2030 forecasts for interchange planning. This growth rate is greater than the approximately 0.3% per year that occurred between 2005 and 2015, according to Caltrans traffic counts.

1.2. Methodology

This section presents the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from new traffic counts and field observations. The following data were collected from these sources:

• existing traffic volumes

• lane configurations

• roadway widths

• intersection control

Analysis Methodologies and Level of Service Standards

Traffic conditions at the study intersections were evaluated using level of service (LOS). Level of Service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The various analysis methods are described below.

Unsignalized Intersections

The study intersections are analyzed by interpolating the levels of service estimated in the 2007 TIA (which used the TRAFFIX level of service software, which uses the Highway Capacity Manual (HCM) 2000 methodology for unsignalized intersections). A description of unsignalized levels of service is included in **Table 1**.

Signal Warrant

Unsignalized intersections are also assessed for the need of signalization. This assessment is made on the basis of the Peak-hour Volume Signal Warrant, Warrant #11, described in the Caltrans Traffic Manual. This method makes no evaluation of intersection level of service, but simply provides an indication whether peak-hour traffic volumes are, or would be, sufficient to justify installation of a traffic signal.

Signalized Intersections

When it was found that study intersections meet signal warrants and/or require signalization based on level of service analysis, the intersections were analyzed in the 2007 TIA with standard signalized intersection methodology. The levels of service in the current study were prorated where appropriate based on current volumes and forecasts. The intersections were analyzed in the 2007 TIA using TRAFFIX, which is based on the Highway Capacity Manual (HCM) 2000 method for signalized intersections. TRAFFIX evaluates signalized intersection operations on the basis of average control delay time

for all vehicles at the intersection. The correlation between average control delay for signalized intersections and level of service is shown in **Table 2**.

1.3. Freeway Segment Analysis

Freeway segments that serve the Soledad area were also analyzed as part of the study. Similar to the selected study intersections, freeway segments were analyzed for the weekday AM and PM peak hours of traffic.

Freeway Segment Level of Service Methodology

Standard methodology for the analysis of freeway segments consists of the evaluation of the segments based on the density method. The density method requires measurement of vehicle travel speeds on the freeway segments. Unfortunately, the use of vehicle density does not lend itself well to the calculation of future levels of service for freeway segments. It is not possible to project the future travel speeds on the segments, due to changes in traffic conditions. Therefore, levels of service for freeway segments were calculated based on a volume-to-capacity ratio (V/C). The V/C method is simpler and does not use travel speed as a variable in its calculation. Freeway segment level of service based on V/C is shown in **Table 3**. Caltrans level of service standard for freeway segments is LOS C.

1.4. Report Organization

The remainder of this report is divided into six chapters, following the format of the 2007 TIA. Chapter 2 describes existing conditions in terms of the existing roadway network, transit service, and existing bicycle and pedestrian facilities. Chapter 3 presents the intersection operations under background conditions. Chapter 4 describes the method used to estimate project traffic and its impact on the transportation system and describes the recommended mitigation measures. Chapter 5 discusses the traffic conditions resulting from additional cumulative growth. Chapter 6 presents the long-term Year 2035 analysis. Chapter 7 presents the conclusions of the traffic impact analysis.

2. EXISTING CONDITIONS

This chapter describes the existing conditions for all of the major transportation facilities in the vicinity of the site, including the roadway network, and bicycle and pedestrian facilities.

2.1 Existing Roadway Network

Regional access to the project site is provided solely via US 101. This facility is described below.

US 101 is a four-lane freeway within the City of Soledad. It extends north through Salinas and south through King City. Access to the site is provided via its interchanges with Moranda Road and Front Street within the City of Soledad.

Local access to the site is provided by Moranda Road, Front Street, San Vicente Road, West Street, Orchard Lane, and Gabilan Drive. These roadways are described below.

Moranda Road is a north/south roadway that runs from Front Street to US 101. Moranda Road serves as the access road to and from the US 101 northbound ramps in the northern part of the city. The roadway is one lane in each direction with a 35-mph speed limit.

Front Street is an arterial that runs parallel to and along the eastside of US 101 and the Union Pacific Railroad tracks, between Moranda Road and Oak Street. South of the Oak Street, Front Street crosses under the tracks and terminates at the US 101 northbound off ramp at Hector De La Rosa Sr. Street. The roadway varies in width between its north and south termination points at US 101. Between the US 101 northbound off-ramps in the southern part of Soledad and West Street, Front Street is two lanes wide. Between West Street and Moranda Road, the roadway widens to four lanes prior to narrowing once again to two lanes at its intersection with Moranda Road. The roadway has a 25-mph speed limit through downtown and increases to 35-mph north and south of downtown.

San Vicente Road is a north/south collector roadway that extends north from Front Street to the project boundary. The roadway is one lane in each direction with a 25-mph speed limit. The project includes the extension of San Vicente Road into the site providing direct access to the project area from northern Soledad. The extension is illustrated on the site plan included as **Figure 2**. A brief discussion of this extension is provided in Section 4.4 - Project Roadway Segment Analysis.

West Street is a north/south collector roadway that runs from Front Street to the project boundary and will extend from the project boundary to Metz Road in the future, as part of the Miravale II development. The roadway is four lanes wide with speed limit ranging from 25 to 35 mph. The roadway is lined by residential uses. The project includes the extension

of West Street into the site providing direct access to the project area from central Soledad.

Orchard Lane is a north/south roadway that runs from Gabilan Drive to the project boundary. As part of the Miravale Phase II development, Orchard lane will be extended from the project boundary to Metz Road. The roadway is one lane in each direction with a 25-mph speed limit. The roadway is lined by residential uses. The project includes the extension of Orchard Lane into the site providing direct access to the project area from southern Soledad.

Gabilan Drive is an east/west arterial roadway that extends from Orchard lane to San Vicente Road. The roadway is four lanes wide with a 25 mph speed limit between San Vicente Road and Prado Drive. Gabilan Drive narrows to one lane in each direction from Toledo Street to its terminus as a cul-de-sac just west of Bryant Canyon Road.

2.2 Existing Bicycle, Pedestrian and Transit Facilities

Bike lanes are provided along Front Street between East Street and Nestles Road and along Gabilan Drive from San Vicente Road to West Street and from Toledo Street to Orchard Lane; and along Orchard Lane from the projects south boundary to Gabilan Drive with future extension of Orchard Lane to Metz Road.

Pedestrian facilities in the study area consist primarily of sidewalks and crosswalks at intersections. Sidewalks are found along all previously described local roadways in the study area and along the local residential streets and collectors surrounding the study area.

Monterey Salinas Transit serves the City of Soledad with Lines 23, 82, 84 and 86. They all stop at the Soledad Mission Shopping Center and along Front Street between the north and south US 101 interchanges.

2.3 Existing Intersection Lane Configurations

The existing lane configurations at the study intersections were obtained by observations in the field. The existing intersection lane configurations are shown on **Figure 3**.

2.4 Existing Traffic Volumes

The existing peak-hour intersection volumes are shown on **Figure 4**. The traffic count data are included in **Appendix B**. A tabular summary of existing (2013 and 2017) PM peak hour volumes at the study intersections is included in **Appendix C**. The 2013/2017 volumes are compared to the 2006 volumes in **Appendix D**. Traffic volumes have increased City-wide by about 24.3% since 2006. This is an annual straight-line growth rate of about 2.2%. Some difference could also be seasonal because the 2006 counts

were conducted in July, when agricultural operations are at capacity, but school was not in session. The 2017 counts were conducted in May when agricultural operations are in full production and school was in session. **Appendix E** provides a comparison of 2017 volumes to the Background volumes forecasted in 2006. The 2007 Background volumes are about 18.4% higher than the 2017 volumes. The 2006 PM peak hour counts totaled 13,683, the 2017 counts totaled 17,011 and the 2007 Background forecast totaled 20,137. The 2017 counts were about 52% of the anticipated increase from the 2006 to the Background volumes.

2.5 Existing Intersection Analysis

The results of the level of service analysis under existing conditions are summarized in **Table 4**. The results show that, measured against the City of Soledad level of service standards, all study intersections currently operate at an acceptable LOS D or better. The following four intersections are currently signalized. These were not signalized in 2007.

3 San Vicente Road and Front Street

7 Front Street and Nestles Road

8 Front Street and US 101 NB Ramps

17 West Street and Gabilan Drive

Peak-hour signal warrant checks were completed for all study intersections to determine whether signalization would be justified on the basis peak-hour volumes. A summary of the signal warrant checks is shown in **Table 5**. The analysis showed that the Caltrans peak-hour volume warrant is met during the PM peak hour at the following intersections under existing conditions:

2 Moranda Road and Front Street

6 East Street and Front Street

Both of these intersections met peak hour signal warrants in 2007.

2.6 Existing Roadway Segment Analysis

Daily roadway segment volumes on all major roadways serving the selected study intersections were estimated from the PM peak hour turning movements counts (assuming the PM peak hour volumes are 10% of the daily volumes) and are shown in **Figure 5.** The PM peak hour segment volumes were derived from the PM peak hour turning movement counts and used to evaluate roadway segment operations. Since there are no evaluation criteria for roadway segments, the roadway segment analysis is presented for informative purposes only. The roadway segment analysis indicates that all

studied roadway segments continue to operate at LOS A. **Table 6** presents the roadway segment analysis.

2.7 Existing Freeway Segment Analysis

Traffic volumes for the studied freeway segments were obtained from 2015 data collected by the Traffic and Vehicle Data Systems Unit for Caltrans District 5. The collected data provides average annual daily and peak hour volumes along each freeway segment for both directions of travel. Peak hour splits for each segment were developed using directional peak-hour volume data collected by Caltrans. The directional peak hour volume provides a percentage of total peak hour traffic by direction. The freeway segment analysis indicates that all freeway segments analyzed continue to operate at LOS C or better. Freeway segment analysis is presented in **Table 7**.

2.8 Existing Freeway Ramp Analysis

Traffic volumes for the studied freeway ramps were obtained from the traffic counts collected at each of the interchange intersections. The collected counts were compared to historical Caltrans ramp counts and found to be greater than Caltrans counts. The freeway ramp analysis indicates that all freeway ramps analyzed currently operate at LOS B or better. Freeway ramp analysis is presented in **Table 8**. Though the levels of service analyses do not indicate deficient operations on the ramps based on the ramps' capacities, there are existing operational deficiencies due to inadequate ramp configurations to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes.

3. BACKGROUND CONDITIONS

This chapter describes background traffic conditions. Background conditions are defined as conditions just prior to completion of the proposed development. Traffic volumes for background conditions comprise volumes from existing traffic counts plus traffic generated by other approved developments in the vicinity of the site. This chapter describes the procedure used to determine background traffic volumes and the resulting traffic conditions.

3.1 Background Transportation Network

It is assumed in this analysis that the transportation network under background conditions would be the same as the existing transportation network.

Background Traffic Volumes

Background peak-hour traffic volumes were estimated by adding to existing volumes the estimated traffic from approved, but not yet constructed, developments. In 2007, City staff provided a list of five approved developments within the City of Soledad.

• Miravale II – 453 single-family homes and 323 Townhomes/Apartments, the site will be bound by Bryant Canyon Road, Orchard Lane, Santa Clara Street and Metz Road.

• Orchard Villas – 172 single-family homes, located along the west side of Orchard Lane north of Metz Road.

These two projects had a combined total of about 948 dwelling units. There are currently about 250 dwelling units remaining to be built in these two projects.

The following three projects have been built and occupied since 2007:

• Gabilan Square – 9,960 square feet of commercial space and 183 Townhomes/Apartments, located south of Gabilan Drive at Orchard Lane.

• Monterey Street Public Housing Facility – 52 multi-family units, located along the north side of Monterey Street between First and Second Streets.

• Benito Street Public Housing – 143 units, located between West and Benito Streets, and Gabilan and North Street.

Several new projects, including AutoZone, ARCO Gas Station and Los Coches Mini Storage were approved but not complete at the time of traffic counts for the current study. These impact the vicinity of the US 101 / South Front Street interchange. The traffic

generated by those projects was added to estimate Background conditions in that part of the study area.

It is interesting to note that the increase in traffic between the 2007 TIA and 2017 is about 52% of the anticipated increase between the 2017 TIA existing and Background volumes. This implies that 52% of the 2007 Background trips have been added to the street system. Assuming no more development than the current Background projects the remaining 48% should represent the remaining Background project trip generation. It happens to be almost identical to this estimate.

The added traffic associated with the approved projects was developed based on trip generation estimates and assignments produced in the 2007 TIA. The magnitude of traffic added to the roadway system by each of the approved developments is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled Trip Generation, ninth edition, 2012, were used for this analysis. On the basis of these rates, it is estimated that the approved projects would generate a combined total of 4,847 daily trips, with 463 occurring during the PM peak hour. The type of land use, size, and trip estimates of each approved development is presented in **Table 9**. Background traffic volumes are shown on **Figure 6**. **Appendix F** indicates that Background traffic volumes resulting from currently approved development traffic added to 2017 volumes are about 8.5% higher than those predicted in the 2007 TIA.

3.2 Background Intersection Levels of Service

The results of the intersection level of service analysis under background conditions are summarized in **Table 10**. The results show that, measured against the City of Soledad level of service standards, two of the study intersections are projected to operate at an unacceptable LOS E or worse during at least one peak hour under background conditions.

2 Moranda Road and Front Street

6 East Street and Front Street

Peak-hour signal warrant checks were completed for all study intersections to determine whether signalization would be justified on the basis of background peak-hour volumes. A summary of the signal warrant checks is shown in **Table 11**. The analysis showed that the Caltrans peak-hour volume warrant is projected to be met during at least one peak hour at the following three intersections under Background conditions:

2 Moranda Road and Front Street

6 East Street and Front Street

15 East Street and North Street/Metz Road

3.3 Background Conditions Necessary Improvements

Based on the results of the background conditions level of service analysis and signal warrant checks, necessary improvements to support approved project traffic volumes were determined for the study intersections projected to operate at LOS D or worse and/or meet signal warrants. The resulting background with improvement conditions will serve as a basis from which to determine impacts attributable to the Miramonte development. Without the improvements in place, level of service conditions with the Miramonte development will not accurately reflect impacts due to project traffic, but rather show problem areas under background conditions compounded by the Miramonte project. Described below and presented in **Figure 7** are the necessary improvements to improve background conditions levels of service to acceptable levels.

(2) Moranda Road and Front Street

Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second eastbound right-turn lane. Intersection operation levels would improve to LOS C with implementation of these improvements.

(6) East Street and Front Street

Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second southbound left-turn lane and exclusive westbound right-turn lane. Intersection operation levels would improve to LOS C with implementation of these improvements.

(15) East Street and North Street/Metz Road

Necessary Improvements: The intersection is projected to meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Metz Road.

Intersections 3 (San Vicente Road and Front Street) and 7 (Front Street and Nestles Road) were expected to be deficient in the 2007 TIA. They are no longer deficient

because the mitigation, traffic signalization has already been implemented at those locations.

3.4 Background Roadway Segment Analysis

Traffic volumes for background conditions on each of the studied roadway segments were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the roadway system in the same manner as with intersections. The roadway segment analysis indicates that all studied roadway segments are projected to continue to operate at LOS B or better during both peak hours under background conditions. **Table 12** presents the roadway segment analysis.

3.5 Background Freeway Segment Analysis

Traffic volumes for background conditions on each of the studied freeway segments were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the freeway system in the same manner as with intersections. The freeway segment analysis indicates that all freeway segments analyzed are projected to operate at LOS C or better under background conditions. Freeway segment analysis is presented in **Table 13**.

3.6 Background Freeway Ramp Analysis

Traffic volumes for background conditions on each of the studied freeway ramps were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the freeway ramps in the same manner as with intersections. The freeway ramp analysis indicates that all freeway ramps analyzed are projected to operate at LOS C or better under background conditions. Freeway ramp analysis is presented in **Table 14.**

As stated under existing conditions, the existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes. The traffic associated with the approved projects will worsen conditions on each of the ramps.

4. PROJECT IMPACTS AND MITIGATION MEASURES

This chapter describes project traffic conditions, significant project impacts, and measures that are recommended to mitigate project impacts. Included are descriptions of the significance criteria that define an impact, estimates of project-generated traffic, identification of the impacts, and descriptions of the mitigation measures. Project conditions are represented by background traffic conditions with the addition of traffic generated by the project.

4.1 Significant Impact Criteria

Significance criteria are used to establish what constitutes an impact. The impact criteria are based on the City of Soledad level of service standards. The project is said to create a significant adverse impact on traffic conditions at an intersection if for either peak hour:

• The level of service at the intersection degrades from an acceptable LOS D or better under background conditions to an unacceptable LOS E or worse under project conditions.

A significant intersection impact is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to LOS D conditions or better.

Future Roadway Network Under Project Conditions

It is assumed in this analysis that the roadway network and intersection configurations under project conditions would be the same as described under background with improvements conditions.

4.2 Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described further in the following sections.

Trip Generation

Through empirical research, data have been collected that correlate to common land uses their propensity for producing traffic. Thus, for the most common land uses there are standard trip generation rates that can be applied to help predict the future traffic increases that would result from a new development. The magnitude of traffic added to

the roadway system by a particular development is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled Trip Generation, 9th edition, 2012, were used for this analysis. On the basis of these rates, it is estimated that the project would generate 18,549 daily trips, with 1,912 occurring during the PM peak hour. Using the specified inbound/outbound splits, the project would produce 1,187 inbound and 725 outbound trips during the PM peak hour.

The trip generation estimates do not include estimates for the proposed schools and other types of complimentary land uses. Therefore, it is assumed that trips to the schools and parks, would originate from within the project area and the proposed residential units.

Similarly, the trip estimates for residential land uses of the project were reduced to account for internalization, or interaction, between the retail and residential land uses. The project is proposing a total of 99,000 square feet of retail space. The retail space will be located centrally within the project area and proposed residential units. The retail land uses are intended to be neighborhood serving retail, not major retail establishments. As such, it is assumed that the majority of trips generated by the retail space will originate from within the project area. The residential uses of the project were reduced by a magnitude equal to 90% of the estimated trips for the retail space. Nearly all trips to the retail area would originate from surrounding neighborhoods within the project area. The project trip generation estimates are presented in **Table 15**. The currently proposed project is expected to generate about 52% of the anticipated daily trips and 59% of the anticipated PM peak hour trips from Miravale III (a net total of 35,504 daily trips with 2,036 during the evening peak hour).

Trip Distribution

The trip distribution pattern for the proposed project was estimated based on existing travel patterns in the area and the locations of complementary land uses. Two separate trip distributions were used for the residential and non-residential land uses of the site. Generally, the non-residential trip distribution contains trips produced by the project within city limits. On the other hand, it is expected that the majority of residential trips will leave city limits for employment zones north and south of Soledad. The trip distribution patterns for each land use type are shown graphically on **Figure 8**. These are identical to the distribution and assignment percentages of Miravale III. The PM peak hour Miramonte impacts at each location in the study area is about 59% of the Miravale III impacts.

Trip Assignment

The peak-hour trips generated by the proposed development were assigned to the roadway system in accordance with the trip distribution pattern discussed above. **Figure 9** shows the project trip assignment.

Project Traffic Volumes

Project trips, as represented in the above project trip assignment, were added to background traffic volumes to obtain background plus project traffic volumes. Background traffic volumes plus project trips are typically referred to simply as project traffic volumes; this is contrasted with the term project trips, which is used to signify the traffic that is produced specifically by the project. The project traffic volumes are shown graphically on **Figure 10**. A comparison of Background plus Project traffic in 2017 with the forecast in the 2007 TIA at the study intersections is tabulated on **Appendix G**. The current forecasts are about 11.8% less than the 2007 TIA forecasts for the entire network compared to the 2007 TIA Background Plus Project scenario, even though the project's impacts are 41% less. This is because Background traffic volumes will be 8.5% higher than the 2007 TIA forecast.

4.3 Project Intersection Level of Service Analysis

The results of the intersection level of service analysis under project conditions are summarized in **Table 16**. This table indicates that the Background plus Project scenario traffic volumes will generally be lower than the same scenario with the larger Miravale III project in the 2007 TIA. Nevertheless, the results show that eight of the study intersections would operate at an unacceptable LOS E or worse under project conditions:

1 Moranda Road and US 101 Northbound Ramps

2 Moranda Road and Front Street

3 San Vicente Road and Front Street

4 West Street and Front Street

9 Front Street and US 101 Southbound Ramps

11 San Vicente Road and Market Street

14 East Street and Market Street

16 San Vicente Road and Gabilan Drive

Each of these intersections would be impacted by the project, according to City of Soledad standards. The remaining 11 intersections would continue to operate at acceptable levels of service.

The peak-hour signal warrants were checked for the existing unsignalized intersections to determine whether signalization would be justified on the basis peak-hour volumes. A summary of the signal warrant checks is shown in **Table 17**. The analysis showed that the Caltrans peak-hour volume warrant would be satisfied at ten intersections under project conditions. As indicated in the comparison columns in Table 17, these were all identified to warrant signals in the 2007 TIA.

2 Moranda Road and Front Street

4 West Street and Front Street

5 Main Street and Front Street

6 East Street and Front Street

12 West Street and Market Street

14 East Street and Market Street

15 East Street and North Street/Metz Road

16 San Vicente Road and Gabilan Drive

18 Main Street and Gabilan Drive

19 Andalucia Drive and Gabilan Drive

4.4 Project Roadway Segment Analysis

Traffic volumes for project conditions on each of the studied roadway segments were developed by adding to background condition volumes the project trips. The project trips were assigned to the roadway system in the same manner as with intersections. The roadway segment analysis indicates that the addition of project traffic will cause the following roadway segment to operate at LOS E under project conditions. This impact will be slightly less than the LOS F identified in the 2007 TIA, but the impact is not reduced to a level of insignificance.

Front Street, between East Street and Nestles Road

Table 18 presents the roadway segment analysis. The degradation of roadway segment levels of service indicates the need for roadway widening. Since there are no evaluation criteria for roadway segments, the roadway segment analysis is presented for informative purposes only. All other studied roadway segments will operate at LOS C or better conditions.

The City desires the San Vicente Road extension along the westerly boundary of the project site. This extension will operate at an acceptable LOS A, as summarized on Table 18.

The San Vicente Road extension along the west side of the project that includes the "S" curve is outside the City limits and is located outside the Miramonte property. Implementing improvements along this extension is likely to be a long process involving other property owners and the County of Monterey. The project will be developed in phases over many years with access initially provided by extensions of West Street and Orchard Lane into the site. In order for impacts on West Street and Orchard Lane to not exceed the ultimate impacts from the buildout of Miramonte, it is estimated that 78% of Miramonte can be developed before San Vicente begins carrying project traffic and "off-loading" West Street and Orchard Lane. This is because the San Vicente Road extension is estimated to carry 22% of project traffic at project buildout.

There is an existing 40 foot right of way for the San Vicente Road extension that follows the existing City limits in the southwest corner of the project. This includes two right angle turns. To approximate the capacity of this alignment each right angle can be considered an intersection. Appendix H includes a level of service calculation indicating that each right angle turn would operate at LOS A, with about 9.3 seconds of average delay. Because there are two curves, the total delay would be more in the order of 18 seconds. Although the overall level of service would be acceptable, it will be circuitous and slow. This will be a disincentive to use the San Vicente Road extension, which is an important access route for the project, especially to reduce project traffic on West Street and Orchard Lane. However, it can operate satisfactorily with appropriate signing and traffic control.

The "S" curve illustrated on the proposed Specific Plan in Figure 2 would reduce travel time along the San Vicente Road extension and is recommended as its preferred alignment. It would have 300-foot radius curves and can be designed to accommodate a speed of about 30 miles per hour. This curve would operate satisfactorily with proper curve warning and advisory speed signing.

4.5 Project Freeway Segment Analysis

Traffic volumes for project conditions on each of the studied freeway segments were developed by adding to background condition volumes the project trips. The project trips were assigned to the freeway system in the same manner as with intersections. The freeway segment analysis indicates that all freeway segments analyzed are projected to operate at LOS C or better under project conditions. This is an improvement from the anticipated LOS D in the 2007 TIA. The freeway segment analysis is summarized in **Table 19**.

4.6 Project Freeway Ramp Analysis

Traffic volumes for project conditions on each of the studied freeway ramps were developed by adding to background condition volumes the project trips. The project trips were assigned to the freeway ramps in the same manner as with intersections. Freeway ramp analysis is presented in **Table 20**. The freeway ramp analysis indicates that one of the studied freeway ramps is projected to operate at LOS E under project conditions. This is an improvement from the anticipated LOS F in the 2007 TIA.

Moranda Road Interchange – Southbound US 101 off-ramp to Moranda Road (PM Peak Hour)

Because the complementary volume in the AM peak hour will be similar on the complementary ramp, the following ramp will also operate at LOS E.

Moranda Road Interchange – Northbound US 101 on-ramp from Moranda Road (AM Peak Hour)

As stated under existing conditions, the existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and marginally accommodate existing traffic volumes. The project traffic will worsen conditions on each of the ramps.

4.7 Intersection Impacts and Mitigation Measures

Described below are the intersection impacts and recommended mitigation measures. **Table 21** shows the resulting levels of service for project conditions with the recommended mitigation measures. **Figure 11** indicates resulting lane configurations at each of the mitigated intersections. Although the current Miramonte project is smaller than the previous Miravale III, there is no reduction in the number of impacted intersections or their respective mitigations. The only exception is intersection 17, the Gabilan Drive /West Street intersection, where a signal has already been installed.

Several of the identified impacts involve significant physical improvements to not only intersection configurations, but also roadway widening. In some cases, the improvements identified below will be undesirable due to the need for right-of-way acquisition and/or create inconsistency with the City's General Plan. The evaluation of necessary mitigation measures revealed that several of the project impacts could be mitigated with the construction of an extension of Gabilan Drive that will provide an alternate route to US 101. The City's General Plan calls for the extension of Gabilan Drive to US 101 as a four-lane divided arterial. The Gabilan Drive extension will provide for a more direct route to the project area and alleviate identified impacts at several intersections. **Figure 12** shows the change in travel patterns of the project that would result with the extension of Gabilan Drive. The figure shows that project traffic would be significantly reduced through several of the intersections identified to be impacted. Therefore, it is recommended that rather than the project implementing undesirable roadway widening, that it instead contribute its fair-share towards the construction costs of the extension of Gabilan Drive to US 101 and widening of San Vicente Road from the project south to the Gabilan Drive extension.

(1) Moranda Road and US 101 NB Ramps

Impact: The intersection level of service would be an acceptable LOS D or better under Background with Improvements conditions and the intersection would degrade to LOS F under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The necessary improvement to mitigate the project impact at this intersection will consist of the signalization of the intersection and the addition of a second northbound left-turn lane, Moranda Road to northbound US 101. The implementation of these improvements will require that the northbound US 101 on-ramp be widened to receive the two lanes. Intersection level of service would improve to LOS B with the improvements.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101. The volume of vehicles bound for northbound US 101 indicate the need for the reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(2) Moranda Road and Front Street

Impact: The intersection level of service would be an acceptable LOS C or better during both peak hours under Background with Improvements conditions and the intersection

would degrade to LOS F under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The additional improvement necessary, beyond those identified under background conditions, to mitigate the project impact at this intersection will consist of the addition of a second northbound through lane and eastbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes. The roadway segment analysis also indicates the need for widening of Front Street between Moranda Road and San Vicente Road. Intersection level of service will improve to LOS A with the improvements.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(3) San Vicente Road and Front Street

Impact: The intersection level of service would be an acceptable LOS B during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The additional improvement necessary, beyond those identified under background conditions, to mitigate the project impact at this intersection will consist of the addition of two eastbound left-turn lanes and southbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes and northbound San Vicente Road be widened to three lanes. Intersection level of service will improve to LOS B with the improvements. The improvements described above will require a significant amount of right-of-way acquisition and will not blend well with surrounding land uses.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(4) West Street and Front Street

Impact: The intersection level of service would be an acceptable LOS B or better during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS E during the PM peak hour under project conditions. This

constitutes a significant impact by City of Soledad standards. The intersection would also meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Front Street. Intersection level of service will improve to LOS C during the PM peak hour with the improvements.

(5) Main Street and Front Street

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Front Street.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(9) Front Street and US 101 SB Ramps

Impact: The intersection would degrade to LOS F during the PM peak hour under project conditions. This constitutes a significant impact by City of Soledad standards. However, the impact is more associated with the LOS E on the SB Off-Ramp.

Mitigation Measure. The volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. A traffic signal is not recommended at this location due to the very low amount of conflicting traffic.

(11) San Vicente Road and Market Street

Impact: The intersection level of service would be an acceptable LOS C or better during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and widening of San Vicente Road to accommodate two lanes in each direction. Intersection level of service will improve to LOS A with the improvements.

With the construction of the Gabilan Drive extension to US 101, the signalization of the intersection and widening of San Vicente Road would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(12) West Street and Market Street

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(14) East Street and Market Street

Impact: The intersection level of service would be an acceptable LOS C or better under Background with Improvements conditions and the intersection would degrade to LOS F during the PM peak hour under project conditions. This constitutes a significant impact by City of Soledad standards. The intersection would also meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection. Intersection level of service will improve to LOS A with the improvements.

(16) San Vicente Road and Gabilan Drive

Impact: The intersection level of service would be an acceptable LOS B under Background with Improvements conditions and the intersection would degrade to LOS F under project conditions. This constitutes a significant impact by City of Soledad standards. The intersection would also meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second westbound left-turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. The improvement will require the widening of southbound San Vicente Road to accommodate the dual left-turn lanes from Gabilan. Intersection level of service will improve to LOS A with the improvements.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(18) Main Street and Gabilan Drive

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(19) Andalucia Drive and Gabilan Drive

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

4.8 Traffic Mitigation Triggers and Impact Fees

Discussed below are project development level trigger points for impacts and mitigation measures for the two major roadway improvements identified in the previous section, as well as the local and regional impact fees.

Traffic Mitigation Triggers

The large size of the proposed project will require that construction of the project be phased over the next ten years. As such, it is necessary to phase mitigation costs/fees along with the development of the project in order to ensure the financial feasibility of the initial development activities. The two major roadway improvements, Gabilan Extension and reconstruction of the US 101/Moranda Road interchange, proposed as mitigation measures for the proposed project will require substantial funding that cannot be provided at the initial stages of this development nor completely by the proposed development alone. Therefore, triggers were determined for the two major roadway improvement projects.

Gabilan Extension Development Level Trigger

Analysis was conducted at intersections and roadway segments along San Vicente Road to determine at what development level the extension of Gabilan Drive needed to be implemented to support project traffic. The traffic analysis indicated that the most critical point of constraint is the intersection of San Vicente Road and Front Street. The capacity of the eastbound left-turn movement, Front Street to San Vicente, during the PM peak hour is the critical movement at the intersection. Under background conditions, the intersection was shown to meet traffic signal warrants. The traffic signal has already been installed. Analysis indicates that with the installation of a signal at the intersection, acceptable levels of service, LOS D, will be maintained at the intersection with up to 84% of the project development traffic added to the roadway system. It should be noted, that though intersection levels of service may be acceptable, the number of left-turning vehicles under background conditions (545 during the PM peak hour) indicates the need for a second left-turn lane and subsequent widening of San Vicente Road to receive the two left-turn lanes. With 84% of the project development traffic added to the roadway system, an additional 350 trips would be added to the left-turn movement during the PM peak hour. By comparison, the 2007 TIA estimated that about 50% of Miravale III could be developed before the Gabilan Drive extension needed to be constructed.

Based on roadway segment analysis conducted along San Vicente Road, LOS D operations along the roadway can be maintained with up to 100% of the project traffic added to the roadway system. However, as previously discussed, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and would create spill over onto adjacent streets, such as West Street, that provide an alternate access to San Vicente Road.

US 101 and Moranda Road Interchange Improvement Development Level Trigger

As described previously, the existing freeway ramps at Moranda Road and US 101 are not designed to accommodate existing traffic volumes. The addition of project traffic, as well as background traffic, would compound the need for improvement of the ramps. The US 101 southbound off-ramp to Moranda Road will be the constraint on any further development. Analysis of ramp capacities indicate that LOS D operations can be maintained on the ramps with up to 42% of the project traffic added to the roadway system. Intersection level of service analysis indicates that with signalization of the ramp termini intersections, up to 84% of the project development traffic can be accommodated; However, even with the signalization of the intersections, the ramps would be inadequate to serve this level of development. By comparison, the 2007 TIA estimated that about 25% of Miravale II could be developed and maintain LOS D on the ramps. The 2007 TIA

estimated that about 50% of Miravale III could be developed before signalization was needed at the ramp termini intersections.

Traffic Impact Fees

Funding for the above described mitigation measures, as well as others described in the previous section, will be obtained via traffic impact fees imposed upon the project by both the City of Soledad and The Transportation Agency for Monterey County (TAMC). Mitigation of the project impacts would be in the form of payment of traffic impact fees estimated for the project.

Local Intersection Impacts

Since the project is one of many potential development projects that would contribute to the unacceptable operating conditions at the identified intersections, the project should make a fair-share contribution toward the cost of the necessary improvements. The intersection improvements necessary under project conditions will be funded by the City's traffic impact fee program. Mitigation of the project impacts would be in the form of payment of City of Soledad's traffic impact fees estimated for the project.

Regional Transportation Impacts

The identified US 101/Moranda Road interchange improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway interchange reconstruction, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program. The payment of fees is considered mitigation for project impacts to freeway facilities. This contribution to the regional fund shall be in addition to the City of Soledad traffic fee.

Monterey County also passed Measure X in the November, 2016 election. Soledad will have funds from this 3/8 cent sales tax to assist in financing transportation improvements such as the US 101 interchanges.

4.9 Project Area Roadway System

Primary access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Each of the roadways will be extended into the project area with connections to a completely new roadway system of collectors and local roads that will serve each of the residential and commercial areas of the project.

Transit and Pedestrian Analysis

It can be assumed that some of the project trips could be made by transit. Assuming up to 3% transit mode share, which is probably the highest that could be expected, yields an estimate of 57 PM transit trips during each of the peak hours. This demand along with existing and other future demand for transit service will justify the need for establishing a plan and expansion of the transit system serving the City of Soledad.

Pedestrian facilities in the project area will consist primarily of sidewalks along the streets. Sidewalks will be provided along virtually all streets and at intersections within the project area. There are no existing bicycle facilities that can be extended into the project area. The residential uses of the project along with existing and future neighborhoods will justify the need for a continuous bicycle facility system throughout the City of Soledad. All pedestrian and bicycle lanes of the project should provide for future connection to existing sidewalks and streets.

5. CUMULATIVE GROWTH CONDITIONS

This chapter presents a summary of the traffic conditions that would occur under cumulative conditions with and without the proposed project. It includes descriptions of nearby pending developments and the procedure used to estimate traffic volumes associated with them. This chapter also presents the results of the intersection level of service calculations. The analysis of cumulative growth conditions was conducted at the request of the City of Soledad and is in conformance with the California Environmental Quality Act CEQA.

5.1 Future Roadway Network Under Cumulative Conditions

It is assumed in this analysis that the roadway network and intersection configurations under cumulative no project conditions would be the same as described under Background conditions with improvements with the exception of the following two intersections:

Moranda Road and Front Street - The improvement consists of the addition of an east leg to the intersection to serve the Soledad Plaza project site. The Soledad Plaza Shopping Center project is inactive. However, it is included as a Cumulative project because it is generally consistent with the General Plan for the site. A project similar to Soledad Plaza has a high probability of occurring.

San Vicente Road and Gabilan Drive - The necessary improvement consists of the addition of a west leg to the intersection to serve the Soledad Plaza project site.

The project mitigation measures described in the previous chapter are included under the cumulative with project conditions analysis. The cumulative with project analysis includes evaluation of intersection levels of service with and without the extension of Gabilan Drive to US 101 as described in the previous chapter.

5.2 Cumulative Traffic Volumes

Cumulative traffic volumes include trips associated with three pending developments located within the City of Soledad. City staff provided the list of cumulative developments. The projects are described below.

• The Village at Soledad – 140,000 square foot shopping center and a 68 room hotel, located along the eastside of Nestles Road south of Los Coches Drive.

• Soledad Plaza – 536,224 square foot shopping center, located along the west side of San Vicente Road between Moranda Road and Gabilan Road.

• 263 Front Street – 12,200 square foot retail center and 102 apartments/condominiums, located along the north side of Front Street between West Street and Benito Street.

Traffic volumes for cumulative conditions were estimated by adding traffic associated with pending developments to background traffic volumes for the cumulative without project scenario and the proposed project for the cumulative with project scenario. The added traffic associated with the pending projects was developed based on trip generation estimates and assignments in the 2007 TIA. The magnitude of traffic added to the roadway system by each of the pending developments is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled Trip Generation, seventh edition, 2003, were used for this analysis. On the basis of these rates, it is estimated that the pending projects would generate a combined total of 30,731 daily trips, with 796 trips occurring during the AM peak hour and 2,662 occurring during the PM peak hour. The type of land use, size, and trip estimates of each development is presented in **Table 22**. Cumulative Growth traffic volumes with the project are shown on **Figure 13.** The cumulative growth without the Project is assumed to be the same as the 2007 TIA, which basically includes an allowance of five more years of growth.

A comparison of Cumulative plus Project traffic in 2017 with the forecast in the 2007 TIA at the study intersections is tabulated in **Appendix I**. The current forecasts are about 13.2% less than the 2007 TIA forecasts for the entire network compared to the 2007 TIA Cumulative Plus Project scenario.

5.3 Cumulative Conditions Intersection Levels of Service

The results of the intersection level of service analysis under cumulative conditions are summarized in **Table 23**. The results show that all of the study intersections would operate at an acceptable LOS D or better under cumulative conditions without and with the project.

The peak-hour signal warrant analysis for cumulative conditions showed that the Caltrans peak-hour volume warrant would not be satisfied at any further study intersections than those identified under project conditions. The results of the signal warrant analysis are summarized in **Table 24**.

5.4 Cumulative Roadway Segment Analysis

Traffic volumes for cumulative conditions on each of the studied roadway segments were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the roadway system in the same manner as with the proposed project. The roadway segment analysis indicates that all studied roadway segments are projected to operate at

LOS D or better under cumulative no project conditions. The roadway segment analysis indicates that the addition of project traffic will cause two studied roadway segments to deteriorate to LOS E or worse under cumulative with project conditions. The degradation of roadway segment levels of service indicates the need for roadway widening. This is a reduction from the four additional segments that would need widening for Cumulative plus the previous Miravale III. **Tables 25** and **26** present the roadway segment analysis including a comparison between the 2007 TIA and the current analysis.

5.5 Cumulative Freeway Segment Analysis

Traffic volumes for cumulative conditions on each of the studied freeway segments were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the freeway system in the same manner as with the proposed project. The freeway segment analysis indicates that all freeway segments analyzed are projected to operate at LOS C or better under cumulative conditions without and with the project. Freeway segment analysis is presented in **Tables 27** and **28**.

5.6 Cumulative Freeway Ramp Analysis

Traffic volumes for cumulative conditions on each of the studied freeway ramps were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the freeway ramps in the same manner as with the proposed project. The freeway ramp analysis indicates that no further study ramps than those identified under project conditions would deteriorate in levels of service. Freeway ramp analyses are presented in **Tables 29** and **30**.

6. YEAR 2035 CONDITIONS

This chapter presents the long-term traffic impacts on the transportation system associated with the proposed development as well as land use growth and transportation improvements within the entire City of Soledad. The purpose of this analysis is to evaluate the long-term traffic impacts on the transportation system associated with the proposed development.

6.1 Year 2035 Traffic Conditions

Year 2035 traffic volumes on the Soledad street system are assumed to be equal with the 2030 forecasts in the 2007 TIA. This is valid because development is occurring at a much slower rate than anticipated in 2007. For example, Background projects, which included about 1131 dwelling units, are only about 50% complete. This is an absorption rate of about 50 dwelling units per year. Miravale III, which was proposed in 2007 to include over 4,200 dwelling units, was assumed to be complete in 10 years according to the "Traffic Mitigation Triggers and Impact Fees" section of "Chapter 4. Project Impacts and Mitigation Measures" of the 2007 TIA. Obviously, the project planning and preliminary design have not been completed. Assuming an absorption rate of 150 per year, the buildout of Background and Miravale III would take about 20 years.

US 101 volumes were developed by adding five years of straight line growth of 1% per year (5% total) in through traffic volumes on US 101 to the 2030 forecast by Omni Means Engineers & Planning Consultants. This growth rate is the same as the approximately 1% per year that occurred between 2005 and 2015. The traffic forecasts for Year 2030 were produced using the Association of Monterey Bay Area Governments (AMBAG) Regional Traffic Model available in 2007. The 2030 model includes land use growth and transportation improvements associated with buildout of all General Plans within the AMBAG region and 30 year through-traffic growth on major regional facilities. The AMBAG forecasts were made before the 2008 recession. It assumes growth rates higher than subsequently anticipated by AMBAG based on the substantially slower growth that occurred for the five years after 2008.

6.2 Model Land Use Adjustments

The 2005 Soledad General Plan is not accounted for in the land use assumptions contained in the AMBAG model. Additionally, the proposed Miramonte land uses plus the portion of Miravale III not developed as a part of Miramonte are of greater intensity than those assumed in the General Plan. Therefore, Omni Means and AMBAG adjusted the land uses contained in the model to include the adopted General Plan and Miramonte land uses. The roadway network contained in the AMBAG model for the City of Soledad was expanded to include the expansion of the street network to serve future land uses.

Year 2030 traffic volumes are presented in the memo produced by Omni Means, dated March 27, 2007 and contained in Appendix G of the 2007 TIA.

Though the Year 2035 forecasts reflected at least 18 years of development growth, the forecasts do not show significant increases in traffic volumes on US 101 and its ramps within the City of Soledad. The lack of volume increases on the regional facilities is primarily due to significant changes in land uses within Soledad that are being represented in the model. There is currently a very small amount of proposed land development besides residential within Soledad. As such, existing traffic volumes on the regional facilities reflect the unbalanced land uses within Soledad where trips originate within Soledad due to its substantial residential development and have destinations outside of Soledad in areas that contain industrial/commercial(employment) land uses. The model reflects the future addition of a significant amount of industrial/commercial (employment) within Soledad thus creating a more balanced land use scenario within the City of Soledad. The future balance of land uses will internalize many trips in Soledad. Additionally, several new roadways that will be constructed to serve future development will provide for enhanced connectivity to US 101, specifically the Gloria/Camphora interchange.

6.3 Miramonte Project Trips

Peak hour project trips associated with the proposed Miramonte project were also produced as part of the forecasts completed by Omni Means and are also shown in Appendix G of the 2007 TIA. The Year 2035 Miramonte project trips differ from those presented in Chapter 5 due to changes in land uses and the transportation system as described above. It is expected that the development of more balanced land uses (employment vs. housing) will internalize many of the project trips within Soledad. The near-term project trip assignment and analysis presented in the Chapter 5 depicts the existing unbalanced land use scenario. The Year 2035 projections and project trip assignment assumes a more balanced land use with project trip destinations within Soledad and the utilization of new and enhanced connections to US 101.

6.4 Year 2035 Level of Service Analysis

Level of service analysis was conducted for all freeway segments and interchange ramps within the City of Soledad. The traffic model is intended to provide projections for interregional facilities, and may project future forecasts that are significantly different than existing and expected future traffic volumes on city-level roadways. Therefore, no intersection analysis is presented. The freeway and ramp analysis consists of an evaluation of volume-to-capacity of each of the facilities.

6.5 Freeway Segment Analysis

Year 2035 conditions freeway segment analysis indicates that all freeway segments within the City of Soledad are projected to operate at LOS C or better conditions. The only exception is the southbound section of US 101 from Soledad Prison to Camphora-Gloria Road, which will decline slightly into LOS D. **Table 31** presents Year 2035 conditions on freeway segments. The table shows that the Miramonte project will add between 0 and 454 vehicles during the PM peak.

6.6 Interchange Ramp Analysis

Year 2035 conditions interchange ramp analysis indicates that all freeway ramps are projected to operate at LOS C or better conditions. **Table 32** presents Year 2035 interchange ramp conditions. The table shows that the Miramonte project will add between 0 and 454 vehicles to the identified ramps during the peak hours.

6.7 Year 2035 Freeway Facility Impacts and Mitigation Measures

Long-term traffic analysis of the proposed development levels for the project as well as long-term land use growth and transportation improvements within the entire City of Soledad indicate that the development levels will not have adverse impacts on the major regional facilities serving Soledad. Nonetheless, the proposed project as well as other development projects within the City of Soledad will be required to contribute to the regional development impact fee program as described under near-term project conditions.

7. CONCLUSIONS

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Soledad. The study included the analysis of AM and PM peak-hour traffic conditions for 19 unsignalized intersections, 11 roadway segments, and 11 freeway segments.

Based on the intersection level of service analysis, the project is projected to have an adverse impact on 8 of the study intersections. In addition, the peak-hour signal warrant analysis showed that the Caltrans peak-hour volume warrant would be satisfied at two additional study intersections under project conditions.

7.1 Project Impacts

The currently proposed Miramonte Specific Plan will result in less impacts than the previously proposed Miravale III Mixed-Use Development. No additional mitigations will be required for any development scenario. On the other hand, the current proposal will not be reduced enough in size to reduce the number of mitigations previously identified in the 2007 TIA. The only exception is intersection 17, the Gabilan Drive /West Street intersection, where a signal has already been installed. The project will have a proportionately smaller pro-rata contribution toward cumulative impact mitigations.

Intersection Impacts

Each of the proposed mitigation measures is presented below:

Several of the identified impacts involve significant physical improvements to not only intersection configurations, but also roadway widening. In some cases, the improvements identified below will be undesirable due to the need for right-of-way acquisition and/or create inconsistency with the City's General Plan. The evaluation of necessary mitigation measures revealed that several of the project impacts could be mitigated with the construction of an extension of Gabilan Drive that will provide an alternate route to US 101. The City's General Plan calls for the extension of Gabilan Drive to US 101 as a four-lane divided arterial. The Gabilan Drive extension will provide for a more direct route to the project area and alleviate identified impacts at several intersections. Therefore, it is recommended that rather than the project implementing undesirable roadway widening, that it instead contribute its fair-share towards the construction costs of the extension of Gabilan Drive to US 101 and widening of San Vicente Road from the project south to the Gabilan Drive extension.

(1) Moranda Road and US 101 NB Ramps - The necessary improvement to mitigate the project impact at this intersection will consist of the signalization of the intersection and

the addition of a second northbound left-turn lane, Moranda Road to northbound US 101. The implementation of these improvements will require that the northbound US 101 on-ramp be widened to receive the two lanes.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements created by the extension. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101. The volume of vehicles bound for northbound US 101 indicate the need for the reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(2) Moranda Road and Front Street - The improvement necessary to mitigate the project impact at this intersection will consist of the addition of a second northbound through lane and eastbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes. The roadway segment analysis also indicates the need for widening of Front Street between Moranda Road and San Vicente Road.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(3) San Vicente Road and Front Street - The improvement necessary to mitigate the project impact at this intersection will consist of the addition of two eastbound left-turn lanes and southbound free-right- turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes and northbound San Vicente Road be widened to three lanes. The improvements described above will require a significant amount of right-of-way acquisition and will not blend well with surrounding land uses.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(4) West Street and Front Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Front Street.

(5) Main Street and Front Street - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Front Street.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(9) Front Street and US 101 SB Ramps - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second lane on the off- ramp. The improvement will require the widening of southbound Front Street to two lanes. The volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(11) San Vicente Road and Market Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and widening of San Vicente Road to accommodate two lanes in each direction.

With the construction of the Gabilan Drive extension to US 101, the signalization of the intersection and widening of San Vicente Road would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(12) West Street and Market Street - The necessary improvements consist of the signalization of the intersection. With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(14) East Street and Market Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection.

(16) San Vicente Road and Gabilan Drive - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second westbound left- turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. The improvement will require the widening of southbound San Vicente Road to accommodate the dual left-turn lanes from Gabilan.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements.

Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(18) Main Street and Gabilan Drive - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(19) Andalucia Drive and Gabilan Drive - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

Freeway Segment Impacts

The results of the freeway segment analysis showed that all freeway segments are projected to operate at LOS C or better conditions with the addition of project traffic.

Freeway Ramp Impacts

The freeway ramp analysis indicates that two of the studied freeway ramps are projected to operate at LOS F under project conditions.

Moranda Road Interchange – Southbound US 101 off-ramp to Moranda Road (PM Peak Hour)

Moranda Road Interchange – Northbound US 101 on-ramp from Moranda Road (AM Peak Hour)

The existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes. The project traffic will worsen conditions on each of the ramps.

Traffic Mitigation Triggers

The large size of the proposed project will require that construction of the project be phased over the next ten years. As such, it is necessary to phase mitigation costs/fees along with the development of the project in order to ensure the financial feasibility of the initial development activities. The two major roadway improvements, Gabilan Extension and reconstruction of the US 101Moranda Road interchange, proposed as mitigation measures for the proposed project will require substantial funding that cannot be provided

at the initial stages of this development nor funded solely by Miramonte. Therefore, triggers were determined for the two major roadway improvement projects.

Gabilan Extension Development Level Trigger

Analysis was conducted at intersections and roadway segments along San Vicente Road to determine at what development level the extension of Gabilan Drive needed to be implemented to support project traffic. The traffic analysis indicated that the most critical point of constraint is the intersection of San Vicente Road and Front Street. The capacity of the eastbound left-turn movement, Front Street to San Vicente, during the PM peak hour is the critical movement at the intersection. Under background conditions, the intersection was shown to meet traffic signal warrants. Analysis indicates that with the installation of a signal at the intersection, acceptable levels of service, LOS D, will be maintained at the intersection with up to 50% of the project development traffic added to the roadway system. It should be noted, that though intersection levels of service may be acceptable, the number of left-turning vehicles under background conditions (545 during the PM peak hour) indicates the need for a second left-turn lane and subsequent widening of San Vicente Road to receive the two left-turn lanes. With 84% of the project development traffic added to the roadway system, an additional 350 trips would be added to the left-turn movement during the PM peak hour.

Based on roadway segment analysis conducted along San Vicente Road, LOS C operations along the roadway can be maintained with up to 100% of the project traffic added to the roadway system. However, as previously discussed, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and would create spill over onto adjacent streets, such as West Street, that provide an alternate access to San Vicente Road.

US 101 and Moranda Road Interchange Improvement Development Level Trigger

The existing freeway ramps at Moranda Road and US 101 are not designed to accommodate existing traffic volumes. The addition of project traffic, as well as background traffic, would compound the need for improvement of the ramps. The US 101 southbound off-ramp to Moranda Road will be the constraint on any further development. Analysis of ramp capacities indicate that LOS D operations can be maintained on the ramps with up to 42% of the project traffic added to the roadway system. Intersection level of service analysis indicates that with signalization of the ramp termini intersections, up to 84% of the project development traffic can be accommodated; However, even with the signalization of the intersections, the ramps would be inadequate to serve this level of development.

7.2 Traffic Impact Fees

Funding for the above described mitigation measures, as well as others described in the previous section, will be obtained via traffic impact fees imposed upon the project by both the City of Soledad and The Transportation Agency for Monterey County (TAMC). Mitigation of the project impacts would be in the form of payment of traffic impact fees estimated for the project.

Local Intersection Impacts

Since the project is one of many potential development projects that would contribute to the unacceptable operating conditions at the identified intersections, the project will make a fair-share contribution toward the cost of the necessary improvements. The intersection improvements necessary under project conditions will be funded by the City's forthcoming (May/June 2007) traffic impact fee program. Mitigation of the project impacts would be in the form of payment of City of Soledad's traffic impact fees estimated for the project.

Regional Transportation Impacts

The identified US 101/Moranda Road interchange improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway interchange reconstruction, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program. The payment of fees is considered mitigation for project impacts to freeway facilities. This contribution to the regional fund shall be in addition to the City of Soledad traffic fee.

7.3 Project Area Roadway System

Primary access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Each of the roadways will be extended into the project area with connections to a completely new roadway system of collectors and local roads that will serve each of the residential and commercial areas of the project. The proposed "S" curve on San Vicente Road near the southwest corner of the project will be able to be designed to operate acceptably.

Transit and Pedestrian Analysis

It can be assumed that some of the project trips could be made by transit. Assuming up to 3% transit mode share, which is probably the highest that could be expected, yields an estimate of 57 PM transit trips during each of the peak hours. This demand along with existing and other future demand for transit service will justify the need for expanding the existing transit system serving the City of Soledad.

Pedestrian facilities in the project area will consist primarily of sidewalks along the streets. Sidewalks will be provided along virtually all streets and at intersections within the project area. There are no existing bicycle facilities that can be extended into the project area. The residential uses of the project along with existing and future neighborhoods will justify the need for a continuous bicycle facility system throughout the City of Soledad. All pedestrian and bicycle lanes of the project should provide for future connection to existing sidewalks and streets.

7.4 Year 2035 Long-Term Analysis

Long-term traffic analysis of the proposed development levels for the project as well as long-term land use growth and transportation improvements within the entire Coty of Soledad indicate that the development levels will not have adverse impacts on the major regional facilities serving Soledad. Nonetheless, the proposed project as well as other development projects within the City of Soledad will be required to contribute to the regional development impact fee program as described under near-term project conditions.

Table 1
Unsignalized Intersection Level of Service Definition Based on Delay

Level of Service	Average Control Delay per Vehicle (sec.)
A	0 - 10
B	> 10 - 15
C	> 15 - 25
D	> 25 - 35
E	> 35 - 50
F	> 50

Source: Transportation Research Board, Highway Capacity Manual (Washington, D.C., 2000) pp. 17-2.

Table 2
Signalized Intersection Level of Service Definitions Based on Delay

Level of Service	Description	Average Control Delay Per Vehicle (Sec.)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	Less than 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.1 to 80.0
F	Operation with delays unacceptable to most drivers occurring due to oversaturation, poor progression, or very long cycle lengths.	Greater than 80.0

Source: Transportation Research Board, Highway Capacity Manual (Washington, D.C., 2000), p. 16-2

Table 3
Freeway Segment Levels of Service Based on Volume-to-Capacity Ratio

Level of Service	Description	V/C Ratio
A	Primarily free-flow operations. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	Less than 0.36
B	Reasonably free-flow conditions. The ability to maneuver within the traffic traffic stream is only slightly restricted.	0.36 - 0.54
C	Provides for stable operation, however flows approach the range in which small increases will cause a substantial deterioration in service. Freedom to maneuver withtin the traffic is noticeably restricted.	0.55 - 0.77
D	Borders on unstable flow. Small increases in flow cause substantial deterioration in service. Freedom to maneuver within the traffic stream is severely limited. Minor incidents can be expected to create substantial queuing, as the traffic stream has little space to absorb disruptions.	0.78 - 0.93
E	Operations are extremely unstable. Any incident can be expected to produce a serious breakdown with extensive queuing. Maneuverability within the traffic stream is extremely limited.	0.94 - 1.00
F	Forced or breakdown conditions. Such conditions generally exist within queues forming behind breakdown points.	Greater than 1.00

Notes:

1. Capacity of freeway lanes based on assumed capacity of 2,400 vphpl, as prescribed by the Highway Capacity Manual.
2. Existing data provided by Caltrans Traffic Census Program 2015, Route 101 District 5.
3. All results shown are for PM Peak Hour conditions.
4. Approved projects from 2007 report are approximately 55% built out. Thus, approved project trips represent 45% of approved project trips from 2007 report.

Notes:

1. Trip generation rates published by Institute of Transportation Engineers, "Trip Generation," 9th Edition, 2012.
2. Shopping center trip rates based ITE on fitted curve equation.
3. A reduction of 90% of commercial trips was applied to the residential trips to account for internal trips between residential and commercial land uses.

Notes:

1. TWSC = Two-way stop-controlled intersection.
2. AWSC = Four-way stop-controlled intersection.
3. Intersections 3 and 17 are now signalized. Existing conditions delay at Intersections 3 and 17 calculated using Traffix analysis software.
4. Intersections 7 and 8 are now signalized. Existing conditions delay at Intersections 7 and 8 referenced from the *Soledad Event Center TIA* , Mott MacDonald, June 2017.
5. Background conditions at Intersection 17 calculated using Traffix analysis software.
6. LOS below LOS standard shown highlighted in red.
7. Significant impacts are shown in **BOLD** and boxed.
8. *Italics* and **BOLD** indicates signal warrant met.
9. All results shown are for PM Peak Hour conditions.

Notes:

1. Capacity of freeway lanes based on assumed capacity of 2,400 vphpl, as prescribed by the Highway Capacity Manual.
2. Existing data provided by Caltrans Traffic Census Program 2015, Route 101 District 5.
3. All results shown are for PM Peak Hour conditions.
4. Approved projects from 2007 report are approximately 55% built out. Thus, approved project trips represent 45% of approved project trips from 2007 report.

Notes:

1. Capacity for diagonal ramps (1,830 vphpl) and loop ramps (1,500 vphpl) based on assumed capacity as prescribed by the Highway Capacity Manual
2. Existing data provided by Caltrans Traffic Census Program 2015, Route 101 District 5.
3. Existing ramp volume derived from peak hour turning movement counts.
4. Approved projects from 2007 report are approximately 55% built out. Thus, approved project trips represent 45% of approved project trips from 2007 report.

Notes:

1. Capacity of roadways based on assumed capacity of 1,200 vphpl and existing lanes on roadways.
2. **BOLD** indicates significant increase in roadway segment volume and LOS.
3. LOS below LOS standard shown highlighted in red.
4. All results shown are for PM Peak Hour conditions.

Notes:

1. Capacity of freeway lanes based on assumed capacity of 2,400 vphpl, as prescribed by the Highway Capacity Manual.
2. Existing data provided by Caltrans Traffic Census Program 2015, Route 101 District 5.
3. All results shown are for PM Peak Hour conditions.

Re: Miramonte Specific Plan Traffic Study Supplemental Analysis, Soledad, CA

Dear Sally,

This supplemental traffic analysis is in response to your request to review the latest version of the "Miravale Phase III Mixed-Use Development Transportation Impact Analysis," Hexagon Transportation Consultants, Inc., August 15, 2007. The "Miramonte Specific Plan Traffic Impact Analysis Administrative Draft Report," Keith Higgins, Traffic Engineer, August 11, 2017 was based on the "Miravale Phase III Mixed-Use Development Transportation Impact Analysis," Hexagon Transportation Consultants, Inc., May 4, 2007. The August 15, 2007 report analyzed a revised project and included two additional intersections. This supplemental analysis incorporates information added or revised in the more recent report.

1. Revised Project Description - The August 15, 2007 report analyzed a project that included 1,470 single family homes, 2,230 multi-family units, 500 senior housing units, 120 hotel rooms, and up to 275,000 s.f. of supporting retail. The project was estimated to generate 34,856 daily trips with 2,451 trips in the AM peak hour and 3,143 trips in the PM peak hour. This was a slight reduction (about 2% less) traffic than the project analyzed in the May 4, 2007 draft report. The May 4, 2007 project description included 1,470 single family homes, 2,430 multi-family units, 300 senior housing units, 120 hotel rooms, and up to 275,000 s.f. of supporting retail. It was estimated to generate 35,504 daily trips with 2,537 trips in the AM peak hour and 3,245 trips in the PM peak hour. The project traffic distribution percentages were the same in the two reports.

2. The impacts identified in the two reports for all development scenarios are virtually the same. The only exceptions are that the later report added the following intersections.
    a. Intersection 20 – Metz Road / Orchard Lane currently is controlled by stop signs on the Orchard Lane and 3rd Street approaches. The Orchard Lane connection between Metz Road and Gabilan Drive has not yet been complete. Traffic volumes on Orchard Lane and Metz Road are essentially the same as in 2007. No improvements are warranted at this intersection. No improvements will be warranted under Background Without Project conditions. However, a signal will be warranted under Cumulative Without Project Conditions. Improvements should also include left turn lanes on both Metz Road approaches. The Orchard Lane and Metz Road approaches are offset by about 80 feet so

2060 ROCKROSE COURT, GILROY, CA 95020
T 408.201.2752 KEITH@KEITHHIGGINSTE.COM WWW.KEITHHIGGINSTE.COM

should have separate signal phasing, which is known as split phasing. This was identified in the August,2007 report.

b. Intersection 21 - Front Street / Oak Street intersection, which was determined to meet signal warrants for existing (2007) conditions. A traffic signal is already in place at this intersection, so this mitigation is complete.
Front Street was also determined in both 2007 reports to require widening to four lanes from East Street to Nestles Road at Project Buildout, which would add a second through lane in each direction at the Oak Street intersection. No additional improvements would be required through Cumulative conditions.

3. The current study also continues to recommend widening Front Street to four lanes. However, a second alternative is to extend Los Coches Drive (also known as Pinnacles Parkway) and Palm Ave to Metz Road. This roadway would provide an additional access connecting the southern US 101 / Front Street interchange and Los Coches business park with the northern and western portions of Soledad. According to the "Soledad Business Park Traffic Impact Study," Yamabe & Horn Engineering, December 2014, Front Street would carry about 1,291 PM peak hour trips (714 northbound and 577 southbound) without Cumulative without Miramonte. Assuming about half of the Miramonte traffic using this section of Front Street via East Street would be diverted to the Los Coches Drive extension, about 269 PM peak hour trips (179 westbound and 90 westbound) would be added by Miramonte. It would then carry about 1,560 PM peak hour trips (893 westbound and 667 eastbound) in the Cumulative plus Project scenario. This would be a V/C ratio of 0.744 westbound and 0.555 eastbound. The Los Coches Drive Extension would preclude the need to widen Front Street to four lanes between East Street and Nestles Road.

856

No other information is included in the August 2007, report.

Please call me if you have any questions about the above information.

Thank you for the opportunity to assist you with this project,
Sincerely yours,

Keith B. Higgins, PE, TE

Re: Miramonte Specific Plan Conversion of Farmer's Community to Single-family or Apartments – Traffic Impact Evaluation, Soledad, CA

Dear Sally,

This supplemental traffic analysis is in response to your request to review the change in impacts and corresponding mitigations from the conversion of 400 Farmer's Community housing units to 314 Apartments or 314 Single Family Homes. The findings of this analysis are as follows.

A. CONVERSION TO APARTMENTS

1. The Farmer's Community housing portion of the project was proposed to include 400 units with 8 individuals per unit. As described in the *Miramonte Specific Plan Traffic Impact Analysis* included in the project's environmental document, this use would be estimated to generate about 651 daily trips with 117 in the PM peak hour. The Apartments conversion alternative that would include 314 Apartments is expected to generate trips at a rate comparable to the apartments already included in the project. The apartments are expected to generate about 2,088 daily trips with 195 in the PM peak hour. A 10% reduction in net trips are expected to be added to the street system external to the project. This accounts for trips to and from the proposed shopping center and other land uses in the project.

   As indicated on **Table 1**, this results in an increase for the total project from the previous estimate of 18,549 daily trips and 1,912 PM peak hour trips to 19,987 daily trips with 1,989 in the PM peak hour. Increases of about 1,437 daily trips and 77 PM peak hour trips are expected. The PM peak hour, which is the critical time period for traffic operations, would experience a 4.0% increase in project traffic throughout the study area. An increase of 77 PM peak hour trips is the equivalent to the PM peak hour traffic generated by about 77 single family homes, which generate about 1.00 PM peak hour trips per unit.

2. The effects in traffic operations are tabulated for the study intersections on **Table 2**, Soledad streets on **Table 3**, US 101 freeway segments on **Tables 4** and **5**, and US 101 freeway ramps on **Table 6**. **Table 12** includes a comparison of US 101 ramp volumes in 2040 for the project with a Farmer's Community, apartments and single-family homes. The increases in traffic throughout the study area will not result in any noticeable increase in traffic. No additional impacts have been identified. No additional mitigations are therefore recommended.

2060 ROCKROSE COURT, GILROY, CA 95020
T 408.201.2752 KEITH@KEITHHIGGINSTE.COM WWW.KEITHHIGGINSTE.COM

3. The *Miramonte Specific Plan Traffic Impact Analysis* estimated that the improvements at the Moranda Road / Front Street intersection would be warranted at 26% of project buildout. With the increase of 4% in project trip generation, this improvement will be warranted at 25% of project buildout.

   The Gabilan Drive Extension and modification of the northbound US 101 ramps was estimated to be warranted at 42% of project buildout. This will now be warranted at about 40% of project buildout.

B. CONVERSION TO SINGLE FAMILY HOMES

1. The Farmer's Community housing portion of the project was proposed to include 400 units with 8 individuals per unit. As described in the Miramonte Specific Plan Traffic Impact Analysis included in the project's environmental document, this use would be estimated to generate about 651 daily trips with 117 in the PM peak hour. The Single-Family Homes conversion alternative that would include 314 Single Family Homes is expected to generate trips at a rate comparable to the single-family homes already included in the project. The single-family homes are expected to generate about 2,989 daily trips with 314 in the PM peak hour. A 10% reduction in net trips are expected to be added to the street system external to the project. This accounts for trips to and from the proposed shopping center and other land uses in the project.

As indicated on **Table 1**, this results in an increase for the total project from the previous estimate of 18,549 daily trips and 1,912 PM peak hour trips to 20,888 daily trips with 2,109 in the PM peak hour. An increase of about 2,339 daily trips and 197 PM peak hour trips are expected. The PM peak hour, which is the critical time period for traffic, would experience a 10.3% increase in project traffic throughout the study area.

2. The effects in traffic operations are tabulated for the study intersections on **Table 7**, Soledad streets on **Table 8**, US 101 freeway segments on **Tables 9** and **10**, and US 101 freeway ramps on **Table 11**. **Table 12** includes a comparison of US 101 ramp volumes in 2040 for the project with a Farmer's Community, apartments and single-family homes. The increases in traffic throughout the study area will not result in an increase in traffic that would result in any additional traffic impacts. No additional mitigations are therefore recommended.

3. The Miramonte Specific Plan Traffic Impact Analysis estimated that the improvements at the Moranda Road / Front Street intersection would be warranted at 26% of project buildout. With the increase of 10.3% in project trip generation, this improvement will be warranted at 23.5% of project buildout.

The Gabilan Drive Extension and modification of the northbound US 101 ramps was estimated to be warranted at 42% of project buildout. This will now be warranted at about 38% of project buildout.

Please call me if you have any questions. Thank you for the opportunity to assist you with this project.

Sincerely yours,

Keith B. Higgins

Notes:

1. TWSC = Two-way stop-controlled intersection.
2. AWSC = Four-way stop-controlled intersection.
3. Existing conditions delay at Intersections 3 and 17 calculated using Traffix analysis software.
4. Existing conditions delay at Intersections 7 and 8 referenced from the *Soledad Event Center TIA* , Mott MacDonald, June 2017.
5. Background and background plus project conditions delay at Intersection 17 calculated using Traffix analysis software.
6. LOS below LOS standard shown highlighted in red.
7. Significant impacts are shown in **BOLD** and boxed.
8. *Italics* and **BOLD** indicates signal warrant met.

Notes:
1. Capacity of roadways based on assumed capacity of 1,200 vphpl and existing lanes on roadways.
2. **BOLD** indicates significant increase in roadway segment volume and LOS.
3. LOS below LOS standard shown highlighted in red.

RESOLUTION NO. 5431

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF SOLEDAD CERTIFYING AN ADDENDUM TO THE FINAL ENVIRONMENTAL IMPACT REPORT FOR THE MIRAVALE III SPECIFIC PLAN (SCH #2006081129)

WHEREAS, the City Council of the City of Soledad received an application for a proposed Specific Plan and related vesting tentative map, along with a request for a city Sphere of Influence boundary adjustment and annexation of territory within the plan boundaries of the Specific Plan. This application was for the phased development of a 920-acre area north and west of the current boundaries of the City of Soledad, including residential, commercial, recreational and public facility uses and supporting infrastructure (Miravale III Project); and

WHEREAS, the City of Soledad has adopted the role of lead agency for the purposes of conducting environmental review of the proposed Miravale III Project under the California Environmental Quality Act (CEQA), and, as lead agency, has caused to be prepared a draft environmental impact report for the Miravale III project in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and related Guidelines (Title 14 California Code of Regulations, Section 15000 et seq.); and

WHEREAS, the City prepared a Notice of Preparation (NOP) of an EIR, which was circulated for public comment between August 24, 2006, and September 22, 2006, and on September 7, 2006, the City conducted a public meeting to refine the scope of the draft EIR in accordance with Section 15082(c)(1) of the State CEQA Guidelines; and

WHEREAS, the Draft EIR on the Miravale III Project was prepared in response to the concerns raised during the NOP public comment period and at the public meeting, and in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and related Guidelines (Title 14 California Code of Regulations, Section 15000 et seq.), and the City's rules and procedures for the implementation of CEQA; and

WHEREAS, the Draft EIR was circulated for public review and comment for 45 days between November 4, 2008, and December 18, 2008, in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and related Guidelines (Title 14 California Code of Regulations, Section 15000 et seq.); and

WHEREAS, on December 11, 2008, the Planning Commission conducted a duly noticed public hearing to consider the Draft EIR, related staff report, and all public comments received; and

WHEREAS, a Final Environmental Impact Report ("FEIR") was prepared for the Miravale III Project in compliance with all requirements of CEQA, and which addressed all elements of the Miravale III Project and Miravale III Project approvals; and

WHEREAS, the FEIR for the Miravale III Project consists of the Draft EIR for the Miravale III project (SCH No. 2006081129), all public written comments submitted within the statutory circulation period for the DEIR, the written responses by the EIR author to all comments received, such additional oral and written comments and responses to those comments

as entered in the public hearing record on the matter, and an Errata Summary (all of which is incorporated herein by reference); and

WHEREAS, the FEIR determined that implementation of the Miravale III Project has the potential to generate significant environmental impacts that could be reduced to a less-than-significant level with full implementation of mitigation measures as recommended in the FEIR; and that potentially significant environmental impacts that can be reduced through the implementation of mitigation measures include the following: aesthetic resources (light and glare); agricultural resources (land use compatibility); geology, seismic hazards and soils; air quality (short-term construction emissions and nuisance odors); biological resources (e.g., habitat alteration, removal of vegetation and trees); cultural resources (historic structure); hydrology, drainage and water quality; local and regional transportation systems; noise; public services and facilities; utilities and infrastructure; health hazards; land use and planning; and population and housing; and

WHEREAS, the FEIR has also determined that implementation of the Miravale III Project, as proposed, has the potential to generate significant unavoidable environmental effects, and that such significant impacts which cannot be mitigated to a less-than-significant level with implementation of the Project are identified as follows: aesthetic resources (permanent alteration of visual character and scenic resources); agricultural resources (conversion of prime agricultural land and cancellation of Williamson Act contract); air quality (e.g., ozone precursor pollutants and greenhouse gas emissions); biological resources (potential impacts to Special-status wildlife species, impacts to wildlife habitat, wildlife corridors and nursery sites); land use and planning (conflicts with General Plan policies intended to avoid and/or mitigate environmental impacts to biological and aesthetic resources); noise; population and housing (significant portion of General Plan's projected growth and growth-inducement); regional transportation system (if necessary improvements are not implemented); and cumulative impacts to aesthetics, agricultural resources, air quality, biological resources, climate change and transportation and traffic; and

WHEREAS, on August 12, 2010, the Planning Commission, conducted a noticed public hearing to consider the adequacy of the FEIR and all comments received, and considered the Staff Report and oral report for the FEIR; and

WHEREAS, the Planning Commission determined that the FEIR for the Miravale III project met all CEQA requirements and constituted a complete, comprehensive and adequate documentation of all environmental effects and impacts of the project and included appropriate and effective implementation measures and alternatives to reduce identified significant impacts; and

WHEREAS, the Planning Commission, through adoption of Resolution 2010-14, resolved to recommend that the City Council of the City of Soledad hold a public hearing and, thereupon, certify the Final EIR for the Miravale III Specific Plan project; and

WHEREAS, on September 1, 2010, the City Council of the City of Soledad conducted a noticed public hearing to consider the FEIR, related staff report and oral presentation of the item, all public comments received, and the recommendation of the Planning Commission; and

WHEREAS, the City Council of the City of Soledad, exercised their independent judgment of the FEIR, herein incorporated by reference, and based upon the evidence presented herein and in the public record, determined that the proposed Miravale III Project was adequately analyzed in the Miravale III Specific Plan Environmental Impact Report; and

WHEREAS, the City Council of the City of Soledad found that the City complied with the requirements of the California Environmental Quality Act ("CEQA"), Public Resources Code Section 21000 *et seq.*, the CEQA Guidelines, California Code of Regulations, Title 14, Section 15000 *et seq.*; and

WHEREAS, The City Council of the City of Soledad resolved to certify the FEIR on September 1, 2010 and adopted Resolution 4564 (included hereto as **Exhibit A**) to do so finding that:

1. The FEIR for the Miravale III project has been completed in compliance with the requirements of CEQA and CEQA Guidelines; and

2. The FEIR for the Miravale III project has been reviewed and considered by the City Council prior to their action; and

3. The FEIR reflects the City of Soledad's independent judgment and analysis; and

WHEREAS, The City Council authorized City Staff to request LAFCO consider initiating a Sphere of Influence amendment for the area proposed by the project, but took no other actions to approve the project; and

WHEREAS, The City Council made recommendations to the City Staff and the applicant for revisions to the project that would make it consistent with the City's General Plan and the city's vision for the area before the City Council would further consider requested actions on the project; and

WHEREAS, The Applicant resubmitted project applications on July 26, 2016 for a revised and reduced size project (647 acres vs. the original project at 920 acres) (hereinafter "Miramonte Project") in an attempt to address the City Council's direction from 2010; and

WHEREAS, It has been determined by City Staff and recommended by the Planning Commission that due to the reduction in size of the project boundary by (273 acres) and density (by 2,081 residential units) that the 2010 certified FEIR is adequate to evaluate the proposed project with the addition of an Addendum, prepared in accordance with Section 15164 of the CEQA Guidelines, to describe the revised and reduced Miramonte Project and to clarify mitigations contained in the 2010 certified FEIR; and

WHEREAS, the City prepared an Addendum to the Miravale III Specific Plan FEIR (hereinafter EIR Addendum), attached hereto as **Exhibit B** and incorporated herein by reference; and

WHEREAS, the City, based on the conclusions of the EIR Addendum, has prepared CEQA findings and a Statement of Overriding Considerations attached hereto as **Exhibit C** and incorporated herein by reference; and

WHEREAS, the City of Soledad Planning Commission and City Council members held a joint duly noticed public workshop on September 14, 2017 to review the previous plan area and project history, past actions, the current plan area and project description, available documentation on the project, currently proposed actions, and to hear public testimony; and

WHEREAS, notice of time and place of hearing for the Planning Commission's deliberations recommending to the City Council adoption of the EIR Addendum was given in the manner prescribed by law and by the City; and

WHEREAS, the City of Soledad Planning Commission held duly-noticed public hearings on April 12, 2018, May 10, 2018, and June 14, 2018, during which it considered the EIR Addendum, CEQA Findings and Statement of Overriding Considerations, Staff Report and presentation, public testimony, and documentary evidence introduced and received during the public hearing along with the entire public record, including the environmental documentation; and,

WHEREAS, the City of Soledad City Council held a duly noticed public workshop on July 18, 2018, to revisit the previous plan area and project history, past actions, the current plan area and project description, available documentation on the project, currently proposed actions, Planning Commission actions and to hear public testimony; and

WHEREAS, the City Council held duly noticed public hearings on August 28, 2018, October 23, 2018 and November 7, 2018 at which it considered the Addendum, the Staff Report and presentation, public testimony, and documentary evidence introduced and received during the public hearing, including all environmental documentation, and

WHEREAS, notice of time and place of hearing for the City Council's deliberations to certify the EIR Addendum was given in the manner prescribed by law and by the City.

NOW THEREFORE BE IT RESOLVED that the City Council of the City of Soledad herby certifies the EIR Addendum and finds that:

1. The FEIR for the Miravale III project was certified by the City of Soledad City Council in 2010 and was completed in compliance with the requirements of CEQA and the CEQA Guidelines and is hereby incorporated by reference; and

2. The Miramonte Project proposed in 2016 is based on the direction of the City Council in 2010 to reduce the physical size and total density of the project; and

3. The environmental effects of the reduced scale Miramonte Project have been studied in the EIR Addendum and will not result in new significant environmental effects or a substantial increase in the severity of significant effects previously identified in the certified Miravale III Specific Plan FEIR; and

4. That certain mitigations in the certified Miravale III FEIR require clarification, and as such are so clarified in the EIR Addendum; and

5. The actions necessary to carry out approval of the project are within the scope of the projects analyzed in the Final EIR and EIR Addendum; and that the Final EIR and EIR Addendum are fully adequate to consider the Miramonte Project; and

6. Findings for the purposes of CEQA and a Statement of Overriding Considerations have been prepared and are attached hereto as **Exhibit C** and

7. Pursuant to CEQA Guidelines Section 15162 et. seq. the City of Soledad makes the following determinations:

   (1) Substantial changes are proposed in the project, but the changes did not require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

   (2) Substantial changes occur with respect to the circumstances under which the project is undertaken, but the change in circumstances does not require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; and

   (3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete, shows the following:

      (A) The project does not have significant effects that were not already discussed in the previous EIR;

      (B) The significant effects previously examined will not be substantially more severe than shown in the previous EIR;

      (C) There are no mitigation measures previously found not to be feasible that would in fact be feasible, that would substantially reduce one or more significant effects of the project, and are not declined by the project proponents;

      (D) No mitigation measures which are considerably different from those analyzed in the previous EIR and would substantially reduce one or more significant effects on the environment have been declined by the project proponent.

8. The EIR Addendum and the certified FEIR been reviewed and considered by the City Council; and

9. The EIR Addendum reflects the independent judgement and analysis of the City Council of the City of Soledad; and

10. The location and custodian of records for the basis of decision of the City of Soledad as Lead Agency approving the actions described herein is the Soledad City Clerk, City Hall, 248 Main Street, Soledad, CA 93960.

PASSED AND ADOPTED by the City Council of the City of Soledad a regular meeting duly noticed and held on the 7th day of November, 2018, by the following vote:

AYES, and in favor thereof, Councilmembers: Christopher Bourke, Mayor Pro Tem Alejandro Chavez, Carla Stewart and Mayor Fred Ledesma

Resolution No. 5431 - EXHIBIT A

RESOLUTION NO. 4564

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF SOLEDAD ANNOUNCING FINDINGS AND CERTIFYING THE FINAL ENVIRONMENTAL IMPACT REPORT FOR THE PROPOSED MIRAVALE III SPECIFIC PLAN

(SCH NO. 2006081129)

WHEREAS, the City Council of the City of Soledad has received an application initiated by Nader Agha. for a proposed Specific Plan and related vesting tentative map for the phased development for a 920-acre area north and west of the current boundaries of the City of Soledad, including residential, commercial, recreational and public facility uses and supporting infrastructure ("Project"); and

WHEREAS, the City of Soledad has adopted the role of lead agency for the purposes of conducting environmental review of the proposed Project under the California Environmental Quality Act (CEQA), and, as lead agency, has caused to be prepared a draft environmental impact report for the Miravale III Specific Plan accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and related Guidelines (Title 14 California Code of Regulations, Section 15000 et seq.); and

WHEREAS, the City prepared a Notice of Preparation (NOP) of an EIR, which was circulated for public comment between August 24, 2006, and September 22, 2006, and on September 7, 2006, the City conducted a public meeting to refine the scope of the draft EIR in accordance with Section 15082(c)(1) of the State CEQA Guidelines; and

WHEREAS, the Draft EIR on the Miravale III project was prepared in response to the concerns raised during the NOP public comment period and at the public meeting, and in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and related Guidelines (Title 14 California Code of Regulations, Section 15000 et seq.), and the City's rules and procedures for the implementation of CEQA; and

WHEREAS, the Draft EIR was circulated for public review and comment for 45 days between November 4, 2008, and December 18, 2008, in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.) and related Guidelines (Title 14 California Code of Regulations, Section 15000 et seq.); and

WHEREAS, on December 11, 2008, the Planning Commission conducted a duly noticed public hearing to consider the draft EIR, related staff report, and all public comments received; and

WHEREAS, a Final Environmental Impact Report ("FEIR") was prepared on the project in compliance with all requirements of CEQA, and which addresses all elements and phases of the Project and Project approvals as described above; and

WHEREAS, the FEIR for the Miravale III Project consists of the Draft EIR for the Miravale III Specific Plan (SCH No. 2006081129), all public written comments submitted within the statutory circulation period for the DEIR, the written responses by the EIR author to

all comments received, such additional oral and written comments and responses to those comments as entered in the public hearing record on the matter, and an Errata Summary (attached hereto\\as **Exhibit B**); and

WHEREAS, the FEIR has determined that implementation of the Project has the potential to generate significant environmental impacts that could be reduced to a less-than-significant level with full implementation of mitigation measures as recommended in the FEIR; and that the areas of potentially significant environmental impacts which can be reduced through mitigation measures include the following: aesthetic resources (light and glare); agricultural resources (land use compatibility); geology, seismic hazards and soils; air quality (short-term construction emissions and nuisance odors); biological resources (e.g., habitat alteration, removal of vegetation and trees); cultural resources (historic structure); hydrology, drainage and water quality; local and regional transportation systems; noise; public services and facilities; utilities and infrastructure; health hazards; land use and planning; and population and housing; and

WHEREAS, the FEIR has also determined that implementation of the Project, as proposed, has the potential to generate significant unavoidable environmental effects, and that such significant impacts which cannot be mitigated to a less-than-significant level with implementation of the Project are identified as follows: aesthetic resources (permanent alteration of visual character and scenic resources); agricultural resources (conversion of prime agricultural land and cancellation of Williamson Act contract); air quality (e.g., ozone precursor pollutants and greenhouse gas emissions); biological resources (potential impacts to Special-status wildlife species, impacts to wildlife habitat, wildlife corridors and nursery sites); land use and planning (conflicts with General Plan policies intended to avoid and/or mitigate environmental impacts to biological and aesthetic resources); noise; population and housing (significant portion of General Plan's projected growth and growth-inducement); regional transportation system (if necessary improvements are not implemented); and cumulative impacts to aesthetics, agricultural resources, air quality, biological resources, climate change and transportation and traffic; and

WHEREAS, on August 12, 2010, the Planning Commission, conducted a noticed public hearing to consider the adequacy of the Final EIR and all comments received, and considered the Staff Report and oral report for the Final EIR; and

WHEREAS, the Planning Commission has determined that the Final EIR for the Miravale III Specific Plan meets all CEQA requirements and constitutes a complete, comprehensive and adequate documentation of all environmental effects and impacts of the project and includes appropriate and effective implementation measures and alternatives to reduce identified significant impacts; and

WHEREAS, the Planning Commission, through adoption of Resolution 2010-14, resolved to recommend that the City Council of the City of Soledad hold a public hearing and, thereupon, certify the Final EIR for the Miravale III Specific Plan project, and

WHEREAS, on September 1, 2010, the City Council of the City of Soledad conducted a noticed public hearing to consider the Final EIR, related staff report and oral presentation of the item, all public comments received, and the recommendation of the Planning Commission; and

WHEREAS, the City Council of the City of Soledad, exercising their independent judgment of the FEIR, herein incorporated by reference, and based upon the evidence presented herein, has determined that the proposed Project has been adequately analyzed in the Miravale III Specific Plan Environmental Impact Report; and

WHEREAS, the City Council of the City of Soledad has found that the City has complied with the requirements of the California Environmental Quality Act ("CEQA"), Public Resources Code Section 21000 *et seq*., the CEQA Guidelines, California Code of Regulations, Title 14, Section 15000 *et seq*.; and

WHEREAS, the FEIR reflects the City's independent judgment and analysis and constitutes the FEIR for the Miravale III Specific Plan project.

NOW THEREFORE BE IT RESOLVED that the City Council of the City of Soledad certifies said FEIR and finds that:

1. The FEIR for the Miravale III Specific Plan has been completed in compliance with the requirements of CEQA and CEQA Guidelines; and

2. The FEIR for the Miravale III Specific Plan has been reviewed and considered by the City Council prior to their recommended action; and

3. The FEIR reflects the City of Soledad's independent judgment and analysis.

PASSED AND ADOPTED by the City Council of the City of Soledad a regular meeting duly held on the 1st day of September, 2010, by the following vote:

EXHIBIT C
City of Soledad Resolution No. 5431

FINDINGS REQUIRED BY THE CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) AND FACTS AND EVIDENCE IN SUPPORT OF FINDINGS FOR THE MIRAMONTE SPECIFIC PLAN AND VESTING TENTTIVE MAP PROJECT

Pursuant to the requirements of California Public Resources Code Section 21000 et seq. and Title 14, California Code of Regulations Section 15000 et seq. the City of Soledad as Lead Agency adopts the following findings, along with the facts and evidence upon which each finding is based.

I

BACKGROUND

The Miramonte Specific Plan and Tentative Map proposes a mixed-use development consisting of approximately 1,318 low-density residential units, 626 medium-density residential units, 134 senior housing units, 100,000 square feet of retail commercial space, 140 acres of open space, and 56 acres of parkland. The specific plan also includes a 35.9-acre residential study area that would provide an opportunity for additional parklands and/or an additional 314 low density residential or medium density residential lots, or a mix of both to provide flexibility as growth within the plan area proceeds. Land uses would be arranged around a core area of neighborhood commercial and higher density residential uses. Some parcels within the core area provide a mixed-use opportunity. The specific plan would allow a variety of residential types, including apartments, townhouses, and detached homes on small and large lots. The specific plan also would create opportunities for two elementary school sites, a fire/police substation, storm water facilities, paved pathways, a community park, and an unimproved trail system within the hillside open space.

A. The Final EIR, incorporated herein by reference, for the project consists of the Draft EIR for the Miravale III Subdivision and the Appendices to the Draft EIR prepared for the City of Soledad by Denise Duffy and Associates, dated October 2008; and the Final EIR for the Miravale III Subdivision prepared for the City of Soledad by Denise Duffy and Associates, dated August 10, 2010. The Final EIR analyzes and evaluates approval and development of a similar, but larger project in approximately the same location as the project described above. The final EIR was certified by the City Council at a duly-noticed public hearing September 1, 2010 (City of Soledad City Council Resolution No. 4564).

B. Addendum to the Miravale III Specific Plan EIR:

The Addendum to the Final EIR and Appendices (EIR Addendum), prepared for the City of Soledad by EMC Planning Group Inc., dated April 5, 2018, including Errata to the Addendum to the Miravale III Specific Plan EIR

(Exhibit D of City Council Resolution 5431), analyze and evaluate approval and development of the project as described above.

II

ENVIRONMENTAL EFFECTS OF THE PROJECT MITIGATED TO A LESS-THAN- SIGNIFICANT LEVEL

The following subsections briefly explain the manner in which each of the recommended mitigation measures have been incorporated or will be implemented into the project plans or conditions and supply the rationale for the finding that the following potential significant effects, as identified in the Miravale III Specific Plan EIR for the Miravale III Specific Plan project (Miravale III) and the Addendum to the Final EIR prepared for the Miramonte I Specific Plan and vesting tentative map project (Miramonte), have been reduced to an acceptable level.

The environmental effects of the project identified in the Final Miravale III EIR and clarified in the Addendum to the Miravale III EIR and mitigation measures required in the Miravale III Final EIR and clarified in the Addendum to the Miravale III EIR to mitigate each impact to a less-than-significant level are listed below.

(a) Aesthetics

Project Impact (Significant). Scenic Vistas. Implementation of the Miravale III project would introduce substantial new development, including structures of various heights and densities in visually sensitive areas above the 400-foot contour line of the Gabilan foothills. The project would change the natural visual character of open space hillside vistas to urban development. Increased visibility and intensity of development of the hillsides, in particular, above the 400-foot contour line, impacts the aesthetic value of the scenic vista.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Specifically, development consistent with the Miramonte specific plan reduces the size of the formerly proposed project boundary by 273 acres and the development density by 2,081 residential units. Scenic open space areas above the 400-foot contour are designated as Hillside/Open Space and are protected in perpetuity by a recorded conservation easement; thereby, eliminating potential new sources of light and glare from this area. Additionally, the following mitigation measures imposed upon the project mitigate impacts to less-than-significant levels:

Mitigation Measure

4.1-1. Building heights of all new structures shall adhere to the limits set forth in adopted Miramonte Specific Plan. Additionally, all new structures shall adhere to the applicable Development Standards as established in Section 2.4 of the Specific Plan. Prior to the issuance of any building permit for development within the Specific Plan area, the project applicant shall submit detailed plans, including elevations, site plans, and/or other documentation detailing compliance with applicable development standards, subject to the review and approval of the City of Soledad Chief Building Official.

4.1-4. Final design plans for proposed development shall utilize natural landforms and vegetation for screening structures, access roads, building foundations, cut and fill slopes, and exterior lighting. Roads, parking, and utilities shall be designed to minimize visual impacts. Prior to the issuance of any grading and/or building permit, the project applicant shall submit design-level drawings demonstrating compliance with this measure, subject to the review and approval of the City of Soledad Community and Economic Development Director.

4.1-5. The applicant shall provide landscape screening appropriate to the surrounding area in order to integrate the development with the existing natural landscape. Landscaping plans shall be submitted to the City of Soledad for review and approval prior to the issuance of any building or grading permit.

4.1-6. All buildings shall be designed with colors and materials that effectively blend the structures with the surrounding landscape. Building applications for new structures shall include color and material sample photo sheets and shall be approved by the City of Soledad, prior to the issuance of any building permit.

4.1-8. Land alterations within areas above the 400 foot elevation shall be minimized by keeping cuts and fills to a minimum, limiting grading to the smallest practical area of land, limiting land exposure to the shortest practical amount of time, replanting graded areas to insure establishment of plant cover before the next rainy season, and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur. Prior to the issuance of any grading permit, the project applicant shall submitted detailed grading plans consistent with the intent of this mitigation, subject to the review and approval of the City of Soledad.

Evidence. In addition to the reduced scale of the project, Mitigation Measures 4.1-1, 4.1-4 – 4.1-6, and 4.1-8 require adherence to specific design and development standards that minimize impacts to the aesthetic value of scenic vistas in the specific plan area. Design requirements include limits on grading and exposed soils and the use of vegetation screening, use of natural colors and materials, and utilization of natural landforms and vegetation to screen infrastructure improvements. As a condition of project approval the project applicant will be required to submit detailed plans, including elevations, site plans, landscape plans and/or other documentation detailing

compliance with applicable development standards, subject to the review and approval of the City of Soledad. As a condition of project approval, the developer will implement Mitigation Measures 4.1-1, 4.1-4 – 4.1-6, and 4.1-8, which will reduce the impact to a less-than-significant level.

Project Impact (Significant). Light and Glare. The proposed project would increase the intensity of development within an existing undeveloped area, and therefore the amount of artificial light produced by the site. The Highway 101 corridor and surrounding urban uses would be most affected by this increase in light and glare. Artificial lighting within the project site would impact nighttime views by altering the natural landscape and potentially lighting up the nighttime sky and reducing the visibility of astronomical features. The additional lighting within the project site, especially unshielded light, could result in spillover light that could impact surrounding land uses. Further, daytime glare could occur as light reflects off pavement, vehicles, rooftops, and structures.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Specifically, the following change in the size and intensity of development that would be allowed by the Miramonte Specific Plan mitigates the impact to a less-than-significant level: Development consistent with the Miramonte specific plan reduces the size of the formerly proposed project boundary by 273 acres and the development density by 2,081 residential units. Scenic open space areas above the 400-foot contour are designated as Hillside/Open Space and are protected in perpetuity by a recorded conservation easement; thereby, eliminating potential new sources of light and glare from this area. Additionally, the following mitigation measure imposed upon the project mitigates impacts to less-than-significant levels:

Mitigation Measures

4.1-14. All buildings shall be designed so that exterior lighting is down-lit and illuminates the intended area only. Building applications for new structures shall include an exterior lighting plan subject to approval of the Soledad Planning Department that includes the following requirements: 1) exterior lighting shall be directional; 2) glare from exterior lighting shall be adequately minimized; 3) the source of directional lighting shall not be directly visible; and 4) vegetative screening shall be considered, where appropriate, as a means of reducing development-related light and glare. The project applicant shall submit an exterior lighting plan to the City of Soledad Planning Department prior to the issuance of any building permit.

4.1-15. Ornamental lighting use for streets, parks, public open spaces, trails, bike paths, parking lots, and walkways shall utilize fixtures consisting of metal

halide with full cut-off luminaries or other form of similar fixtures in order to control light and glare. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1- 14 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department.

4.1-16. Light reduction and screening measures shall be required in order to reduce nighttime ambient light increases in the area. Lighting levels in commercial areas shall be kept as low as feasible and controlled to minimize operating time. Light sources shall be installed, so there is no light radiation above the horizontal plane (i.e., dark sky). Lighting shall be focused downward to prevent the splay of ambient light to other areas. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department.

Evidence. Mitigation Measures 4.1-14 through 4.1-16 require the applicant to prepare an exterior lighting plan that includes light minimization measures such as down-lit illumination, screening, and limited operational times that will directly reduce the amount of ambient light produced by the project. The applicant will be required to provide documentation that these measures have been incorporated into the site lighting. As a condition of project approval, the developer will implement Mitigation Measures 4.1-15 through 4.1-16 which will reduce potential lighting impacts to a less-than-significant level.

(b) Agricultural Resources

Project Impact (Significant) Land Use Conflicts-Land Use Compatibility. The proposed specific plan includes areas of single-family residential development that would be sited adjacent to agricultural lands located on the northern, eastern, and western boundary of the project site, which has the potential to cause significant land use compatibility impacts.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.2-1. Adequate buffer areas between urban and agricultural uses, including a minimum 50-foot buffer along the northern and eastern boundary of the project site and a 200-foot buffer along the western boundary, shall be incorporated into the proposed project. These buffers shall also be supplemented with physical barriers in areas where residential and commercial structures are to be located, as recommended by the Agricultural Resources Report contained in Appendix T-1 of the Miravale EIR. The 200-foot buffer along the project's western boundary may be reduced upon demonstration to the satisfaction of the City Council that other measures, including those recommended in Mitigation Measure 4.2-2, will adequately protect human health and safety and minimize potential conflicts, and provided that any such reduction shall not result in a buffer width of less than 100 feet consistent with the Permanent Agricultural Edge location identified in the 2016 Monterey County/City of Soledad Memorandum of Understanding. The County of Monterey Agricultural Commissioner shall be consulted regarding the adequacy of the proposed buffers and physical barriers and evidence of said consultation and recommendation shall be submitted to the city prior to approval of the tentative map. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report contained in the Miravale III EIR Appendix T-1, subject to the review and approval of the City of Soledad. All agricultural buffers, excluding public right-of-ways, shall be maintained by the Project Proponent and/or his/her successor(s) in interest through easements dedicated to the city or other entity until such time that the adjoining agricultural operation and use no longer exists

4.2-2. In order to ensure the adequacy of the agricultural buffer located along the western boundary of the project site, as required by Mitigation Measure 4.2-1, the project applicant shall submit a detailed landscape plan that includes vegetative screening in addition to physical barriers, such as fences, walls, or similar structures to protect human health and safety. One or more of the following options may also be used in combination with landscaping requirements to create an adequate buffer between the agricultural parcel property line and habitable structures within the Plan area:

a. Public or private road right-of-ways;

b. Landscaped islands and planting areas;

c. Recreational trail corridors; and/or

d. Placing dwellings in the rear portion of lots.

Prior to the recordation of any final map along the western project boundary, the agricultural buffer and any related easement shall be delineated on the final map in each phase, subject to the review and approval of the City of Soledad.

4.2-3. Prior to the issuance of any certificate of occupancy for residences adjacent to or in close proximity to the agricultural buffer along the western project boundary, the project applicant shall provide documentation demonstrating that adequate screening, landscaping and structural improvements have been installed and/or constructed within the buffer, subject to the review and approval of the City of Soledad Community Development Director.

4.2-5. Prior to the recordation of final map(s), the project applicant shall have recorded a right-to-farm notice on parcels adjacent to existing and on-going agricultural uses consistent with the requirements of the City of Soledad General Plan, subject to the review and approval of the City of Soledad City Council.

Evidence. Mitigation Measure 4.2-1 requires the implementation of buffers and physical barriers between urban and agricultural uses ensures adequate separation of residential/commercial and agricultural uses to lessen the likelihood of conflicts. To ensure the adequacy of the buffers and physical barriers, , and prior to the recordation of any final map, the project applicant must submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report consistent with the 2016 Monterey County/City of Soledad Memorandum of Understanding. Additionally, to further ensure the adequacy of the agricultural buffer located along the western boundary of the project site, mitigation measure 4.2-2 and 4.2-3 require the project applicant to submit a detailed landscape plan that includes vegetative screening in addition to physical barriers subject to review and approval by the city. These measures will ensure adequate separation of urban and agricultural uses thereby lessening the potential for land use conflicts. The Miramonte Specific Plan incorporates buffers along the northern and western boundary to implement this measure and prohibits residential development above the 400-foot elevation contour on the east side of the site in perpetuity through recorded conservation easement(s). Mitigation Measure 4.2-5 requires the developer to record right-to-farm notices on parcels adjacent to active agricultural operations. As a condition of project approval, the developer will implement Mitigation Measures 4.2-1 through 4.2-3, and Mitigation Measure 4.2-5, which reduces the potential for land use conflicts to a less-than-significant level.

(c) Air Quality

Project Impact (Significant) Construction Impacts-Construction Dust. Construction activities associated with implementation of the Specific Plan would include clearing, excavation and grading operations, construction vehicles traffic on unpaved ground, and wind blowing over exposed earth that would generate dust and particulate matter that could significantly degrade air quality.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously

identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.3-1. Grading activity shall be limited to a maximum of 2.5 acres daily, or, if grading cannot be limited to 2.5 acres daily. Prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall include the following measures as necessary to control visible dust:

- Water all active construction areas at least twice daily and more often during windy periods.
- Active areas adjacent to existing businesses should be kept damp at all times. If necessary, during windy periods, watering is to occur on all days of the week regardless of onsite activities.
- Cover all trucks hauling dirt, sand, or loose materials.
- Haul trucks shall maintain at least 2’0” of freeboard.
- Plant tree windbreaks on the windward perimeter of construction project if adjacent to open land.
- Install wheel washers at the entrance to construction sites for all exiting trucks.
- Upon completion of mass grading, pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.
- Sweep daily all paved access roads, parking areas and staging areas at construction sites.
- Sweep streets daily if visible soil material is deposited onto the adjacent roads.
- Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more).

- Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles.
- Limit traffic speeds on unpaved roads to 15 mph.
- Replant vegetation in disturbed areas as quickly as possible.
- Suspend excavation and grading activity when hourly-average winds exceed 15 mph and visible dust clouds cannot be contained within the site.

Evidence. If grading cannot be limited to 2.5 acres daily, Mitigation Measure 4.3-1 requires the project applicant or contractor to submit a construction dust mitigation plan to the City of Soledad Public Works Department which specifies the methods of dust control that would be utilized to ensure a direct reduction in visible dust during construction activities. This will ensure the reduction in dust and particulate matter that could significantly degrade air quality. As a condition of project approval, the applicant or contractor will implement Mitigation Measures 4.3-1 which will reduce the construction dust impacts to a less-than-significant level.

Project Impact. Construction Impacts-Diesel Emissions. Grading of the site would generate diesel particulate emissions from equipment exhaust during the construction period. Diesel particulate matter includes air contaminants that could impact sensitive receptors including residences that border the project site as well as new on-site residences constructed during earlier phases of the project.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.3-2a. Prior to each final map and use permits, the developer shall have a construction air quality report prepared by a qualified air quality consultant. The report shall be subject to review and approval by the City Planning Department and all recommendations shall be implemented during construction.

4.3-2b. In addition to the construction air quality analysis required in mitigation measure 4.3-2a, during construction the following shall be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment:

- The following equipment may be used without control devices or additional mitigation

  • No engineers greater than 750HP are used; and

  • Engines between 501 HP and 750 HP are model years 2002 and newer; and

  • Engines between 251 HP and 500 HP are model years 1996 or newer; and

  • Engines between 175 HP and 250 HP are model years 1985 or newer.

- The following equipment may be used without causing acute adverse health effects, if retrofitted with a catalyzed diesel particulate filter (CDPF):

  • Engines greater than 750 HP; if model year 2006 and newer; and

  • All engines less than 749 HP, regardless of model year.

- If construction equipment uses B99 biodiesel, no acute adverse health effect would be expected in the following:

  • Engines between 501 HP and 750 HP, if model years 2002 or newer; and

  • Engines between 250 HP and 500 HP, if model years 1996 and newer; and

  • Any engine less than 250 HP.

Evidence. Mitigation Measure 4.3-2a requires the developer to have a construction air quality report prepared by a qualified air quality consultant, subject to review and approval by the City. All recommendations contained within this report will be implemented during construction, which will directly reduce diesel particulate matter emissions. In addition to the construction air quality analysis required in mitigation measure 4.3-2a, Mitigation Measure 4.3-2b adds control measures for the type of equipment that can be utilized during construction to further reduce diesel particulate emissions from on-site construction equipment. Implementation of these measures will be required as a condition of project approval and will reduce impacts to a less-than-significant level.

(d) Biological Resources

Project Impact (Significant) Vegetation. The proposed project would cause temporary and permanent impacts to agricultural fields and to non-cultivated

grassland habitat below the 400-foot elevation contour Temporary impacts to vegetation include grubbing and grading associated with site preparation and permanent impacts include the conversion of open vegetated areas to urban housing through placement of structures, homes, roads, driveways, etc.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.4-2. Prior to the onset of construction, trees and vegetation not planned for removal shall be protected during construction. This shall include the use of exclusionary fencing of herbaceous and shrubby vegetation, such as hay bales and protective wood barriers for trees. Only certified weed-free straw shall be used to avoid the introduction of non-native, invasive species. A qualified biological monitor retained by the developer shall verify that adequate protective measures are in place prior to construction and remain intact throughout the construction phase.

4.4-3. Following construction, the disturbed areas that are proposed as parks and native landscaping areas shall be restored to pre-project contours and revegetated by the contractor using locally-occurring native species and native erosion control seed mix. Landscape plans for all such areas adjoining natural open space, including landscaped strips within right-of-ways, shall be reviewed by a qualified biologist to ensure that only native and non-invasive species are included in the planting palette and shall include a supplemental note and/or report by said biologist documenting compliance with this requirement. Landscape plans for other disturbed areas or for designated parks shall utilize native species to the extent feasible and avoid the use of all invasive species; such plans shall include a note from the licensed professional who prepared the plan(s) or from a qualified biologist retained by the developer documenting compliance with this requirement. Prior to the issuance of any grading and/or building permit, the project applicant shall submit landscape plans prepared by a licensed landscape architect for review and approval by the City of Soledad.

4.4-4. Prior to the onset of construction, protective fencing shall be placed so as to keep construction vehicles and personnel from impacting vegetation adjacent to the project site outside of work limits. A qualified biological monitor shall verify protection is in place prior to construction and remains intact throughout the construction phase.

4.4-5. Grading, excavating, and other activities that involve substantial soil disturbance shall be planned and carried out in consultation with a qualified hydrologist, engineer, or erosion control specialist retained by the developer, and shall utilize standard erosion control techniques to minimize erosion and sedimentation to native vegetation. Only natural-fiber, biodegradable meshes shall be used in erosion control mats, blankets, and straw or fiber wattles. "Photodegradable" and other plastic mesh products will not be used as these materials are known to persist in the environment, ensnaring and killing a variety of terrestrial wildlife species. A qualified biological monitor retained by the developer shall verify that erosion control measures are implemented and materials used are consistent with this measure and remain intact throughout the construction phase.

4.4-6. No construction equipment shall be serviced or fueled outside of designated staging areas. A qualified biological monitor retained by the developer shall verify that this measure is being implemented throughout the construction phase.

Evidence. Mitigation Measures 4.4-3 through 4.4-6 require the implementation of a variety of vegetation protection and restoration measures to ensure that vegetation is avoided when possible and restored to pre-project contours. The developer would be required to utilize locally-occurring native species and native erosion control seed mix for re-vegetation when impacts cannot be avoided. Prior to the issuance of any grading and/or building permit, the project applicant would be required to submit landscape plans prepared by a licensed landscape architect for review and approval by the City of Soledad. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measures 4.4-3 through 4.4-6 which will reduce potential impacts to vegetation to a less-than-significant level.

Project Impact (Potentially Significant). Special Status Plant Species-Lemmon's Jewelflower. The presence/absence of jewelflower could not be determined during site surveys, but appropriate habitat was present within project boundaries in the grassland areas. This species could be permanently impacted by grading and other activities associated with potential infrastructure improvements in the grassland areas that may result in the permanent loss or disturbance of individual jewelflower plants and/or jewelflower habitat.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition

to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.4-7. A qualified botanist shall be retained by the developer to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species. If no Lemmon's jewelflower is present, no additional mitigation is required. If Lemmon's jewelflower is present, a qualified biologist shall prepare a mitigation plan to be approved by CDFW prior to initiation of construction. The mitigation plan shall include a description of the special-status plant population(s), map depicting the location(s), and size of the population(s). If feasible, disturbance of the population(s) of Lemmon's jewelflower shall be avoided and its habitat protected utilizing methods developed in coordination with the CNPS and CDFW. Avoidance shall be confirmed by the City prior to approval of the first final map. If impacts to the Lemmon's jewelflower population(s) cannot be avoided, mitigation shall include preservation on- or off-site at a minimum 1:1 ratio (one plant preserved for each plant impacted), or restoration on- or off-site at a minimum 3:1 ratio (three plants planted for each plant impacted). The CNPS and CDFW shall be consulted to evaluate the suitability for transplanting the impacted species to suitable habitat within the identified and established preserve/restoration area. These details shall be described and included in the mitigation plan. Restoration and preservation strategies shall be developed in coordination with the CNPS and CDFW. The City of Soledad Planning Department shall be provided verification of CDFW concurrence and satisfaction prior to issuance of grading permits.

Evidence: Mitigation Measure 4.4-7 requires that in the event Lemmon's jewelflower is found on the site, a mitigation plan approved by CDFW would be required prior to initiation of construction. This plan would require the avoidance of jewelflower, or, in the event avoidance is infeasible, on or off-site preservation will be required to ensure that impacts to Lemmon's jewelflower are less than significant. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). A condition of approval requires implementation of this measure, which reduces the project impact to less than significant.

Project Impact (Significant). Wildlife Corridors, Movement, and Nurseries. An increase in the permanent on-site presence of homes, roads, and infrastructure may fragment habitats surrounding the project site, which would be a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously

identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.4-8. Areas above the 400 foot elevation contour shall be protected from development in perpetuity. Prior to recordation of the first final map, the applicant shall prepare and submit to the city for review and approval a draft conservation easement for all areas above the 400 foot elevation contour. The easement shall include the following:

a) prohibit recreational off-road vehicle use;

b) prohibit illegal discharge of firearms;

The conservation easement shall be reviewed and approved by the City of Soledad City Council prior to approval of the first final map. The developer shall record the conservation easement concurrent with recordation of the first final map or the onset of any other site disturbance.

Evidence. Mitigation Measure 4.4-8 requires recordation of a conservation easement prior to the recordation of the first final map, which limits the type of activities that can take place on the property above the 400 foot contour. The portion above the 400 foot contour is where the most sensitive habitat, wildlife corridors, and nurseries are most likely to occur. Limiting allowable uses and activities in this area will reduce the potential for impacts to wildlife corridors, movement, and nurseries. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measure 4.4-8, which will reduce potential impacts to vegetation to a less-than-significant level.

Project Impact (Significant). Special Status Wildlife Species-San Joaquin Kit Fox. Due to the presence of suitable habitat on and in proximity to the site, there is the possibility for the San Joaquin kit fox to occur on the site. Construction of the proposed project could result in unintended harassment, habitat removal, or direct mortality of this special status species which would be a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition

to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.4-9. The applicants shall enter into consultation with USFWS and CDFWCDFW and shall provide evidence of their compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act to the City prior to the issuance of building permits.

4.4-10. Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. The preconstruction surveys shall be conducted per Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to or During Ground Disturbance (USFWS 1999b), as updated. Potential dens (including man-made structures) and known dens shall be protected by minimum buffers of 50 feet and 100 feet, respectively. If an occupied or unoccupied natal den is detected, no construction shall occur for the Phase until the USFWS and CDFW have been contacted and authorization to proceed has been obtained by the applicant. Pre-construction surveys shall be conducted by a qualified biologist retained by the developer no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites.

In addition to pre-construction surveys, a qualified biologist retained by the developer, meeting the required qualifications described in the U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox. In the event that an active kit fox den is found, then the standard mitigation actions outlined in the USFWS Recommendations for SJKF, are recommended to avoid possible take of kit fox during future construction activities. These actions are general in nature; therefore, site specific strategies for the project site shall be based upon consultation with USFWS and CDFW, as stated above in Mitigation Measure 4.4-9. To reduce the risk of impacts during construction, the applicant shall, at a minimum, implement the following measures, unless directed otherwise through consultation with the USFWS and CDFW:

a) Restrict project-related vehicle speed to 20 mph on project roads.

b) Cover all excavated, steep-walled holes or construction trenches more than 2 feet deep at the close of each working day by plywood or similar materials or provide such holes or trenches with one or more escape ramps constructed of earth fill or wooden planks, inspect such holes or trenches for trapped San Joaquin kit fox prior to filling.

c) Inspect all construction pipes, culverts, or similar structures with a diameter of 4 inches or greater that are stored at a construction site

for one or more overnight periods for kit foxes before the pipe is subsequently buried, capped, or otherwise used or moved in any way.

d) Contain all food-related trash items in closed containers and remove food related trash at least once a week from the project site.

e) No firearms shall be allowed on the project site.

f) No pets shall be permitted on the project site.

g) Use of rodenticides and herbicides on the project site shall be restricted to the use of zinc phosphide, in cases where it is necessary to protect public health and safety.

h) A representative shall be appointed by the project proponent who will be the contact source for any employee or contractor who might inadvertently kill or injure a kit fox or who finds a dead, injured or entrapped individual. The representative will be identified during the employee education program. The representative's name and telephone number shall be provided to the Service.

i) An employee education program shall be conducted and shall consist of a brief presentation by persons knowledgeable in kit fox biology and legislative protection to explain endangered species concerns to contractors, their employees, and agency personnel involved in the project. The program shall include the following: a description of the San Joaquin kit fox and its habitat needs; a report of the occurrence of kit fox in the project area; an explanation of the status of the species and its protection under the Endangered Species Act; and a list of measures being taken to reduce impacts to the species during project construction and implementation. A fact sheet conveying this information shall be prepared for distribution to the above-mentioned people and anyone else who may enter the project site.

j) In the case of trapped animals, escape ramps or structures shall be installed immediately to allow the animal(s) to escape, or the Service shall be contacted for advice.

k) To the extent feasible, nighttime construction shall be avoided.

l) Include kit fox mitigation measures on project plans.

If active kit fox den sites are found and/or kit fox individuals are observed during the survey, the applicant will be required to comply with all mitigation actions required by USFWS and CDFW and the City shall monitor implementation of

those actions. Examples of mitigation actions that may be required by the regulatory agencies may include, but are not limited to:

- To the extent feasible, lot placement shall be situated to create wildlife corridors in protected open space to allow for kit fox and other wildlife movement through the site.

- Fencing shall surround the site to restrict kit fox movement into the development area; types of fencing (e.g. exclusionary or kit fox friendly) shall depend on the density of the development area.

- Speed bumps, rolls, or reduced speed limits shall be employed along project roads in or near open space areas to reduced likelihood of kit fox mortality by vehicle strikes.

- Street lighting shall be situated as to not spill into adjacent open space areas. The height and intensity of street lighting shall be designed to minimize indirect impacts to open space. Outdoor lighting for residential uses adjacent to open space and large lots shall also be restricted to CC&Rs to be low wattage (150 watts or less) and directed toward the residences to reduce effects on kit fox nocturnal activities.

Evidence. Mitigation Measure 4.4-9 requires the applicant to provide evidence of compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act to the City prior to the issuance of building permits. Further, Mitigation Measure 4.4-10 requires pre-construction surveys for kit fox dens. In the event that an active kit fox den is found the applicant will be required to consult with USFWS and CDFW and will implement site specific strategies determined sufficient based on this consultation. Implementation of these mitigation measures would reduce the likelihood of the harassment or mortality of kit fox in the event it is found to occur on the site, thereby reducing the potential for impacts. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measures 4.4-9 and 4.4-10 which will reduce potential impacts to the San Joaquin kit fox to a less-than-significant level.

Project Impact (Significant). Special Status Wildlife Species - American Badger. Due to the presence of suitable habitat within and in proximity to the site, there is the possibility for the American Badger to occur. Construction of the proposed project could result in unintended harassment, habitat removal, or direct mortality of this special status species which would be a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.4-11.The applicant shall retain a qualified biologist to conduct focused preconstruction surveys for potential American badger dens. These surveys shall be conducted no sooner than 2 weeks prior to the start of construction. Surveys for badger dens may be conducted at the same time as burrowing owl surveys. The results of the survey shall be submitted to the City prior to issuance of grading permit or initiation of grading for that phase of development on the site. Based on the results of these surveys, one or more of the following additional measures shall be implemented:

- If the qualified biologist determines that potential dens are inactive, the biologist shall excavate these dens by hand with a shovel to prevent badgers from re-using them during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities.

- If the qualified biologist determines the presence of active dens, the location of these dens shall be documented and reported to CDFW. Avoidance of active dens, particularly natal dens, is the preferred approach; Impacts to active badger dens shall be avoided by establishing a 100-meter exclusion zones around all active badger dens, within which construction related activities shall be prohibited until denning is complete and/or the den is abandoned. A qualified biologist shall monitor each den once per week in order to track the status and inform the project sponsor of when a den area has been abandoned.

- If the qualified biologist determines that avoidance of an active badger den is not feasible, the biologist shall coordinate with CDFW on the appropriate way to evict/exclude badgers from their dens. Please note that special consideration of natal dens is required given the low likelihood that excluded young would survive; a CDFW depredation permit would be required to disrupt a natal den. For non-natal dens, CDFW has permitted badgers to be gradually excluded from their dens by placement of soil, sticks, and debris at den entrances, incrementally increasing the degree of blockage over a

period of three to five days (please note that blockage cannot trap/entomb badgers). After the monitoring biologist determines that badgers have stopped using active dens within the project boundary, the dens shall be hand-excavated with a shovel to prevent re-use during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities. Please note that eviction of onsite badgers will reduce construction phase impacts to this species, but given the large home ranges and territoriality of this species, emigration to alternative habitats may not be feasible without inter/intra specific competition (energetic stress possibly resulting in mortality). CDFW may require that appropriate onsite or adjacent habitat be conserved to allow relocation of excluded animals within their home range.

Evidence. Mitigation Measure 4.4-11 requires focused preconstruction surveys to determine whether American badger are present on the site and provides for specific avoidance measures in the event badgers or badger dens are found. Implementation of these measures will ensure that the potential for harassment or mortality of badger individuals is reduced. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measure 4.4-11 which will reduce potential impacts to the American Badger to a less-than-significant level.

Project Impact (Significant). Special Status Bat Species. The Townsend's big-eared bat and pallid bat have the potential to occur on the project site. Construction of the proposed project could result in unintended harassment or direct mortality of this special status species which would be a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.4-12. A qualified bat specialist retained by the developer shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist). The results of the survey shall be

submitted to the City prior to issuance of grading permit or initiation of grading for that phase of development on the site. Based on the results of these surveys, one or more of the following additional measures shall be implemented:

- If it is determined that bats are not present at the site, no additional mitigation is required.
- If it is determined that bats are utilizing the site and would likely be impacted by the proposed project, preconstruction surveys shall be conducted no more than 30 days prior to modification, demolition, or removal of onsite buildings and/or any other occupied habitat.
- If no bat or bat sign are observed in the course of preconstruction surveys, then demolition/removal of buildings and/or construction initiation may proceed. If bat and/or bat sign are observed during the preconstruction surveys, the biologists shall determine if disturbance will jeopardize a maternity roost, or another type of roost (foraging, day, night).
- If a single bat and/or only adult bats are roosting, demolition or removal of the structure can proceed after the bats have been safely excluded from the roost. Exclusion techniques shall be determined by the biologist and depend on the type utilization; the biologist shall prepare a mitigation plan for provision of alternative habitat to be approved by CDFW and the City.
- If an active maternity roost is detected, work in the vicinity of the roost (and/or demolition of the structure) shall be postponed until the qualified biologist monitoring the roost(s) determines that the young have fledged and are no longer dependent on the roost. The monitor shall ensure that all bats have left the building and or area of disturbance prior to initiation of construction and/or demolition activities. If the biologist determines that disruption of a maternity roost cannot be avoided, a depredation permit would be required.

Evidence. Mitigation Measure 4.4-12 requires site surveys for special status bats prior to the issuance of a grading permit. If it is determined that bats are utilizing the site and would likely be impacted by the proposed project, preconstruction surveys will be required no more than 30 days prior to modification, demolition, or removal of onsite buildings and/or any other occupied habitat. Mitigation Measure 4.4-12 requires the implementation of exclusion or protection measures dependent upon what is found during the preconstruction survey. If during an active maternity roost is detected, work in the vicinity of the roost (and/or demolition of the structure) will be postponed until the qualified biologist monitoring the roost(s) determines that the young have fledged and are no longer dependent on the roost. In the event single bats or only adult bats are found to be roosted, Mitigation Measure 4.4-12 requires the implementation of

exclusion techniques. Mitigation Measure 4.4-12 ensures that the likelihood of the harassment or loss of bat individuals is minimized. The Miramonte Specific Plan incorporates portions of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measure 4.4-12 which will reduce potential impacts to special status bats to a less-than-significant level.

Project Impact (Significant). Special Status Wildlife Species - Salinas Pocket Mouse. The Salinas pocket mouse has the potential to occur on the project site. Construction of the proposed project could result in unintended harassment or direct mortality of this special status species which would be a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.4-13. The applicant shall contract a qualified biologist to coordinate with CDFW and prepare a mitigation and monitoring plan for the Salinas pocket mouse. The mitigation and monitoring plan shall include a description of the population and locations of known and potential habitat within the project site, mitigation to avoid and reduce impacts to the species, monitoring actions success criteria, and adaptive management measures if success criteria are not met. Verification of CDFW concurrence/approval shall be submitted to the City of Soledad prior to issuance of a grading permit for that phase of development of the site.

Evidence. Mitigation Measure 4.4-13 requires the applicant to contract with a qualified biologist to prepare a mitigation and monitoring plan for the Salinas pocket mouse in coordination with CDFW. This mitigation and monitoring plan must include measures to directly reduce impacts to the species. The applicant will be required to submit verification of CDFW's approval or concurrence of the plan to the City of Soledad prior to the issuance of a grading permit. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measure 4.4-13 which will reduce potential impacts to the Salinas pocket mouse to a less-than-significant level.

Project Impact (Significant). Special Status Bird Species. The following special-status bird species were observed foraging within or in proximity to the project site: Western burrowing owl, Northern harrier, white-tailed kite, loggerhead shrike, and Northern harrier. In addition, golden eagle, merlin, prairie-falcon, and horned lark were identified as having the potential to utilize the site for foraging. Harassment or mortality of these species would be a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.4-14. Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the Miravale site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist retained by the developer shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The survey shall conform to the CDFW 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied). If occupied burrows are found the avoidance and mitigation measures regarding burrowing owl identified in the Preliminary BA (June, 2008) may be implemented based on the results of these surveys..

4.4-15. If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist retained by the developer shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area. If active nests are found, a suitable construction buffer shall be established by a qualified biologist, and no work shall occur within that buffer until August 1 when young are assumed fledged. Alternatively, a qualified biologist can conduct weekly nest checks to gauge nestling/fledgling status, and construction may proceed once fledglings have dispersed from the nest provided written concurrence from CDFW. No active nest shall be impacted or removed without a depredation permit from CDFW, and a depredation permit will not be issued for impacts to Fully Protected Species such as the white-tailed

kite. For activities that occur outside of the nesting season (generally September 1 through February 14), preconstruction surveys are not required. If construction is initiated outside of the nesting season and continues into the nesting season, preconstruction surveys are required if construction will occur in areas not previously accessed and/or disturbed (>300 feet from previous construction activities).

4.4-16. A preconstruction survey shall be conducted by a qualified biologist retained by the developer no more than 14 days prior to modification, demolition, or removal of onsite buildings. If no owls or other nesting birds are observed, then demolition or removal may proceed. If barn owls (or any other nesting birds) are observed during the preconstruction survey, a determination shall be made on whether birds are roosting or nesting. If a single owl is roosting, demolition or removal of the structure can proceed after the owl has been persuaded to move from the roost area. Non-invasive techniques include light shining into the roost space for one or two nights and days. If barn owls (or other nesting avian species) are found to be actively nesting in the barn, work on or demolition of the structure shall be postponed until one of the following conditions have been met: 1) a qualified biologist monitoring the nest determines that the owls have abandoned the nest without any outside interference or 2) a qualified biologist monitoring the nest has determined that the young have fledged and are capable of relocating and using another roost site. Once the young have fledged, non-invasive techniques may be used to encourage the owls to leave the barn. Under either scenario, the monitor shall ensure that all owls have left the building prior to construction or demolition activities. The barn owl nesting period is typically between February 15 and July 15.

Evidence. Mitigation Measures 4.4-14 and 4.4-16 require a pre-construction survey for burrowing owls and other nesting birds. In the event burrowing owls, barn owls, or other nesting birds, or evidence of burrowing owls, barn owls, or other nesting birds are discovered, avoidance or mitigation in accordance with CDFW requirements must be implemented. Additionally, Mitigation Measure 4.4-15 requires preconstruction surveys if construction activities will initiate during avian nesting season and implementation of buffers, other avoidance measures, or mitigation techniques in accordance with CDFW requirements. Additionally, surveys must be conducted no more than 14 days prior to the modification, demolition, or removal of onsite buildings and appropriate protocol must be implemented in the event any are observed. Implementation of these measures would directly reduce the potential for harassment or mortality of special status birds. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measures 4.4-14 through 4.4-16 which will reduce potential impacts to vegetation to a less-than-significant level.

Project Impact (Significant). Special Status Reptile and Amphibian Species. California Red-Legged Frog, Western Spadefoot Coast Horned Lizard, Black Legless Lizard, and San Joaquin Coachwhip. The California red-legged frog, Western

spadefoot, Coast horned lizard, Black legless lizard, and San Joaquin coachwhip have the potential to occur on the project site, harassment or mortality of which would be a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.4-17. Protocol-level CRLF surveys (USFWS, August 2005) shall be completed by a qualified biologist retained by the developer at each aquatic resource present within project boundaries. Protocol-level CRLF surveys would likely detect Western spadefoot, if present (Western spadefoot toad surveys are also conducted at night during winter months, preferably January through March, and therefore, overlap CRLF survey protocol requirements). The results of the survey shall be submitted for the review and approval of the City, USFWS, and CDFW. If it is determined that CRLF are present, the applicant shall coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA (e.g., applying for an Incidental Take Permit [Section 10]) and implementing the permit requirements prior to issuance of a grading permit. Any mitigation and avoidance measures required by USFWS for potential impacts to CRLF (if applicable) would likewise reduce impacts to Western spadefoot given their overlapping habitat characteristics. If CRLF is not found on-site and USFWS concurs with a negative finding, no further mitigation is required.

If it is determined that spadefoot are present, but CRLF are not, coordination with CDFW regarding appropriate mitigation to reduce impacts to this species shall be required prior to issuance of a grading permit. If the Western spadefoot toad is not found on-site, no further mitigation is required.

4.4-18. The applicant shall retain a qualified biologist to conduct a construction monitoring program for black legless lizards, coast horned lizards, and San Joaquin coachwhip which shall include procedures for capture and release. The biologist shall remain on-site during initial grading activities to salvage and relocate these species that may be uncovered during earthmoving activities. Recovered individuals shall be placed in appropriate habitat outside of the project site in accordance with the memorandum of understanding with CDFW. The biologist shall walk alongside the grading equipment in each new area of disturbance and shall have the authority to halt construction temporarily if necessary to capture and relocate an individual. Any individual captured in the grading zone shall be relocated as soon as possible to adjacent

suitable habitat outside of the area of impact, pursuant to the memorandum of understanding.

4.4-19. The applicant shall conduct an employee education program for construction crew and City staff prior to construction activities. A biological monitor shall meet with the construction crew at the onset of construction to educate the construction crew on the following: 1) the appropriate access route in and out of the construction area; 2) how biological monitor will examine the area and agree upon a method which will ensure the safety of the monitor during such activities, 3) the special-status species that may be present; 4) the specific mitigation measures that will be incorporated into the construction effort; and 5) the proper procedures if a special-status animal or any other animal is encountered within the project site.

4.4-20. A representative shall be appointed by the City who will be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. The representative shall be legally responsible to notify USFWS and CDFW immediately in the event that "take" of any special-status wildlife species occurs. The representative shall be identified during the Employee Education Program and his/her contact information shall be provided to USFWS and CDFW. The representative will be present onsite every day and will be accessible to regulatory agency personnel

4.4-21. All food-related and other trash shall be disposed of in closed containers and removed from the project area at least once a week during the construction period or more often if trash is attracting avian or mammalian predators. Construction personnel shall not feed or otherwise attract wildlife to the area. These instructions to the construction crew shall be reiterated during the employee education program and during update meetings with construction crews. The instructions shall also be posted conspicuously on the site.

Evidence. Mitigation Measure 4.4-17, requires protocol-level surveys for CRLF (these surveys would also identify western spadefoot, if present, given their overlapping habitat characteristics). If it is determined that CRLF or Western spadefoot are present, the applicant must coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA which would reduce the potential for impacts to these species. Mitigation Measure 4.4-18 requires that a qualified biologist conduct a construction monitoring program for black legless lizards, coast horned lizards, and San Joaquin coachwhip which includes procedures for capture and release in accordance with the memorandum of understanding with CDFW which would reduce the potential for impacts to these species. Mitigation Measure 4.4-19 requires the applicant to conduct an employee education program for the construction crew to aid the crew in identifying and avoiding impacts to any special status species. Additionally, Mitigation Measure 4.4-20 requires a City appointed representative to be onsite every day to be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. Finally Mitigation Measure 4.4-21 requires the adequate disposal of trash so as to avoid attracting

mammalian or avian predators to the construction site thereby reducing the potential for them to be harmed. The Miramonte Specific Plan incorporates portions of these measures into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measures 4.4-17 through 4.4-21 which will reduce potential impacts to vegetation to a less-than-significant level.

Project Impact (Significant). Special Status Wildlife Species-California Tiger Salamander. No impacts to California tiger salamander were identified in the Miravale III EIR after coordination with USFWS regarding ESA jurisdiction over onsite hybrid/non-native tiger salamanders determined that tiger salamanders present at Miravale Pond 1 (onsite reservoir) are not subject to regulation under ESA and are therefore not within the regulatory jurisdiction of USFWS regulation. However, a CDFW report, A Status Review of the California Tiger Salamander, includes a recommendation that even hybrid populations with small amounts of native genetic material should not lose their protected status. Coordination with the CDFW is required to determine whether the CDFW will take jurisdiction over the on-site tiger salamander population.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.4-22. The applicant shall enter into consultation with CDFW to determine the appropriate course of action per the requirements of the state ESA regarding the protection of hybridized California tiger salamander populations and to determine if requirements include applying for an Incidental Take Permit (Section 2081). If an ITP is required, implement all corresponding permit requirements. No approval or issuance of a grading permit shall occur until such time as the consultation process is complete.

Evidence. The Miramonte Specific Plan incorporates much of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour, including the former agricultural pond, and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). Mitigation Measure 4.4-22 requires the applicant to consult with CDFW to determine appropriate measures to be taken for the protection of hybridized California tiger salamander populations in accordance with the ESA. This will ensure protection of the California

tiger salamander in the event CDFW takes jurisdiction over the on-site hybridized populations. As a condition of project approval, the developer will implement Mitigation Measures 4.4-21 which will reduce potential impacts to the California tiger salamander to a less-than-significant level.

(e) Cultural Resources

Project Impact (Significant). Historic Resources. The proposed project requires the removal of the historically significant Morris Lorentzen House in order to accommodate project development, which is a potentially significant impact due to the historical significance of structure.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project mitigates impacts to less-than-significant levels:

Mitigation Measure

4.5-1. Relocation of House. The historic Morris Lorentzen House on site shall be relocated in accordance with the relocation plan prior to the issuance of a grading permit for development of the storm water detention basin in the southwest corner of the Specific Plan area. The project proponent shall ensure that the design and implementation of the relocation project is consistent with the Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, and the Mitigation Monitoring and Reporting Plan (MMRP) for the project. Prior to recordation of the final map, the project applicant shall submit a relocation plan prepared by a qualified professional in accordance with the general recommendations of Moving Historic Buildings, a publication of the National Park Service, to the City of Soledad for review and approval. The relocation plan shall discusses planning, research, and recording prior to the move. In addition, the relocation plan shall identify siting, foundation construction, building reassembly, and restoration work after a successful move. See John Obed Curtis, Moving Historic Buildings, Heritage Conservation and Recreation Service, Publication No. 9, US Department of Interior (1979) for further details. Prior to the relocation, the applicant shall provide verification of compliance with mitigation measure 4.5-2 to the City of Soledad Community Development Department Director for review and approval. In addition, the structure shall be relocated prior to the issuance of any building and/or grading permit for development within the Specific Plan area.

4.5-2. Protective Measures. The project proponent shall develop and implement measures to protect the character-defining features of the Lorentzen House building from damage by the relocation project. The features include, but are not limited to scale, massing, and layout of the house, as well as siding and wood frame fenestration.

Protective measures shall be prepared by a qualified professional in accordance with the Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, Moving Historic Buildings, and the MMRP for the project. Prior to the relocation of the structure, the applicant shall submit evidence from a qualified professional demonstrating that protective measures have been implemented, subject to the review and approval of the City of Soledad.

4.5-3. Repair of Inadvertent Damage. The project proponent shall ensure that any inadvertent damage to the character-defining features of the Morris Lorentzen House resulting from the rehabilitation project is repaired in accordance with the Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992) and California Historical Building Code. A qualified professional shall be consulted prior to any repairs. The condition of the building shall be photographed as part of the proposed recordation document and/or video documentation, prior to the start of the relocation, and this will help to establish the baseline condition for assessing inadvertent damage. The project developer shall submit detailed documentation prepared by a qualified professional demonstrating that all repairs have been completed in accordance with applicable standards prior to the issuance of the first certificate of occupancy.

4.5-4. Professional Standards. All activities regarding historical architectural resources and historic preservation carried out as part of this project shall be carried out by or under the direct supervision of persons meeting, at a minimum, the Secretary of the Interior’s professional qualifications standards (48 FR 44738-9) in these disciplines. Prior to the relocation of the Lorentzen House, the applicant shall submit evidence to the City of Soledad demonstrating compliance with this measure.

4.5-5 Monitoring. The mitigation measures applying to the relocation of the Lorentzen House shall be set forth in a Mitigation Monitoring and Reporting Program (MMRP) for the project. The MMRP will guide project-specific mitigation, monitoring, and/or reporting programs for various aspects of mitigation monitoring, reporting, and enforcement in order to ensure full compliance with the conditions of project approval.

4.5-6. Coordination. The project proponent shall coordinate with and inform interested parties, including, but not limited to the Soledad Historical Society and the Monterey County Historical Society, regarding the status of its compliance with the mitigation measures set forth in the MMRP.

4.5-7. Recordation to Historic American Building Survey standards. Prior to the start of any project work, the project proponent shall ensure that the Lorentzen House property is recorded and documented in accordance with the Level II recordation standards of the Historic American Building Survey/Historic American Engineering Record (HABS/HAER) program. This level of recordation would include:

- Archival reproduction of any existing historic images of the property and grounds;
- Archival reproduction of any existing maps, sketches, or drawings of the house;
- Production of measured architectural plans and drawings;
- Production of large-format photographs of exterior and interior views of the house, and exterior views of the house and current setting, including relationship to non-eligible outbuildings; and
- Narrative history and description of the property (based on the narrative provided in the Seavey (2006) evaluation of the property, and the Monterey County survey(s) of similar properties.

The original archival set of recordation documents and photograph prints will be submitted to the Soledad Historical Society (or its designee), and archival quality photocopies of the documentation set will be provided to the following interested parties and local repositories: the Monterey County Historical Society; the Monterey County Libraries (Soledad and Salinas branches), and the UC Santa Cruz Library Special Collections Department. The project proponent would ensure that this recordation documentation was prepared prior to carrying out any other treatment and would make the content of the document available for other mitigation measures, such as the preparation of interpretive material.

Evidence. Mitigation Measures 4.5-1 through 4.5-3 require the applicant to submit a relocation plan for the Lorentzen House prepared by a qualified professional. The applicant will be required to protect the character-defining features of the building from damage during relocation and ensure that any inadvertent damage to the character-defining features resulting from the relocation is repaired in accordance with the applicable standards. Mitigation Measure 4.5-4 through 4.5-7 require the implementation of professional qualification standards, coordination with interested parties, and recordation and documentation to Historic American Building Survey standards. The relocation, protection from damage, repair of any inadvertent damage, strict adherence to professional standards, and recordation of the Lorentzen house would all serve to reduce impacts to this historic resource. As a condition of project approval, the developer will implement Mitigation Measures 4.5-1 through 4.5-7 which will reduce potential impacts to the historic resource to a less-than-significant level.

Project Impact (Significant) Archeological Resources and Human Remains. A records search and field reconnaissance conducted for the Miravale III EIR found no evidence of archaeological resources or human remains on the project site. However, it was determined that construction of the project could potentially uncover unknown buried archaeological resources or human remains during excavation and clearing activities which is a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.5-8. In order to ensure that project-impacts to potentially unknown resources are avoided, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring.

If archaeological resources or human remains are accidentally discovered during construction, work shall be halted within 150 feet (50 meters) of the find until a qualified professional archaeologist can evaluate it. Work shall not recommence until the project archaeologist has submitted documentation to the City indicating that discovered resources have been adequately salvaged and no further resources have been identified within the area of disturbance.

4.5-9 In order to ensure that the proposed project does not impact buried human remains during project construction, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If buried human remains are encountered during construction, work in that area must halt and the archaeologist and the coroner immediately notified. If the remains are determined to be Native American, then the NAHC must be notified within 24 hours as required by Public Resources Code 5097. The NAHC will notify designated Most Likely Descendants who will provide recommendations for the treatment of the remains within 48 hours. The NAHC will mediate any disputes regarding treatment of remains. Work shall not recommence until the project archaeologist, coroner, and NAHC, submit documentation to the City indicating that buried human remains have been adequately salvaged and no further remains have been identified within the area of disturbance.

Evidence. Mitigation Measure 4.5-8 reduces the potential for impacts to previously undiscovered archaeological resources by requiring that all work halt within 150 feet of any archaeological discovery. A qualified archaeologist will be required to evaluate the resource and recommend appropriate actions to adequately salvage the resource before construction can reconvene. Additionally Mitigation Measure 4.5-9 reduces the potential for impacts to human remains by requiring an on-site monitor

during construction and that construction work cease in the area in the event of a discovery. If the remains are determined to be Native American, then the NAHC must be notified and the designated Most Likely Descendants contacted to provide recommendations for the treatment of the remains. Work will not be allowed to recommence until the project archaeologist, coroner, and NAHC, submit documentation to the City indicating that buried human remains have been adequately salvaged and no further remains have been identified within the area of disturbance. This will avoid impacts to previously undiscovered human remains. The Miramonte Specific Plan incorporates a portion of this measure into the land use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s). As a condition of project approval, the developer will implement Mitigation Measures 4.5-8 and 4.5-9 which will reduce potential impacts to archaeological resources and human remains to a less-than-significant level.

(f) Geology and Soils

Project Impact (Significant) Seismic Hazards. The Reliz-Rinconada fault zone, passes within six miles of the project site and the San Andreas Fault Zone passes within 12 miles of the site. The project could be exposed to potential adverse effects from strong seismic ground shaking that may result in damage to proposed structures which would represent a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.6-1. To minimize the potential effects from strong seismic ground shaking on project components, a project-specific geotechnical analysis shall be performed by a registered professional engineer with geotechnical expertise, and all recommendations shall be incorporated into final design plans. Prior to the issuance of any building and/or grading permit, the project applicant shall submit a project-specific geotechnical analysis to the City of Soledad Public Works Director for review and approval. The project engineer shall develop project-level plans based upon and in response to the observations and recommendations made in the project specific geotechnical analysis.

4.6-2. In order to minimize potential seismic-related hazards, the project engineer shall incorporate the seismic shaking analysis contained within the Geologic Hazards Investigation Update prepared by Nolan Associates (September 2006) into project design. Prior to the issuance of any building and/or grading permits, the project applicant shall submit design level plans demonstrating that the recommendations of the Geologic Hazards Investigation Update are incorporated into project design, subject to the review and approval of the City of Soledad Public Works Director. In addition, all structures shall be designed to the most current standards of the California Building Code, at a minimum.

4.6-3. In order to minimize seismic-related hazards to new public facilities, a site-specific probabilistic seismic hazards assessment shall be incorporated into the design of any schools, hospitals, fire or police stations, or any other critical facilities planned for the project site. An individual assessment shall be performed for each site by an engineering geologist. Prior to the issuance of any grading and/or building permit for new public facilities, including but not limited to new schools, hospitals, and fire or police stations, a probabilistic seismic hazards assessments shall be prepared and submitted to the Soledad Unified School District and City of Soledad Building Officials for review and approval.

Evidence. Mitigation Measures 4.6-1 and 4.6-2 minimize the potential impacts from strong seismic ground shaking on the project by requiring adherence to the most current standards of the California Building Code and incorporation of recommendations in the project-specific geotechnical analysis into final design plans. The applicant will be required to submit design level plans demonstrating incorporation of these recommendations. Additionally, Mitigation Measure 4.6-3 requires site-specific probabilistic seismic hazards assessments for public facilities for review and approval by the city. Development consistent with the Miramonte Specific Plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units; thereby reducing exposures to seismic risks, but not to a less than significant level. As a condition of project approval, the developer will implement Mitigation Measures 4.6-1 through 4.6-3, which will reduce potential impacts related to seismic ground shaking to a less-than-significant level.

Project Impact (Significant). Erosion. Site preparation and construction activities would disturb soil and increase its susceptibility to erosion. Removal of soils by wind or water can undermine buildings, roads, and other developments, as well as contribute siltation of local streams or water bodies. Moreover, removal of existing mature eucalyptus and other tree species along San Vicente Road could result in additional erosion-related impacts. Implementation of the project could result in substantial soil erosion or loss of topsoil which is a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously

identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.1-7. A site-specific geotechnical report shall be prepared for new development on hillsides in order to ensure that the development will not cause or worsen natural hazards, such as erosion and sedimentation, and will minimize risk to life and property from slope failure, landslides, and flooding. The report shall include erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas. Prior to the issuance of any grading and/or building permit for new development within the hillside portions of the project site, the project applicant shall submit a geotechnical report prepared by a qualified professional to the City of Soledad Department of Public Works for review and approval. The site-specific geotechnical report shall identify feasible recommendations and avoidance measures to minimize potential impacts.

4.6-4. In order to reduce wind and water erosion on the project site, an erosion control plan and Storm Water Pollution Prevention Plan (SWPPP) shall be prepared for the site preparation, construction, and post-construction periods. The erosion control plan shall incorporate best management practices consistent with the requirements of the National Pollution Discharge Elimination System (NPDES). The erosion component of the plan must at least meet the requirements of SWPPP required by the California State Water Resources Control Board. If earth disturbing activities are proposed between October 15 and April 15, these activities shall be restricted per the requirements of Soledad Municipal Code Chapter 15.08. Prior to the issuance of any permit, the project proponent shall submit detailed plans to the satisfaction of the City of Soledad Public Works Director. The components of the erosion control plan and SWPPP shall be monitored for effectiveness by City of Soledad Public Works. The following measures shall be implemented where deemed appropriate by the Director of Public Works to control erosion:

1. Keep construction machinery off of established vegetation as much as possible, especially the vegetation on the upwind side of the construction site;

2. Establish specific access routes at the planning phase of the project, and limits of grading prior to development, which should be strictly observed;

3. Utilize mechanical measures (i.e. walls from sand bags and/or wooden slat or fabric fences) to reduce sand movement;

4. Immediate revegetation (plus the use of temporary stabilizing sprays), to keep sand movement to a minimum; and

5. For larger-scale construction, fabric or wooden slat fences should be placed around the construction location to reduce sand movement.

4.6-5. Areas disturbed by grading shall be stabilized with adequate landscaping vegetative cover. A revegetation and landscaping plan shall be prepared by a landscape architect with experience in working with the type of soils that are characteristic of the site, subject to the review and approval of the City of Soledad. Prior to the issuance of any certificate of occupancy and concurrent with project construction, disturbed areas shall be re-vegetated consistent with the City approved landscaping plan. All project replanting shall be continually monitored by the landscape architect for a duration of three years. The landscape architect shall submit annual monitoring reports to the City of Soledad after each successive year detailing the success of landscaping. Success shall be based on an 80% survival rate. If it is determined that the replanting has not been successful, additional replanting shall be required by the City of Soledad.

4.6-6. All drainage from improved surfaces shall be captured by closed pipe or lined ditches and carried to neighborhood storm sewers or natural drainages. At no time shall any concentrated discharge be allowed to spill directly onto the ground adjacent to structures or to fall directly onto steep slopes. The control of runoff is essential for erosion control and prevention of water ponding against foundations and other improvements. The project shall implement Low Impact Development (LID) strategies, as determined appropriate by the City of Soledad consistent with the requirements of Mitigation Measure 4.8-4. LID strategies shall be implemented in connection with the proposed project to the satisfaction of the City of Soledad. Prior to the issuance of any grading and/or building permit for each new structure, the project applicant shall submit an erosion control plan consistent with this measure, subject to the review and approval of the City of Soledad Public Works Director.

Evidence. Mitigation Measure 4.1-7 requires a site-specific geotechnical report for any development of infrastructure in the hillside portion of the project site which will include erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas, to decrease susceptibility to erosion. Mitigation Measure 4.6-4 requires preparation of an erosion control plan and Storm Water Pollution Prevention Plan that incorporate Best Management Practices consistent with National Pollution Discharge Elimination Requirements to minimize wind and water erosion during site preparation, construction, and post-construction periods. Additionally, Mitigation Measure 4.6-5 requires preparation and implementation of a revegetation and landscaping plan that will ensure stabilization of disturbed areas to minimize the erosion potential. Mitigation Measure 4.6-6 requires that all drainage is captured and carried to neighborhood storm sewers or natural drainages to control runoff which effectively minimizes the potential for erosion. Development consistent with the Miramonte specific plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units. The Miramonte Specific Plan incorporates portions of

these measures into the land use map, and reduces risks of erosion by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s), but not to a less-than-significant level. As a condition of project approval, the developer will implement Mitigation Measures 4.5-8 and 4.5-9 which will reduce potential erosional impacts to a less-than-significant level.

Project Impact (Significant). Liquefaction. The project will increase risks of seismically-induced liquefaction that could lead to human harm and property damage, which is a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.6-7. In order to reduce the risk of localized liquefaction and collapse, and allow for adequate foundation and structural fill support, grading plans shall be consistent with a project-specific geotechnical analysis. The project geotechnical engineer shall prepare a quantitative assessment of liquefaction and seismically-induced settlement potential for the project as part of a comprehensive site geotechnical evaluation, prior to the recordation of each final map. Measures to ensure adequate reduction of risk to standard acceptable levels in accordance with standard geotechnical practice shall be incorporated into project design and specifications, subject to the review and approval of the City of Soledad Public Works Director.

Evidence. Mitigation Measure 4.6-7 requires preparation of project specific geotechnical analyses. The project geotechnical engineer will prepare a quantitative assessment of liquefaction and seismically-induced settlement potential for the project as part of a comprehensive site geotechnical evaluation, prior to the recordation of each final map. The analyses will include recommendations to reduce the risk of localized liquefaction and collapse, and allow for adequate foundation and structural fill support that must be incorporated into project design and specifications and will be subject to review by the City. Development consistent with the Miramonte Specific Plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units; thereby reducing impacts related to seismicity, but not to a less than significant level. As a condition of project approval, the developer will implement Mitigation Measures 4.6-7, which will reduce potential seismically-induced liquefaction impacts to a less-than-significant level.

Project Impact (Significant). Landslide, Debris Flow, Lateral Spreading. Development within certain areas of the project site could be exposed to potential adverse effects from on- or off-site landslides and lateral spreading, or debris flow from hillside areas that may result in human harm or property damage, which is a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.6-8. Portions of the project located within debris flow hazard areas as described in the Geological Hazards Investigation Update prepared by Nolan Associates (September 2006, see pg. 14) shall incorporate design measures to mitigate this hazard to acceptable levels in accordance with standard engineering practices. Suitable measures include: 1) Restricting development to outside these areas; 2) Constructing artificial channels or diversion walls, designed to divert fluidized debris away from habitable structures; or 3) Constructing impact walls, designed to withstand anticipated debris flow volumes and velocities. An engineering geologist shall be retained by the developer to provide site-specific geologic design criteria for debris flow hazard areas once the final project plans are available. Diversion or retaining structures shall be designed based on recommendations by a geotechnical engineer, subject to review and approval of the City of Soledad Public Works Director. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate design measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad Public Works Director.

Evidence. Mitigation Measure 4.6-8 requires development within portions of the project site in the debris flow hazard area to incorporate design measures, such as impact or diversion walls, that minimize the landslide, debris flow, and lateral spreading impacts to acceptable levels in accordance with standard engineering practices. Prior to the recordation of each final map, the project applicant must submit evidence demonstrating that adequate design measures have been incorporated consistent with engineering standards. Development consistent with the Miramonte specific plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units. Scenic open space areas above the 400-foot contour are designated as Hillside/Open Space and are protected in perpetuity by a recorded conservation easement; thereby reducing risks of debris flow from development in this area. The Miramonte Specific Plan incorporates a portion of this measure into the land

use map, by prohibiting residential development above the 400-foot elevation contour and requiring the preservation of hillside areas in perpetuity through recorded conservation easement(s).As a condition of project approval, the developer will implement Mitigation Measures 4.6-8, which will reduce the impacts of human harm and property damage resulting from potential landslide, debris flow, and lateral spreading to a less-than-significant level.

Project Impact (Significant). Expansive Soils. The project could be exposed to localized soil expansion, which would result in increased risks of property damage, and is a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant soils impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level: Mitigation Measure

4.6-9. In order to minimize potential hazards associated with expansive soils, the expansion potential of site soils shall be evaluated as part of a site-specific geotechnical study to ensure hazards are reduced to an acceptable level of geotechnical and Uniform Building Code practices. The recommendations of a geotechnical engineer for mitigating soil shrink-swell hazards shall be incorporated into project design. These measures may include replacement of soil with engineered backfill or treatment of expansive soil with lime. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad Building Official.

Evidence. Mitigation Measure 4.6-9 requires the evaluation of project site soils for expansion potential as part of a site specific geotechnical study. The recommendations of the geotechnical engineer for mitigating soil shrink-swell hazards shall be incorporated into project design to ensure hazards are reduced to an acceptable level of geotechnical and Uniform Building Code practices. The applicant will be required to submit evidence that these recommendation shave been incorporated prior to the recordation of each final map. Development consistent with the Miramonte Specific Plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units; thereby reducing the risks of damage from development on unstable soils, but not to a less-than-significant level. As a condition of project approval, the developer will implement Mitigation Measure 4.6-9, which will reduce potential impacts related to expansive soils to a less-than-significant level.

(g) Hazards and Hazardous Materials

Project Impact (Significant). Hazardous Materials/Waste Sites. According to a Phase 1 Assessment, portions of the project site may be contaminated with hazardous materials from agricultural use and within existing buildings that may contain lead paint and asbestos, the release of which could pose a health risk to construction workers and future uses on the site.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant hazards or hazardous materials effects or substantially increase the severity of previously identified significant effects. Changes in hazards or hazardous materials related circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant hazards or hazardous materials impacts than were identified for the original project. The following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.7-1. Prior to the recordation of any final map, the applicant shall arrange for a Phase II Environmental Site Assessment to be prepared which assesses the localized environmental conditions described in the Phase I Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. (September 2006) and identifies any required remedial actions for the safe handling, removal and special needs for any identified materials. The Phase II Assessment shall include site-specific soil sampling in order to assess the presence of potential soil contamination and to identify special needs for soil handling during construction/grading activities and possible health risks to construction workers and future users consistent with the recommendations contained in the Phase 1 Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. If results indicate the presence of such materials in excess of screening levels for residential, educational, or commercial uses, a Remediation Plan shall be prepared and implemented to reduce contamination to acceptable levels, maintain the safety of construction workers and future site users, and assure proper management of contaminated materials in accordance with state and local regulatory requirements. This plan shall be subject to review and approval by the Monterey County Division of Environmental Health. Prior to the issuance of any building and/or grading permit, the project applicant shall submit evidence to the City of Soledad for review and approval demonstrating compliance with this measure.

4.7-2. Prior to commencement of new development, the applicant shall obtain approval of a Soil Management Plan from the Monterey County Division of

Environmental Health, which establishes management practices for handling potentially contaminated soil, if encountered, during construction/grading activities.

4.7-3. In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to survey all buildings to be demolished for asbestos under the National Emissions Standards for Hazardous Air Pollutants (NESHAP) guidelines prior to demolition activities. If asbestos containing material is documented within existing on-site structures, all potentially friable asbestos shall be removed prior to building demolition in accordance with NESHAP guidelines. Prior to the issuance of a grading permit, the project proponent shall submit written evidence to the City of Soledad Director of Public Work from a qualified consultant demonstrating that all asbestos containing material, if present, has been properly removed and demolition activities may proceed without exposing construction personnel to asbestos related-hazards.

4.7-4. In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to conduct a lead-based paint survey to evaluate the presence of lead-based paint residues in site soils adjacent to existing structures. If lead contamination is documented on-site, all peeling and flaking lead-based paint shall be removed and properly disposed of separately from building debris, in accordance with current Department of Toxic Substances Control policies. In addition, all existing structures within the Specific Plan area that were constructed prior to 1978 shall be surveyed for lead-based paint prior to any demolition activities. Prior to the issuance of any permit for each phase of development, the project proponent shall submit written evidence from a qualified consultant documenting that all lead-based paint hazards have been appropriately removed and disposed of in accordance with industry standards, subject to the review and approval of the City of Soledad.

Evidence. Mitigation Measure 4.7-1 requires the preparation of a Phase II Environmental Site Assessment which will identify any required remedial actions for the safe handling, removal and special needs for hazardous materials. If results indicate the presence of hazardous materials in excess of screening levels for residential, educational, or commercial uses, a Remediation Plan will be prepared and implemented to reduce contamination to acceptable levels, maintain the safety of construction workers and future site users, and assure proper management of contaminated materials in accordance with state and local regulatory requirements. Mitigation Measure 4.7-2 requires the applicant to obtain approval of a Soil Management Plan from the Monterey County Division of Environmental Health, which establishes management practices for handling potentially contaminated soil to prevent exposure to hazardous contaminates. Mitigation Measure 4.7-3 and 4.7-4 require surveys for lead paint and asbestos and adherence to applicable standards and guidelines in the event a qualified consultant determines lead or asbestos is present. This would ensure construction personnel are not exposed to asbestos or lead related-hazards. As a condition of project approval, the developer will implement Mitigation Measures 4.7-1 through 4.7-4, which will reduce potential impacts related to hazardous materials sites to a less-than-significant level.

Project Impact (Significant). Hazardous Materials Use. The proposed specific plan includes areas of residential development that would be sited adjacent to agricultural lands located on the northern, eastern, and western boundaries of the project site, which has the potential to result exposure of residents to hazardous chemicals.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant hazards or hazardous materials effects or substantially increase the severity of previously identified significant effects. Changes in hazards or hazardous materials related circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant hazards or hazardous materials impacts than were identified for the original project. Specifically, Mitigation Measures 4.2-1 and 4.2-3, previously discussed, imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Evidence. Mitigation Measure 4.2-1 requires the implementation of buffers and physical barriers between urban and agricultural uses ensures adequate separation of residential/commercial and agricultural uses which effectively lessens the likelihood of urban exposure to hazardous chemicals. To ensure the adequacy of the buffers and physical barriers, the applicant will be required to consult with the County of Monterey Agricultural Commissioner, and prior to the recordation of any final map, the project applicant must submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report. Additionally, to further ensure the adequacy of the agricultural buffer located along the western boundary of the project site, mitigation measure 4.2-2 requires the project applicant to submit a detailed landscape plan that includes vegetative screening in addition to physical barriers subject to review and approval by the city. These measures will ensure adequate separation of urban and agricultural uses thereby lessening the potential for the exposure of urban uses to hazardous chemicals. As a condition of project approval, the developer will implement Mitigation Measures 4.2-1 and 4.2-2 which will reduce the impacts related to hazardous materials use to a less-than-significant level.

Project Impact (Significant). Surface Water/Water Quality. Construction and operation of the project could impact water quality through soil erosion during grading activities, loss of topsoil, and surface runoff from the proposed development. This is a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were

identified for the original project. Therefore, the proposed project would not result in new significant effects or substantially increase the severity of previously identified significant effects. Specifically, Mitigation Measure 4.6-4 through 4.6-6 previously discussed in Geology and Soils, and the following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.8-1. In order to ensure that impacts are minimized to the greatest extent feasible, the project shall be designed to meet the BMP standards for operational phase storm water runoff and to maintain the onsite BMPs. The project shall implement BMPs to manage water quality by providing onsite runoff treatment in line with the onsite infiltration system. Prior to the issuance of any grading and/or building permit, the project applicant shall prepare a Construction Management Plan that identifies a designated construction supervisor responsible for the continued implementation of all construction BMPs throughout the duration of project construction. Moreover, the Construction Management Plan shall also identify BMPs to be implemented as part of the project and associated monitoring activities. The Construction Management Plan shall be reviewed by the City of Soledad Public Works Director prior to the issuance of any permit.

4.8-2. In order to prevent excess sediment buildup and ensure that all percolation basins are functioning in accordance with project-level plans, the project applicant and/or his/her successor in interest, shall be responsible for the long-term maintenance of all percolation basins and related private on-site drainage improvements and shall enter into a maintenance agreement with the city to provide for such. Bi-annually a basin maintenance report shall be submitted to the City of Soledad, subject to the review and approval of the Public Works Director, demonstrating that the basins have been properly maintained and cleaned in accordance with City standards. Prior to the issuance of any building and/or grading permit, the project applicant shall enter into a maintenance agreement with the City of Soledad.

Evidence. Mitigation Measure 4.8-1 requires a project design that incorporates BMP standards to minimize impacts to water quality through onsite runoff treatment. A Construction Management Plan will be required that identifies a designated construction supervisor who will be responsible for the continued implementation of BMPs. Further, Mitigation Measure 4.8-2 requires a bi-annual maintenance report to be submitted to the City that demonstrates that basins have been properly maintained and cleaned in accordance with City standards to prevent excess sediment buildup and ensure that all percolation basins are functioning to prevent degradation to water quality. As a condition of project approval, the developer will implement Mitigation Measures 4.8-1 and 4.8-2 which will reduce the potential for water quality impacts to a less-than-significant level.

Project Impact (Significant). Surface Drainage/Flooding. While the proposed project site is not located within a flood hazard area as delineated by the Federal Emergency Management Agency (FEMA), localized flooding had been known to occur within the project area and surrounding vicinity. Development of the proposed project, which would result in substantial grading, changes in topography, and increased impervious surface area, has the potential to result in on- and off-site flooding due to changes in existing drainage patterns.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Therefore, the proposed project would not result in new significant effects or substantially increase the severity of previously identified significant effects. Specifically, the following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure 4.8-3. In order to ensure that project-induced impacts related to changes in the existing drainage patterns on the project site are minimized, the project applicant shall submit design-level improvement plans for the project's storm drainage collection and retention system. Final design-level plans shall be supported with appropriate soils and hydrologic data in accordance with City standards.

All conveyance system and retention basins shall be sized and designed in accordance with applicable City design standards and shall be appropriately sized to accommodate stormwater runoff from a 100-year storm event. Prior to the recordation of any final map, the project applicant shall submit all design-level plans and supporting details to the City of Soledad Director of Public Works for review and approval prior to approval of the first final map.

4.8-4. In order to reduce the extent of impervious surface coverage and potential drainage/flooding impacts, Low Impact Development (LID) strategies shall be implementedin connection with all new development within the Specific Plan area. Prior to the approval of any final map or approval of any permit for all new residential and commercial developments, the project applicant shall submit design-level site and improvement plans to the City of Soledad for review and approval that incorporate the latest approved LID strategies and best practices as applicable, and the City shall ensure that all such measures are included in the final design plans, Examples of various LID strategies and best practices are identified as follows:

- Where possible, landscaped or grassy areas shall be substituted for impervious surfaces such as building entrances, traffic medians, etc.

- Permeable pavements such as crushed aggregate, turf lock or unit pavers shall be used in place of sidewalks, walkways or overflow parking areas wherever design allows.

- Bioretention cells, planter boxes, vegetated swales, and greenbelt buffer zones shall be implemented in landscaped areas, along streets and sidewalks wherever feasible.

- Final roadway design and street layout shall convey surface water runoff and storm flows into bioretention cells and swales.

- All commercial development shall integrate bioretention into parking lot islands or filter strips distributed throughout the parking area(s) to infiltrate, store and/or convey stormwater flows. In addition, permeable paving materials shall be used in spillover parking that is used only for peak demand periods.

- Alternative types of LID strategies and measures may also be approved provided evidence is submitted to the City of Soledad by a qualified engineer at the developer's expense demonstrating that said strategies will achieve the intended result of this mitigation measure. Alternative strategies must be reviewed and approved by the Public Works Director.

Evidence. Mitigation Measure 4.8-3 requires the applicant to submit design-level improvement plans for the project's storm drainage collection and retention system sized and designed in accordance with applicable City design standards to ensure that project-induced impacts related to changes in the existing drainage patterns on the project site are minimized. Additionally, Mitigation Measure 4.8-4 requires the project applicant to submit design-level site and improvement plans to the City that incorporate the latest approved LID strategies and best practices prior to the approval of any final map or approval of any permit. As a condition of project approval, the developer will implement Mitigation Measures 4.8-3 and 4.8-4 which will reduce the potential for surface drainage and flooding impacts to a less-than-significant level.

(h) Noise

Project Impact (Significant). Future residential uses developed at the project site would be exposed to exterior noise levels greater than 65 dBA CNEL and interior noise exceeding 45 dBA, which exceed the exterior and interior noise and land use compatibility standards presented in the city's general plan. This is a significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts, and no new information has been identified

that indicates the proposed project would have new or more significant impacts than were identified for the original project. Therefore, the proposed project would not result in new significant effects or substantially increase the severity of previously identified significant effects. Specifically, the following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure 4.10-1. Maintain a sufficient buffer distance between transportation noise sources and future sensitive land uses, or alternatively, construct noise barriers or create acoustically shielded outdoor use areas utilizing buildings to achieve noise exposures of 65 dBA CNEL or less. The specific determination of necessary mitigation measures will be included in the detailed acoustical analyses (see mitigation 4.10-2) and design of future development projects within the specific plan area. Results of the analysis shall be subject to review and approval by the City Planning Department and all recommendations shall be incorporated into the project prior to each final map and issuance of a building permit.

4.10-2. Retain a qualified Acoustical Specialist to prepare for City review and approval a detailed acoustical analysis of interior noise reduction requirements and specifications for all projects proposed within the 60 dBA CNEL contours of area roadways, in accordance with State and City standards. Interior noise levels must be maintained at or below 45 dBA CNEL. Building sound insulation requirements will include forced air mechanical ventilation in noise environments exceeding 60 dBA CNEL. Special building construction techniques (e.g., sound-rated windows and building facade treatments) may be required where exterior noise levels exceed 65 dBA CNEL. These treatments include, but are not limited to, sound rated windows and doors, sound rated exterior wall assemblies, and acoustical caulking. The specific determination of required treatments will be made on a unit-by-unit basis during project design. Results of the analysis, including the description of the necessary noise control treatments, will be submitted to the City along with the building plans prior to issuance of a building permit. Feasible construction techniques such as these would adequately reduce interior noise levels to 45 Ldn or lower.

4.10-3. Non-residential development will comply with the noise standards established in the Zoning Code at existing or planned residential properties in the vicinity. Further, efforts will be made to reduce noise impacts through the following planning and equipment requirements:

- Development site planning will be utilized in a fashion that reduces noise impacts for nearby sensitive receptors, such as by not locating loading docks near residences.

- Equipment screens, fan silencers, and engine mufflers will be used to mitigate noise from mechanical equipment.

- Noise barriers will be used to control noise from parking and vehicle circulation.

- For recreational uses, proposed development must consider impacts upon the adjacent residential development in terms of the location of active sports areas, their orientation on the site, whether or not lights are included, and speech amplification systems.

Evidence. Mitigation Measures 4.10-1 and 4.10-2 require the preparation of a detailed acoustical analysis and implementation of recommendations therein that would reduce the interior and exterior noise levels for residential development to acceptable levels. Mitigation Measure 4.10-3 requires non-residential development to adhere to noise standards established in the Zoning Code and through adherence to planning and equipment requirements. Implementation of these measures into project design would ensure that exterior and interior noise levels are below city standards. As a condition of project approval, the developer will implement Mitigation Measures 4.10 -1 through 4.10-3 which will reduce the interior and exterior noise levels below city noise thresholds and would reduce impacts to a less-than-significant level.

(i) Population and Housing

Project Impact (Potentially Significant). Inclusionary Housing. Future development of the site as described in the specific plan may be inconsistent with the Housing Element, which requires affordable housing to be fully integrated with market rate housing.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR and clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The specific plan includes policies that require integration of affordable housing consistent with the City's Housing Element. Therefore, the proposed project would not result in new significant effects or substantially increase the severity of previously identified significant effects. Additionally, the following mitigation measure imposed upon the project ensures that the final map(s) is consistent with these policies.

Mitigation Measure

4.11-3 The applicant's approved Development Agreement shall include a Housing Agreement per Program 4.3 of the City's Housing Element with the City that prescribes the parameters of the development of affordable housing consistent with the City's Housing Element, Inclusionary Housing Ordinance, and the revised Specific Plan. The Development Agreement shall be reviewed and approved by the City of Soledad City Council prior to or concurrent with recording of the first final map.

Evidence. The Miramonte Specific Plan includes policies and design standards that require integration of housing for very low, low and moderate income households throughout the site either by minimum densities of 20 units per acre or deed restricted units, or multifamily development. Because development of the site is anticipated to occur over a 30-year timeframe Mitigation Measure 4.11-3 requires the developer to enter into a housing agreement with the City prior to recordation or concurrent with the first final map to ensure consistency with the affordable and inclusionary housing requirements of the City's Housing Element, Inclusionary Housing Ordinance, and the Miramonte Specific Plan. Implementation of Mitigation Measure 4.11-3 is a required condition of approval, which will reduce potential impact to a less-than-significant level.

(j) Public Services

Project Impact (Significant). Police and Fire. The proposed project would increase the demand for police and fire services to the extent that new facilities would be required.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Therefore, the proposed project would not result in new significant effects or substantially increase the severity of previously identified significant effects. The following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.12-1. Prior to the occupancy of medium density residential north of the linear park or occupancy of low density residential north of both Orchard Lane and the linear park, the proposed fire and police facilities located on Orchard Lane shall be constructed and operational. The project applicant shall also be responsible for providing the necessary funding to the City of Soledad or establishing the appropriate funding mechanism to ensure the provision of adequate police and fire staffing to meet the demands of the proposed project, as determined by the City of Soledad. Prior to the issuance of any building permit for new medium density residential development north of linear park or low density residential north of both Orchard Lane and the linear park, the project applicant shall obtain written documentation from the Soledad Fire and Police Departments indicating that the fire and police substations are operational and adequately staffed to meet the needs of the proposed project, subject to the review and approval of the City of Soledad. This mitigation measure shall not be construed as prohibiting the implementation of infrastructure necessary to serve the proposed facilities.

Evidence. The Miramonte Specific Plan provides a site for potential police and fire substations. This location is included on the Specific Plan land use map and the specific plan requires the dedication of this land to the City prior to approval of the first final map. Mitigation Measure 4.12-1 requires construction and verification of facility operations as needed by the respective Soledad Police and Fire Department Chiefs prior to issuance of building permits for new medium density residential development. Implementation of Mitigation Measure 4.12-1 is a required condition of approval, which will reduce potential impacts from an increase in service demand to a less-than-significant level.

Project Impact (Significant). Schools. The plan area is served by Soledad Unified School District for grades K-12. Buildout of the proposed specific plan is expected to generate 875 students for grades K-6, 261 students for grades 7-8, and 378 students for grades 9-12 (a total of 1,514 students).

Findings. Changes in circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Therefore, the proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant effects. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The Miramonte Specific Plan provides two school sites that will be offered for dedication to the Soledad Unified School District to serve the students generated by the reduced size and scale of development allowed by the Miramonte Specific plan in addition to the following mitigation measures imposed upon the project mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.12-4. Prior to recording of the first final map, the project developer shall submit an agreement with evidence demonstrating that two school sites of sufficient size will be dedicated within the project boundaries, subject to the review and approval of the City of Soledad and the Soledad Unified School District. The agreement shall be established between the developer and/or successors in interest and the Soledad Unified School District that establishes the sites to be dedicated.

4.12-5. In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment. The applicant/developer shall pay a school impact fee for each type of development pursuant to the criteria set forth within California Government Code Section 65995. Prior to the issuance of building permits, the applicant shall pay required school mitigation fees and provide evidence of payment to the city. As indicated above, the fees set forth in Government Code Section 65996 constitute the exclusive means of both "considering" and "mitigating" school facilities impacts of projects [Government Code Section

65996(a)]. They are "deemed to provide full and complete school facilities mitigation" [Government Code Section 65996(b)].

Evidence. The proposed project would provide two school sites. The applicant and/or developer(s) will provide an offer to dedicate the school sites (i.e. turn over fee simple title to the land to the school district). In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions. The proposed specific plan includes a policy that requires that an agreement be established between the developer and/or successors in interest and the Soledad Unified School District that establishes the timing of the school construction or improvements and financing obligations. The Miramonte Specific Plan incorporates a portion of these measures into the land use map. Implementation of Mitigation Measures 4.12-4 and 4.12-5 are required condition of approval, which will reduce potential impacts from an increase in service demand to a less-than-significant level.

Project Impact (Significant). Parks and Recreation. Anticipated population growth associated with the project would create additional demands on existing park and recreational facilities throughout the city such that physical deterioration of these facilities may occur, which is a potentially significant impact.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Therefore, the proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant effects. Specifically, the following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.12-6. Prior to the recordation of the first final map, the project applicant shall submit a comprehensive Park Master Plan to the City of Soledad for review and approval. This plan shall address park design and development consistent with the City's adopted Parks and Recreation Master Plan, along with maintenance, operation and financing components. t This plan shall also identify the appropriate types of improvements within each park parcel to meet the recreational needs of all age groups The Park Master Plan will identify timing for concurrent park improvements for each phase of development. The Parks Master Plan is subject to review and recommendation by the Parks and Recreation Commission and approval by the City Council.

4.12-7. Prior to the issuance of any building permit, the applicant/developer shall submit payment of a Park Facilities Impact Fee in accordance

with the adjusted impact fee in effect at the time of building permit issuance, if determined to be applicable. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.

Evidence. The Miramonte Specific Plan calls for the provision of five acres of parkland for every 1,000 persons, consistent with the general plan goals and supplements the current city deficit by more than 140 acres of public open space and approximately 56 acres of improved parks. Mitigation Measure 4.12-6 requires the preparation of a Parks Master Plan that will guide required park improvements on the site and ensure that parks are provided with each phase of development. Mitigation Measure 4.12-7 requires payment of park facility impact fees in effect at the time of building permit issuance. Implementation of Mitigation Measures 4.12-6 and 4.12-7 are required condition of approval, which will reduce potential impacts from an increase in service demand to a less-than-significant level.

(k) Traffic and Circulation

Project Impact (Potentially Less than Significant) Unacceptable Level of Service at Moranda Road/Front Street and U.S. Highway 101 NB Ramps. Traffic generated by the proposed project would cause LOS F operations on the U.S. Highway 101 northbound on-ramp from Moranda Road at the Moranda Road Interchange. This is a significant impact.

Finding. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impact to a less-than-significant level:

Mitigation Measure

4.13-10 Moranda Road and U.S. Highway 101 Northbound Ramps: Signalize the intersection and widen the Northbound US 101 on ramp to add a second NB left-turn lane. This improvement requires coordination and approval by Caltrans.

The project developer is responsible for a fair share contribution of costs towards the construction of this improvement. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's proportionate share of costs to construct this improvement and shall also pay the TAMC Regional Development Transportation Impact Fees.

The payment of fees is considered mitigation for project impacts to freeway highway and regional facilities. All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Subject to the review and approval by the Director of Public Works, the City Council may exercise its discretion and instead use the project's payment of city fees for the project's proportionate share of costs for construction of the Market Street Extension to Moranda Road and/or an extension of Gabilan Drive to U.S. Highway 101.

All required traffic impact fees shall be subject to review by the Director of Public Works and approval by the City Council.

Improvements to this interchange are within the jurisdiction of Caltrans and not under the control of the city. Should the improvement of the interchange not be implemented by Caltrans the impact would be considered significant and unavoidable.

Evidence. Development consistent with the Miramonte Specific Plan would generate approximately 40 percent fewer vehicle trips than the originally proposed project. Mitigation Measure 4.13-10 requires the project developer to contribute fair share of required city traffic impact fees and TAMC Regional Development Impact Fees to mitigate this regional impact. The payment of these fees mitigates the project contribution to the impact at this intersection. However, because the improvements to this interchange are within the jurisdiction of Caltrans and not under the control of the City. Should the improvement of the interchange not be implemented by Caltrans the impact would be considered significant and unavoidable.

Project Impact (Significant): U.S. Highway 101 Freeway Segments. Traffic generated by development of the project would cause unacceptable LOS D operations on the following U.S. Highway 101 freeway segments:

- Northbound U.S. Highway 101 north of Gonzales-5th Street (AM peak hour).
- Northbound U.S. Highway 101 between Gonzales-5th Street to Gloria Road (AM peak hour).
- Northbound U.S. Highway 101 between Camphora Road and North Soledad (AM Peak Hour).
- Southbound U.S. Highway 101between North Soledad and Camphora Road (PM Peak Hour).

Finding. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.13-12 Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the TAMC Regional Development Transportation Impact Fee in effect at the time of building permit issuance in order to mitigate the project's impacts to the identified freeway segments. The payment of fees is considered mitigation for project impacts to highway and regional facilities. All fees shall be subject to the approval of the Director of Public Works.

Evidence. Development consistent with the Miramonte Specific Plan would generate approximately 40 percent fewer vehicle trips than the originally proposed project. The payment of Regional Traffic impact fees mitigate the project's impact to the affected segments. As a condition of approval the developer will implement Mitigation Measure 4.13-12 which mitigates the project's contribution to the impact.

Project Impact (Significant) Unacceptable Level of Service at Moranda Road and Front Street: Although traffic volumes would be reduced by approximately 17 percent at this intersection, traffic generated by the proposed project would cause operations to degrade from acceptable LOS C to unacceptable LOS F. This is a significant impact.

Finding. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the reduced size and intensity of development allowed by the Miramonte Specific Plan in addition to implementation of Mitigation Measures 4.13-2, 4.13-15 and potentially mitigation measures 4.13-16 and 4.13-17 mitigate the impact to a less-than-significant level:

Mitigation Measure

4.13-2. Intersection of Moranda Road and Front Street. Signalize and add a second northbound through lane, and eastbound free-right-turn lane. This improvement is necessary with or without the project. The intersection of Moranda Road and Front Street would operate at LOS A with construction of this improvement or with construction of an extension of Market Street extension between San Vicente Road and the intersection of Moranda Road / Front Street (see Mitigation Measure 4.13-16) or an extension of Gabilan Drive from San Vicente Road to the U.S. Highway 101 northbound ramps (Mitigation Measure 4.13-17).

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used, at the discretion of the

City Council, to instead acquire land and construct either or both extensions of Market Street and Gabilan Drive identified above.

If the extension of Market Street and/or Gabilan Drive is undertaken either by the City or by the developer (see Mitigation Measure 4.13-16 and Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of Moranda Road and Front Street until the roadway extensions are complete.

No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Market Street or Gabilan Drive is complete.

4.13-15. Traffic Level of Service Monitoring Program. The following intersections shall be monitored by the city at the developer's expense to ensure that acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards throughout development of the specific plan area.

- Moranda Road / Front Street;
- U.S. Highway 101 Northbound Ramps and Moranda Road / Front Street;
- San Vicente Road / Front Street;
- San Vicente Road / Gabilan Drive; and
- Main Street / Gabilan Drive.

Monitoring shall be conducted by a qualified transportation engineer retained by the applicant and shall commence at issuance of the first residential building permit and routinely thereafter in increments of 200 residential building permits until the intersection improvements identified in Mitigation Measures 4.13-2, 4.13-3, 4.13-4, 4.13-6, and 4.13-10, or the Market Street and/or Gabilan Drive extensions are complete.

The Monitoring Program shall include the following:

a. Conduct analyses of all applicable traffic operations based on field-measured data;

b. Study prevailing traffic and roadway conditions;

c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is identified above is necessary.

No building permit shall be issued for any phase of the project unless intersection levels of service are operating at the City's adopted acceptable threshold LOS D.

4.13-16 Market Street Extension Alternative Mitigation. Payment of the project's proportionate share of fees to mitigate project contributions to cumulative impacts to the three intersections identified in Mitigation Measures 4.13-2, 4.13-3, and 4.13-10, may be used, at the discretion of the City Council, to instead acquire land and construct an extension of Market Street between San Vicente Road and the intersection of Moranda Road / Front Street. This improvement would mitigate the project's impacts to the following intersections:

- Moranda Road / Front Street;
- U.S. Highway 101 Northbound Ramps and Moranda Road / Front Street; and
- San Vicente Road / Front Street.

The project developer may choose to design and construct the Market Street Extension in exchange for a potential credit in traffic impact fees for future development within the specific plan area, and would be eligible for entering into a reimbursement agreement with the City. The developer's costs associated with this improvement may be subject to partial reimbursement subject to a reimbursement agreement with the City.

If the developer chooses to construct this improvement, the developer shall retain a qualified engineer to design the improvement in conformance with the City's performance thresholds and design criteria. The engineered plans shall be submitted to the Director of Public Works prior to issuance of the 200th residential building permit, and shall be constructed prior to issuance of the 400th residential building permit. This timeframe may be modified by the Director of Public Works if the results of traffic monitoring (Mitigation Measure 4.13-15) indicate that a shorter or lengthier time frame is warranted. All traffic facility improvement plans or traffic impact fees shall be subject to the review and approval by the Director of Public Works.

If the Market Street Extension is constructed, the improvements identified in mitigation measures 4.13-2, 4.13-3, and 4.13-10 would not be required.

4.13-17 Gabilan Drive Extension Alternative Mitigation. Payment of the project's proportionate share of fees to mitigate project contributions to cumulative impacts to the five intersections identified in Mitigation Measures 4.13-2, 4.13-3, 4.13-4, 4.13-6, and 4.13-10, may be used, at the discretion of the City Council, to instead acquire land and construct an extension of Gabilan Drive between San Vicente Road and the U.S. Highway 101 Northbound ramps. This improvement requires coordination with Caltrans for modification of the northbound ramps.

This improvement, if constructed in lieu of the Market Street extension or the intersection improvements identified in mitigation measures 4.13-2, 4.13-3, and 4.13-10, would mitigate the project's impacts to the following intersections:

- Moranda Road / Front Street;
- U.S. Highway 101 Northbound Ramps and Moranda Road / Front Street;
- San Vicente Road / Front Street;
- San Vicente Road / Gabilan Drive; and
- Main Street / Gabilan Drive.

The project developer may choose to design and construct the Gabilan Drive Extension in exchange for a potential credit in traffic impact fees for future development within the specific plan area, and would be eligible for entering into a reimbursement agreement with the City. The developer's costs associated with this improvement may be subject to partial reimbursement subject to a reimbursement agreement with the City..

If the developer chooses to construct this improvement the developer shall retain a qualified engineer to design the improvement in conformance with the City's performance thresholds and design criteria. The engineered plans shall be submitted to the Director of Public Works prior to issuance of the 200th residential building permit, and shall be constructed prior to issuance of the 400th residential building permit. This timeframe may be modified by the Director of Public Works if the Market Street extension is operational and the results of traffic monitoring (Mitigation Measure 4.13-15) indicate that a shorter or lengthier time frame is warranted. All traffic facility improvement plans and traffic impact fees shall be subject to the review and approval by the Director of Public Works.

If the Market Street Extension and the Gabilan Drive Extension are constructed, the improvements identified in Mitigation Measures 4.13-4, 4.13-6, and 4.13-10 are not required. If only the Gabilan Drive Extension is constructed, the improvements identified in Mitigation Measures 4.13-2, 4.13-3, 4.13-4, 4.13-6and 4.13-10 are not required.

Evidence. This intersection meets signal warrants with or without the proposed project, and also requires the addition of a second northbound through lane and eastbound free-right-turn lane to mitigate the cumulative impacts to which the project contributes. Mitigation Measure 4.13-2 requires the project developer to pay the project's fair share contribution of costs to mitigate the project's impact to this intersection prior to issuance of any building permit for each phase of development. The measure also allows the fees collected to be used instead, at the discretion of the City Council, to acquire land and construct extensions of either or both Market Street (Mitigation Measure 4.13-16)

and/or Gabilan Drive (Mitigation Measure 4.13-17) identified in above. The project developer may also choose to implement the roadway extension options. Mitigation Measure 4.13-15 requires routine monitoring of intersection operations to ensure that acceptable levels of service are maintained until the intersection improvements or Market Street extension and/or the Gabilan Drive extension are complete. The measure further requires all required traffic impact fees in effect at the time of building permit issuance to be paid prior to the issuance of any building permit for each phase of development. No building permit shall be issued for any phase of the project unless intersection levels of service are operating at the City's adopted acceptable threshold LOS D. .

Mitigation Measure4.13-2 and 4.13-15 are required conditions of approval, which will reduce impacts to this traffic facility to a less-than-significant level.

Project Impact (Significant) Unacceptable Level of Service. Although traffic volume would be reduced in comparison to the Miravale III project, traffic generated by the proposed project would cause operations to degrade from acceptable LOS B to unacceptable LOS F at the intersection of San Vicente Road and Front Street during at least one of the peak hours analyzed. This is a significant impact.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to Mitigation Measures 4.13-15, and potentially 4.13-16, and 4.13-17 listed above, and in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impact to a less-than-significant level:

Mitigation Measures

4.13-3 Intersection of San Vicente Road and Front Street. Widen northbound San Vicente Road to three lanes, add two eastbound left-turn lanes and one southbound free-right turn lane. The intersection of San Vicente Road and Front Street would operate at LOS B with the construction of these improvements or with construction of a Market Street extension between San Vicente Road and the intersection of Moranda Road / Front Street (see Mitigation Measure 4.13-16) or an extension of Gabilan Drive from San Vicente Road to the U.S. Highway 101 northbound ramps (Mitigation Measure 4.13-17).

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used by the city, at the discretion of the City Council, to instead acquire land and construct an extension of Market Street or Gabilan Drive as described above.

If the extension of Market Street or Gabilan Drive are implemented (see Mitigation Measure 4.13-16 and Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of San Vicente Road and Front Street until the roadway extensions are complete. No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Market Street or Gabilan Drive is complete.

Evidence. Mitigation Measure 4.13-3 requires the project developer to pay the project's fair share contribution of costs to mitigate the project's impact to this intersection prior to issuance of any building permit for each phase of development. The measure also allows the fees collected to be used instead, at the discretion of the City Council, to acquire land and construct extensions of either or both Market Street (Mitigation Measure 4.13-16) and/or Gabilan Drive (Mitigation Measure 4.13-17) identified in above. The project developer may also choose to implement the roadway extension options. Mitigation Measure 4.13-15 requires routine monitoring of intersection operations by the City at the developers expense to ensure that acceptable levels of service are maintained until the intersection improvements or Market Street extension and/or the Gabilan Drive extension are complete. The measure further requires all required traffic impact fees in effect at the time of building permit issuance to be paid prior to the issuance of any building permit for each phase of development. No building permit shall be issued for any phase of the project unless intersection levels of service are operating at the City's adopted acceptable threshold LOS D.

Mitigation Measure 4.13-3 and 4.13-15 are required conditions of approval, which will reduce impacts to this traffic facility to a less-than-significant level.

Project Impact (Significant): San Vicente Road and Gabilan Drive: Although traffic volumes would be reduced in comparison to the Miravale III project, traffic generated by the proposed project would still cause signal warrants to be met and cause operations to degrade from acceptable LOS B to unacceptable LOS F during at least one peak hour at the intersection of San Vicente Road and Gabilan Drive. This is a significant impact.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impact to a less-than-significant level:

Mitigation Measure

4.13-4 Intersection of San Vicente Road and Gabilan Drive. Signalize and add a second westbound left turn lane, and widen southbound San Vicente Road to accommodate the two left-turn lanes. The intersection would operate at an acceptable LOS A with the construction of these improvements or with construction of the Gabilan Drive extension from San Vicente Road to the U.S. Highway 101 northbound ramps (Mitigation Measure 4.13-17).

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used by the city, at the discretion of the City Council, to instead acquire land and construct an extension of Gabilan Drive as described above.

If the extension of Gabilan Drive is implemented (see Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of San Vicente Road and Gabilan Drive until the roadway extension improvement is complete. No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Gabilan Drive is complete.

Evidence: The traffic impact analysis for the EIR Addendum found that the intersection of San Vicente Road and Gabilan Drive would operate at LOS A with the construction of the Gabilan Drive Extension. Mitigation Measure 4.13-4 requires the project developer to pay the project's fair share contribution of costs to mitigate the project's impact to this intersection prior to issuance of any building permit for each phase of development. The measure also allows the fees collected to be used instead, at the discretion of the City Council, to acquire land and construct an extension of Gabilan Drive (Mitigation Measure 4.13-17) identified above. The project developer may also choose to construct the Gabilan Drive extension option. Mitigation Measure 4.13-15 requires routine monitoring of intersection operations by the City at the developers expense to ensure that acceptable levels of service are maintained until either the intersection improvements or the Gabilan Drive extension are complete. No building permit shall be issued for any phase of the project unless intersection levels of service are operating at the City's adopted acceptable threshold LOS D.

Mitigation Measure 4.13-4 and 4.13-15 are required conditions of approval, which will reduce impacts to this traffic facility to a less-than-significant level.

Project Impact (Significant): Main Street and Gabilan Drive. Although traffic volumes would be reduced, traffic generated by development associated with the proposed project would cause signal warrants to be met during at least one peak hour at the intersection of Main Street and Gabilan Drive. This is a significant impact.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.13-6. Intersection of Main Street and Gabilan Drive. The intersection of Main Street and Gabilan Drive will operate at LOS A with signalization and protected left-turn phasing along Gabilan Drive. With the construction of the Gabilan Drive extension to U.S. Highway 101, signalization of this intersection would not be necessary.

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used by the city, at the discretion of the City Council, to instead acquire land and construct an extension of Gabilan Drive as described above.

If the extension of Gabilan Drive is implemented (see Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of Main Street and Gabilan Drive until the roadway extension improvement is complete. No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Gabilan Drive is complete..

Evidence: Mitigation Measure 4.13-6 mitigates project impacts to the Main Street and Gabilan Drive intersection by either requiring the developer to pay the fair share contribution of costs to fund this improvement or by constructing the Gabilan Drive Extension as set forth in Mitigation Measure 4.13-17. Mitigation Measure 4.13-6 requires the project developer to pay the project's fair share contribution of costs to mitigate the project's impact to this intersection prior to issuance of any building permit for each phase of development. The measure also allows the fees collected to be used instead, at the discretion of the City Council, to acquire land and construct an extension

of Gabilan Drive (Mitigation Measure 4.13-17) identified above. The project developer may also choose to construct the Gabilan Drive extension option. Mitigation Measure 4.13-15 requires routine monitoring of intersection operations by the City at the developers expense to ensure that acceptable levels of service are maintained until either the intersection improvements or the Gabilan Drive extension are complete. No building permit shall be issued for any phase of the project unless intersection levels of service are operating at the City's adopted acceptable threshold LOS D.

Mitigation Measure 4.13-6 and 4.13-15 are required conditions of approval, which will reduce impacts to this traffic facility to a less-than-significant level. If the extension of Gabilan Drive is implemented (see Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of Main Street and Gabilan Drive or until the roadway extension improvement is complete. No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Gabilan Drive is complete. Implementation of Mitigation Measures 4.13-6 and Mitigation Measure 4.13-15 are required conditions of approval, which will reduce impacts to this traffic facility to a less-than-significant level. Implementation of Mitigation Measure 4.13-17 and Mitigation Measure 4.13-15 would also reduce impacts to this traffic facility to a less-than-significant level.

Project Impact (Significant): Signal Warrant Met at Andalucia Drive and Gabilan Drive. Although traffic volumes would be reduced at this intersection in comparison to the Miravale III project, traffic generated by the proposed project would cause signal warrants to be met during at least one peak hour at the intersection of Andalucia Drive and Gabilan Drive. This is a significant impact.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.13-7 The intersection of Andalucia Drive and Gabilan Drive will operate at an acceptable level of service, determined by the Director of Public Works, with protected left-turn phasing along Gabilan Drive. The project developer is responsible for the construction of this improvement. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of Director of Public Works.

Evidence: Mitigation Measure 4.13-7 would mitigate project impacts to the Andalucia Drive and Gabilan Drive intersection by requiring that the developer construct the left-turn phasing along Gabilan Drive prior to the issuance of a certificate of occupancy. This improvement ensures that the intersection operates at an acceptable level of service with the addition of project vehicles at the intersection. Implementation of Mitigation Measures 4.13-7 is a required condition of approval, which will reduce impacts to this traffic facility to a less-than-significant level.

Project Impact (Significant): Signal Warrant Met at Orchard Lane and Metz Road. Although traffic volumes would be reduced at this intersection in comparison to the Miravale III project, traffic generated by the proposed project would still cause signal warrants to be met and cause operations to degrade from acceptable LOS C to unacceptable LOS E or worse during at least one peak hour at the intersection of Orchard Street and Metz Road.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level.

Mitigation Measure

4.13-8. The intersection of Orchard Lane and Metz Road will operate at an acceptable level of service, determined by the Director of Public Works, with signalization and protected left-turn phasing on Metz Road and split phasing on Orchard Lane. The project developer is responsible for the construction of the improvement. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the Director of Public Works.

Evidence: Mitigation Measure 4.13-8 would mitigate project impacts to the Orchard Lane and Metz Road intersection by requiring that the developer construct the signalization and left-turn phasing along Gabilan Drive prior to the issuance of a certificate of occupancy. This improvement will ensure that the intersection operates at an acceptable level of service and will mitigate traffic impacts at the intersection. Implementation of Mitigation Measures 4.13-8 is a required condition of approval, which will reduce impacts to this traffic facility to a less-than-significant level.

Project Impact (Significant): Unacceptable levels of service at Oak Street and Front Street and Front Street and Nestles Road. Although traffic volumes would be reduced at this intersection when compared to the Miravale III project, traffic generated by proposed project would still cause intersection operations to decline from acceptable LOS C to unacceptable LOS E. This is a significant impact.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level.

Mitigation Measure

4.13-9 Intersections of Oak Street and Front Street and Front Street and Nestles Road. Widen Front Street between Nestles Road and Oak Street and add a second eastbound left-turn lane at the intersection of Nestles Road and Front Street. The project developer is responsible for the project's fair share contribution of costs to mitigate the impact to this intersection; however, construction of the Pinnacles Parkway project, funded by Measure X revenues, would improve intersection operations to an acceptable level of service.

If the development of the project precedes completion of the Pinnacles Parkway, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance. All necessary fees shall be paid prior to the issuance of any building permits for each phase of development and shall be subject to review bythe approval of the Director of Public Works and approval of the City Council.

Evidence: Mitigation Measure 4.13-9 requires the project developer to submit payment of the City of Soledad traffic impact fee to make a fair share contribution to the improvements that would mitigate impacts at the intersections of Oak Street and Front Street and Front Street and Nestles Road, if the Pinnacles Parkway is not completed by the time the first building permit is issued for the project. Payment of the impact fee would mitigate project impacts to a less-than-significant level. Implementation of Mitigation Measure 4.13-9 is a required condition of approval, which will reduce impacts to this traffic facility to a less-than-significant level.

Impact (potentially significant). Traffic generated by the project would contribute to cumulative operational deficiencies at the intersection of Moranda Road and Front Street and the intersection of San Vicente Road and Gabilan Drive.

Finding. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level.

Mitigation Measures

4.13-13. Moranda Road and Front Street: Addition of an east leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development. The fees collected for this improvement may instead be used by the City, at the discretion of the City Council, for the project's proportionate share of costs associated with the construction of an extension of Market Street from San Vicente Road to the Moranda Road/Front Street intersection. Construction of the Market Street extension would mitigate the project's cumulative impact at the intersection of Moranda Road and Front Street.

4.13-14. San Vicente Road and Gabilan Drive: Addition of a west leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development. The fees collected for this improvement may instead be used by the City, at the discretion of the City Council, for the project's proportionate share of costs associated with the construction of an extension of Gabilan Drive from San Vicente Road to the northbound U.S. Highway 101 northbound ramps. Construction of the Gabilan Drive extension would mitigate the project's cumulative impact at the intersection of San Vicente Road and Gabilan Drive.

Evidence. Mitigation Measure 4.13-13 and Mitigation 4.13-14 require the project developer to submit payment of the City of Soledad traffic impact fees to make a fair share contribution to the improvements necessary to mitigate the impact at the intersection of Moranda Road and Front Street and the intersection of San Vicente Road and Gabilan Drive. Implementation of Mitigation Measures 4.13-13 and 4.13-14 are required conditions of approval, which will reduce impacts to this traffic facility to a less-than-significant level.

(l) Utilities and Service Systems

Project Impact: (Significant) Construction of New Water Supply System Infrastructure. To serve the plan area, new water supply infrastructure such as domestic wells and additional storage will be needed to meet the project's water demands. Required infrastructure may include supplemental pumps to provide service to the development on the northeastern side of the plan area that is above the 340-foot contour line. Significant impacts could result from construction of the facilities if not planned and constructed consistent with City-wide infrastructure improvement plans.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.14-1. The developer shall retain an engineer to design and construct the water supply and distribution system for the project integrated with the City's water distribution system consistent with the Urban Water Management Plan and the City's Water Master Plan. Review and approval of the City of Soledad Director of Public Works is required prior to recordation of the first final map. . Prior to the issuance of any building permit in any phase, the developer shall construct the water supply and distribution system for the project based upon the performance standards in the Water Master Plan and with city design criteria in accordance with the approved design-level infrastructure plans, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-2. All water facilities and infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.

4.14-3. All water pipelines shall be placed underground and in the utilities right-of-way and constructed to comply with all applicable state and local standards. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-8. Prior to the issuance of any building permit, the applicant/developer shall submit payment of the current City Development Impact Fee for each type of land use in accordance with the adjusted impact fee in effect at the time of building permit issuance subject to the review and approval of the Director of Public Works.

Evidence: Mitigation Measures 4.14-1 - 4.14-3 require the applicant to submit a detailed design-level water infrastructure plan prepared by an engineer that are consistent with City-wide infrastructure improvement plans all local and state standards for construction, design, and sizing subject to the review and approval by the Director of Public Works prior to recordation of the first final map. This will ensure that impacts related to construction of new infrastructure are less than significant. Implementation of Mitigation Measures 4.14-1 through 4.14-3 and 4.13-8 are required conditions of

approval, which will reduce impacts to water supply and distribution infrastructure to a less-than-significant level.

Project Impact (Significant): Construction of New Sewer Infrastructure. New wastewater infrastructure (i.e. distribution lines, treatment facility, etc.) would need to be constructed in order to provide services to the project area. The city is currently developing a wastewater collection system master plan that will identify existing and necessary line sizes and capacity upgrades for future development including the project site. Construction of the identified new infrastructure could result in significant impacts.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measures

4.14-8. Prior to the issuance of any building permit, the applicant/developer shall submit payment of the current City Development Impact Fee for each type of land use in accordance with the adjusted impact fee in effect at the time of building permit issuance subject to the review and approval of the Director of Public Works.

4.14-9 All wastewater infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building and/or grading plan, the project applicant shall submit detailed evidence, including but not limited todesign-level infrastructure plans, consistent with the requirements of this mitigation, subject to the approval of the Director of Public Works.

Evidence: The Miramonte Specific Plan includes policies and standards for the provision of adequate wastewater collection and conveyance systems. The plan also requires the construction of wastewater collection infrastructure that will be integrated with the city's existing sanitary sewer system, and requires that the new sewer system within the plan area will be designed, funded, and constructed by the developer, with plans subject to the review and approval of the City Engineer. All development impact fees applicable at the time of issuance of a building permit are required, but may be offset by developer designed, funded, and constructed wastewater system improvements. Mitigation Measure 4.14-9 requires the developer to submit and receive approval for design-level engineered wastewater infrastructure plans consistent with City design criteria and performance standards. In addition, Mitigation measure 4.14-8 requires the developer to pay any applicable development impact fees prior the issuance of building permits, which will mitigate project impacts related to construction of new sewer infrastructure. Implementation of Mitigation Measures 4.14-8 and 4.14-9

arerequired conditions of approval, which will reduce impacts related to wastewater collection and conveyance infrastructure to a less-than-significant level.

Project Impact (Significant) Landfill with Adequate Capacity: The project could generate 3,367.6 tons per year of solid waste from the plan area. Considering the maximum amount of 185,000 tons of solid waste received annually at the Johnson Canyon Landfill, the landfill would have adequate capacity to serve the project, but could impacts could result from construction-generated solid waste disposed at the landfill.

Findings: Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts to a less-than-significant level:

Mitigation Measure

4.14-12 Prior to the commencement of construction related activities, the applicant/developer shall prepare and submit a Construction and Demolition Diversion Plan consistent with the requirements of the City's adopted Diversion Plan Ordinance, subject to the review and approval of the Salinas Valley Solid Waste Authority and the City of Soledad. This plan shall identify ongoing implementation measures for the diversion and separation of construction waste to ensure that all construction-generated solid waste is recycled to the greatest extent possible.

Evidence. Mitigation Measure 4.14-12 requires the preparation and implementation of a Construction and Demolition Diversion consistent with city standards that will ensure the greatest rate of recycling of construction-generated solid waste. Implementation of Mitigation Measure 4.14-12 is a required condition of approval, which will reduce impacts related to wastewater collection and conveyance infrastructure to a less-than-significant level.

III.

SIGNIFICANT UNAVOIDABLE ADVERSE IMPACTS

The Addendum to the Miravale III EIR identifies certain unavoidable or potentially unavoidable adverse impacts of the project, i.e., environmental effects that cannot be reduced to an insignificant level if development in accordance with the project description is implemented. These impacts were also identified as significant and unavoidable in the Miravale III EIR. These impacts are as follows::

(a) Aesthetics

Project Impact (Significant) Permanent Alteration of Visual Character. Implementation of the Miramonte project introduces substantial new development,

including structures of various heights and densities and will permanently change the visual character of 647 acres from rural agriculture fields and open spaces below the 400-foot contour to urban development.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Specifically, development consistent with the Miramonte specific plan reduces the size of the formerly proposed project boundary by 273 acres and the development density by 2,081 residential units. Scenic open space areas above the 400-foot contour are designated as Hillside/Open Space and are protected in perpetuity by a recorded conservation easement; thereby, eliminating potential new sources of light and glare from this area. The imposition of mitigation measures 4.1-1, and 4.1-4 – 4.1-6 and 4.1- listed in Section II in addition to the following mitigation measures will reduce the impacts, but not to a less-than-significant level:

Mitigation Measures

4.1-9. In order to minimize tree removal and associated visual impacts, final design-level improvements plans shall retain existing mature eucalyptus and other tree species to the greatest extent possible. Final design-level plans shall be prepared in consultation with a registered arborist/forester to minimize tree removal and ensure the health of remaining trees. Prior to the issuance of any grading and/or building permits, final plans shall be subject to the review and approval of the City of Soledad Director of Public Works. If the removal of existing mature eucalyptus is required the applicant shall submit evidence demonstrating that there are no feasible design alternatives to avoid tree removal. In the event that tree removal is required, the project proponent shall prepare a tree removal and replacement plan for each phase of construction, subject to the review and approval of the City of Soledad Community Development Director. The tree removal and replacement plan shall identify specific grading limits that minimize tree removal, as well as appropriate tree replacement ratios and replanting locations.

4.1-10. Final design plans for the proposed gateways shall include elements, such as signage, landscaping and landscaped center medians, and appropriate architectural detailing consistent with the Miravale III Specific Plan. Prior to issuance of any permit for the construction of any of the four gateways, the project applicant shall submit detailed plans that include the above referenced elements, subject to the review and approval of the City of Soledad.

4.1-11. Final design plans for proposed residential development shall include form, scale, and character elements which emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks. Prior to the issuance

of any building permit for residential development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad. All residential development within the Specific Plan area shall be subject to a conditional use or design-review process as administered by the City of Soledad.

4.1-12. Final design plans for proposed multi-family development shall include useable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood. Prior to the issuance of any building permit for multi-family development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad.

4.1-13. Final design plans for proposed development shall include a tree planting plan in order to increase the number and density of tree cover within new development areas. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed tree planting plan, subject to the review and approval of the City of Soledad.

Evidence. The site is located in several general plan expansion areas, within which, development of the project site and subsequent changes to the visual character are anticipated by the City of Soledad 2005 General Plan. Mitigation Measures 4.1-1, and 4.1-4 through 4.1-6, and 4.1-9 through 4.1-13 require adherence to specific design and development standards that minimize impacts to the aesthetic value of the visual character of the specific plan area. The Miramonte Specific Plan provides design requirements for all land use designations that include limits on building heights, use of natural colors and materials, and utilization of natural landforms and vegetation to screen development within the specific plan area. As a condition of project approval the project applicant would be required to submit detailed plans, including elevations, site plans, and/or other documentation detailing compliance with applicable development standards, subject to the review and approval of the City of Soledad As a condition of project approval, the developer will implement Mitigation Measures 4.1-1, and 4.1-4 through 4.1-6, and 4.1-9 through 4.1-13, which will reduce potential impacts from permanent alterations to visual character, but not to a less-than-significant level. Therefore, the impacts to the visual character of the site remain significant and unavoidable.

(b) Agricultural Resources

Project Impact (Significant and Unavoidable) Conversion of Important Farmland. The Miravale III EIR determined that the project would convert 760 acres of Prime Farmland to a non-agricultural use. This impact to conversion of agricultural lands due to proposed development was considered to be significant and unavoidable.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have

occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Mitigation Measure 4.2-6, listed below, has been incorporated into the specific plan policies consistent with the 2016 Memorandum of Understanding between the County of Monterey and the City of Soledad, Compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses is required by the memorandum of understanding, using one of four methods, at the discretion of the City Council prior to or concurrent with recordation of the first final subdivision map. The specific plan policies are consistent with the memorandum of understanding requirements. Therefore, the proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant effects. Specifically, the following mitigation measure imposed upon the project lessens the impact, but not to a less-than-significant level:

Mitigation Measure

4.2-6. Concurrent with recordation of a final subdivision map, developers shall provide compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses using one of four methods, at the discretion of the city:

a) provide the in-kind direct purchase/acquisition of an agricultural mitigation easement at a 1:1 ratio and dedicate the easement to an agricultural land trust or other qualifying entity; and/or

b) if available, purchase agricultural banked mitigation credits at a 1:1 ratio from a qualifying entity; and/or

c) pay an in-lieu mitigation fee, which amount shall be determined by the city prior to project approval. The amount of the fee should reasonably be expected to lead to the preservation of agricultural land. Said fee shall be kept by the city in a fund established specifically for agricultural land mitigation purposes; and/or

d) implement other innovative approaches as approved by the city that results in the preservation of agricultural land within areas targeted by the city.

Evidence. The city entered into a memorandum of understanding with Monterey County on March 15, 2016. Compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses is required by the memorandum of understanding, using one of four methods, at the discretion of city to coincide with the time of the recordation of a final subdivision map. The specific plan includes policies that are consistent with the memorandum of understanding requirements, and implement Mitigation Measure 4.2-6. The proposed project would not result in new or greater impacts than those identified in the Miravale III EIR. However, mitigation measure 4.2-6 will ensure compensation for the conversion of Prime Farmland or Statewide Importance to urban uses is provided as required by the 2016 memorandum of understanding. While implementation of 4.2-6 will ensure compliance with the memorandum of understanding

requirements for compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses, the project would still result in the conversion of important farmland which remains a significant and unavoidable impact.

(c) Air Quality

Project Impact (Significant and Unavoidable) Development of the uses consistent with the Miramonte Specific Plan would generate significant operational greenhouse gas (GHG) and criteria air pollutant emissions volumes.

Finding. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant impacts. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. The following mitigation measures imposed upon the project in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan that mitigate the impacts, but not to a less-than-significant level:

Mitigation Measure

4.3-3 In order to reduce operational greenhouse gas (GHG) and regional criteria air pollutants and ozone precursor emissions to the extent feasible, the applicant/project proponent shall prepare and submit for Planning Director approval a GHG and CAP Reduction Plan (Emissions Reduction Plan) prior to recordation of the first final map. The Emissions Reduction Plan shall include a description of the measures that are proposed to be implemented, including one or more of the measures contained in Appendix (F-1) of the Miravale III Specific Plan Final EIR. The Emissions Reduction Plan shall be approved by the city prior to construction of structures and site improvements, including but not limited to, determination of substantial conformance, building permits, and grading permits. For each of the measures not included, the applicant shall describe why the measure was not included. The Plan shall present estimated reductions in GHGs and criteria air pollutants emissions based on best available information sources.

No certificate of occupancy for any phase, or portion thereof, of the project shall be granted until all of the feasible, applicable measures have been implemented by the applicant/project proponent. The proponent shall demonstrate that measures that must be implemented throughout the life of the project are included in all applicable CC&Rs, property deeds, commercial center rules and regulations, and draft tenant lease agreements.

4.3-4. Fireplaces and stoves shall be gas-fired and meet U.S. Environmental Protection Agency certification requirements. The installation or operation of a wood-burning fireplace or a wood-burning stove shall be prohibited in

perpetuity on all residential properties in the Miramonte I Specific Plan Development. This restrictive covenant shall be recorded on the title of all parcels in the Miramonte I Specific Plan area and shall run with the land.

Evidence. Development associated with the Miravale III specific plan would have resulted in significant GHG emissions volumes and long-term operational emissions of ozone precursor pollutants in exceedance of Monterey Bay Air Resources District thresholds. Criteria air pollutant emissions for the former project were estimated at 193 lbs per day VOC (exceeding the 137 lb threshold) and 226 lbs per day PM_{10} (exceeding the 82 lb threshold). In addition to the requirements of Mitigation Measure 4.3-2a, Mitigation Measure 4.3-3 requires the preparation of an emissions reduction plan to identify measures that will be undertaken to reduce operational criteria air pollutant and GHG emissions volumes. Examples of reduction measures applicable to the proposed project are included in the Miravale III Final EIR Appendix F-1, incorporated herein by reference that will reduce on-site project-related emissions. Additionally, Mitigation Measure 4.3-4 prohibits the installation of wood-burning stoves and appliances in residential development to reduce criteria pollutant emissions of particulate matter and other criteria air pollutants during operations. The plan is required to be submitted prior to any changes made to the first final map. Emissions are reduced by implementation of these measures, but not to a less-than-significant level. The currently proposed project is smaller and would generate fewer GHG emissions than the original project although emissions volumes would still be large enough to warrant preparation of an emissions reduction plan as identified in Mitigation Measures 4.3-3 and 4.3-4. Implementation of each of these measures is required as a condition of project approval, which will reduce project-related operational GHG and criteria air pollutant emissions, but not to a less-than-significant level. Therefore, impacts would remain significant and unavoidable.

(d) Noise

Project Impact (Significant and Unavoidable). Project Generated Traffic Noise. Traffic volume increases from the project would increase traffic noise along the existing local roadway network. In some locations, there would be a substantial, permanent increase in noise levels at sensitive receptors.

Findings. Changes or alterations have been made or required in the project that avoid or lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Development consistent with the Miramonte specific plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units. The current project would not result in new significant noise effects or substantially increase the severity of previously identified significant effects, no significant changes in noise related circumstances have occurred that would increased noise generation, and no new information has been identified that indicates the proposed project would have new or more significant noise impacts than were identified in the Miravale III EIR. Specifically, the following mitigation measures imposed upon the project lessen impacts, but not to a less-than-significant level:

Mitigation Measure

4.10-4 The project shall incorporate noise reduction methods into all improvement plans to reduce transportation noise subject to the review and approval of the City of Soledad Director of Public Works or Building Official as applicable. Methods to reduce noise on the project site may include the following measures:

- Pave and re-pave streets with "quieter" pavement types, such as Open-Grade Rubberized Asphaltic Concrete, that would reduce noise levels by 2 to 3 dBA depending on the existing pavement type, traffic speed, traffic volumes, and other factors. All new and improved streets within the project area shall use quieter pavement types.
- Implement new or larger noise barriers that may reduce noise levels by 5 dBA CNEL in areas that would not impair access requirements. Final design of such barriers, including an assessment of their feasibility and reasonableness, must be approved by the City during project-specific development applications. An increase in barrier height per foot equates to approximately 1 dBA noise reduction. However, noise barriers must be considered as a last resort to alternative noise reduction methods per the City of Soledad General Plan.
- Install traffic calming measures to slow traffic and provide qualitative improvement by smoothing out the rise and fall in noise levels caused by speeding vehicles. For each 5 mph reduction in average speed, noise generation is reduced by approximately 1 dBA.Provide affected residences with building sound insulation, such as sound rated windows and doors to reduce interior noise levels to below the 45 dBA CNEL noise standard.

Evidence. A noise report was prepared for the Miravale III EIR which concluded measures such as repaving of area roadways, the replacement or construction of noise barriers, traffic calming, and sound insulation, noise barriers and sound insulation treatments would be required to be installed on private property necessitating agreements with each property owner on affected local streets. Therefore, it may not be reasonable or feasible to reduce project-generated traffic noise at all affected receivers. If the City determines that the mitigation measures would not be feasible, the impact will be considered significant and unavoidable. The noise report concluded that with mitigation noise levels might still be substantially and permanently increased in nearby residential areas. Development consistent with the Miramonte specific plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units, and also reduce project-related traffic volumes. The identified measures to reduce the project traffic-related noise levels would still apply. Some noise reduction levels require individual homeowner cooperation; therefore, they cannot be guaranteed. Implementation of Mitigation Measure 4.10-4 is required as a condition of project approval, which will reduce project-related mobile-source noise levels, but potentially not to a less-than-significant level. Therefore, the impact would remain significant and unavoidable.

Project Impact (Significant and Unavoidable). Construction Noise. Existing and proposed noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one construction season (one year). The city considers construction noise lasting more than one year to be significant.

Findings. Changes or alterations have been made or required in the project that avoid or substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts (reduced project size and scale), and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Therefore, the proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant effects. However, the duration of construction would extend beyond one construction season. The following mitigation measures imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan mitigate the impacts, but not to a less than significant level:

Mitigation Measure 4.10-5. Noise-generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturdays, unless otherwise approved by the City. No construction activities should occur on Sundays or holidays, including New Years and 4th of July.

4.10-6. Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment. 4.10-7 Locate stationary noise generating equipment (e.g., portable concrete crusher) as far as possible from sensitive receptors. Construct temporary noise barriers to screen stationary noise generating equipment when located near adjoining sensitive land uses.

4.10-8. Utilize "quiet" air compressors and other stationery noise sources where technology exists.

4.10-9. Route all construction traffic to and from the project site via designated truck routes where possible. Prohibit construction related heavy truck traffic in residential areas where feasible.

4.10-10. Control noise from construction workers' radios to a point that they are not audible at existing residences bordering the project site.

4.10-11. Consider the use of multiple-pile drivers to expedite construction where pile driving is required. (Although noise levels generated by multiple pile drivers would be higher than the noise generated by a single pile driver, the total duration of pile driving activities would be reduced.)

4.10-12. Use temporary noise control blanket barriers to shroud pile drivers or erect in a manner to shield the adjacent land uses. Such noise control blanket barriers can be rented and quickly erected.

4.10-13. Pre-drill foundation pile holes to minimize the number of impacts required to seat the pile. Predrilling reduces the number of blows required to seat the pile and is a standard construction noise control technique.

4.10-14. The contractor shall prepare a detailed construction management plan identifying the schedule for major noise-generating construction activities. The construction management plan shall identify a procedure for coordination with the adjacent noise sensitive facilities so that construction activities can be scheduled to minimize noise disturbance. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed construction management plan to the City of Soledad for review and approval.

4.10-15. The project applicant shall designate a "disturbance coordinator" who shall be responsible for responding to any local complaints about construction noise. The disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall require that reasonable measures warranted to correct the problem are implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule. Prior to the issuance of any grading and/or building permit, the project proponent shall provide the City of Soledad with the contact information for the designated “disturbance coordinator.”

Evidence. Although Mitigation Measures 4.10-6 through 4.10-15 would reduce noise generated by construction, the impact would remain significant and unavoidable as a result of the extended period of time that adjacent receivers would be exposed to construction noise.

(e) Population and Housing

Project Impact (Significant and Unavoidable). Population Growth/Growth Inducing effects. The proposed specific plan could result in a population addition of 9,712 people at build-out. The project also includes commercial uses that would generate 218 jobs with additional employment at the schools and other public facilities. Growth in population would increase demands on existing community facilities, requiring construction of new facilities that could cause significant environmental effects.

Findings. Changes or alterations have been made or required in the project that lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Changes in circumstances have occurred that would lessen certain impacts (reduced project size and scale), and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project. Therefore, the proposed project would not

result in new significant impacts or substantially increase the severity of previously identified significant effects. Development consistent with the Miramonte Specific Plan would reduce the size of the project boundary by 273 acres and the development density by 2,081 residential units. The reduced scale of the project would still result in significant increased demands for community facilities and infrastructure, although to a lesser extent than the Miravale III EIR.

Evidence. Although the project site is located in an area that has been identified for future population growth in city's general plan and would result in 36.1 percent less growth than the Miravale III project, the project would still result in a significant growth-inducing impacts through the introduction of new sources of employment and a significant portion of the city's projected population growth. Consequently, additional demand would be placed on existing facilities. This remains a significant and unavoidable impact that cannot be reduced to less-than-significant level with mitigation.

(f) Traffic and Circulation

Impact (Potentially Significant and Unavoidable). Unacceptable LOS at Front Street and U.S. Highway 101 SB Ramps: Traffic generated by the proposed project would cause LOS F operations on the U.S. Highway 101 southbound off-ramp to Moranda Road and Front Street at the Moranda Road Interchange during at least one peak hour. Improvements to the interchange and Front Street would be required to accommodate greater than 42 percent of trips generated by development consistent with the Miramonte specific plan uses.

Finding. Changes or alterations have been made or required in the project that substantially lessen the significant environmental effect as identified in the Miravale III EIR or as clarified in the EIR Addendum. Specifically, the following mitigation measure imposed upon the project, in addition to the reduced size and intensity of development allowed by the adopted Miramonte Specific Plan reduce the impact to this intersection to a less-than-significant level; however, this intersection is under the jurisdiction of Caltrans and not under the control of the City. If Caltrans does not implement improvements, the impact would be significant and unavoidable.

Mitigation Measure

4.13-11 U.S. Highway 101 Interchange at Moranda Road/Front Street. Prior to the issuance of any building permit the project developer shall pay the project's fair share of TAMC Regional Development Transportation Impact fees. These fees may be used by TAMC for the construction of interchange improvements that may include signalizing the intersection and adding a second lane on the off-ramp and/or reconfiguration and/or reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street.

However, improvements to the interchange are within the jurisdiction of Caltrans and not under the control of the city. Should the improvement of the interchange not be implemented by Caltrans the impact would be considered significant and unavoidable.

All required traffic impact fees shall be subject to review by the Director of Public Works and approval of the City Council.

Evidence. Development consistent with the Miramonte Specific Plan would generate approximately 40 percent fewer vehicle trips than the originally proposed project. The payment of Regional Traffic impact fees mitigates the project's contribution to impacts to the interchange. These fees may be used by TAMC toward construction of interchange improvements that may include signalizing the intersection and adding a second lane on the off-ramp and/or reconfiguration and/or reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street. As a condition of approval the developer will implement Mitigation Measure 4.13-11, which will reduce the project's impact to this Caltrans facility to less than significant. However, improvements to the interchange are within the jurisdiction of Caltrans and not under the control of the City. Should the improvement of the interchange not be implemented by Caltrans the impact would be significant and unavoidable.

IV

CUMULATIVE IMPACTS

The proposed project would contribute to cumulative impacts identified in the Miravale III EIR including significant and unavoidable cumulative impacts related to aesthetics, agriculture, air quality, GHG emissions, noise, and traffic. With the exceptions of these resource areas, the cumulative impacts and project contributions to them will either be less than cumulatively considerable or reduced to a less-than-cumulatively-considerable level with implementation of standard conditions of project approval and implementation of the mitigation measures identified in the EIR Addendum. Due to the lengthy implementation timeline of the project and the potential for the project to contribute to unacceptable levels of service at Front Street intersections and roadway segment levels of service indicates the need for intersection improvements or construction of either or both of the Market Street extension identified in Mitigation Measure 4.13-16 and/or the Gabilan Drive extension identified in Mitigation Measure 4.13-17, and/or the U.S. Highway 101/State Route 146 Bypass (Pinnacles Parkway) identified in Mitigation Measure 4.13-9 to reduce the impacts to less than significant. Routine monitoring conducted by the City at the developers' expense and overseen by the Director of Public Works is required by Mitigation Measure 4.13-15, and ensures that no building permit shall be issued for any phase of the project unless intersection levels of service are operating at the City's adopted acceptable threshold LOS D.

The EIR Addendum does not change the conclusions regarding the project's contribution to cumulative roadway impacts. The proposed project would not result in new or greater

cumulatively considerable contributions to cumulative impacts that were not already identified and addressed in the certified Miravale III EIR.

V.
STATEMENT OF OVERRIDING CONSIDERATIONS

The California Environmental Quality Act and the State CEQA Guidelines provide that:

> "CEQA requires the decision-maker to balance the benefits of a proposed project against its unavoidable adverse risks in determining whether to approve the project. If the benefits of the proposed project outweigh the unavoidable adverse environmental effects, the adverse impacts may be considered acceptable.
>
> Where the decision of the public agency allows the occurrence of significant effects which are identified in the final EIR but are not at least substantially mitigated, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. This statement may be necessary if the agency also makes a finding under Section 15091(a)(2) or (a)(3).
>
> If any agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the Notice of Determination." (Section 15093 of the State CEQA Guidelines).

Project benefits are defined as those improvements or gains to the community that will not occur without the project.

Project Impacts

As previously discussed, development of the project site will result in significant and unavoidable individual and cumulative impacts related to aesthetics, agriculture, air quality, GHG emissions, noise, and traffic and circulation.

Project Benefits

The City of Soledad finds that the following substantial benefits will occur as a result of approval of the project:

- Provision of a mixed-use development of housing, parks, schools, fire and/or police sub-station, and neighborhood commercial uses guided by a specific plan to serve the local area and provide a balance of uses, consistent with the general plan;

- Preservation of the scenic hills above the 400-foot elevation contour as open space for passive recreational use, with directed public access, space

for infrastructure to serve the plan area, alternative energy, a community room or clubhouse, and grazing; and

- Provision of a mix of housing types to serve the housing needs of the city consistent with the general plan housing element through policy requirements for the development of a range of low, very low, affordable and inclusionary housing in an amount greater than current regional housing needs, and housing opportunities for senior citizens by providing a range of moderate-income housing types on a variety of lots for the existing and future residents of Soledad; and

- Reserving land for two public schools and new police and fire department substations; and

- Reserving land for commercial development to allow for future economic growth within the city and assist in maintaining a local jobs/housing balance and reducing vehicle trips; and

- Provision of integrated water, wastewater, and storm drainage infrastructure improvements on and off the site; and,

- Provision of storm water drainage system that retains post-development runoff within the plan area, aiding in recharging the groundwater basin, and minimizing or avoiding impacts to downstream facilities; and

- Provision of complete streets to serve the plan area and connect to the surrounding road network, directing most trips by way of San Vicente Road, in addition to improving San Vicente Road and facilitating construction of the Gabilan Drive Extension identified in the general plan; and

- Provision of interconnected public parklands to serve the recreational needs of the development and surrounding community by dedicating land sufficient to provide public park and recreational facilities at a minimum ratio of five acres per 1,000 persons; and

- Provision of 150 acres of open space and an opportunity to extend the Golden Stairway trail system identified in the general plan; and

- Supports the local economy by increasing income within the plan area through permits, fees, property taxes, and job creation.

The City of Soledad City Council has considered each of the significant and unavoidable adverse environmental impacts identified above in deciding whether to approve the project. Pursuant to Public Resources Code 21081 (CEQA) the City of Soledad City

Council makes the following findings in adopting this statement of overriding conditions for each significant impact:

(1) Changes or alterations have been required in, or incorporated into, the project which mitigate or avoid the significant effects on the environment.

(2) Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency.

(3) Specific economic, legal, social, technological, or other considerations, including considerations for the provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or alternatives identified in the environmental impact report.

Although substantial evidence demonstrates that the unavoidable impacts identified in the Final EIR and EIR Addendum and its Errata will be substantially lessened by the mitigation measures incorporated into the project, the City recognizes that approval of the project will nonetheless result in certain unavoidable effects.

After balancing the project's environmental risks with its benefits described above, the City specifically finds that, despite the reduced scale of the Miramonte Specific Plan project, and to the extent that adverse or potentially adverse impacts set forth above have not been mitigated to a level of insignificance, that specific economic and social benefits, namely, the provision of affordable housing stock that exceeds regional housing need requirements, preservation of the scenic hillsides above the 400-foot contour, an increase in public parks and recreational facilities, utility and roadway infrastructure improvements on San Vicente Road, new school sites and a police and fire substation site, outweigh the significant effects on the environment. Furthermore, the City specifically finds that any one and each of the foregoing benefits constitutes a significant consideration sufficient to approve the project despite the unavoidable impacts identified herein. Therefore, each of the foregoing benefits is adopted as an overriding consideration with respect to each of the significant unavoidable impacts individually.

Additionally, for the potentially significant and unavoidable impacts to Caltrans facilities, the City specifically finds that the potentially adverse impacts set forth above have not been mitigated to a level of insignificance, that the necessary changes identified herein are not under the control of the City but are within the responsibility and jurisdiction of another public agency (Caltrans) and can and should be, adopted by that other agency.

Each overriding consideration is severable from any other consideration should one or more consideration be shown to be legally insufficient for any reason. The Statement of Overriding Considerations for the project is thus adopted.

EXHIBIT D
City of Soledad City Council Resolution 5431

ERRATA FOR THE ADDENDUM TO THE MIRAVALE III SPECIFIC PLAN EIR (MIRAMONTE SPECIFIC PLAN AND VTM PROJECT)

This Exhibit presents revisions to the EIR Addendum (Dated April 5, 2018) analysis and mitigation measures made in response to concerns raised and issues discussed by the Planning Commission and City Council during their consideration of the proposed Miramonte Specific Plan and Vesting Tentative Map project. Additions and deletions are presented in underline and strikethrough text.

AESTHETICS, SECTION 3.2

Mitigation Measure 4.1-4 is revised as follows:

4.1-4. Final design plans for proposed development shall utilize natural landforms and vegetation for screening structures, access roads, building foundations, cut and fill slopes, and exterior lighting. Roads, parking, and utilities shall be designed to minimize visual impacts. Prior to the issuance of any grading and/or building permit, the project applicant shall submit design-level drawings demonstrating compliance with this measure, subject to the review and approval of the City of Soledad Community and Economic Development Director. ~~If an alternative design would minimize impacts, the applicant shall submit evidence demonstrating that the alternative design is infeasible.~~

AGRICULTURAL RESOURCES, SECTION 3.3

Mitigation Measure 4.2-1 text is modified as follows:

4.2-1 Adequate buffer areas between urban and agricultural uses, including a minimum 50-foot buffer along the northern and eastern boundary of the project site and a 200-foot buffer along the western boundary, shall be incorporated into the proposed project. These buffers shall also be supplemented with physical barriers in areas where residential and commercial structures are to be located, as recommended by the Agricultural Resources Report contained Appendix T-1. The 200-foot buffer along the project's western boundary may be reduced upon demonstration to the satisfaction of the ~~city~~City Council that other measures, including those recommended in Mitigation Measure 4.2-2, will adequately protect human health and safety and minimize potential conflicts, and provided that any such reduction shall not result in a buffer width of less than 100 feet. The County of Monterey Agricultural Commissioner shall be consulted regarding the adequacy of the proposed buffers and physical barriers and evidence of said consultation and recommendation shall be submitted to the city prior to approval of the tentative map. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report contained in the Miravale III EIR Appendix T-1, subject to the review and approval of the City of Soledad. All agricultural buffers, excluding public right-of-ways, shall be maintained by the Project Proponent and/or his/her successor(s) in interest through easements dedicated to the city or other entity until such time that the adjoining agricultural operation and use no longer exists.

Mitigation Measure 4.2-5 is modified as follows:

4.2-5 Prior to the recordation of final map(s)~~issuance of any permit~~, the project applicant shall have recorded a right-to-farm notice on parcels adjacent to existing and ongoing agricultural uses consistent with the requirements of the City of Soledad General Plan, subject to the review and approval of the City of Soledad City Council.

AIR QUALITY, SECTION 3.4

Mitigation measure 4.3-3 is modified as follows:

4.3-3 No certificate of occupancy for any phase, or portion thereof, of the project shall be granted until all of the ~~feasible, applicable~~ measures included in the approved Emissions Reduction Plan have been implemented by the applicant/project proponent. The proponent shall demonstrate that measures that must be implemented throughout the life of the project are included in all applicable CC&Rs, property deeds, commercial center rules and regulations, and draft tenant lease agreements.

BIOLOGICAL RESOURCES, SECTION 3.5

All references to the California Department of Fish and Game are updated to California Department of Fish and Wildlife (CDFW).

The first sentence of Mitigation Measure 4.4-2 is revised as follows:

~~Prior to the onset of~~During construction, trees and vegetation not planned for removal as identified on the improvement plans shall be protected during construction to the maximum extent feasible.

Mitigation Measure 4.4-3 is revised as follows:

4.4-3 Following construction, the disturbed areas that are proposed as parks and landscaping areas shall be restored to pre-project contours and revegetated by the contractor using locally-occurring native species and native erosion control seed mix~~ to the maximum extent feasible~~. Landscape plans for all such areas adjoining natural open space, including landscaped strips within right-of-ways, shall be reviewed by a qualified biologist to ensure that only native and non-invasive species are included in the planting palette and shall include a supplemental note and/or report by said biologist documenting compliance with this requirement. Landscape plans for other disturbed areas or for designated parks shall utilize native species ~~to the extent feasible~~and avoid the use of all invasive species; such plans shall include a note from the licensed professional who prepared the plan(s) or from a qualified biologist retained by the developer documenting Applicant compliance with this requirement. Prior to the issuance of any grading and/or building permit, the project applicant shall submit landscape plans prepared by a licensed landscape architect for review and approval by the City of Soledad Community Development Director.

The first sentence of Mitigation Measure 4.4-7 is revised as follows:

EXHIBIT D
City of Soledad City Council Resolution 5431

4.4-7 A qualified botanist shall be retained by the developer to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species.

The last paragraph of Mitigation Measure 4.4-7 is revised as follows:

Avoidance shall be confirmed by the City prior to ~~the time~~approval of the first final~~tentative~~ map ~~approval for this phase of the project~~. If impacts to the Lemmon's jewelflower population(s) cannot be avoided, mitigation shall include preservation on- or off-site at a minimum 1:1 ratio (one plant preserved for each plant impacted), or restoration on- or off-site at a minimum 3:1 ratio (three plants planted for each plant impacted).

Mitigation Measure 4.4-8 is revised as follows:

4.4-8 The developer shall record the conservation easement for all areas above the 400 foot elevation contour ~~prior to~~ concurrent with recordation of the first final map or the onset of any other site disturbance

The first and second paragraphs of Mitigation Measure 4.4-10 are revised as follows:

4.4-10 Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. The preconstruction surveys shall be conducted per Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to or During Ground Disturbance (USFWS 1999b), as updated. Potential dens (including man-made structures) and known dens shall be protected by minimum buffers of 50 feet and 100 feet, respectively. If an occupied or unoccupied natal den is detected, no construction shall occur for the Phase until the USFWS and CDFG have been contacted and authorization to proceed has been obtained by the applicant. Pre-construction surveys shall be conducted by a qualified biologist retained by the developer no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites.

In addition to pre-construction surveys, a qualified biologist retained by the developer, meeting the required qualifications described in the U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox.

The first sentence of the third bullet point of Mitigation Measure 4.4-11 is revised as follows:

If the biologist determines that avoidance of an active badger den is not feasible, the biologist shall coordinate with CDFGCDFW on the appropriate way to evict/exclude badgers from their dens.

The first sentence of Mitigation Measure 4.4-12 is modified as follows:

A qualified bat specialist retained by the developer shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist).

The last sentence of the fourth bullet point of Mitigation Measure 4.4-12 is modified as follows:

If the biologist determines that disruption of a maternity roost cannot be avoided, a depredation permit would be required

Mitigation Measure 4.4-14 is modified as follows:

4.4-14 Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the Miramonte site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist retained by the developer shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The survey shall conform to the CDFG 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied). If occupied burrows are found the avoidance and mitigation measures~~Please refer to the mitigation measures~~ regarding burrowing owl identified in the Preliminary BA (June, 2008) ~~for avoidance and mitigation measures that~~may be implemented based on the results of these surveys.

The first sentence of Mitigation Measure 4.4-15 is modified as follows:

If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist retained by the developer shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area.

The first sentence of Mitigation Measure 4.4-15 is modified as follows:

If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist retained by the developer shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area.

The first sentence of Mitigation Measure 4.4-17 is modified as follows:

Protocol-level CRLF surveys (USFWS, August 2005) shall be completed by a qualified biologist retained by the developer at each aquatic resource present within project boundaries.

EXHIBIT D
City of Soledad City Council Resolution 5431

Mitigation Measure 4.4-20 is revised as follows:

A representative shall be appointed by the City who will be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. The representative shall be legally responsible to notify USFWS and CDFW immediately in the event that "take" of any special-status wildlife species occurs. The representative shall be identified during the Employee Education Program and his/her contact information shall be provided to USFWS and CDFW. The representative will be present onsite every day and will be accessible to regulatory agency personnel.

CULTURAL RESOURCES, SECTION 3.5

Mitigation Measure 4.5-1 is revised as follows:

Relocation of House. The historic Morris Lorentzen House on site shall be relocated in accordance with the relocation plan prior to the issuance of a grading permit for development of the storm water detention basin in the southwest corner of the Specific Plan area. The project proponent shall ensure that the design and implementation of the relocation project is consistent with the Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, and the Mitigation Monitoring and Reporting Plan (MMRP) for the project. Prior to recordation of the final map, the project applicant shall submit a relocation plan prepared by a qualified professional in accordance with the general recommendations of Moving Historic Buildings, a publication of the National Park Service, to the City of Soledad for review and approval. The relocation plan shall discusses planning, research, and recording prior to the move. In addition, the relocation plan shall identify siting, foundation construction, building reassembly, and restoration work after a successful move. See John Obed Curtis, Moving Historic Buildings, Heritage Conservation and Recreation Service, Publication No. 9, US Department of Interior (1979) for further details. Prior to the relocation, the applicant shall provide verification of compliance with ~~related mitigations~~mitigation measure 4.5-2 to the City of Soledad Community Development Department Director for review and approval. In addition, the structure shall be relocated prior to the issuance of any building and/or grading permit for development within the Specific Plan area.

The second paragraph of Mitigation Measure 4.5-2 is amended as follows:

~~Prior to the recordation of the final map, the project applicant shall submit a relocation plan, consistent with Mitigation Measure 4.5-1, which incorporates protective measures consistent with the intent of this measure.~~ Prior to the relocation of the structure, the applicant shall submit evidence from a qualified professional demonstrating that protective measures have been implemented, subject to the review and approval of the City of Soledad.

EXHIBIT D
City of Soledad City Council Resolution 5431

The last sentence of Mitigation Measure 4.5-3 is revised as follows:

The project ~~applicant~~developer shall submit detailed documentation prepared by a qualified professional demonstrating that all repairs have been completed in accordance with applicable standards prior to the issuance of ~~any building permit~~the first certificate of occupancy.

Mitigation Measure 4.5-6 is revised as follows:

Coordination. The project proponent shall coordinate with and inform interested parties, including, but not limited to the Soledad Historical Society and the Monterey County Historical Society, regarding the status of its compliance with the mitigation measures set forth in the MMRP~~, as necessary~~.

HYDROLOGY AND WATER QUALITY, SECTION 3.6

The last sentence of Mitigation Measure 4.6-3 is revised as follows:

Prior to the issuance of any grading and/or building permit for new public facilities, including but not limited to new schools, hospitals, and fire or police stations, a probabilistic seismic hazards assessments shall be prepared and submitted to the Soledad Unified School District and City of Soledad ~~Director of Public Works~~Building Official for review and approval.

The first sentence of Mitigation Measure 4.6-4 is revised as follows:

4.6-4 Per the approved SWPPP, the following measures shall be implemented, where deemed appropriate by the Director of Public Works, to control erosion:

GEOLOGY, SOILS, AND MINERAL RESOURCES, SECTION 3.7

The text of Mitigation Measure 4.6-8, is revised as follows:

An engineering geologist shall be retained by the developer to provide site-specific geologic design criteria for debris flow hazard areas once the final project plans are available. Diversion or retaining structures shall be designed based on recommendations by a geotechnical engineer, subject to review and approval of the City of Soledad Public Works Director. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate design measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad Public Works Director.

The last line of Mitigation Measure 4.6-9 is revised as follows:

Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad ~~Director of Public Works~~Building Official.

HAZARDS AND HAZARDOUS MATERIALS, SECTION 3.8

The text of Mitigation Measure 4.8-3 is revised as follows:

All design-level plans and supporting details shall be submitted to the City of Soledad Director of Public Works for review and approval prior to recording the first final map. ~~The VTM and Specific Plan shall be revised as necessary to reflect final locations of drainage facilities, subject to the review and approval of the Director of Public Works.~~

The last paragraph of Mitigation Measure 4.8-4 is revised as follows:

Alternative types of LID strategies and measures may also be approved provided evidence is submitted to the City of Soledad by a qualified engineer at the developer's expense, demonstrating that said strategies will achieve the intended result of this mitigation measure. Alternative strategies must be reviewed and approved Public Works Director.

LAND USE AND PLANNING, SECTION 3.10

The first paragraph and last bullet item of Mitigation Measure 4.10-4 is revised as follows:

4.10-4 The project shall incorporate noise reduction methods into all improvement plans to reduce transportation noise, subject to the review and approval of the City of Soledad Director of Public Works or Building Official as applicable. Methods to reduce noise on the project site may include the following measures:

- Provide affected residences with building sound insulation, such as sound rated windows and doors~~, on a case-by-case basis~~ to reduce interior noise levels to below the 45 dBA CNEL noise standard.

POPULATION AND HOUSING, SECTION 3.12

The following changes are made to the text, page 3-88:

The specific plan is consistent with the housing element's integrated affordable housing requirementsHowever, to ensure final plan consistency mitigation measure 4.11-3 identified in the Miravale III EIR remains applicable to this project and is modified as follows.

Mitigation Measure 4.11-3 is amended as follows:

4.11.3 The applicant's approved ~~shall enter into a~~ Development Agreement shall include a Housing Agreement per Program 4.3 of the City's Housing Element with the City that prescribes

the parameters of the development of affordable housing consistent with the City's Housing Element, Inclusionary Housing Ordinance, and the revised Specific Plan. The Development Agreement shall be reviewed and approved by the City of Soledad City Council prior to or concurrent with ~~project approval~~recording of the first final map.

PUBLIC SERVICES AND RECREATION, SECTION 3.13

Police and Fire

The last sentence of Mitigation Measure 4.12-1 is revised as follows:

This mitigation measure shall not be construed as prohibiting the implementation of infrastructure necessary to serve the proposed facility or facilities~~or the need of the proposed project~~.

Schools

Based on information provided by the Soledad Unified School District (letter dated August 28, 2018) the following change is made to Mitigation Measure 4.12-4, pp 3-93 – 3-94:

4.12-4 Prior to ~~project approval~~ recording of first final map, the project Developer shall submit an agreement with evidence demonstrating that ~~an additional~~two school sites of sufficient size will be dedicated within the project boundaries~~ to meet project demands~~, subject to the review and approval of the City of Soledad and the Soledad Unified School District. ~~An agreement shall be established between the developer and/or successors in interest and the Soledad Unified School District that establishes the timing of the school construction or improvements and financing obligations. In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions.~~ The agreement shall be established between the developer and/or successors in interest and the Soledad Unified School District that establishes the sites to be dedicated.

Based on information provided by the Soledad Unified School District (letter dated August 28, 2018) the following change is made to Mitigation Measure 4.12-5, page 3-94:

4.12-5 In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment. The applicant/developer shall pay a school impact fee for each type of development pursuant to the criteria set forth within California Government Code Section 65995. Prior to the issuance of building permits, the applicant shall pay required school mitigation fees and provide evidence of payment to the city.

Parks and Recreation

The following change is made to Mitigation Measure 4.12-6, page 3-92:

4.12-6 Prior to the recordation of the first final map, the project Developer shall submit a comprehensive Park Master Plan to the City of Soledad for review and approval. This plan shall address park design and development consistent with the City's adopted Parks and Recreation Master Plan, along with maintenance, operation and financing components. ~~for each dedicated~~

~~recreation parcel in that phase of development~~ This plan shall also identify the appropriate types of improvements within each park parcel to meet the recreational needs of all age groups ~~within that phase of the project~~. The Park Master Plan will identify timing for concurrent park improvements for each phase of development. The Parks Master Plan is subject to review and recommendation by the Parks and Recreation Commission and approval by the City Council.

TRAFFIC AND CIRCULATION, SECTION 3.14

The mitigation measures listed in this section (pp 3-117 – 3-136) are modified and three new mitigation measures are added in response to concerns raised by the Planning Commission and City Council during their review and consideration of the project's effects to traffic and circulation.

Since the original traffic report was prepared, Front Street has been widened to four lanes between San Vicente Road and the Moranda Road/Front Street intersection.

In response to concerns voiced by Planning Commissioners and City Council members, the traffic mitigation measures have been revised to eliminate repetitive language regarding alternative roadway extensions and monitoring. Three additional mitigation measures, 4.13-15, 4.13-16, and 4.13-17 are added to address these issues and are described in the following paragraph.

Mitigation Measure 4.13-15, Level of Service Monitoring Program, is added to the addendum to eliminate repetitive language in multiple mitigation measures describing the required monitoring program. The new measure identifies the affected intersections and performance thresholds including minimum frequency, duration, and reporting for the monitoring that shall be conducted by the City at the applicant's expense. Correspondingly the details of required monitoring have been deleted from the individual mitigation measures. Mitigation measures identifying improvement alternatives of an extension of Market Street from San Vicente Road to the intersection of Moranda Road / Front Street (Mitigation Measure 4.13-16) and an extension of Gabilan Drive from San Vicente Road to Moranda Road / U.S. Highway 101 northbound ramps (Mitigation Measure 4.13-17) are added to the EIR Addendum and mitigation. An extension of Gabilan Drive was identified in many of the mitigation measures as an alternative improvement that will mitigate cumulative impacts to several affected intersections and the project's contribution to them. The new mitigation measure 4.13-17 describes the extension and the intersection impacts it will mitigate if constructed. Additionally an extension of Market Street from San Vicente Road to the intersection of Moranda Road / Front Street was also identified during City Council consideration of the proposed project. The extension of Market Street is identified in the general plan and the environmental impacts were analyzed in the general plan EIR. This improvement is included in the 2007 traffic impact fee study. The new mitigation measure 4.13-16 describes the extension and the intersection impacts it will mitigate if constructed. The remaining mitigation measures are modified accordingly as described below.

Mitigation Measure 4.13-15 (NEW)

4.13-15 Traffic Level of Service Monitoring Program. The following intersections shall be monitored by the city at the developer's expense to ensure that acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards throughout development of the specific plan area.

- Moranda Road / Front Street;
- U.S. Highway 101 Northbound Ramps and Moranda Road / Front Street;
- San Vicente Road / Front Street;
- San Vicente Road / Gabilan Drive; and
- Main Street / Gabilan Drive.

Monitoring shall be conducted by a qualified transportation engineer retained by the applicant and shall commence at issuance of the first residential building permit and routinely thereafter in increments of 200 residential building permits until the intersection improvements identified in Mitigation Measures 4.13-2, 4.13-3, 4.13-4, 4.13-6, and 4.13-10, or the Market Street and Gabilan Drive extensions are complete.

The Monitoring Program shall include the following:

a. Conduct analyses of all applicable traffic operations based on field-measured data;
b. Study prevailing traffic and roadway conditions;
c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is identified above is necessary.

No building permit shall be issued for any phase of the project unless intersection levels of service are operating at the City's adopted acceptable threshold LOS D.

Mitigation Measure 4.13-16 (NEW)

4.13-16 Market Street Extension Alternative Mitigation. Payment of the project's proportionate share of fees to mitigate project contributions to cumulative impacts to the three intersections identified in Mitigation Measures 4.13-2, 4.13-3, and 4.13-10, may be used, at the discretion of the City Council, to instead acquire land and construct an extension of Market Street between San Vicente Road and the intersection of Moranda Road / Front Street. This improvement would mitigate the project's impacts to the following intersections:

- Moranda Road / Front Street;
- U.S. Highway 101 Northbound Ramps and Moranda Road / Front Street; and
- San Vicente Road / Front Street.

The project developer may choose to design and construct the Market Street Extension in exchange for a potential credit in traffic impact fees for future development within the specific plan area, and would be eligible for entering into a reimbursement agreement with the City. The developer's costs associated with this improvement may be subject to partial reimbursement subject to a reimbursement agreement with the City.

If the developer chooses to construct this improvement, the developer shall retain a qualified engineer to design the improvement in conformance with the City's performance thresholds and design criteria. The engineered plans shall be submitted to the Director of Public Works prior to

issuance of the 200th residential building permit, and shall be constructed prior to issuance of the 400th residential building permit. This timeframe may be modified by the Director of Public Works if the results of traffic monitoring (Mitigation Measure 4.13-15) indicate that a shorter or lengthier time frame is warranted. All traffic facility improvement plans or traffic impact fees shall be subject to the review and approval by the Director of Public Works.

If the Market Street Extension is constructed, the improvements identified in mitigation measures 4.13-2, 4.13-3, and 4.13-10 would not be required.

Mitigation Measure 4.13-17 (NEW)

4.13-17 Gabilan Drive Extension Alternative Mitigation. Payment of the project's proportionate share of fees to mitigate project contributions to cumulative impacts to the five intersections identified in Mitigation Measures 4.13-2, 4.13-3, 4.13-4, 4.13-6, and 4.13-10, may be used, at the discretion of the City Council, to instead acquire land and construct an extension of Gabilan Drive between San Vicente Road and the U.S. Highway 101 Northbound ramps. This improvement requires coordination with Caltrans for modification of the northbound ramps.

This improvement, if constructed in lieu of the Market Street extension or the intersection improvements identified in mitigation measures 4.13-2, 4.13-3, and 4.13-10, would mitigate the project's impacts to the following intersections:

- Moranda Road / Front Street;
- U.S. Highway 101 Northbound Ramps and Moranda Road / Front Street;
- San Vicente Road / Front Street;
- San Vicente Road / Gabilan Drive; and
- Main Street / Gabilan Drive.

The project developer may choose to design and construct the Gabilan Drive Extension in exchange for a potential credit in traffic impact fees for future development within the specific plan area, and would be eligible for entering into a reimbursement agreement with the City. The developer's costs associated with this improvement may be subject to partial reimbursement subject to a reimbursement agreement with the City..

If the developer chooses to construct this improvement the developer shall retain a qualified engineer to design the improvement in conformance with the City's performance thresholds and design criteria. The engineered plans shall be submitted to the Director of Public Works prior to issuance of the 200th residential building permit, and shall be constructed prior to issuance of the 400th residential building permit. This timeframe may be modified by the Director of Public Works if the Market Street extension is operational and the results of traffic monitoring (Mitigation Measure 4.13-15) indicate that a shorter or lengthier time frame is warranted. All traffic facility improvement plans and traffic impact fees shall be subject to the review and approval by the Director of Public Works.

If the Market Street Extension and the Gabilan Drive Extension are constructed, the improvements identified in Mitigation Measures 4.13-4, 4.13-6, and 4.13-10 are not required. If only the Gabilan Drive Extension is constructed, the improvements identified in Mitigation Measures 4.13-2, 4.13-3, 4.13-4, 4.13-6and 4.13-10 are not required.

EXHIBIT D
City of Soledad City Council Resolution 5431

The following change is made to the discussion of impacts to the intersection of Moranda Road and Front Street p 3-124 of the EIR Addendum:

This impact was identified in the Miravale III EIR as less than significant with mitigation. The necessary improvements to mitigate project impacts are identified in mitigation measure 4.13-2 of the Miravale III EIR, and include widening of northbound Front Street to two lanes, which has already occurred. No additional mitigation is required; however, the language of mitigation measure 4.13-2 has been revised for clarification based on the roadway improvements called for in the proposed specific plan, the reduced project size, the configuration of allowable uses under the specific plan, and the analysis of traffic "triggers" discussed earlier in this section.

The following change is made to the discussion of impacts to the intersection of Moranda Road and Front Street p 3-125 of the Addendum:

Implementation of the following revised Mitigation Measure 4.13-2 ~~in addition to implementation of revised Mitigation Measure 4.13-10 and revised Mitigation Measures 4.13-11~~ would reduce the project's impact to this intersection to less than significant.

The following change is made to Mitigation Measure 4.13-2 (Moranda Road and Front Street Intersection), pp 3-125 – 3-127 of the Addendum:

4.13-2 Intersection of Moranda Road and Front Street. Signalize and add a second northbound through lane, and eastbound free-right-turn lane. This improvement is necessary with or without the project. The intersection of Moranda Road and Front Street would operate at LOS A with construction of this improvement or with construction of an extension of Market Street extension between San Vicente Road and the intersection of Moranda Road / Front Street (see Mitigation Measure 4.13-16) or an extension of Gabilan Drive from San Vicente Road to the U.S. Highway 101 northbound ramps (Mitigation Measure 4.13-17).

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used, at the discretion of the City Council, to instead acquire land and construct either or both extensions of Market Street and Gabilan Drive identified above.

If the extension of Market Street and/or Gabilan Drive is undertaken either by the City or by the developer (see Mitigation Measure 4.13-16 and Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of Moranda Road and Front Street until the roadway extensions are complete.

No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of

Public Works, until either the intersection improvements listed in this measure or an extension of Market Street or Gabilan Drive is complete.

~~4.13-2 Widen northbound Front Street to two lanes, add a second northbound through lane, eastbound free right-turn lane and widen Front Street between Moranda Road and San Vicente Road or. construct the Gabilan Drive Extension. This improvement is necessary with or without the project. The intersection of Moranda Road and Front Street would operate at LOS B with construction of the Gabilan Drive Extension.~~

~~The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:~~

~~Prior to the issuance of any building permit for each phase of development, the project developer shall either submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the construction of the Gabilan Drive Extension in order to mitigate the project's share of impacts at this location or construct the Gabilan Drive Extension.~~

~~The project developer shall also be responsible for monitoring the intersection of Moranda Road/Front Street. Local roadways shall be monitored by the city at the developer's expense to ensure that acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until the intersection improvements or extension of Gabilan Drive is complete. At minimum, monitoring shall commence upon issuance of the first residential building permit, and shall be conducted prior to issuance of the 600th, 900th, and 1,800th residential building permit (excluding secondary units). Monitoring shall include the following:~~

- ~~a. Conduct analyses of all applicable traffic operations based on field-measured data;~~
- ~~b. Study prevailing traffic and roadway conditions;~~
- ~~c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.~~

~~The project developer shall install the required improvements at the intersection if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement.~~

~~The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.~~

~~All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension is installed, subject to the review and approval of the City of Soledad Director of Public Works.~~

~~In the alternative, if the City of Soledad Director of Public Works determines that the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, the project developer shall comply with the following.~~

~~If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension. The developer may choose to construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad.~~

~~Traffic facility improvement plans or traffic impact fees shall be subject to the review and approval by the Director of Public Works.~~

The following change is made to Mitigation Measure 4.13-3 (San Vicente Road and Front Street Intersection), pp 3-127 – 3-129 of the Addendum:

4.13-3 Intersection of San Vicente Road and Front Street. Widen northbound San Vicente Road to three lanes, add two eastbound left-turn lanes and one southbound free-right turn lane. The intersection of San Vicente Road and Front Street would operate at LOS B with the construction of these improvements or with construction of a Market Street extension between San Vicente Road and the intersection of Moranda Road / Front Street (see Mitigation Measure 4.13-16) or an extension of Gabilan Drive from San Vicente Road to the U.S. Highway 101 northbound ramps (Mitigation Measure 4.13-17).

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used by the city, at the discretion of the City Council, to instead acquire land and construct an extension of Market Street or Gabilan Drive as described above.

If the extension of Market Street or Gabilan Drive are implemented (see Mitigation Measure 4.13-16 and Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of San Vicente Road and Front Street until the roadway extensions are complete. No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Market Street or Gabilan Drive is complete.

~~4.13-3 Intersection of San Vicente Road and Front Street. The intersection of San Vicente Road and Front Street would operate at LOS B with the construction of the Gabilan Drive extension or~~

~~by widening northbound Front Street to two lanes, northbound San Vicente Road to three lanes, adding two eastbound left-turn lanes and a southbound free-right turn lane.~~

~~The project developer is responsible for the project's fair-share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:~~

~~Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the construction of the intersection improvements or Gabilan Drive Extension in order to mitigate the project's share of impacts at this location. Alternatively the developer may construct the Gabilan Drive Extension.~~

~~The project developer shall also be responsible for monitoring the intersection of San Vicente Road and Front Street. Local roadways shall be monitored by the city at the developer's expense to ensure that acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until buildout occurs or the extension of Gabilan Drive is complete.~~

~~At minimum, monitoring shall commence upon issuance of the first residential building permit, and shall be conducted prior to issuance of the 600th, 900th, and 1,800th residential building permit (excluding secondary units). residential building permit (excluding secondary units) or until improvement is complete. Monitoring shall include the following:~~

- ~~a. Conduct analyses of all applicable traffic operations based on field-measured data;~~
- ~~b. Study prevailing traffic and roadway conditions;~~
- ~~c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.~~

~~The project developer shall commence to construct the Gabilan Drive Extension if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement. The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.~~

~~All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension improvement is installed, subject to the review and approval of the City of Soledad Director of Public Works.~~

~~In the alternative, if the City of Soledad Director of Public Works determines that the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, the project developer shall comply with the following.~~

~~If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. The developer may choose to~~

~~construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension.~~

~~Traffic facility improvement plans or traffic impact fees shall be subject to review and approval by the Director of Public Works.~~

The following change is made to Mitigation Measure 4.13-4 (San Vicente Road and Gabilan Drive) on pp 3-130 – 3-131 of the Addendum:

4.13-4 Intersection of San Vicente Road and Gabilan Drive. Signalize and add a second westbound left turn lane, and widen southbound San Vicente Road to accommodate the two left-turn lanes. The intersection would operate at an acceptable LOS A with the construction of these improvements or with construction of the Gabilan Drive extension from San Vicente Road to the U.S. Highway 101 northbound ramps (Mitigation Measure 4.13-17).

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used by the city, at the discretion of the City Council, to instead acquire land and construct an extension of Gabilan Drive as described above.

If the extension of Gabilan Drive is implemented (see Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of San Vicente Road and Gabilan Drive until the roadway extension improvement is complete. No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Gabilan Drive is complete.

~~4.13-4 Intersection of San Vicente Road and Gabilan Drive. The intersection of San Vicente Road and Gabilan Drive would operate at an acceptable level of service with the construction of the Gabilan Drive extension, or with signalization and addition of a second westbound left turn lane. The latter improvement requires southbound San Vicente Road to be widened to accommodate the two left-turn lanes.~~

~~The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:~~

~~Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building~~

~~permit issuance for the construction of the Gabilan Drive Extension in order to mitigate the project's share of impacts at this location, construct the improvement, or construct the Gabilan Drive Extension.~~

~~The project developer shall also be responsible for monitoring the intersection of San Vicente Road and Gabilan Drive. Local roadways shall be monitored annually by the city at the developer's expense to ensure that acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. Monitoring shall commence at issuance of the first building permit and shall be conducted in at least four stages: upon issuance of the first residential building permit, and prior to issuance of the 600th, 900th, and 1,800th residential building permit (excluding secondary units) or until the intersection improvements are complete. Monitoring shall include the following:~~

~~a. Conduct analyses of all applicable traffic operations based on field-measured data;~~
~~b. Study prevailing traffic and roadway conditions;~~
~~c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.~~
~~d. The project developer shall commence to construct the Gabilan Drive Extension if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement. The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.~~

~~All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension is installed, subject to the review and approval of the City of Soledad Director of Public Works.~~

~~In the alternative, if the City of Soledad Director of Public Works determines that the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, the project developer shall comply with the following.~~

~~If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. The developer may choose to construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension.~~

~~Traffic facility improvement plans or traffic impact fees shall be subject to review and approval by the Director of Public Works.~~

EXHIBIT D
City of Soledad City Council Resolution 5431

The following change is made to Mitigation Measure 4.13-6 (Main Street and Gabilan Drive), Pages 3-132 - 3-133:

4.13-6 Intersection of Main Street and Gabilan Drive. The intersection of Main Street and Gabilan Drive will operate at LOS A with signalization and protected left-turn phasing along Gabilan Drive. With the construction of the Gabilan Drive extension to U.S. Highway 101, signalization of this intersection would not be necessary.

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's fair share costs of construction of the improvements described in this measure. These fees may be used by the city, at the discretion of the City Council, to instead acquire land and construct an extension of Gabilan Drive as described above.

If the extension of Gabilan Drive is implemented (see Mitigation Measure 4.13-17), the intersection improvements listed in this measure would not be required unless the monitoring results (Mitigation Measure 4.13-15) indicate they are necessary to maintain acceptable levels of service at the intersection of Main Street and Gabilan Drive until the roadway extension improvement is complete. No certificate of occupancy shall be issued if the monitoring demonstrates that levels of service at this intersection degrade to an unacceptable level of service, determined by the Director of Public Works, until either the intersection improvements listed in this measure or an extension of Gabilan Drive is complete.

~~4.13-6 Intersection of Main Street and Gabilan Drive. The intersection of Main Street and Gabilan Drive will operate at LOS A with signalization and protected left-turn phasing along Gabilan Drive. With the construction of the Gabilan Drive extension to U.S. Highway 101, signalization of this intersection would not be necessary.~~

~~The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:~~

~~Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the construction of the Gabilan Drive Extension in order to mitigate the project's share of impacts at this location or construct the Gabilan Drive Extension.~~

~~The project developer shall also be responsible for monitoring the intersection of Main Street and Gabilan Drive. Local roadways shall be monitored by the city at the developer's expense to ensure that acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete~~

~~Monitoring shall commence at issuance of the first building permit and shall be conducted in at least three stages, prior to issuance of the 600th, 900th, and 1,800th residential building permit~~

~~(excluding secondary units) or until the improvement is complete. Monitoring shall include the following:~~

~~a. Conduct analyses of all applicable traffic operations based on field-measured data;~~

~~b. Study prevailing traffic and roadway conditions;~~

~~c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.~~

~~d. The project developer shall commence to construct the Gabilan Drive Extension if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement. The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.~~

~~All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension improvements are installed, subject to the review and approval of the City of Soledad Director of Public Works.~~

~~In the alternative, if the City of Soledad Director of Public Works determines that the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, the project developer shall comply with the following.~~

~~If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. The developer may choose to construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension.~~

~~Traffic facility improvement plans or traffic impact fees shall be subject to review and approval by the Director of Public Works.~~

The following change is made to Mitigation Measure 4.13-7, page 3-134 of the EIR Addendum:

4.13-7 The intersection of Andalucia Drive and Gabilan Drive will operate at an acceptable level of service<u>, determined by the City Director of Public Works,</u> with protected left-turn phasing along Gabilan Drive. The project developer is responsible for the construction of this improvement. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the Director of Public Works.

The following change is made to Mitigation Measure 4.13-8, pp 3-134 – 3-135:

4.13-8 The intersection of Orchard Lane and Metz Road will operate at an acceptable ~~LOS~~ level of service, determined by the Director of Public Works, with signalization and protected left-turn phasing on Metz Road and split phasing on Orchard Lane. The project developer is responsible for the construction of the improvement. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the Director of Public Works.

The following change is made to Mitigation Measure 4.13-9, pp 3-135 – 3-136:

4.13-9 Intersections of Oak Street and Front Street and Front Street and Nestles Road. ~~Construction of the Pinnacles Parkway project would improve intersection operations to acceptable levels of service:~~ Widen Front Street between Nestles Road and Oak Street and add a second eastbound left-turn lane at the intersection of Nestles Road and Front Street. The project developer is responsible for the project's fair share contribution of costs to mitigate the impact to this intersection; however, construction of the Pinnacles Parkway project, funded by Measure X revenues, would improve intersection operations to an acceptable level of service.

If the development of the project precedes completion of the Pinnacles Parkway, ~~The~~ the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance. All necessary fees shall be paid prior to the issuance of any building permits for each phase of development and shall be subject to the approval of the Director of Public Works.

The following change is made to Mitigation Measure 4.13-10, pp 3-118 – 3-119:

4.13-10 Moranda Road and U.S. Highway 101 Northbound Ramps: Signalize the intersection and widen the Northbound US 101 on ramp to add a second NB left-turn lane. This improvement requires coordination and approval by Caltrans.

The project developer is responsible for a fair share contribution of costs towards the construction of this improvement. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's proportionate share of costs to construct this improvement and shall also pay the TAMC Regional Development Transportation Impact Fees.

The payment of fees is considered mitigation for project impacts to freeway highway and regional facilities. All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Subject to the review and approval by the Director of Public Works, the City Council may exercise its discretion and instead use the project's payment of city fees for the project's proportionate share of costs for construction of the Market Street Extension to Moranda Road and/or an extension of Gabilan Drive to U.S. Highway 101.

Improvements to this interchange are within the jurisdiction of Caltrans and not under the control of the city. Should the improvement of the interchange not be implemented by Caltrans the impact would be considered significant and unavoidable.

All required traffic impact fees shall be subject to the approval of the Director of Public Works.

~~4.13-10 The project developer is responsible for a fair share contribution of costs towards the construction improvements to the U.S. Highway 101 interchange at Moranda Road. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the project's proportionate share of costs to construct improvements to the intersection and northbound ramps of U.S. Highway 101 interchange at Moranda Road and shall also pay the TAMC Regional Development Impact Fees The improvements may include signalization of the intersection and widening the northbound U.S. Highway 101 on ramp to add a second northbound left turn lane. Implementation of these improvements would require widening the northbound ramp to accommodate two lanes. If the aforementioned improvements are not implemented by the time required, the project could either construct or contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. Highway 101. Under this approach to mitigation, local roadways shall be monitored by the city at the developer's expense to ensure that LOS levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. In addition the U.S. Highway 101 interchange at Moranda Road/Front Street will require reconfiguration/reconstruction to provide more efficient access to the project site and north Soledad in general. However, improvements to this interchange are within the jurisdiction of Caltrans and not under the control of the city.~~

~~All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.~~

The following change is made to Mitigation Measure 4.13-11, page 3-120:

4.13-11. U.S. Highway 101 Interchange at Moranda Road/Front Street. Prior to the issuance of any building permit the project developer shall pay the project's fair share of TAMC Regional Development Transportation Impact fees. These fees may be used by TAMC for the construction of interchange improvements that may include signalizing the intersection and adding a second lane on the off-ramp and/or reconfiguration and/or reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street.

However, improvements to the interchange are within the jurisdiction of Caltrans and not under the control of the city. Should the improvement of the interchange not be implemented by Caltrans the impact would be considered significant and unavoidable.

All required traffic impact fees shall be subject to the approval of the Director of Public Works.

~~The project developer shall pay the project's fair share of TAMC regional development Impact fees for the construction of interchange improvements that may include signalization of the intersection the addition of a second lane on the off- ramp and/or reconfiguration/reconstruction~~

~~of the US 101 interchange at Moranda Road/Front Street. Widening Front Street (a city traffic facility) to two lanes southbound, between US 101 and Moranda Road is also necessary to provide more efficient access to the project site and north Soledad in general.~~

~~However, improvements to the interchange are within the jurisdiction of Caltrans and not under the control of the city. Should the improvement of the interchange be deemed infeasible by the Caltrans, or the widening of Front Street be deemed infeasible by the city, the impact would be considered significant and unavoidable. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the traffic impact fee in effect at the time of building permit issuance, including the Regional Development Transportation Impact Fees, in order to mitigate the impact at this location. All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.~~

The following change is made to Mitigation Measure 4.13-12, page 3-121:

4.13-12 U.S. Highway 101 Freeway Segments. Prior to the issuance of any building permit for each phase of development, the project developer shall submit payment of the TAMC Regional Development Transportation Impact Fee and City of Soledad traffic impact fees in effect at the time of building permit issuance in order to mitigate the project's impacts to the identified freeway segments. The payment of fees is considered mitigation for project impacts to freeway highway and regional facilities. All fees shall be shall be subject to the approval of the Director of Public Works.

CUMULATIVE TRAFFIC, SECTION 4.2

The following text is added to Mitigation Measure 4.13-13, page 4-4:

The fees collected for this improvement may instead be used by the City, at the discretion of the City Council, for the project's proportionate share of costs associated with the construction of an extension of Market Street from San Vicente Road to the Moranda Road/Front Street intersection. Construction of the Market Street extension would mitigate the project's cumulative impact at the intersection of Moranda Road and Front Street.

The following text is added to Mitigation Measure 4.13-14, page 4-4:

The fees collected for this improvement may instead be used by the City, at the discretion of the City Council, for the project's proportionate share of costs associated with the construction of an extension of Gabilan Drive from San Vicente Road to the northbound U.S. Highway 101 northbound ramps. Construction of the Gabilan Drive extension would mitigate the project's cumulative impact at the intersection of San Vicente Road and Gabilan Drive.

UTILITIES AND SERVICE SYSTEMS, SECTION 3.15

Mitigation Measure 4.14-1 is revised as follows:

EXHIBIT D
City of Soledad City Council Resolution 5431

~~D~~The developer shall retain an engineer to design ~~and construct~~ the water supply and distribution system for the project ~~that is~~ to be integrated with the City's water distribution system ~~and~~ consistent with the Urban Water Management Plan and the City's ~~2005~~ Water Master Plan. ~~project applicant shall submit detailed design level infrastructure plans in accordance with this measure, subject to the r~~Review and approval by the City of Soledad Director of Public Works and City Council is required prior to recordation of first final map.

Prior to the issuance of any building permit in any phase, the developer shall construct the water supply and distribution system for the project based upon the performance standards in the Water Master Plan and with city design criteria in accordance with the approved design-level infrastructure plans, subject to the review and approval of the City of Soledad Director of Public Works.

Mitigation Measure 4.14-9 is revised as follows:

4.14-9 All ~~water and~~wastewater infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building and/or grading plan, the project applicant shall submit detailed ~~evidence, including but not limited to~~design-level infrastructure plans, consistent with the requirements of this mitigation, subject to the approval of the Director of Public Works.

The first line of Mitigation Measure 4.13-5 is revised as follows:

4.14-13 In order to prevent the wasteful use of energy, all new residential, commercial, and hospitality oriented structures shall incorporate the principles of passive solar design ~~to the maximum extent feasible~~.

APPENDICES

Appendix E (NEW)

Appendix E, Impact and Mitigation Summary, is added to the EIR Addendum that includes a summary table of significant impacts, mitigation measures that reduce them and their resultant significance with mitigation.
