1.0
Introduction

1.1 BACKGROUND

In early 2000, the City of Soledad ("city") received an application initiated by Nader Agha (applicant) for a proposed specific plan (Miravale III Specific Plan) and related preliminary vesting tentative map. The application proposed a phased development for a 920-acre area north and west of the current boundaries of the City of Soledad, including residential, commercial, recreational, and public facility uses and supporting infrastructure, hereinafter referred to as Miravale III Specific Plan project.

The City of Soledad, as lead agency, determined that the Miravale III Specific Plan project could result in significant adverse environmental impacts and required that an environmental impact report (EIR) be prepared to evaluate these potentially significant adverse environmental impacts. A Notice of Preparation (NOP) was sent out in August 2006. The *Draft Environmental Impact Report for the Miravale Phase III Specific Plan* (hereinafter "Miravale III EIR" or "Draft EIR") was circulated for public review and comment for 45 days between November 4, 2008, and December 18, 2008. The *Final Environmental Impact Report for the Miravale Specific Plan* (hereinafter Final EIR), consisting of the Draft EIR, public comments and responses to comments was prepared in accordance with the California Environmental Quality Act (CEQA, California Public Resources Code, Sections 21000, et seq.) and the State CEQA Guidelines (California Code of Regulations, Title 14, Sections 15000, et seq.).

The Final EIR for the Miravale III Specific Plan analyzed the potential environmental effects of the then-proposed specific plan and vesting tentative map for environmental effects. The proposed specific plan would have provided policy guidance for the phased annexation and development of a portion of the Mirrasou Specific Plan area, the San Vicente West Specific Plan area, and Northwest Expansion Area identified in the city's 2005 General Plan. The preliminary vesting tentative map provided the basis for the conceptual lotting plan and infrastructure improvements for the uses proposed by the Miravale III Specific Plan.

The Miravale III Specific Plan, which was never adopted by the City Council, identified the following implementation measures for development of the project (Draft EIR page 3.0-7):

- Amendment of the General Plan – both policy provisions and diagrams— concurrently with the adoption of the specific plan to incorporate the land use designations illustrated in the Land Use Plan, and policies included in the text of the specific plan.

- Amendment of the Zoning Ordinance to rezone the property "MIIISP" within the specific plan area.
- Preparation of a final tentative map for subdivision of the specific plan area consistent with the design and zoning standards described in the specific plan. Requests for modifications to the land uses or zoning standards identified in the specific plan may be approved by the city provided they are in substantial conformance with city goals and criteria of the specific plan.
- Development of individual phases of the project consistent with the land use designations and with the policies and implementation measures contained in the specific plan.
- Application for a Sphere of Influence Amendment and subsequent annexation approval(s) from Monterey County Local Agency Formation Commission (LAFCO).

Approval of the then-proposed Miravale III Specific Plan and vesting tentative map would have resulted in the construction of 1,470 single-family residential units, 116 duplex/small lot single-family residential units, 2,614 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space, and an 18-hole golf course. The previously proposed project would have also included three school sites (two elementary schools and one middle school), a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system. Table 1-1 Miravale III Specific Plan Land Use (Formerly Proposed Specific Plan) presents the uses and acreage of the formerly-proposed Miravale III specific plan project that were analyzed in the Miravale III EIR.

In the Final EIR, the city concluded that many of the significant impacts resulting from the former project could be mitigated by adding or modifying specific plan provisions and by making changes to the preliminary vesting tentative map. Project revisions would be necessary to comply with the mitigation measures listed in the Final EIR.

The Final EIR was certified by the City Council in September 2010. The Final EIR is included in Appendix A. The applicant was directed to revise the specific plan and vesting tentative map for the Miravale Specific Plan project. Issues identified by the City Council included inconsistency of the Miravale Specific Plan project with a number of General Plan policies and provisions, in particular, those outlined in the Miravale III Specific Plan EIR analysis of impacts related to aesthetics, biological resources, public services and facilities, and population and housing. The project has since been revised and a new specific plan and vesting tentative map have been prepared to address the issues identified by the City Council during its review of the Miravale III Specific Plan EIR in 2010. The applicant has since submitted revisions to the specific plan and vesting tentative map and new applications, which are the subject of this addendum.

Table 1-1 Miravale III Specific Plan Land Use (Formerly Proposed Specific Plan)[1]

Land Use	Acreage	Amount	Gross Density[2]
Single-family Residential	240.88	1,470	6.1 du/acre
Multi-family Residential (Townhomes/Apartments)	146.97	1,183	18.99 du/acre
Senior Housing Units[3]	-	500	18.99 du/acre
Workforce/Senior Housing Units[3]	-	1,047	18.99 du/acre
Total Residential	387.85	4,200 DU	10.83[2]

SOURCE: Denise Duffy and Associates 2008

NOTES:

1. Amounts may vary due to rounding.
2. Includes land occupied by roadway and utility infrastructure and neighborhood public parks.
3. The acreage of Senior and Workforce housing is included in Multi-family acreage.

1.2 DECISION TO PREPARE AN ADDENDUM TO THE MIRAVALE III SPECIFIC PLAN EIR

The city has determined that the proposed project (specific plan amendment and tentative map application) is not an exempt project as defined in CEQA and therefore, must be evaluated for its potential impacts on the environment pursuant to CEQA.

CEQA Guidelines Section 15164 states that the lead agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for the preparation of a subsequent EIR have

occurred. CEQA Guidelines sections 15162 and 15163 define the conditions under which a subsequent or supplemental EIR may be prepared for a project. Section 15162 states:

> (a) When an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:
>
> (1) Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;
>
> (2) Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
>
> (3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the Negative Declaration was adopted, shows any of the following:
>
> (A) The project will have one or more significant effects not discussed in the previous EIR or negative declaration;
>
> (B) Significant effects previously examined will be substantially more severe than shown in the previous EIR;
>
> (C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
>
> (D) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.
>
> (b) If changes to a project or its circumstances occur or new information becomes available after adoption of a negative declaration, the lead agency shall prepare a subsequent EIR if required under subdivision (a).

> Otherwise the lead agency shall determine whether to prepare a subsequent negative declaration, an addendum, or no further documentation.

The city's decision to prepare an addendum to the Miravale III Specific Plan EIR is based on its determination that none of the conditions in CEQA Guidelines section 15162 or 15163, which would require preparation of a subsequent or supplemental EIR, are met. This conclusion is in turn based on the analysis provided in Section 3.0, Project Analysis.

This side intentionally left blank.

2.0
Project Description

2.1 Project Site and Vicinity Setting

Project Location

The project site is located in unincorporated Monterey County on the northern edge of the Soledad city limits. The project site is located east of U.S. Highway 101, approximately nine miles southeast of Gonzales, 22 miles southeast of Salinas, and nine miles north of Greenfield. The project location is illustrated in Figure 2-1, Location Map. Surrounding land uses include a farmworker housing area to the west, agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the north and east.

Project Site Setting

The approximate 647-acre project site consists of six parcels: Assessors Parcels Numbers (APN) 417-151-082, 417-151-084, 417-151-089, 417-151-090, 417-151-091, and 417-151-092. The 647 acres includes portions of the following parcels that will be dedicated for expansion of the San Vicente Road right-of-way and the park/drainage facility: APN 257-081-005, 257-091-009, and 257-091-012. Refer to Figure 2-2, Project Parcels.

The project site consists primarily of undeveloped land. The site's topography slopes naturally from the southwest corner of the site to the northeast with steeper slopes located at the eastern boundary. The majority of the site ranges in elevation between approximately 180 and 600 feet above mean sea level. The site generally drains to the southwest. Existing trees are located near a cluster of farm buildings at the southwestern corner of the site. A portion of the eucalyptus tree row historically located along San Vicente Road has been recently cut down.

The project site has a rural/agricultural appearance with a majority of the site reserved for agricultural uses. Much of the site is in active agricultural production for row crops and vineyards. The western and central portions of the site are generally vacant of structures and other physical features except for a farming buildings and support structures, farming equipment, detention and percolation ponds, pumping houses and equipment, and access roads. The eastern edge of the site contains predominantly undeveloped foothills currently

utilized for grazing activities. Existing development within these foothills include ranch roads, City of Soledad water tanks (located on APN 417-151-091 and 417-151-092), electrical power lines, and small-scale communication equipment.

The project site is bounded on the south by the Soledad city limits, which consist predominately of residential uses that are suburban in nature and include single-family residences comparable in density to the single family residential units proposed along the southern boundary of the project site. The project site's southwestern and eastern edges are visible by cars traveling on U.S. Highway 101. Other views of the project site are available from surrounding urban areas, primarily those areas adjacent to San Vicente Road.

Figure 2-3, Aerial Photograph, presents the project site characteristics. Figure 2-4, Site Photographs, present photographs of the existing setting at the project site.

Vicinity Setting

The project site is bordered by agricultural and grazing lands on three sides (east, north, and west). Residential development borders the site to the south.

There are several parks and open space areas within the vicinity of the project site including the Mission Nuestra Senora de la Soledad, located approximately two miles southwest of the city; Pinnacles National Park, located approximately five miles east of the city; and Arroyo Seco in the Los Padres National Forest, located approximately 25 miles southwest of Soledad.

Permitted aggregate resources located within the project vicinity include Stonewall Canyon Quarry, which is operated by Syar Industries and located off of Metz Road and Stonewall Canyon Road, approximately 1.5 miles east of the project site. There are no public airports within the vicinity of the project site. However, a private airstrip is located four miles south of the project site.

2.2 REGIONAL SETTING

The City of Soledad is located in the center of the Salinas Valley between the Santa Lucia Mountains to the west and the Gabilan Mountains to the east. The city encompasses 4.6 square miles and is surrounded by unincorporated Monterey County on all sides. The closest cities include Gonzales to the north and Greenfield to the south. Regional access to the city is provided solely via U.S. Highway 101. The Salinas Valley is one of the most economically productive and technologically advanced agricultural regions in the world and the area around Soledad is primarily productive agricultural land and range land. Natural resources of concern within the Soledad area include important farmland and limited habitat for rare and endangered species.

2.3 PROPOSED PROJECT

The City of Soledad Planning Department has received a planning permit application for a specific plan, general plan amendment, sphere of influence amendment, prezone and annexation, zoning map and text amendment, vesting tentative map, and a development agreement (hereinafter referred to as the "proposed project"). The proposed specific plan and vesting tentative map revise the previously-proposed Miravale III Specific Plan, summarized above in Section 1.1, Background.

The name of the proposed project has changed to Miramonte Specific Plan (also referred to herein as "specific plan"). The specific plan would guide the development of the uses identified in the accompanying proposed vesting tentative map. The specific plan includes text, tables and graphics that identify the total acreage in residential land use, total dwelling units within the specific plan area ("plan area"), population changes, etc. The proposed specific plan (*Draft City of Soledad Miramonte Specific Plan*) is included as Appendix B of this document. The proposed specific plan land use diagram is shown in Figure 2-5, Miramonte Specific Plan Land Use Diagram and would be the controlling land use diagram for development within the plan area. The proposed Miramonte Residential Subdivision vesting tentative map is shown as Figure 2-6, Miramonte Residential Subdivision Vesting Tentative Map. The proposed specific plan was prepared after the revised map was submitted city. The map will be required to be revised prior to City of Soledad approval of the final map, to match the development patterns, intensities, and densities described in the approved specific plan for the project site. The proposed specific plan and vesting tentative map are discussed in greater detail below.

Specific Plan

A specific plan is required by the city in advance of a sphere of influence amendment, annexation, entitlement approvals, and development of the project site. The proposed Miramonte Specific Plan would provide policy guidance and would be the controlling document for development of the site, once it is adopted by the city. Requests for modifications to the land uses or zoning standards identified in the specific plan may be approved by the city provided they are in substantial conformance with city goals and criteria of the Miramonte Specific Plan, once it is adopted by the city.

Proposed Land Uses

The specific plan proposes a mixed-use development consisting of approximately 1,318 low-density residential units, 626 medium-density residential units, 134 senior housing units, 100,000 square feet of retail commercial space in a central core area, over 140 acres of open space, and 56 acres of parklands. The specific plan also includes a 35.9-acre Residential Study Area (Sub-area 13 on the land use map) that would provide an opportunity for additional parklands and/or an additional 314 low density residential or medium density residential

lots, or a mix of both to provide flexibility as growth within the plan area proceeds. Land uses would be arranged around a core area of neighborhood commercial and higher density residential uses. Some parcels within the core area provide a mixed-use opportunity. The specific plan would allow a variety of residential types, including apartments, townhouses, and detached homes on small and large lots. The specific plan also would create opportunities for two elementary school sites a fire/police substation, storm water facilities, paved pathways, a community park, and an unimproved trail system within the hillside open space. The proposed land uses are summarized below in Table 2-1, Miramonte Specific Plan Proposed Land Use.

Table 2-1 Miramonte Specific Plan Proposed Land Use[1]

Land Use	Acreage[2]	Number of Units	Commercial Square Feet
Low-Density Residential	296.1	1,318	
Medium-Density Residential	31.3	626	
Senior Housing	6.7	134	0
Residential Study Area	35.9	314	
Total Residential	370.0	2,392	
Neighborhood Commercial	8.6	-	100,000
Schools and Public Facilities	22.0	-	-
Parks	56.18		
Open Space	140.4	-	-
Collector Streets	32.2	-	-
San Vicente Road	14.1		
Totals	647.0	2,392	100,000

SOURCE: EMC Planning Group 2017

NOTES:

1. Amounts may vary due to rounding
2. Residential acreage includes local street rights-of-Way and agricultural buffers.

The specific plan area will be served by a series of collector streets that tie into the city's existing collector and arterial street system. Local streets and bicycle paths will provide access to residential areas, the neighborhood commercial area, parks, and schools. Based on the anticipated mix of land uses, population was projected using U.S. Census Bureau data for Soledad for the low-density and medium-density housing, and custom estimates for the specialty housing for senior housing. Table 2-2, Miramonte Specific Plan Population Estimate, provides the population estimate for the specific plan area.

0 1,200 feet

Table 2-2 Miramonte Specific Plan Population Estimate

Land Use	Units	Persons per Unit	Population
Low-Density Residential	1,318	4.2	5,536
Medium-Density Residential	626	4.2	2,629
Senior Housing	134	1.7	228
Residential Study Area	314	4.2	1,319
Totals	2,392		9,712

SOURCE: EMC Planning Group 2017; United States Census Bureau 2015.

NOTE: Low density and medium density based on U.S. Census Bureau data; Medium-density residential includes land designated as Affordable Housing. Senior housing based on 70 percent couples and 30 percent singles.

As shown in Figure 2-7, City of Soledad General Plan Expansion Areas, the project site occupies a 633.8-acre portion of the general plan's 1,165-acre Mirrasou Specific Plan Area, currently located in unincorporated Monterey County. The city's desired improvements to San Vicente Road would require right-of-way acquisition consisting of approximately 1.28 acres within the Northwest Expansion Area and right-of-way acquisition and additional parkland consisting of approximately 9.71 acres within the San Vicente West Specific Plan Area. An additional 2.05 acres are located in the North Entry Commercial Specific Plan Area and Entry Commercial Expansion Area. The affected areas associated with the San Vicente roadway improvements are also located in unincorporated Monterey County. Table 2-3, Comparison of Development Potential, presents a comparison of the proposed project's potential development intensities with the Mirrasou Specific Plan Area development potential identified in the general plan.

Table 2-3 Comparison of Development Potential

Land Use	Mirrasou Specific Plan Area Development Potential	Miramonte Specific Plan	Difference
Residential	1,867 dwelling units	2,392 dwelling units	525 additional dwelling units
Commercial	100,000 square feet	100,000 square feet	none
Parks and Open Space	50 acres park and 515 acres open space	56.18 acres park and 140.4 acres open space	14.1 less park and 364.6 less open space

Source: City of Soledad General Plan 2005, page 11-19 and Table 11-1

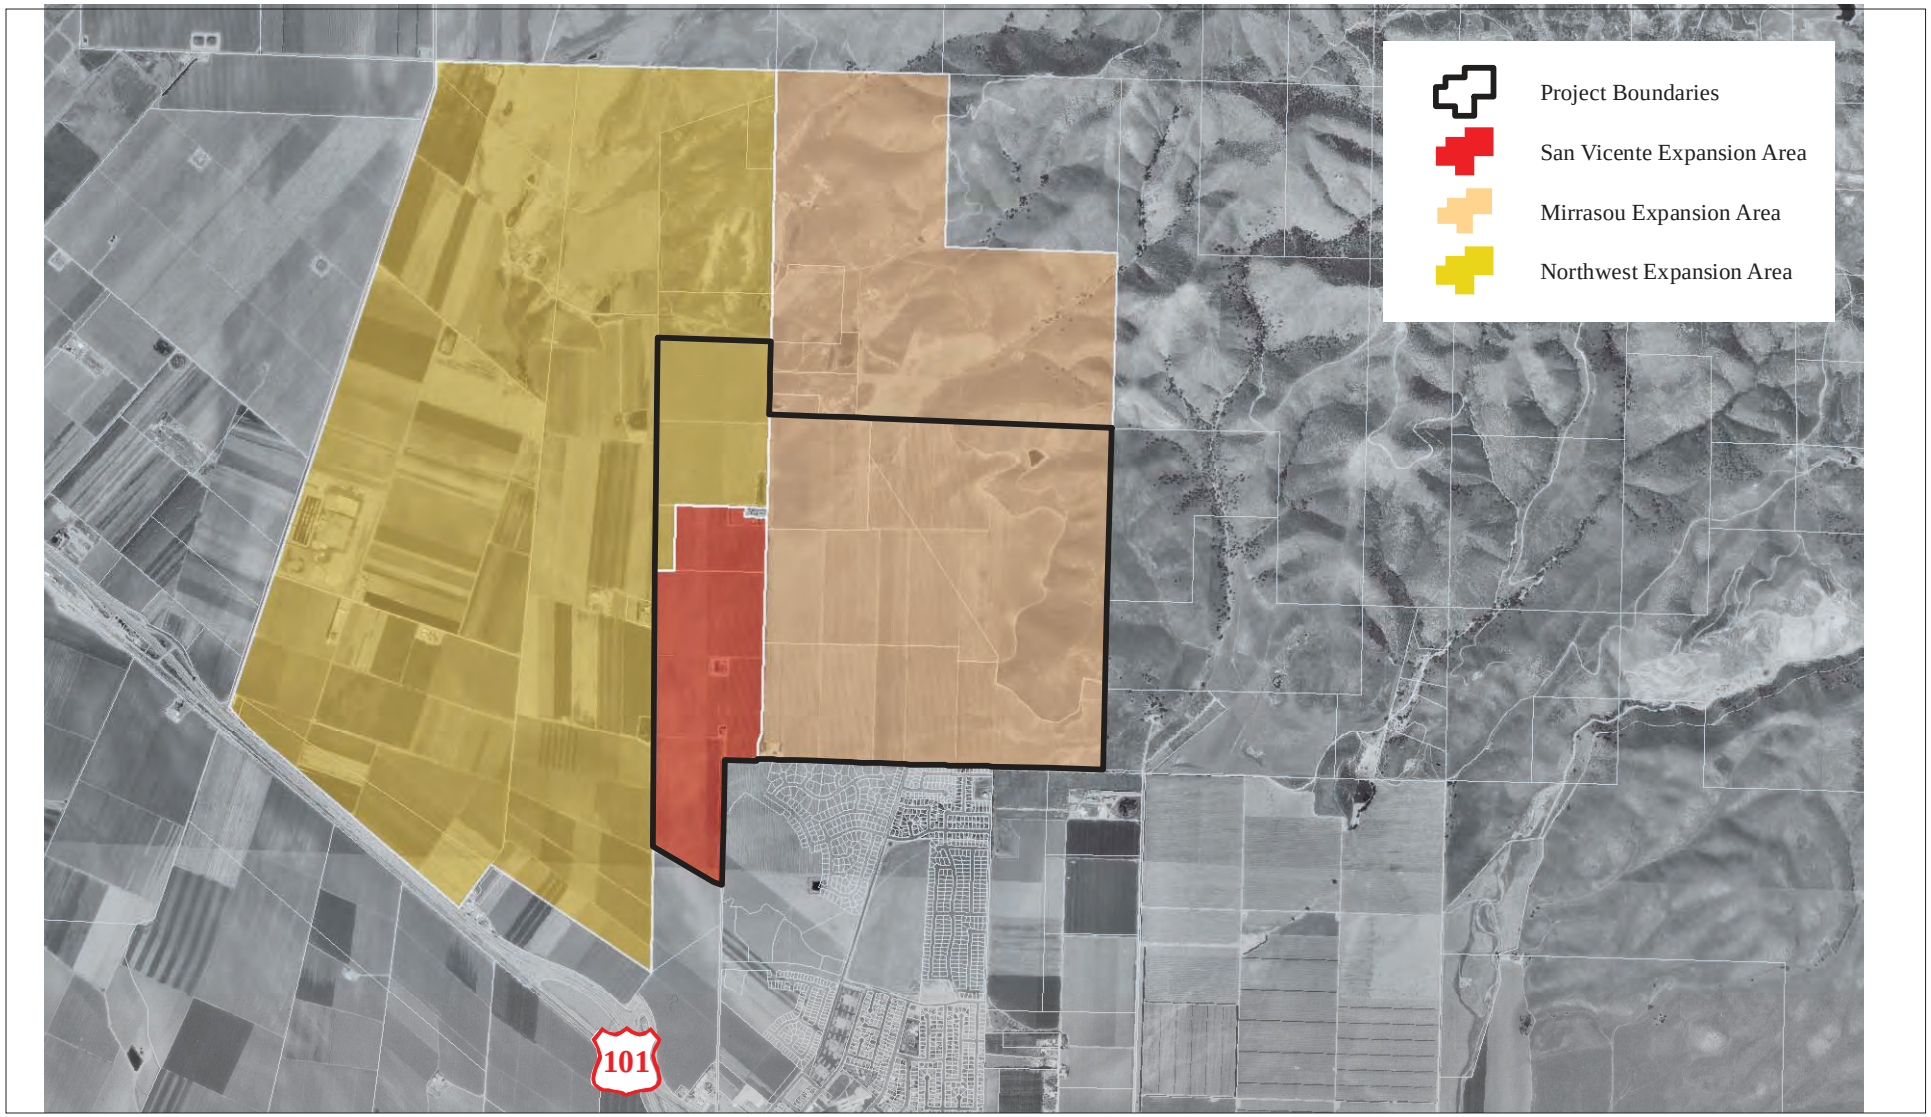
* May vary from original 2005 source table due to rounding, or addition errors in source table

The proposed specific plan exceeds the residential unit allowance as provided in the Mirrasou Specific Plan Area by 525 units. In contrast, the general plan identifies a total development potential of 10,317 dwelling units within its four expansion areas; 6,500 of these units are identified within the Northwest Expansion Area, adjacent to the western boundary

of the Mirrasou Specific Plan Area (Table II-1 of the general plan). The proposed project represents the full residential buildout potential for the Mirrasou Specific Plan Area, as well as 525 units of the identified residential potential of the Northwest Expansion Area.

Circulation Improvements

The specific plan's circulation system is designed to provide a functional and efficient transportation network for automobiles, transit, bicyclists, and pedestrians. The street system is comprised of a network of arterial, collector, and local residential streets designed to accommodate traffic generated by plan area residents. All streets are public with the exception of the private driveways that serve hillside lots and some roads within areas that may be developed within the commercial and multi-family residential areas. All streets will be designed to meet the *City of Soledad Design Standards and Standard Specifications* (City of Soledad 2007). Every street will include one traffic lane in each direction, gutter, storm drains, curb, planting strip, and sidewalks.



The City of Soledad desires that San Vicente Road provide the primary access route to the San Vicente West Specific Plan Area, the Northwest Expansion Area, and the Mirrasou Specific Plan Area. The city's desired roadway improvements and related right-of-way acquisition are not proposed by the applicant but are included in the specific plan and are considered part of the project description for analysis in this EIR addendum. City-desired improvements to San Vicente Road would require acquisition of approximately 13 acres land currently located in unincorporated Monterey County for city public right-of-way.

Open Space and Parks

The specific plan incorporates a network of parks and pathways that form a comprehensive and thoroughly interconnected system through the plan area. Several open space and recreational opportunities are provided including soccer or other sports fields, picnic areas, playgrounds, paved trails, and unimproved open space trails. The park and open space areas are arranged within the specific plan area to connect Sub-areas and to protect the hillside area from development.

Storm Water and Drainage

Existing drainage on the site flows generally from northeast to southwest. The specific plan includes requirements for the provision of storm water collection and conveyance and includes policy standards for design and performance of the storm drain and storm water facilities system, and for implementation of pre- and post-construction best management practices and low impact design to capture and retain flows on the site. The proposed system consists of storm drains, collection pipes, a drainage bio-swale within the linear park, a retention basin to capture post-development runoff, and other improvements to capture, retain, and percolate storm water within the project site consistent with the requirements of the Central Coast Regional Water Quality Control Board. Storm water flows would be

0 0.5 Miles

Source: Denise and Duffy Associates, Inc.

Figure 2-7

City of Soledad General Plan Expansion Areas

Miravalle III Specific Plan EIR Addendum

This side intentionally left blank.

collected in the linear park and through an underground storm drain system and directed to a retention pond (basin) located within the southwest corner of the project site. The linear park would serve as a bio-swale, following the existing topography and leading from upper elevations to the storm water retention basin. Storm water within developed areas would be collected and conveyed in a curb, gutter and underground storm drain system to the storm water retention basin. The basin, which may serve as a dual-use facility for recreational purposes, would be sized to accept the increase in flow resulting from full buildout of the uses identified in the specific plan. The preliminary design of the new storm water system within the project site is shown conceptually on Figure 2-8, Conceptual Storm Water Plan.

Flows in storms of greater intensity than an approximately 50-year return period may be discharged to the downstream city storm drainage facilities consistent with the city's *2007 Storm Water Management Plan* (2004). Any runoff that would be discharged from the storm water retention basin would be treated prior to release to existing downstream storm water facilities located on San Vicente Road, and would be released at a rate equal to or less than the historic flows of the site prior to development.

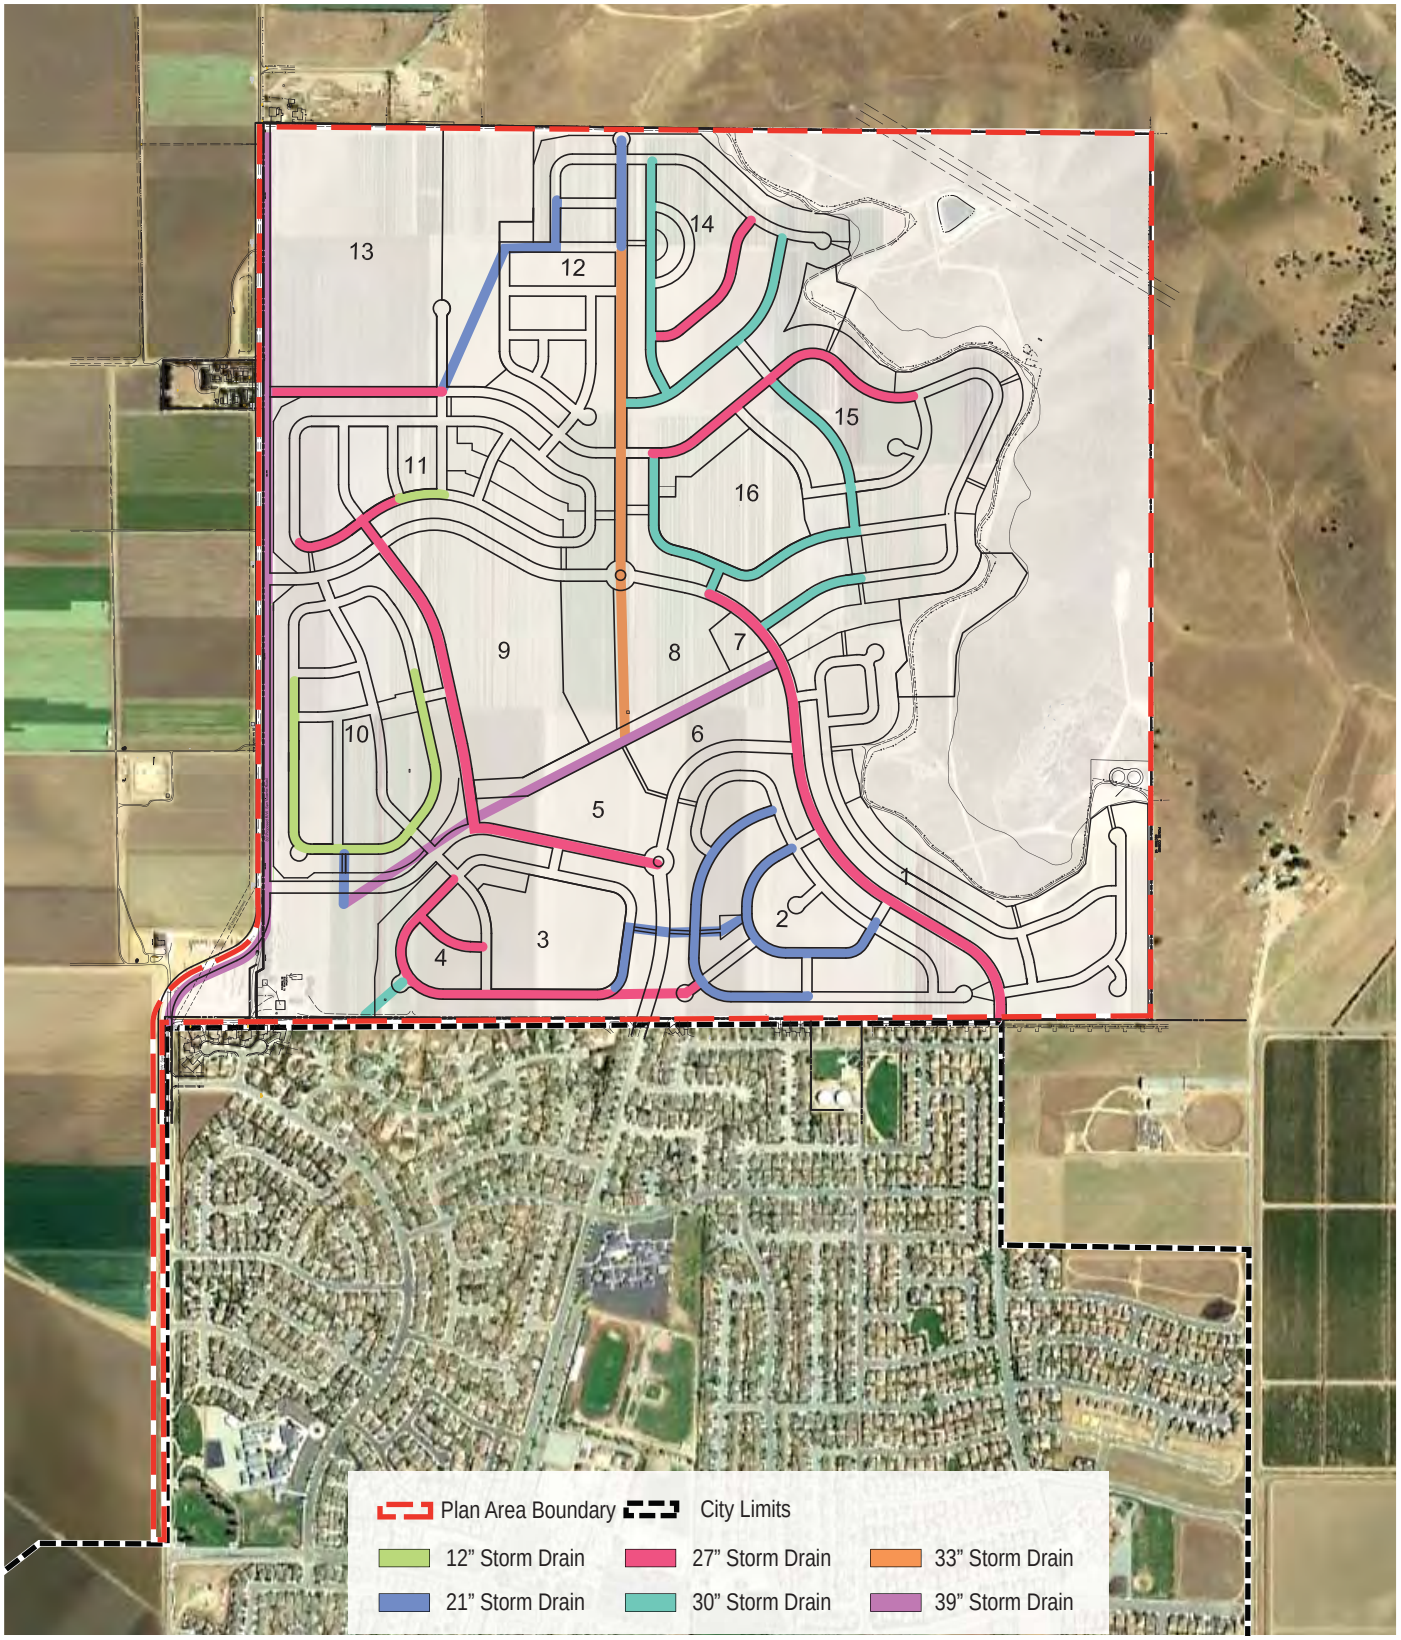
Sanitary Sewer

The City's water reclamation facility was issued an approval to construct permit with a treatment capacity rating of 5.7 mgd (Donald Wilcox, email message, June 8, 2017) and disposal capacity of 5.5 mgd. However the permitting is not complete as the water reclamation facility was never fully completed. The city is in this process now and it is anticipated that the facility can be completed and rated as designed. Average daily flow to the water reclamation facility is approximately 2.4 million gallons per day (mgd). In addition, the California Department of Corrections has a "reserved" capacity of approximately 1 mgd (Donald Wilcox, email message, March 7, 2017).

Once the facility is completed, the city's water reclamation facility will have sufficient capacity to accommodate the addition of wastewater generated by development consistent with the specific plan, because the water reclamation facility upgrade was originally designed to accommodate developments outside of the current city limits. Additionally, since the upgrade, little or no development has occurred outside of the current city limits creating an abundance of capacity available for the plan area (Akel Engineering Group 2016).

Based on the calculations completed by Bestor Engineers, wastewater generated by the plan area will be approximately 1.5 mgd. When adding the city's current wastewater flow of 2.4 mgd to the projected 1.5 mgd flow from the Plan Area, the total wastewater flow to the plant would be 3.9 mgd, which can be accommodated by the total facility treatment capacity of 5.7 mgd, including the California Department of Corrections "reserved" capacity. The proposed specific plan includes policies that minimize wastewater generation through the implementation of water conservation efforts and include design and performance standards for the construction of wastewater infrastructure consistent with the *2015 Urban Water*

*Management Plan (*Akel Engineering Group 2016*)* (urban water management plan) and *Long-term Wastewater Management Plan (*City of Soledad 2006*)*. An on-site recycled water facility is not proposed.



Similar to the Miravale III project, future development of the project site would connect to the existing municipal sanitary sewer main located on San Vicente Road. Construction of an offsite 18-inch sewer main from the southwest corner of the plan area south along San Vicente Road to Gabilan Drive is necessary to transport wastewater from the project site to the city's municipal reclamation facility. The proposed on-site wastewater conveyance system would be gravity-fed. Wastewater would be collected and conveyed by a network of 8-inch or larger pipes throughout the site before discharging from the site through the new 18-inch sewer main extension. The preliminary design of the new wastewater system within the project site is shown conceptually on Figure2-9, Conceptual Wastewater Plan.

Water Supply

The plan area also contains two existing agricultural wells owned by the property owner, two one million (each) domestic storage tanks owned by the city, a number of easements and unpaved farm access roads. The existing easements in the plan area will need to be removed or relocated as a part of the final subdivision map(s) and map(s) recordation. The two existing wells will be required to be contained in separate well parcels or in a public easement for ownership, use as an irrigation supply, and for on-going maintenance when the final map is prepared, adopted, and recorded.

The city's 2005 Water System Master Plan assumed the project site would develop as a combination of multi-family residential, public facility, and open space land use types. The *Soledad Water Master Plan* (City of Soledad 2005c) (water master plan) assumes the project site will develop as a combination of medium density residential, public facility, and open space land use types. An updated water supply assessment has been prepared: *City of Soledad Water Supply Assessment for Miramonte Specific Plan* (AKEL Engineering Group 2017) (water supply assessment) to determine whether sufficient water supply is available for the Miramonte Specific Plan Project.

According to the water supply assessment, the water demand for the plan area will be 980 acre feet per year (afy). This amount is 99 afy greater than the water demand of 881 afy identified in the city's 2005 water master plan for a similarly-sized use using 2005 water demand coefficients (page 3). However, the water supply assessment also notes that the existing agricultural water demand on the site is approximately 1,568 afy. When compared with the existing water demand on the site, the water demand from the proposed project would be 587 afy less than water demand for the existing agricultural use of the site (AKEL Engineering Group 2017, page 4). WSA update concludes that the proposed project would demand less water than the 1,566.7 acre feet per year than the original project and current agricultural water consumption on the site, but more water than the existing water system infrastructure can currently provide to adequately meet the peak hour demand.

E M C

This side intentionally left blank.

As noted in the urban water management plan (page 6-15) the City's groundwater supply has been adequate to meet the City's historical demands. In order to meet growing demand for new development not annexed into the City's sphere of influence, the urban water management plan concludes that new groundwater wells will have to be constructed and paid for by future development applicants. The City intends to continue to use groundwater as the sole source of supply. However, domestic water supplies would be augmented by the city's recycled water distribution system, which is expected to come online in 2020 (AKEl Engineering. The proposed project would connect to the municipal water distribution system, which, based on the city's urban water management plan, has a total reliable supply of 148,000 acre feet per year for the year 2035 and is equal to the sustainable yield of the Forebay Subarea (City of Soledad 2015, page 6-16). According to the urban water management plan, the reliable supply will serve a projected 2035 demand of 148,000 acre feet per year. The proposed project would contribute to this demand. However, the proposed project will be required to provide new water supply infrastructure to increase the city's available water system storage and distribution capacity.

The specific plan includes policy design and performance standards for the water supply and distribution system and its connection to existing municipal infrastructure consistent with the urban water management plan and the water master plan. The water distribution system would be sized in anticipation of future development phases. The specific plan also includes policies that reduce potable water consumption through the use of recycled water or non-potable ground water for irrigation, emphasis on drought-tolerant plant materials for landscaping, and the incorporation of state-of- the art low water/high efficiency use fixtures and appliances in all new private development and public facility construction, including schools. The conceptual design of the new water delivery system is presented in Figure 2-10, Conceptual Water Plan.

Other Utilities

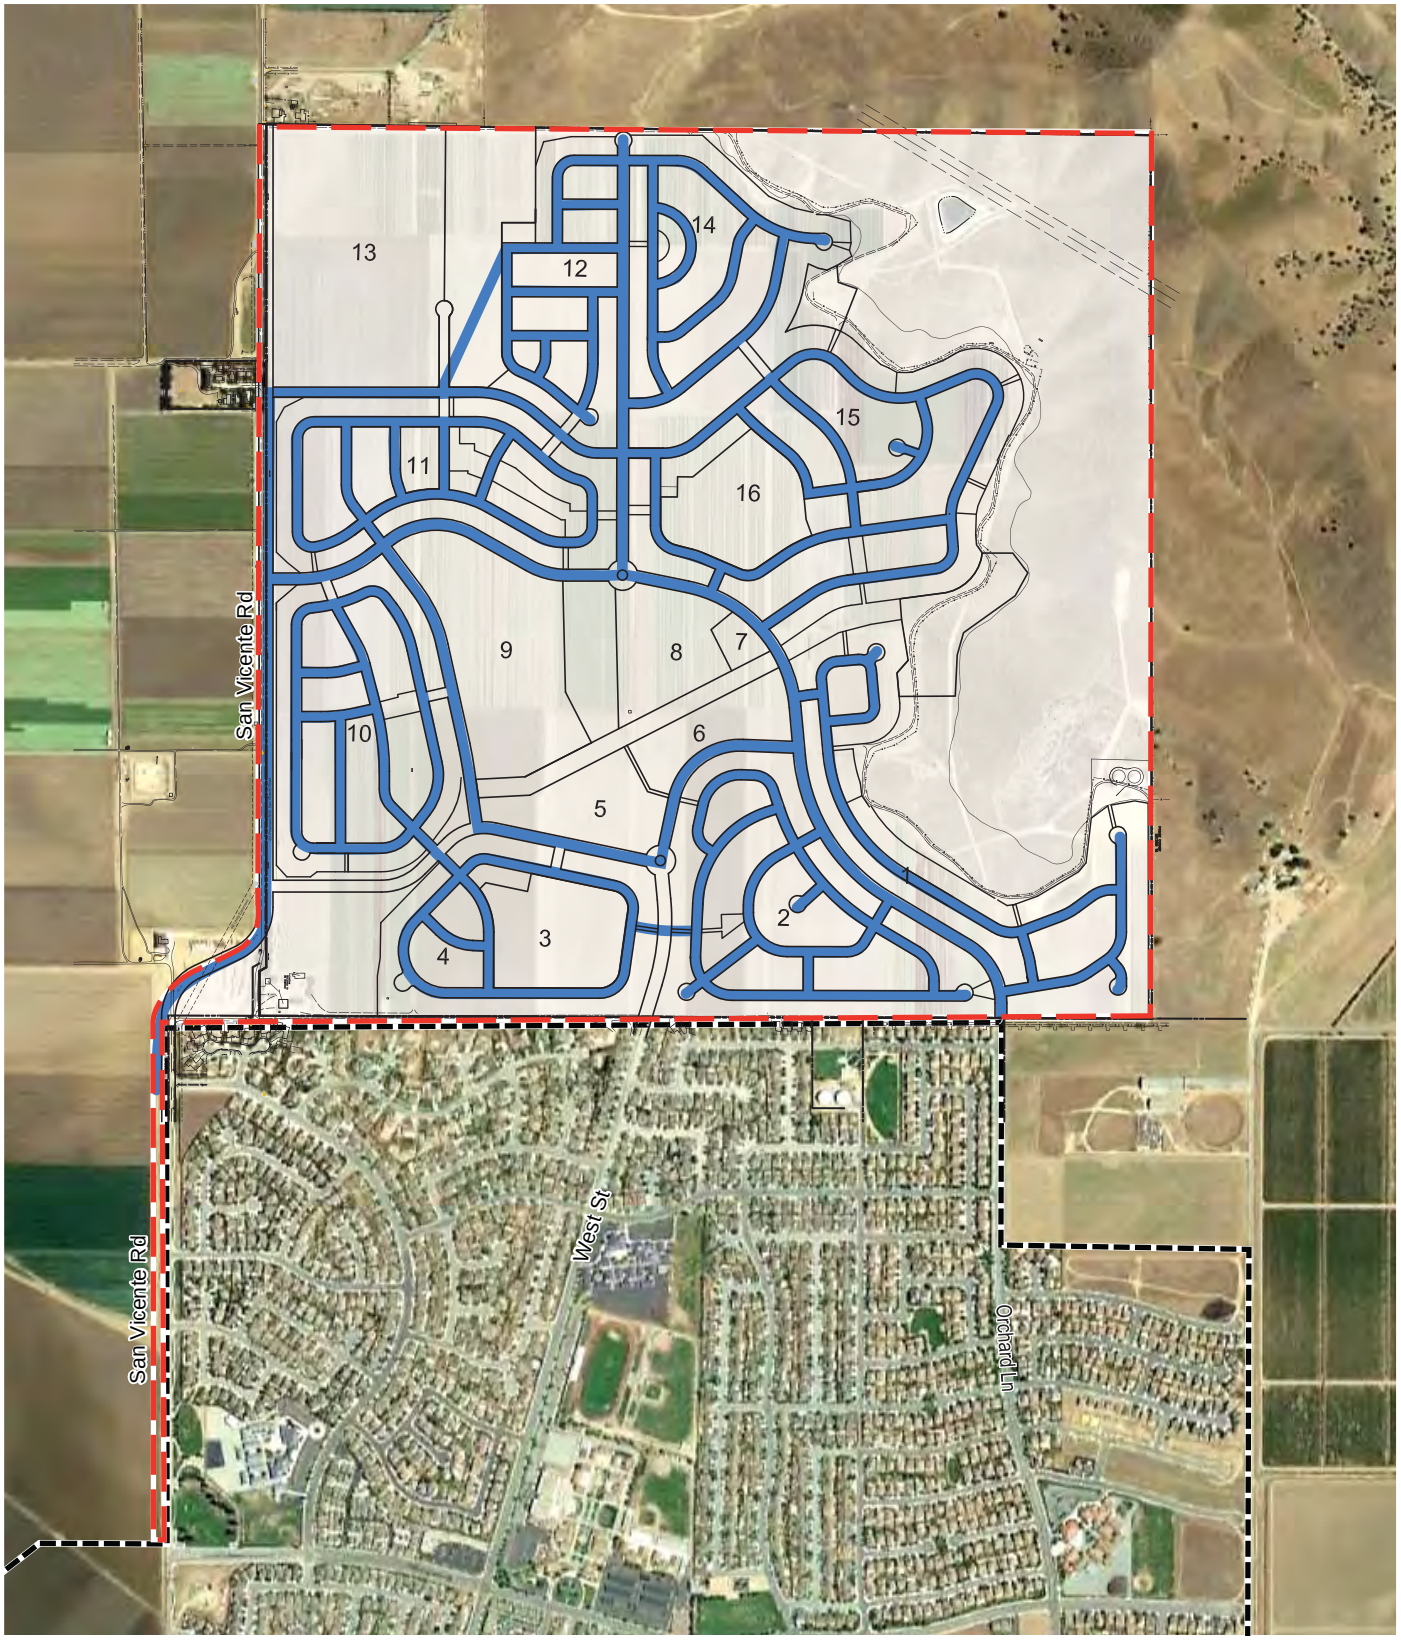
Natural gas and electricity is provided by the Pacific Gas and Electric Company. Cable television and telephone land lines are provided by Charter Communication and AT&T, respectively. All new public energy and communications lines and equipment (excepting solar panels and cell towers) within the plan area shall be placed underground pursuant to the standards and requirements of the city and/or appropriate State or Federal regulatory agencies. Planning and design of the new underground infrastructure, including phasing of the improvements will be coordinated with the local agency for each utility. The requirements for undergrounding of existing utilities and/or relocation of existing utilities will also be coordinated with the local utility agencies.

Off-Site Improvements

Construction of an offsite 18-inch sewer main from the southwest corner of the plan area south along San Vicente Road to Gabilan Drive will be required to transport wastewater from the plan area (at buildout) to the city's municipal reclamation facility. The on-site wastewater conveyance system is gravity-fed and will be collected and conveyed by a network of 8-inch or larger pipes throughout the site before discharging from the site through the new 18-inch sewer main extension. The developer shall be responsible for the payment of required development impact fees for new facility construction and may participate in a reimbursement program per Municipal Code Chapter 14.06 for the new sewer main and upgrades to the existing sewer main on San Vicente Road.

Public Services

Schools



The plan area is served by Soledad Unified School District for grades K-12. Buildout of the proposed specific plan is expected to generate 1,062 students for grades K-6, 317 students for grades 7-8, and 468 students for grades 9-12 (a total of 1,847 students). The proposed specific plan includes two 11-acre elementary school sites. The locations of the proposed school sites are shown in Figure 2-5, Miramonte Specific Plan Land Use Diagram, presented earlier. The applicant and/or developer(s) will provide an offer to dedicate the school sites (i.e. turn over fee simple title to the land to the school district). In addition to the dedication of land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions. The proposed specific plan includes a policy that requires that an agreement be established between the developer and/or successors in interest and the school district that establishes the timing of the school construction or improvements and financing obligations.

Law Enforcement

The Monterey County Sheriff's Office currently provides service to the project site, which is located in unincorporated Monterey County. Upon annexation, the Soledad Police Department would serve the project site. The proposed specific plan includes a new site for a police substation centrally located within the project site to help serve and reduce response time to existing and future residents. The proposed site for a potential substation is located approximately 1.6 miles north of the current city police station in downtown Soledad.

Fire Prevention/Protection

Fire protection service within the City of Soledad and the surrounding rural areas is provided by the City of Soledad Fire Department and the California Department of Forestry and Fire Protection (CAL FIRE). The current service area for CAL FIRE overlaps the northeast half of the plan area (California Department of Forestry and Fire Protection 2017)

while the southwest half of the plan area is currently the responsibility of the Mission Soledad Fire Protection District (LAFCO 2012). Once annexed, the City of Soledad Fire Department area of responsibility will be expanded to include the plan area and potentially adjacent streets. The proposed specific plan includes a site for the provision of a new fire substation to provide shorter response times than would the existing station located at 525 Monterey Street. A new substation in this location would reduce response times within the project site and adjacent areas within the current city limit.

Solid Waste Collection

Solid waste collection services will be provided by the Salinas Valley Solid Waste Authority which uses the Johnson Canyon Landfill, Monterey Peninsula Landfill, and the Foothill Sanitary Landfill (in San Joaquin County) for disposal purposes. Waste collection and disposal for the City of Soledad is provided by Tri-Cities Disposal, a private hauler that primarily uses the Johnson Canyon which is located approximately 12 miles northeast of the City of Soledad.

Libraries

The Monterey County Free Libraries network supports Soledad residents with a branch at 401 Gabilan Drive, approximately ¼ mile south of the plan area. The Monterey County Free Libraries funds are largely from a portion of the property tax that is collected within its service area.

As identified in the specific plan, upon annexation of the plan area to the city, development and growth in population would result in an increase in service demand on the county library services. Funding for library facilities will continue to come primarily from a share of the property tax collected. As a result of the current depletion of staffing levels, the city will be required to provide support for the county library facilities and services in the form of funding mechanisms (e.g. Community Facilities District, Assessment District, etc.) to provide staffing as well as additional capital facilities, on-going operations, and maintenance.

It may be appropriate to provide county library services at or near the two designated school sites and/or the commercial site within the plan area. These options should be considered by the city as a part of the development approval process, along with funding mechanisms to provide additional capital facilities, on-going operations, and maintenance.

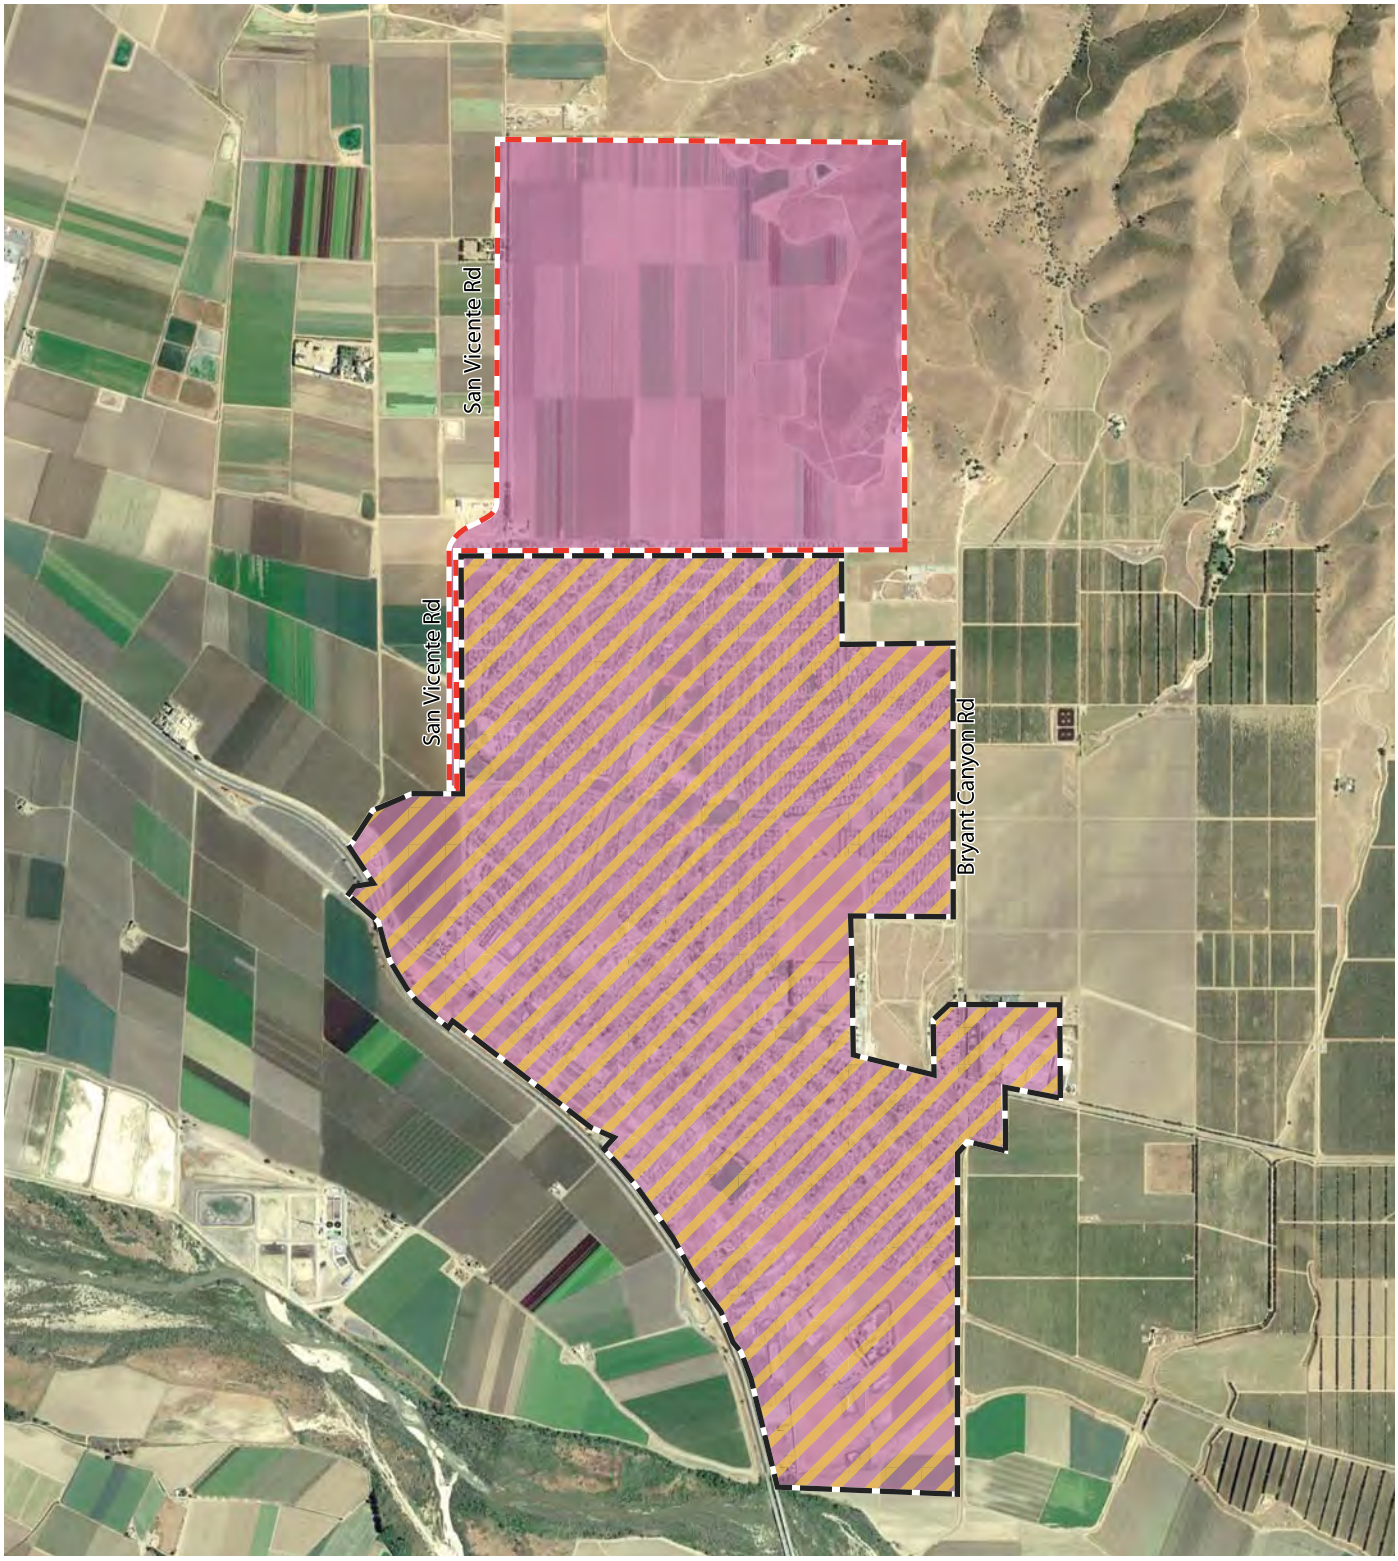
General Plan Amendment-Miramonte Specific Plan

1. A specific plan has been prepared to guide the development of the proposed Miramonte Project (formerly Miravale III Specific Plan). An amendment to the General Plan is needed to allow residential uses at greater densities within the General Plan Mirrasou Specific Plan Area than currently allowed by the City of

Soledad 2005 General Plan; related changes to the land use map and text to reflect the Miramonte Specific Plan land use designation, 647-acre boundary, and policy guidance contained in the proposed specific plan as follows: Change the City of Soledad General Plan land use designation for 633.8 acres of the Mirrasou Specific Plan Area to Miramonte Specific Plan;

2. Change the City of Soledad General Plan land use designation for 1.28 acres of the project site from Northwest Expansion Area to Miramonte Specific Plan;
3. Change the City of Soledad General Plan land use designation for 9.71 acres of the project site from San Vicente West Specific Plan Area to Miramonte Specific Plan;
4. Change the City of Soledad General Plan land use designation for 2.05 acres of the project site from the North Entry Commercial Specific Plan Area and Entry Commercial Expansion Area to Miramonte Specific Plan;
5. Identify a development potential of 5,975 units in the Northwest Expansion Area (6,500 identified in the current General Plan less 525 reallocated to the Mirrasou Specific Plan Area); and
6. Change the existing jurisdictional boundaries to include the 647-acre specific plan area (which includes the approximately 14.1 acres of land needed for the City's desired San Vicente Road improvements in the City of Soledad).Figure 2-11, City of Soledad Planning Boundaries, shows the new land use designations and change to the jurisdictional boundary.

Sphere-of-Influence Amendment



The proposed project includes amending the City of Soledad sphere of influence to include the 647-acre project site, which requires LAFCO approval, as illustrated by Figure 2-12, City of Soledad Existing and Proposed Sphere of Influence.

Prezoning

The proposed project includes prezoning the 647-acre project site as Miramonte Specific Plan, in accordance with the Planning Areas and overlay zones outlined in Table 2-2, Miramonte Specific Plan Proposed Land Use, and shown in Figure 2-5, Miramonte Specific Plan Land Use Diagram.

Annexation

The proposed project includes annexing the 647-acre project site into the city limits of Soledad, which requires LAFCO approval.

Figure 2-12

City of Soledad Existing and Proposed Sphere of Influence

Miravalle III Specific Plan EIR Addendum

This side intentionally left blank.

Zoning Amendment

Amending Title 17 of the Soledad Municipal Code is required to add the Miramonte Specific Plan zoning categories as shown on Figure 2-13, Miramonte Specific Plan Zoning Map, as follows: LDR Low Density Residential (M3-R-1); VR Village Residential (M3-R-V), C Village Commercial (M3-C-V), MU Mixed Use Opportunity (M3–MU), PF Public Facility (P-F), and OSP Open Space & Parks (O-S). This action includes mapping and text amendments.

Vesting Tentative Map

The application includes a vesting tentative map, which was prepared and submitted prior to preparation of the specific plan. The vesting tentative map would subdivide the site for the development of mixed uses including single- and multi-family residential uses, senior housing, sites for commercial development, police and fire facility improvements if needed, two elementary school sites, a community park, linear park, pocket parks and open space above the 400-foot contour line in hillside areas. The tentative map includes diagrams for water, wastewater, storm water, and roadway infrastructure. Figure 2-6, Miramonte Residential Subdivision Vesting Tentative Map, presented earlier, provides an overview of the vesting tentative.

The vesting tentative map includes 16 sub-areas that may be developed over the next over 10-30 years. The anticipated order of development may occur in one or more phase encompassing one or more sub-areas as identified in the specific plan.

Approval of the vesting tentative map would allow development of the site in accordance with the specific plan when approved, once the site is annexed to the city. Approval of the final map will be contingent upon the developer, or developers of the project site to prepare final map(s) and improvement plans that reflect the development of the plan area pursuant to and consistent with the specific plan. For the purposes of this EIR, the development pattern, intensities and densities are those identified in the specific plan land use diagram.

Development Agreement

The plan area developer(s) are expected to sign one or more development agreements as an implementation tool for facilitating buildout development of the plan area. The development agreement(s) include, but are not limited to, clarifying responsibilities of the developer, city, and others (as applicable) for implementing the Miramonte Specific Plan.

2.4 Comparison to the Project Evaluated in the Miramonte Specific Plan EIR

The proposed project is similar to the larger 2010 Miravale III Specific Plan; however, the current proposal eliminates approximately 273 acres from the originally proposed project and does not include subdivision of the San Vicente West Specific Plan Area and the Northwest Expansion Area.

A comparison of proposed land uses between the formerly proposed Miravale III project analyzed in the Miravale III EIR, with the proposed Miramonte Specific Plan, evaluated in this EIR addendum, is presented in Table 2-4, Land Use Comparison.

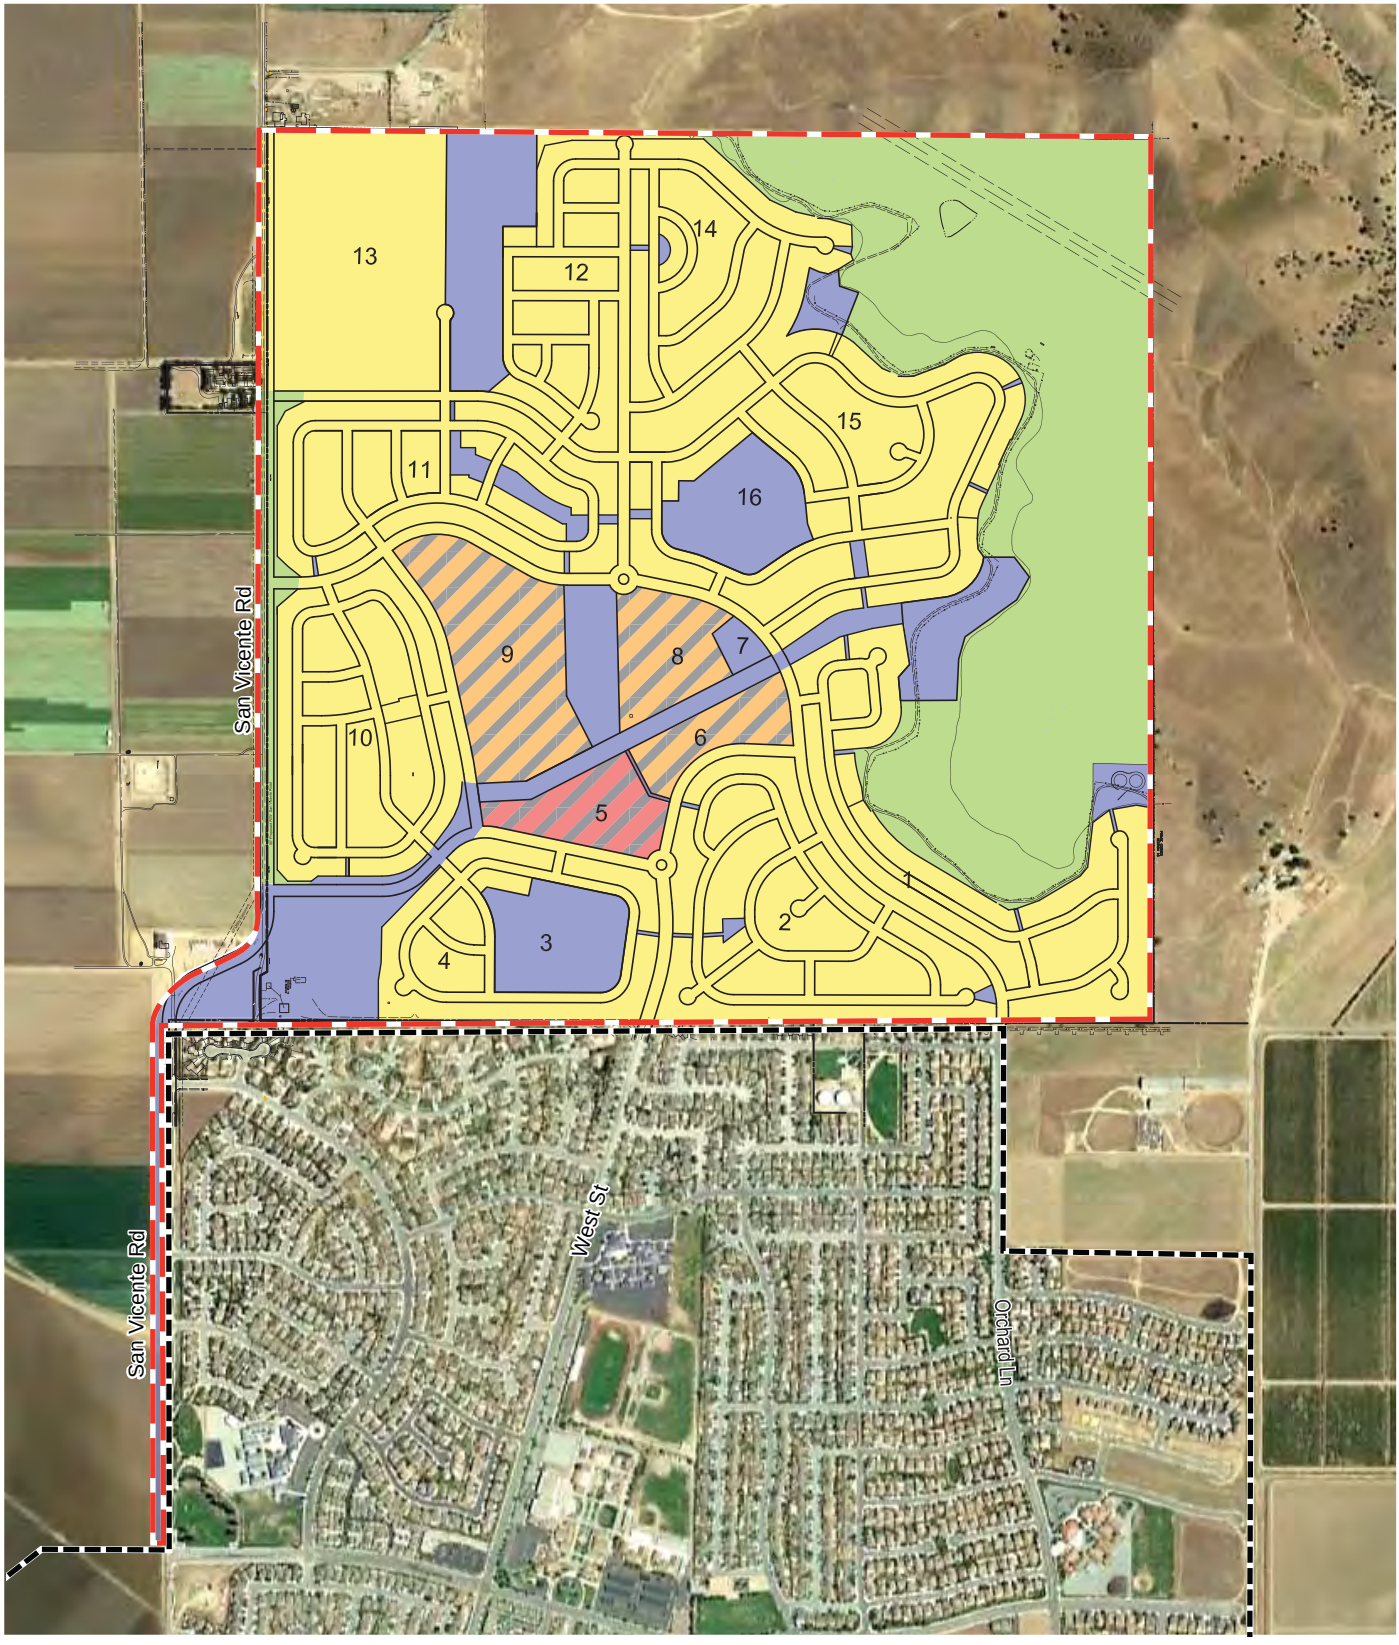

Table 2-4 Land Use Comparison[1]

Land Use	Miravale III Project		Miramonte Specific Plan		Change	
	Acres	Units	Acres	Units	Acres	Units
Low-Density Residential	240.88	1,470	296.1	1,318	+54.5	-152
Medium-Density Residential and Affordable Housing	146.97[3]	2,230	31.3	626	-115.67	-1,604
Senior Housing Units[3]	--[3]	500	6.7	134	--[3]	-366
Residential Study Area	0	0	35.9	314	+35.9	+314
Total Residential	387.85	4,200	370.0	2,392	-17.85	-1,808
Non-Residential Uses	Acres		Acres		Change	
Hotel	6.5		0.0		Eliminated	
Retail/Commercial	33.22		8.6		-24.16 acres	
Fire/Police	1.31		2.0		+0.69 acres	
Elementary School	20.00		22.0		+2 acres	
Middle School	19.00		None per SUSD		Eliminated	
Churches	1.67		0		Eliminated	
Park/ Recreation/Open Space	75.77		196.4		+ 120.23

Recycled Water Plant	1.82		0.0		Eliminated	
Detention/Retention Ponds	15.75		--[4]		-15.75	
Water Tanks	3.02 (Assumed)		2.0		-1.02	
Collector Streets/ROW	121.78 (Assumed)		32.2/14.1		-77.88	
Agricultural buffer	1.61		Yes		Eliminated	
Urban Reserve/Agriculture	85.80		0		Eliminated	
Utility Easements	Unknown		Unknown		Unknown	
Total Acres	921.77		647.0		-274.77	

SOURCE: Denise Duffy and Associates 2008; Bestor Engineers 2017; EMC Planning Group 2017

NOTES:

1. Amounts may vary due to rounding
2. Acreage and land use types and sizes may change pending submittal and review of the proposed specific plan
3. The acreage of Senior Housing is included in Medium Density acreage
4. Acreage of the retention pond is included in the Parks and Recreation category

Note: Neighborhood Park locations are conceptual within Sub-areas

Figure 2-13

Miramonte Specific Plan Zoning Map

Miravalle III Specific Plan EIR Addendum

This side intentionally left blank.

2.5 INTENDED USED OF THE EIR ADDENDUM

The purpose of this EIR addendum is to document why a subsequent or supplemental EIR is not required. The City of Soledad is the lead agency responsible for certification of the EIR addendum and approval the project. Project actions will include, but not be limited to, a general plan amendment, specific plan adoption, sphere of influence amendment, pre-zone, annexation request, vesting tentative subdivision map, architectural review and a development agreement(s) to allow for the proposed development. The following is a listing of permits and approvals under the city and other jurisdictions.

City of Soledad

- Amend the General Plan concurrently with the adoption of the specific plan and certification of the addendum to the previously certified EIR to incorporate the land use designations and provisions of the specific plan.
- Approve sphere of influence and annexation requests and pre-zone the territory requested for annexation. Related detachments (i.e., Mission Soledad Rural Fire Protection District, Soledad-Mission Recreation District, and the Resources Conservation District of Monterey County) will be requested concurrently.
- Adopt the water supply assessment, the plan for services and the fiscal analysis, and forward them to LAFCO of Monterey County along with the sphere of influence and annexation request.
- Adopt the vesting tentative map, subject to:
    - Changes proposed in and consistent with the specific plan;
    - Mitigations in the certified EIR and EIR addendum;
    - Conditions of approval; and
    - Subject to LAFCO action on the requested sphere of influence change and reorganization.
- File and obtain approval for a sphere of influence amendment and subsequent annexations from LAFCO of Monterey County.
- Upon completion of annexation, the city must amend the Zoning Ordinance to rezone the property within the plan area consistent with Figure 2-12, Miramonte Specific Plan Zoning Map contained herein.
- Adoption of the development agreement(s).
- Review and approve all required permits, including, but not limited to, building, grading, encroachment, and occupancy permits.

Agencies

- Monterey County LAFCO for the approval of sphere of influence amendment and annexation required for development within the incorporated limits of the city, and for the approval of special district detachments (i.e., Mission Soledad Rural Fire Protection District, Soledad-Mission Recreation District, Resources Conservation District of Monterey County).
- Other agencies with permit or review authority over some aspect of the project.

3.0
Project Analysis

3.1 METHODOLOGY

The primary purpose of this EIR addendum is to validate that the proposed project would not trigger the need for a subsequent or supplemental EIR as described in CEQA Guidelines sections 15162 and 15163. The primary methodological approach is to identify whether the proposed specific plan amendment would result in new significant environmental effects or cause previously identified effects found to be less than significant to rise to a level of significance.

As with the Miravale III EIR, the following analysis assumes that the entire specific plan would build out consistent with the Miramonte Specific Plan and does not evaluate any interim scenarios.

Miravale III specific plan policy mitigations and mitigations contained in the Miravale III EIR that address all development within the specific plan boundary and the proposed project in particular would continue to apply to all development pursuant to the specific plan. The proposed tentative map would be conditioned to be consistent with the policy mitigations and to implement Miravale III EIR mitigation measures. Consequently, all significant impacts of the revised project would be reduced to a less than significant level unless otherwise noted in this addendum or noted in the Miravale III EIR as significant and unavoidable.

3.2 AESTHETICS

Miravale III Specific Plan EIR Analysis

Scenic Vista

The general plan identifies the highly visible foothills of the Gabilan Mountain Range located on the eastern edge of the project site as an important scenic vista which serves as a dramatic backdrop to the flat valley land below.

The Miravale III EIR determined that the project would permanently alter views to the Gabilan Mountain Range foothills by developing above the 400 foot contour of the foothills. Although the Miravale III Specific Plan contained specific policies governing development

within the hillside portion of the project site, the Miravale III EIR found that development within and above the 400 foot contour foothill portions of the project site constituted ridgeline development and would result in a significant and unavoidable impact to a scenic vista. Implementation of the following mitigation measures would reduce impacts, but not to a less than significant level. The Miravale III EIR additionally determined that implementation of the project would introduce substantial new development, including structures of various heights and densities, which would result in decreased views of open space. This increased visibility and intensity of development would have a substantial adverse effect on a scenic vista. However, the EIR determined that these impacts could be reduced to a less-than-significant level with implementation of the following mitigation measures:

Mitigation Measures

4.1-1 Building heights of all new structures shall adhere to the limits set forth in the Miravale III Specific Plan dated June 2007. Additionally, all new structures shall adhere to the applicable Development Standards as established in Section 2.0 of the Specific Plan. Prior to the issuance of any building permit for development within the Specific Plan area, the project applicant shall submit detailed plans, including elevations, site plans, and/or other documentation detailing compliance with applicable development standards, subject to the review and approval of the City of Soledad.

4.1-2 In order to minimize potential adverse visual impacts associated with development within the hillside portions of the project site, the project applicant shall submit and have approved, prior to the recordation of the final map for Phases three and four, building envelopes for each new residential lot proposed above the 400 foot elevation contour. The proposed building envelopes shall be located in the least visually sensitive area of each lot. No new structures shall be constructed outside of the approved building envelopes, unless otherwise approved by the City of Soledad.

4.1-3 In order to minimize aesthetic-related impacts due to development within the hillside portion of the site, the project applicant, prior to project approval, shall submit a revised Specific Plan that includes the following policy in Section 2.6 Low Density Residential (LDR & LDR-H/M3-R-1): All new residential units proposed within areas of the project site above the 400 foot elevation contour shall be subject to a Design Review approval process or similar. As part of the design review process, vertical building envelopes shall be identified and staking and flagging shall be required to demonstrate the extent of proposed development. All new structures shall be designed to minimize visual impacts to the greatest extent feasible.

4.1-4 Final design plans for proposed development shall utilize natural landforms and vegetation for screening structures, access roads, building foundations, cut and fill slopes, and exterior lighting. Roads, parking, and utilities shall be designed to minimize visual impacts. Prior to the issuance of any grading and/or building permit, the project applicant shall submit design-level drawings demonstrating compliance with this measure, subject to the review and approval of the City of Soledad. If an alternative design would minimize impacts, the applicant shall submit evidence demonstrating that the alternative design is infeasible.

4.1-5 The applicant shall provide landscape screening appropriate to the surrounding area in order to integrate the development with the existing natural landscape. Landscaping plans shall be submitted to the City of Soledad for review and approval prior to the issuance of any building or grading permit.

4.1-6 All buildings shall be designed with colors and materials that effectively blend the structures with the surrounding landscape. Building applications for new structures shall include color and material sample photo sheets and shall be approved by the City of Soledad, prior to the issuance of any building permit.

4.1-7 A site-specific geotechnical report shall be prepared for new development on hillsides in order to ensure that the development will not cause or worsen natural hazards, such as erosion and sedimentation, and will minimize risk to life and property from slope failure, landslides, and flooding. The report shall include erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas. Prior to the issuance of any grading and/or building permit for new development within the hillside portions of the project site, the project applicant shall submit a geotechnical report prepared by a qualified professional to the City of Soledad Department of Public Works for review and approval. The site-specific geotechnical report shall identify feasible recommendations and avoidance measures to minimize potential impacts.

4.1-8 Land alterations within areas above the 400 foot elevation shall be minimized by keeping cuts and fills to a minimum, limiting grading to the smallest practical area of land, limiting land exposure to the shortest practical amount of time, replanting graded areas to insure establishment of plant cover before the next rainy season, and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur. Prior to the issuance of any grading permit, the project applicant shall submitted detailed grading plans consistent with the intent of this mitigation, subject to the review and approval of the City of Soledad.

Visual Degradation

Development of the Miravale III Specific Plan project would permanently alter the visual character of the site, transforming what is currently 920 acres of relatively undeveloped agricultural and grazing land into an urban landscape. Substantial grading would be required in order to accommodate project development. As a result, project development would alter the existing visual character of the site by causing changes to topography, removing vegetation, including mature eucalyptus along San Vicente Road, and adding roads, residences and commercial uses. Although the Miravale III Specific Plan has incorporated design measures, including height restrictions, landscape screening, appropriate color and architectural schemes, light and glare reduction and screening measures, and the use of non-reflective building materials, to minimize visual impacts, the introduction of urban features would permanently alter the existing visual character of the project site as perceived from adjacent public vantage points, including Highway 101 and adjacent residential uses. Currently, the project site, as perceived from adjacent and distant land uses, consists predominantly of existing mature eucalyptus trees, agricultural uses, and associated infrastructure. Removal of existing vegetation, particularly the mature eucalyptus trees, would substantially alter the existing visual character of the project site. This would constitute a significant impact to the existing visual character of the site. Below is a description of the project's primary development components, uses, and their resulting visual effects. The Miravale III EIR concluded that the loss of agricultural land and natural open space and introduction of urban development would result in significant and unavoidable impacts to the visual character of the site. In order to minimize the extent of project-induced impacts, the following mitigation measures were required. However, these mitigations were determined not reduce the impact to a less-than-significant level.

Mitigation Measures

4.1-9 In order to minimize tree removal and associated visual impacts, final design-level improvements plans shall retain existing mature eucalyptus and other tree species to the greatest extent possible. Final design-level plans shall be prepared in consultation with a registered arborist/forester to minimize tree removal and ensure the health of remaining trees. Prior to the issuance of any grading and/or building permits, final plans shall be subject to the review and approval of the City of Soledad Director of Public Works. If the removal of existing mature eucalyptus is required the applicant shall submit evidence demonstrating that there are no feasible design alternatives to avoid tree removal. In the event that tree removal is required, the project proponent shall prepare a tree removal and replacement plan for each phase of construction, subject to the review and

approval of the City of Soledad Community Development Director. The tree removal and replacement plan shall identify specific grading limits that minimize tree removal, as well as appropriate tree replacement ratios and replanting locations.

4.1-10 Final design plans for the proposed gateways shall include elements, such as signage, landscaping and landscaped center medians, and appropriate architectural detailing consistent with the Miravale III Specific Plan. Prior to issuance of any permit for the construction of any of the four gateways, the project applicant shall submit detailed plans that include the above referenced elements, subject to the review and approval of the City of Soledad.

4.1-11 Final design plans for proposed residential development shall include form, scale, and character elements which emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks. Prior to the issuance of any building permit for residential development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad. All residential development within the Specific Plan area shall be subject to a conditional use or design-review process as administered by the City of Soledad.

4.1-12 Final design plans for proposed multi-family development shall include useable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood. Prior to the issuance of any building permit for multi-family development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad.

4.1-13 Final design plans for proposed development shall include a tree planting plan in order to increase the number and density of tree cover within new development areas. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed tree planting plan, subject to the review and approval of the City of Soledad.

Light and Glare

The Miravale III EIR determined that the proposed project would increase the intensity of development within an existing undeveloped area, and therefore the amount of artificial light produced by the site. The Highway 101 corridor and surrounding urban uses would be most affected by this increase in light and glare. Artificial lighting within the project site would impact nighttime views by altering the natural landscape and, in sufficient quantity,

lighting up the nighttime sky and reducing the visibility of astronomical features. The additional lighting within the project site, especially unshielded light, could result in spillover light that could impact surrounding land uses. Further, daytime glare could occur as light reflects off pavement, vehicles, rooftops, and structures. However, the EIR concluded that this impact could be reduced to a less-than-significant level with implementation of the following mitigation measures.

Mitigation Measures

4.1-14 All buildings shall be designed so that exterior lighting is down-lit and illuminates the intended area only. Building applications for new structures shall include an exterior lighting plan subject to approval of the Soledad Planning Department that includes the following requirements: 1) exterior lighting shall be directional; 2) glare from exterior lighting shall be adequately minimized; 3) the source of directional lighting shall not be directly visible; and 4) vegetative screening shall be considered, where appropriate, as a means of reducing development-related light and glare. The project applicant shall submit an exterior lighting plan to the City of Soledad Planning Department prior to the issuance of any building permit.

4.1-15 Ornamental lighting use for streets, parks, public open spaces, trails, bike paths, parking lots, and walkways shall utilize fixtures consisting of metal halide with full cut-off luminaries or other form of similar fixtures in order to control light and glare. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1- 14 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department.

4.1-16 Light reduction and screening measures shall be required in order to reduce nighttime ambient light increases in the area. Lighting levels in commercial areas shall be kept as low as feasible and controlled to minimize operating time. Light sources shall be installed, so there is no light radiation above the horizontal plane (i.e., dark sky). Lighting shall be focused downward to prevent the splay of ambient light to other areas. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department.

Proposed Project Analysis

The proposed project is similar to the larger project analyzed in the Miravale III EIR; however, the current proposal eliminates approximately 275 acres from the originally proposed project. While project design may necessitate the placement of infrastructure improvements above the portion of the project site above the 400-foot elevation contour line of the Gabilan foothills, the Miramonte project otherwise eliminates development above the 400 foot contour. As discussed in the Miravale III EIR, the Gabilan foothills are identified by the general plan as a scenic vista and the Miravale III EIR concluded that development of the hillside portion of the project site would be a significant and unavoidable impact despite mitigation. Because the currently proposed project no longer includes residential development on the portion of the project in the Gabilan foothills there is no longer a significant and unavoidable impact to the scenic vista resulting from hillside residential development. Therefore, the following mitigation measures identified in the Miravale III EIR are not applicable to the currently proposed specific plan: 4.1-2 and 4.1-3. Mitigation measure 4.1-7 is still required to mitigate impacts related to erosion effects and is discussed in Section 3.7. Mitigation Measure 4.1-8, as edited for clarification remain applicable to address any impacts related to the placement of infrastructure above the 400 foot contour line. Impacts to scenic vistas are less than significant.

Although smaller, the proposed project would still permanently alter the visual character of the site, transforming what is currently approximately 647 acres of relatively undeveloped agricultural and grazing land into an urban landscape and would introduce new light and glare to the project area similar to those analyzed in Miravale III EIR. Therefore, the remainder of the mitigation measures (measures 4.1-1, 4.1-4 through 4.1-6, and 4.1-8 through 4.1-16) remain applicable to the currently proposed project with the following edits:

Mitigation Measure

4.1-1 Building heights of all new structures shall adhere to the limits set forth in the ~~Miravale III~~ adopted Miramonte Specific Plan ~~dated 2007~~. Additionally, all new structures shall adhere to the applicable Development Standards as established in Section ~~2.0~~ 2.4 of the Specific Plan. Prior to the issuance of any building permit for development within the Specific Plan area, the project applicant shall submit detailed plans, including elevations, site plans, and/or other documentation detailing compliance with applicable development standards, subject to the review and approval of the City of Soledad. The following mitigation measure is edited for clarification.

4.1-10 Final design plans for the proposed gateways shall include elements, such as signage, landscaping and landscaped center medians, and appropriate architectural detailing consistent with the adopted Miramonte ~~Miravale III~~

Specific Plan. Prior to issuance of any permit for the construction of any of the four gateways, the project applicant shall submit detailed plans that include the above referenced elements, subject to the review and approval of the City of Soledad.

Aesthetics Conclusion

The proposed project would not result in new significant aesthetic impacts or substantially increase the severity of previously identified significant effects. The proposed project would have lesser impacts to scenic vistas, reducing the previously proposed project's significant and unavoidable impact to less than significant with mitigation. No new information has been identified that indicates the proposed project would have new or more significant impacts on aesthetics than were identified for the original project.

3.3 AGRICULTURAL RESOURCES

Miravale III Specific Plan EIR Analysis

Conversion of Important Farmland

The Miravale III EIR determined that the project would convert 760 acres of Prime Farmland to a non-agricultural use which is a significant and unavoidable impact and that no feasible mitigation exists that could reduce impacts to a less-than-significant level.

Williamson Act

According to the Miravale III EIR, two parcels totaling approximately 107 acres (APN 257-001-026 and APN 257-001-027) located on the northwestern portion of the plan area were under Williamson Act contract. The EIR concluded that the project would require cancellation of these contracts which would be a significant and unavoidable impact.

Land Use Conflicts

Land Use Compatibility

Implementation of the proposed Miravale III Specific Plan would result in sensitive receptors being sited adjacent to existing agricultural uses located on the boundary of the project footprint. The EIR found that this has the potential to cause an increase in land use compatibility problems and nuisance complaints due to urban uses being sited adjacent to agricultural uses. The EIR found that in order to minimize these potential land use conflicts, the project design included a minimum 60-foot buffer zone between the residential and agricultural uses along the western boundary of the project site but additional buffers were warranted along the northern and eastern project boundaries. Further, the EIR found that the proposed 60-foot buffer did not meet the minimum buffer distance recommended by the

Monterey County Agricultural Commissioner to ensure that residential uses are adequately buffered from agricultural uses. The EIR concluded that these impacts could be reduced to less-than-significant with the following mitigation.

Mitigation Measures

4.2-1 Adequate buffer areas between urban and agricultural uses, including a minimum 50-foot buffer along the northern and eastern boundary of the project site and a 200-foot buffer along the western boundary, shall be incorporated into the proposed project. These buffers shall also be supplemented with physical barriers in areas where residential and commercial structures are to be located, as recommended by the Agricultural Resources Report contained Appendix T-1. The 200-foot buffer along the project's western boundary may be reduced upon demonstration to the satisfaction of the city that other measures, including those recommended in Mitigation Measure 4.2-2, will adequately protect human health and safety and minimize potential conflicts, and provided that any such reduction shall not result in a buffer width of less than 100 feet. The County of Monterey Agricultural Commissioner shall be consulted regarding the adequacy of the proposed buffers and physical barriers and evidence of said consultation and recommendation shall be submitted to the city prior to approval of the tentative map. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report, subject to the review and approval of the City of Soledad. All agricultural buffers, excluding public right-of-ways, shall be maintained by the Project Proponent and/or his/her successor(s) in interest through easements dedicated to the city or other entity until such time that the adjoining agricultural operation and use no longer exists.

4.2-2 In order to ensure the adequacy of the agricultural buffer located along the western boundary of the project site, as required by Mitigation Measure 4.2-1, the project applicant shall submit a detailed landscape plan that includes vegetative screening in addition to physical barriers, such as fences, walls, or similar structures to protect human health and safety. One or more of the following options may also be used in combination with landscaping requirements to create an adequate buffer between the agricultural parcel property line and habitable structures within the Plan area:

a. Public or private road right-of-ways;

b. Landscaped islands and planting areas;

c. Recreational trail corridors; and/or

d. Placing dwellings in the rear portion of lots.

Prior to the recordation of any final map along the western project boundary, the agricultural buffer and any related easement shall be delineated on the final map, subject to the review and approval of the City of Soledad.

4.2-3 Prior to the issuance of any certificate of occupancy for residences adjacent to or in close proximity to the agricultural buffer along the western project boundary, the project applicant shall provide documentation demonstrating that adequate screening, landscaping and structural improvements have been installed and/or constructed within the buffer, subject to the review and approval of the City of Soledad.

Land Use Conflicts

Disruption of Adjacent Agricultural Activities

Additionally, the Miravale III Specific Plan EIR found that the specific plan has the potential to impact routine and on-going agricultural activities on the areas adjacent to the northern, eastern, and western boundaries of the project site. The EIR recommended implementation of the following mitigation measures to reduce these impacts to the extent possible. However, the EIR determined that project related impacts were significant and unavoidable.

4.2-4 Access for agricultural equipment and vehicles to the adjoining row crop land on the western boundary shall continue to be provided from the ramp to Highway 101 North (see Figure 2 in Technical Appendix T-1, Agricultural Report). The current access road to the Braga property should remain at the current width to allow for passing and ensure adequate turnaround space for field equipment. Implementation of this measure would reduce impacts to routine and on-going agricultural operations on lands west of the proposed project site.

4.2-5 Prior to the issuance of any permit, the project applicant shall have recorded a right-to-farm notice on parcels adjacent to existing and on-going agricultural uses consistent with the requirements of the City of Soledad General Plan, subject to the review and approval of the City of Soledad.

Proposed Project Analysis

Conversion of Important Farmland

The Miravale III EIR determined that the project would convert 760 acres of Prime Farmland to a non-agricultural use. This impact to conversion of agricultural lands due to proposed

development was considered to be significant and unavoidable. The currently proposed project is smaller than the previously proposed project and thus would convert fewer acres of important farmland to non-agricultural uses.

The city entered into a memorandum of understanding with Monterey County on March 15, 2016. Compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses is required by the memorandum of understanding, using one of four methods, at the discretion of city to coincide with the time of the recordation of a final subdivision map. The specific plan includes policies that are consistent with the memorandum of understanding requirements. The proposed project would not result in new or greater impacts than those identified in the Miravale III EIR.

To ensure compensation for the conversion of Prime Farmland or Statewide Importance to urban uses is provided as required by the 2016 memorandum of understanding; the following mitigation measure shall be required:

Mitigation Measure

4.2-6 Concurrent with recordation of a final subdivision map, developers shall provide compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses using one of four methods, at the discretion of the city:

a) provide the in-kind direct purchase/acquisition of an agricultural mitigation easement at a 1:1 ratio and dedicate the easement to an agricultural land trust or other qualifying entity; and/or

b) if available, purchase agricultural banked mitigation credits at a 1:1 ratio from a qualifying entity; and/or

c) pay an in-lieu mitigation fee, which amount shall be determined by the city prior to project approval. The amount of the fee should reasonably be expected to lead to the preservation of agricultural land. Said fee shall be kept by the city in a fund established specifically for agricultural land mitigation purposes; and/or

d) implement other innovative approaches as approved by the city that results in the preservation of agricultural land within areas targeted by the city.

The memorandum of understanding requirements for compensation for conversion of Prime Farmland or Farmland of Statewide Importance to urban uses lessens the impact; however, the project would still result in the conversion of important farmland which remains a significant and unavoidable impact.

Williamson Act

The two parcels (APN 257-001-026 and APN 257-001-027) that were identified by the Miravale III Specific Plan EIR as Williamson contract properties are not proposed for development in the currently proposed specific plan. Thus, under the specific plan would not result in impacts related to the conversion of Williamson contract land.

Land Use Conflicts

Land Use Compatibility

As with the Miravale Specific Plan, the proposed specific plan includes areas of single-family residential development that would be sited adjacent to agricultural lands located on the northern, eastern, and western boundary of the project site, which has the potential to cause an increase in land use compatibility problems. Mitigation measures identified in the Miravale III EIR requiring adequate agricultural buffers (mitigation measures 4.2. 1 through 4.2.3) are applicable to these areas and would reduce impacts related to land use conflicts to less than significant. The following edits are made to 4.2-1 to update the project reference.

4.2-1 Adequate buffer areas between urban and agricultural uses, including a minimum 50-foot buffer along the northern and eastern boundary of the project site and a 200-foot buffer along the western boundary, shall be incorporated into the proposed project. These buffers shall also be supplemented with physical barriers in areas where residential and commercial structures are to be located, as recommended by the Agricultural Resources Report contained in the Miravale III EIR Appendix T-1. The 200-foot buffer along the project's western boundary may be reduced upon demonstration to the satisfaction of the city that other measures, including those recommended in Mitigation Measure 4.2-2, will adequately protect human health and safety and minimize potential conflicts, and provided that any such reduction shall not result in a buffer width of less than 100 feet. The County of Monterey Agricultural Commissioner shall be consulted regarding the adequacy of the proposed buffers and physical barriers and evidence of said consultation and recommendation shall be submitted to the city prior to approval of the tentative map. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report, subject to the review and approval of the City of Soledad. All agricultural buffers, excluding public right-of-ways, shall be maintained by the Project Proponent and/or his/her successor(s) in interest through easements dedicated to the city or other entity until such time that the adjoining agricultural operation and use no longer exists.Land Use Conflicts

Disruption of Adjacent Agricultural Activities

The Miravale III EIR found that the specific plan has the potential to impact routine and on-going agricultural activities on the areas adjacent to the northern, eastern, and western boundaries of the project site. The proposed specific plan is no longer adjacent to the Braga property; therefore, mitigation measure 4.2-4 is no longer applicable to the project.

However, mitigation measure 4.2-5 is applicable to the project and would reduce impacts, but not to a less-than-significant level and disruption of adjacent agricultural activities would remain a significant and unavoidable impact

Agricultural Resources Conclusion

The proposed project would not result in new significant agricultural impacts or substantially increase the severity of previously identified significant effects. The currently proposed project would not result in the conversion of Williamson contract lands and therefore would avoid the significant and unavoidable impact identified in the Miravale III EIR.

A mitigation measure has been provided to ensure that compensation for the conversion of Prime Farmland or Statewide Importance to urban uses is provided as required by the 2016 memorandum of understanding. This mitigation will lessen the impact; however the project would still result in the conversion of important farmland which remains a significant and unavoidable impact. Impacts due to disruption of adjacent agricultural activities remain a significant unavoidable impact. All mitigation measures identified in the Miravale III EIR are applicable to the currently proposed specific plan with the exception of mitigation measure 4.2-4. No new information has been identified that indicates the proposed project would have new or more significant impacts on agricultural resources than were identified for the original project.

3.4 AIR QUALITY

Miravale III Specific Plan EIR Analysis

Construction Impacts

The Miravale III EIR concluded that construction activities associated with implementation of the specific plan such as clearing, excavation and grading operations, construction vehicles traffic on unpaved ground, and wind blowing over exposed earth would generate dust and particulate matter that result in significant and unavoidable impacts. Implementation of Best Management Practices as required by the following mitigation measure and limiting the size of the grading area would reduce project impacts to a less-than-significant level only if emissions can be limited to 82 pounds per day or subsequent

dispersion modeling of construction activities demonstrates that PM_{10} concentrations from construction activity would not cause an exceedance of the State ambient air quality standard, as averaged over 24 hours. The Miravale III EIR concluded that limiting construction activities was likely not feasible for this project and dispersion modeling could not be conducted at that time (due to lack of detailed construction plans). Therefore, the impact was considered to remain significant and unavoidable, even with mitigation.

Mitigation Measure

4.3-1 Prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall, at a minimum, include the following measures:

- Limit grading activity to a maximum of 2.5 acres daily. As more detailed construction information becomes available, emissions from grading activities could be reassessed to determine if the area of grading could be increased. Such an assessment would have to be conducted using appropriate assumptions and mitigation measures.
- Water all active construction areas at least twice daily and more often during windy periods.
- Active areas adjacent to existing businesses should be kept damp at all times. If necessary, during windy periods, watering is to occur on all days of the week regardless of onsite activities.
- Cover all trucks hauling dirt, sand, or loose materials.
- Haul trucks shall maintain at least 2'0" of freeboard.
- Plant tree windbreaks on the windward perimeter of construction project if adjacent to open land.
- Install wheel washers at the entrance to construction sites for all exiting trucks.
- Pave all roads at construction sites.
- Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.

- Sweep daily all paved access roads, parking areas and staging areas at construction sites.
- Sweep streets daily if visible soil material is deposited onto the adjacent roads.
- Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more).
- Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles.
- Limit traffic speeds on unpaved roads to 15 mph.
- Replant vegetation in disturbed areas as quickly as possible.
- Suspend excavation and grading activity when hourly-average winds exceed 15 mph and visible dust clouds cannot be contained within the site.

According the Miravale III EIR, grading of the site is expected to result in the highest emissions of diesel particulate matter during the construction period. Diesel particulate matter includes air contaminants that could impact sensitive receptors including residences that border the project site as well as new on-site residences constructed during earlier phases of the project. However, the Miravale III EIR concluded that this potentially significant impact can be reduced to a less-than-significant level with the implementation of the following mitigation measure.

Mitigation Measure

4.3- 2 Projects developed under the specific plan shall be evaluated for individual construction period air quality impacts. Project-specific mitigation measures shall be identified at that time to reduce impacts to a less-than-significant level, if feasible.

However, the following shall be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment:

- The following equipment may be used without control devices or additional mitigation
  - No engineers greater than 750HP are used;
  - Engines between 501 HP and 750 HP are model years 2002 and newer;
  - Engines between 251 HP and 500 HP are model years 1996 or newer; and
  - Engines between 175 HP and 250 HP are model years 1985 or newer.

- The following equipment may be used without causing acute adverse health effects, if retrofitted with a catalyzed diesel particulate filter (CDPF):
  - Engines greater than 750 HP; if model year 2006 and newer; and
  - All engines less than 749 HP, regardless of model year.
- If construction equipment uses B99 biodiesel, no acute adverse health effect would be expected in the following:
  - Engines between 501 HP and 750 HP, if model years 2002 or newer;
  - Engines between 250 HP and 500 HP, if model years 1996 and newer; and
  - Any engine less than 250 HP.

Operational Impacts

The EIR additionally found that implementation of the proposed specific plan would result in increases in long-term operational emissions of ozone precursor pollutants that would exceed significance thresholds established by the Monterey Bay Air Resources District (formerly Monterey Bay Unified Air Pollution Control District, hereinafter "air district") , which is a significant and unavoidable impact. The Miravale III EIR provides calculations produced by the URBEMIS model, which forecasts daily emissions linked to the designated land uses. The pollutants measured by the model include volatile organic compounds (VOC), nitrogen oxides (NO_x), carbon monoxide (CO), and respirable particulates (PM_{10}). Both NO_x and PM_{10} are largely discussed in terms of their effect on air quality because according to the URBEMIS model, the emissions of NO_x and PM_{10} generated in the build out of the Miravale III Specific Plan would surpass the air district thresholds.

Mitigation Measure

4.3-3. In order to reduce greenhouse gas (GHG) and regional air pollutants and precursors (criteria air pollutants or CAPs) emissions to the extent feasible, the applicant/project proponent shall prepare and submit a GHG and CAP Reduction Plan (GCRP) concurrent with submittal of any revised Tentative Map under the Specific Plan or any Site Plan that differs from the Specific Plan as described in this EIR. The GCRP shall include a description of the measures that are proposed to be implemented by that phase of the project, including one or more of the measures contained in Appendix (F-1) of this Final EIR. The plan shall be approved by the city prior to construction of structures and site improvements, including but not limited to, determination of substantial conformance, building permits, and grading permits. For each of the measures not included, the applicant shall describe why the measure was not included. The GCRP shall present estimated reductions in GHGs and CAPs based on available information source.

No certificate of occupancy for any phase, or portion thereof, of the project shall be granted until all of the feasible, applicable measures have been implemented by the applicant/project proponent. The proponent shall demonstrate that measures that must be implemented throughout the life of the project are included in all applicable CC&Rs, property deeds, commercial center rules and regulations, and draft tenant lease agreements.

4.3-4 Fireplaces and stoves shall be gas-fired and meet U.S. Environmental Protection Agency certification requirements. The installation or operation of a wood-burning fireplace or a wood-burning stove shall be prohibited in perpetuity on all residential properties in the Miravale III Specific Plan Development. This restrictive covenant shall be recorded on the title of all parcels in the Miravale III Specific Plan area and shall run with the land.

Nuisances and Odors

The Miravale III EIR determined that the project would not create significant odors and that while agricultural activities adjacent to the project site could result in short-term nuisances, these nuisances would be reduced to a less-than-significant level with adequate agricultural buffers.

Proposed Project Analysis

Since the certification of the Miravale III EIR, the air district adopted the *2012-2015 Air Quality Management Plan* (Monterey Bay Air Resources District 2017) (AQMP). This AQMP does not call for significant changes in past air district's programs and plans, and the policies and programs of this AQMP would not significantly alter the air quality findings of the Miravale III EIR.

The proposed project is smaller than the previously proposed project and would result in less development in than what was evaluated in the Miravale III EIR. Specifically, the currently proposed project includes a mixed-use development consisting of approximately 1,318 single-family residential units, 626 multi-family residential units, 134 senior housing units, a 35.9-acre low- to medium-density Residential Study Area (up to 314 residential units), and 100,000 square feet of retail commercial space. The previously proposed project included 1,470 single-family units and 2,730 multi-family, units including affordable housing, workforce, and senior housing, 275,000 square feet of retail commercial space, and an 18-hole golf-course.

Construction Impacts

The proposed project is smaller than the project analyzed in the Miravale III EIR. However, construction activities associated with implementation of the specific plan would still include clearing, excavation and grading operations, construction vehicles traffic on unpaved

ground, and wind blowing over exposed earth that would generate dust and particulate matter. The Miravale III EIR concluded that limiting construction activities was likely not feasible for this project and dispersion modeling could not be conducted at that time (due to lack of detailed construction plans); therefore, the impact was significant and unavoidable. While limiting construction activities may remain infeasible for this project and dispersion modeling similarly cannot be completed at this time due to lack of sufficient detail; implementation of mitigation measure 4.3-1, as edited below, is feasible and would reduce construction dust impacts to a less-than-significant level.

Mitigation Measure

4.3-1 Grading activity shall be limited to a maximum of 2.5 acres daily, or, if grading cannot be limited to 2.5 acres daily, prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall, ~~at a minimum,~~ include the following measures as necessary to control visible dust:

~~Limit grading activity to a maximum of 2.5 acres daily. As more detailed construction information becomes available, emissions from grading activities could be reassessed to determine if the area of grading could be increased. Such an assessment would have to be conducted using appropriate assumptions and mitigation measures.~~

- Water all active construction areas at least twice daily and more often during windy periods.
- Active areas adjacent to existing businesses should be kept damp at all times. If necessary, during windy periods, watering is to occur on all days of the week regardless of onsite activities.
- Cover all trucks hauling dirt, sand, or loose materials.
- Haul trucks shall maintain at least 2'0" of freeboard.
- Plant tree windbreaks on the windward perimeter of construction project if adjacent to open land.
- Install wheel washers at the entrance to construction sites for all exiting trucks.
- ~~Pave all roads at construction sites.~~

- Upon completion of mass grading, ~~P~~pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.
- Sweep daily all paved access roads, parking areas and staging areas at construction sites.
- Sweep streets daily if visible soil material is deposited onto the adjacent roads.
- Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more).
- Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles.
- Limit traffic speeds on unpaved roads to 15 mph.
- Replant vegetation in disturbed areas as quickly as possible.
- Suspend excavation and grading activity when hourly-average winds exceed 15 mph and visible dust clouds cannot be contained within the site.

Grading of the site would result in the highest emissions of diesel particulate matter during the construction period. Diesel particulate matter includes air contaminants that could impact sensitive receptors including residences that border the project site as well as new on-site residences constructed during earlier phases of the project. However, like Miravale III, this potentially significant impact can be reduced to a less-than-significant level with the implementation of mitigation measure 4.3-2 identified in the Miravale III EIR. Because construction details of future development projects cannot be know at this time, and feasible mitigation will need to be incorporated into future projects to ensure air quality impacts are reduced to a less-than-significant-level, mitigation measure 4.3-2, as clarified below, is required:

Mitigation Measure

4.3-2a ~~Projects developed under the specific plan shall be evaluated for individual construction period air quality impacts. Project specific mitigation measures shall be identified at that time to reduce impacts to a less-than-significant level, if feasible.~~ Prior to each final map and use permits, the developer shall have a construction air quality report prepared by a qualified air quality consultant. The report shall be subject to review and approval by the City Planning Department and all recommendations shall be implemented during construction.

4.3-2b In addition to the construction air quality analysis required in mitigation measure 4.3-2a, during construction ~~At a minimum~~, the following shall be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment:

- The following equipment may be used without control devices or additional mitigation
  - No engineers greater than 750HP are used;
  - Engines between 501 HP and 750 HP are model years 2002 and newer;
  - Engines between 251 HP and 500 HP are model years 1996 or newer; and
  - Engines between 175 HP and 250 HP are model years 1985 or newer.
- The following equipment may be used without causing acute adverse health effects, if retrofitted with a catalyzed diesel particulate filter (CDPF):
  - Engines greater than 750 HP; if model year 2006 and newer; and
  - All engines less than 749 HP, regardless of model year.
- If construction equipment uses B99 biodiesel, no acute adverse health effect would be expected in the following:
  - Engines between 501 HP and 750 HP, if model years 2002 or newer;
  - Engines between 250 HP and 500 HP, if model years 1996 and newer; and
  - Any engine less than 250 HP.

Operational Impacts

Miravale III EIR determined that the previously proposed project would result in 34,856 daily vehicle trips. The currently proposed project, including the residential uses in Sub-area 13 would result in 20,888 daily trips (Higgins 2018), which is approximately 40 percent fewer trips than analyzed in the Miravale III EIR. However, even with a 40 percent reduction in trips, implementation of the proposed specific plan would result in increases in long-term operational emissions of ozone precursor pollutants that would likely exceed significance thresholds established by the air district, which is a significant and unavoidable impact.

Daily project emissions for the specific plan were estimated using a 47 percent reduction in vehicle trips identified in the 2017 traffic report (Higgins 2017a) and based on URBEMIS modeling conducted by for the Miravale III project with a 47 percent reduction in daily trips. With a 47 percent reduction it was determined that the proposed project would produce 193 lbs per day VOC (exceeding the 137 lb threshold), and 226 lbs per day PM_{10} (exceeding the 82

lb threshold). Thus, VOC and PM impacts for this project remain significant and unavoidable. A 40 percent reduction in trips would generate emissions that exceed these standards.

The Miravale III EIR was prepared in advance of the California Air Resources Board development of acceptable and appropriate methodologies for identifying thresholds of significance, modeling greenhouse gas (GHG) emissions, and determining the significance of emissions associated with specific development. In the absence of thresholds and quantification methods, the Miravale III EIR presumed that the GHG emissions volumes generated by the land uses consistent with the then-proposed specific plan would be significant and unavoidable. Mitigation Measure 4.3-3 required the preparation of an emissions reduction plan prior to any changes made to the then-proposed tentative map and/or specific plan. Implementation of the measures required by this mitigation measure (refer to the Miravale III Final EIR Appendix F-1), would reduce project-related emissions, but not to a less-than-significant level.

The currently proposed project is smaller and would generate fewer GHG emissions than the original project although emissions volumes would still be large enough to warrant preparation of an emissions reduction plan as identified in Mitigation Measure 4.3-3. The currently proposed project does not yet contain enough project-specific data to enable a meaningful assessment and quantification of project-related emissions. Therefore, the timing of preparation of the plan required by Mitigation Measure 4.3-3 has been determined to be more appropriate prior to recordation of the first final map. Mitigation will need to be incorporated into site-specific plan area development projects. To ensure GHG emissions volumes impacts are reduced to the extent feasible, mitigation measure 4.3-3, as clarified below, is required:

Mitigation Measure

4.3-3. In order to reduce greenhouse gas (GHG) and regional air pollutants and precursors (criteria air pollutants or CAPs) emissions to the extent feasible, the applicant/project proponent shall prepare and submit a GHG and CAP Reduction Plan (GCRP) prior to recordation of the first final map.~~concurrent with submittal of any revised Tentative Map under the Specific Plan or any Site Plan that differs from the Specific Plan as described in this EIR.~~ The GCRP shall include a description of the measures that are proposed to be implemented ~~by that phase of the project~~, including one or more of the measures contained in Appendix (F-1) of the ~~is~~ Miravale III Specific Plan Final EIR. The plan shall be approved by the city prior to construction of structures and site improvements, including but not limited to, determination of substantial conformance, building permits, and

grading permits. For each of the measures not included, the applicant shall describe why the measure was not included. The GCRP shall present estimated reductions in GHGs and CAPs based on available information source.

No certificate of occupancy for any phase, or portion thereof, of the project shall be granted until all of the feasible, applicable measures have been implemented by the applicant/project proponent. The proponent shall demonstrate that measures that must be implemented throughout the life of the project are included in all applicable CC&Rs, property deeds, commercial center rules and regulations, and draft tenant lease agreements.

The following minor revision to mitigation measure 4.2-4 is made for clarification purposes:

Mitigation Measure

4.3-4. Fireplaces and stoves shall be gas-fired and meet U.S. Environmental Protection Agency certification requirements. The installation or operation of a wood-burning fireplace or a wood-burning stove shall be prohibited in perpetuity on all residential properties in the ~~Miravale III~~ Miramonte I Specific Plan Development. This restrictive covenant shall be recorded on the title of all parcels in the ~~Miravale III~~ Miramonte I Specific Plan area and shall run with the land.

Air Quality Conclusion

The proposed project would not result in new significant air quality effects or substantially increase the severity of previously identified significant effects, and would result in lesser construction and operational impacts than identified in the Miravale III EIR. No new information has been identified that indicates the proposed project would have new or more significant impacts on air quality or the generation of GHG emissions volumes that were identified and addressed for the original project.

3.5 BIOLOGICAL RESOURCES

Miravale III Specific Plan EIR Analysis

The Miravale III EIR addressed the existing biological conditions within the proposed project, identified the potential occurrence of special-status plant species, wildlife species, and sensitive habitats at the project site, and discussed potential project-related impacts to those resources. Mitigation measures were proposed to avoid or reduce any potential impacts that were identified. The section was based on the results of the *Preliminary Biological Assessment Report for the Proposed Miravale Phase III Specific Plan, City of Soledad, CA*, prepared by Denise Duffy & Associates, Inc. (August 2007), an initial site visit, a site review, a preliminary wetland assessment, assessment of nesting bank swallow *(Riparia riparia)*

presence, a California tiger salamander (*Ambystoma californiense*, CTS) Habitat Assessment Report followed by one spring of protocol-level aquatic sampling (4 sampling events) and a tissue sample collection, a San Joaquin kit fox habitat evaluation, a presence/absence study of the Salinas pocket mouse *(Perognathus inornatus psammolphilus*) via a small mammal trapping study, and protocol-level western burrowing owl surveys. These reports are on file with the City of Soledad.

Wetlands/Waters of the U.S.

Wetlands and waters of the U.S. were identified and assessed in the Miravale III EIR, including the reservoir within the grassland area and three agricultural basins occurring west of San Vicente Road. Fringe wetlands adjacent to the reservoir and basins were identified that could potentially be considered jurisdictional by the CDFW. No mitigation measures were proposed, however verification from the USACE that the fringe wetlands are not considered jurisdictional and coordination with CDFW to determine if a permit is required was recommended.

Vegetation

The Miravale III EIR determined that the project would result in temporary and permanent impacts to all habitats and the vast majority of vegetation within project boundaries, and would result in the removal of three or more oak trees and all Eucalyptus and/or Tamarisk trees lining San Vicente Road. Temporary impacts to vegetation included grubbing and grading associated with development of the site; permanent impacts include the conversion of open vegetated areas to urban housing through placement of structures, homes, roads, driveways, etc. However, these impacts were determined to be less than significant with implementation of the following measures.

Mitigation Measures

4.4-1 A Forest Management Plan shall be prepared for the project due to proposed tree removals. The Forest Management Plan shall include a map that indicates all of the trees within the project site and denotes which trees are to be removed. The map shall also include notes which clearly state protection procedures for trees that are to be preserved. In addition, the Forest Management Plan shall include, but is not limited to, a description of each tree by species and its condition .The City approved Forest Management Plan (and associated replanting plan) shall be incorporated as a condition of project approval to satisfy General Plan Conditions C/OS 17-19. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a Forest Management Plan, subject to the review and approval of the City of Soledad.

4.4-2 Prior to the onset of construction, trees and vegetation not planned for removal shall be protected during construction to the maximum extent feasible. This shall include the use of exclusionary fencing of herbaceous and shrubby vegetation, such as hay bales and protective wood barriers for trees. Only certified weed-free straw shall be used to avoid the introduction of non-native, invasive species. A qualified biological monitor shall verify that adequate protective measures are in place prior to construction and remain intact throughout the construction phase.

4.4-3 Following construction, the disturbed areas that are proposed as parks and native landscaping areas shall be restored to pre-project contours and revegetated using locally-occurring native species and native erosion control seed mix to the maximum extent feasible. Landscape plans for all such areas adjoining natural open space, including landscaped strips within right-of-ways, shall be reviewed by a qualified biologist to ensure that only native and non-invasive species are included in the planting palette and shall include a supplemental note and/or report by said biologist documenting compliance with this requirement. Landscape plans for other disturbed areas or for designated parks shall utilize native species to the extent feasible and avoid the use of all invasive species; such plans shall include a note from the licensed professional who prepared the plan(s) or from a qualified biologist documenting compliance with this requirement. Prior to the issuance of any grading and/or building permit, the project applicant shall submit landscape plans prepared by a licensed landscape architect for review and approval by the City of Soledad.

4.4-4 Prior to the onset of construction, protective fencing shall be placed so as to keep construction vehicles and personnel from impacting vegetation adjacent to the project site outside of work limits. A qualified biological monitor shall verify protection is in place prior to construction and remains intact throughout the construction phase.

4.4-5 Grading, excavating, and other activities that involve substantial soil disturbance shall be planned and carried out in consultation with a qualified hydrologist, engineer, or erosion control specialist, and shall utilize standard erosion control techniques to minimize erosion and sedimentation to native vegetation. Only natural-fiber, biodegradable meshes shall be used in erosion control mats, blankets, and straw or fiber wattles. “Photodegradable” and other plastic mesh products will not be used as these materials are known to persist in the environment, ensnaring and killing a variety of terrestrial wildlife species. A qualified biological monitor shall verify that erosion control measures are implemented and materials used are consistent with this measure and remain intact throughout the construction phase.

4.4-6 No construction equipment shall be serviced or fueled outside of designated staging areas. A qualified biological monitor shall verify that this measure is being implemented throughout the construction phase.

Special Status Plant Species

According to the Miravale III Specific Plan EIR, the presence/absence of jewelflower could not be determined, but appropriate habitat was present within project boundaries. This species could be permanently impacted by proposed grading, excavation, and other activities that may result in the permanent loss or disturbance of individual jewelflowers and/or jewelflower habitat. However, the EIR concluded that with the following mitigation measure this impact would be less than significant.

Mitigation Measure

4.4-7 A qualified botanist shall be retained to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species. If no Lemmon's jewelflower is present, no additional mitigation is required. If Lemmon's jewelflower is present, a qualified biologist shall prepare a mitigation plan to be approved by CDFG prior to initiation of construction. The mitigation plan shall include a description of the special-status plant population(s), map depicting the location(s), and size of the population(s). If feasible, disturbance of the population(s) of Lemmon's jewelflower shall be avoided and its habitat protected utilizing methods developed in coordination with the CNPS and CDFG. Avoidance shall be confirmed by the City prior to the time of tentative map approval for this phase of the project. If impacts to the Lemmon's jewelflower population(s) cannot be avoided, mitigation shall include preservation on- or off-site at a minimum 1:1 ratio (one plant preserved for each plant impacted), or restoration on- or off-site at a minimum 3:1 ratio (three plants planted for each plant impacted). The CNPS and CDFG shall be consulted to evaluate the suitability for transplanting the impacted species to suitable habitat within the identified and established preserve/restoration area. These details shall be described and included in the mitigation plan. Restoration and preservation strategies shall be developed in coordination with the CNPS and CDFG. The City of Soledad Planning Department shall be provided verification of CDFG concurrence and satisfaction prior to issuance of grading permits.

Wildlife Corridors

The Miravale III EIR found that project development would fragment the vast majority of the existing wildlife habitat on the site, and would encroach into the foothills of the Gabilan Range which is an important wildlife corridor. The ongoing presence of homes, roads, cars,

people, firearms, pets, etc. would adversely impact any wildlife currently utilizing the site, particularly in the grassland portions of the site. This fragmentation of habitat was found to be a significant impact that can be partially reduced by implementation of the following mitigation. However, it was determined that the impact could not be fully mitigated without project redesign. Therefore, the fragmentation of habitat was considered a significant, unavoidable impact of the project as designed.

Mitigation Measure

4.4-8 Prior to approval of each final map, the applicant shall prepare and submit draft Covenant, Conditions, and Restrictions (CC&Rs) applicable to that phase that shall include the following:

a) restrict installation fencing to the immediate vicinity of residences, and where fencing is placed adjacent to open space areas and areas of natural, undisturbed habitat, fences shall be installed such that a six inch space is left between the bottom of the fence and the surface of the ground;

b) prohibit off-road vehicle use;

c) prohibit illegal discharge of firearms;

d) prohibit the installation of road medians throughout the development.

These CC&Rs shall be reviewed and approved by the City of Soledad prior to approval of each final map.

Special Status Wildlife Species

San Joaquin Kit Fox

The Miravale III EIR determined that the project would result the loss of potential San Joaquin kit fox denning, foraging, and migratory habitat resulting from development within the grassland area. The EIR concluded that while this impact could be reduced by the following mitigation measure, the impact remained significant and unavoidable.

Mitigation Measures

4.4-9 The applicants shall enter into consultation with USFWS and CDFG and shall provide evidence of their compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act to the City prior to the issuance of building permits.

4.4-10 Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. The preconstruction surveys shall be conducted per Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to or During Ground Disturbance (USFWS 1999b), as updated. Potential

dens (including man-made structures) and known dens shall be protected by minimum buffers of 50 feet and 100 feet, respectively. If an occupied or unoccupied natal den is detected, no construction shall occur for the Phase until the USFWS and CDFG have been contacted and authorization to proceed has been obtained by the applicant. Pre-construction surveys shall be conducted by a qualified biologist no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites.

In addition to pre-construction surveys, a qualified biologist, meeting the required qualifications described in the U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox. In the event that an active kit fox den is found, then the standard mitigation actions outlined in the USFWS Recommendations for SJKF, are recommended to avoid possible take of kit fox during future construction activities. These actions are general in nature; therefore, site specific strategies for the project site shall be based upon consultation with USFWS and CDFG, as stated above in Mitigation Measure 4.4-9. To reduce the risk of impacts during construction, the applicant shall, at a minimum, implement the following measures, unless directed otherwise through consultation with the USFWS and CDFG:

a) Restrict project-related vehicle speed to 20 mph on project roads.

b) Cover all excavated, steep-walled holes or construction trenches more than 2 feet deep at the close of each working day by plywood or similar materials or provide such holes or trenches with one or more escape ramps constructed of earth fill or wooden planks, inspect such holes or trenches for trapped San Joaquin kit fox prior to filling.

c) Inspect all construction pipes, culverts, or similar structures with a diameter of 4 inches or greater that are stored at a construction site for one or more overnight periods for kit foxes before the pipe is subsequently buried, capped, or otherwise used or moved in any way.

d) Contain all food-related trash items in closed containers and remove food related trash at least once a week from the project site.

e) No firearms shall be allowed on the project site.

f) No pets shall be permitted on the project site.

g) Use of rodenticides and herbicides on the project site shall be restricted to the use of zinc phosphide, in cases where it is necessary to protect public health and safety.

h) A representative shall be appointed by the project proponent who will be the contact source for any employee or contractor who might inadvertently kill or injure a kit fox or who finds a dead, injured or entrapped individual. The representative will be identified during the employee education program. The representative's name and telephone number shall be provided to the Service.

i) An employee education program shall be conducted and shall consist of a brief presentation by persons knowledgeable in kit fox biology and legislative protection to explain endangered species concerns to contractors, their employees, and agency personnel involved in the project. The program shall include the following: a description of the San Joaquin kit fox and its habitat needs; a report of the occurrence of kit fox in the project area; an explanation of the status of the species and its protection under the Endangered Species Act; and a list of measures being taken to reduce impacts to the species during project construction and implementation. A fact sheet conveying this information shall be prepared for distribution to the above-mentioned people and anyone else who may enter the project site.

j) In the case of trapped animals, escape ramps or structures shall be installed immediately to allow the animal(s) to escape, or the Service shall be contacted for advice.

k) To the extent feasible, nighttime construction shall be avoided.

l) Include kit fox mitigation measures on project plans.

If active kit fox den sites are found and/or kit fox individuals are observed during the survey, the applicant will be required to comply with all mitigation actions required by USFWS and CDFG and the City shall monitor implementation of those actions. Examples of mitigation actions that may be required by the regulatory agencies may include, but are not limited to:

- To the extent feasible, lot placement shall be situated to create wildlife corridors in protected open space to allow for kit fox and other wildlife movement through the site.

- Fencing shall surround the site to restrict kit fox movement into the development area; types of fencing (e.g. exclusionary or kit fox friendly) shall depend on the density of the development area.

- Speed bumps, rolls, or reduced speed limits shall be employed along project roads in or near open space areas to reduced likelihood of kit fox mortality by vehicle strikes.

- Street lighting shall be situated as to not spill into adjacent open space areas. The height and intensity of street lighting shall be designed to minimize indirect impacts to open space. Outdoor lighting for residential uses adjacent to open space and large lots shall also be restricted to CC&Rs to be low wattage (150 watts or less) and directed toward the residences to reduce effects on kit fox nocturnal activities.

American Badger

The Miravale III EIR determined that the project would result the loss of potential American badger denning and foraging habitat resulting from development within the grassland area and the loss of foraging habitat within agricultural areas. The EIR concluded that while this impact could be reduced by the following mitigation measure, the impact remained significant and unavoidable.

Mitigation Measure

4.4-11 The applicant shall retain a qualified biologist to conduct focused preconstruction surveys for potential American badger dens. These surveys shall be conducted no sooner than 2 weeks prior to the start of construction. Surveys for badger dens may be conducted at the same time as burrowing owl surveys. The results of the survey shall be submitted to the City prior to issuance of grading permit or initiation of grading for that phase of development on the site. Based on the results of these surveys, one or more of the following additional measures shall be implemented:

- If the qualified biologist determines that potential dens are inactive, the biologist shall excavate these dens by hand with a shovel to prevent badgers from re-using them during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities.

- If the qualified biologist determines the presence of active dens, the location of these dens shall be documented and reported to CDFG. Avoidance of active dens, particularly natal dens, is the preferred approach; Impacts to

active badger dens shall be avoided by establishing a 100-meter exclusion zones around all active badger dens, within which construction related activities shall be prohibited until denning is complete and/or the den is abandoned. A qualified biologist shall monitor each den once per week in order to track the status and inform the project sponsor of when a den area has been abandoned.

- If avoidance of an active badger den is not feasible, the biologist shall coordinate with CDFG on the appropriate way to evict/exclude badgers from their dens. Please note that special consideration of natal dens is required given the low likelihood that excluded young would survive; a CDFG depredation permit would be required to disrupt a natal den. For non-natal dens, CDFG has permitted badgers to be gradually excluded from their dens by placement of soil, sticks, and debris at den entrances, incrementally increasing the degree of blockage over a period of three to five days (please note that blockage cannot trap/entomb badgers). After the monitoring biologist determines that badgers have stopped using active dens within the project boundary, the dens shall be hand-excavated with a shovel to prevent re-use during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities. Please note that eviction of onsite badgers will reduce construction phase impacts to this species, but given the large home ranges and territoriality of this species, emigration to alternative habitats may not be feasible without inter/intra specific competition (energetic stress possibly resulting in mortality). CDFG may require that appropriate onsite or adjacent habitat be conserved to allow relocation of excluded animals within their home range.

Special Status Bats

The Miravale III EIR determined that the project had the potential to impact two bat species (pallid bat and Townsend's big-eared bat) due to the potential for direct impacts to bats and/or bat roosts (day, night, foraging, and maternity) and the loss of the vast majority of onsite foraging habitat for these species. The Miravale III EIR concluded that this impact could be reduced to a less-than-significant level with the following mitigation measure.

Mitigation Measure

4.4-12 A qualified bat specialist shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist). The results of the survey shall be submitted to the City prior to

issuance of grading permit or initiation of grading for that phase of development on the site. Based on the results of these surveys, one or more of the following additional measures shall be implemented:

- If it is determined that bats are not present at the site, no additional mitigation is required.
- If it is determined that bats are utilizing the site and would likely be impacted by the proposed project, preconstruction surveys shall be conducted no more than 30 days prior to modification, demolition, or removal of onsite buildings and/or any other occupied habitat.
- If no bat or bat sign are observed in the course of preconstruction surveys, then demolition/removal of buildings and/or construction initiation may proceed. If bat and/or bat sign are observed during the preconstruction surveys, the biologists shall determine if disturbance will jeopardize a maternity roost, or another type of roost (foraging, day, night).
- If a single bat and/or only adult bats are roosting, demolition or removal of the structure can proceed after the bats have been safely excluded from the roost. Exclusion techniques shall be determined by the biologist and depend on the type utilization; the biologist shall prepare a mitigation plan for provision of alternative habitat to be approved by CDFG and the City.
- If an active maternity roost is detected, work in the vicinity of the roost (and/or demolition of the structure) shall be postponed until the qualified biologist monitoring the roost(s) determines that the young have fledged and are no longer dependent on the roost. The monitor shall ensure that all bats have left the building and or area of disturbance prior to initiation of construction and/or demolition activities. If disruption of a maternity roost cannot be avoided, a depredation permit would be required.

Salinas Pocket Mouse

According to the Miravale III EIR the Salinas pocket mouse and Salinas pocket mouse habitat are known to occur on the site. The vast majority of the onsite grassland habitat would have been converted to residential usage and the remaining portions would have been fragmented from surrounding habitat and subject to ongoing disturbance (cars, lights, noise, sound, vibration, etc.) that could result in direct and indirect mortality. The following mitigation measure was determined to lessen the impact but not to a less-than-significant level. The EIR concluded that this would be a significant and unavoidable impact.

Mitigation Measure

4.4-13 The applicant shall contract a qualified biologist to coordinate with CDFG and prepare a mitigation and monitoring plan for the Salinas pocket mouse. The mitigation and monitoring plan shall include a description of the population and locations of known and potential habitat within the project site, mitigation to avoid and reduce impacts to the species, monitoring actions success criteria, and adaptive management measures if success criteria are not met. Verification of CDFG concurrence/approval shall be submitted to the City of Soledad prior to issuance of a grading permit for that phase of development of the site.

Special Status Avian Species

According to the Mirvale III EIR, suitable breeding habitat is present for burrowing owl, northern harrier, white-tailed kite, and loggerhead shrike. The project would result in the loss of foraging and/or nesting habitat for these species. Raptors and their nests are protected by both federal and state regulations (MBTA and CDFG Code Sections 30503 and 3503.5), which protect birds of prey and their eggs and nests. Construction disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by CDFG. The EIR concluded that construction activities such as tree removal or site grading that result in any loss of fertile raptor eggs or nesting raptors, or any activities resulting in raptor nest abandonment onsite or immediately adjacent to the site would constitute a significant impact. However, the EIR determined that the impact could be reduced to a less-than-significant level with implementation of the following mitigation measure.

Mitigation Measures

4.4-14 Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the Miravale site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The survey shall conform to the CDFG 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied). Please refer to the mitigation measures regarding burrowing owl in the Preliminary BA (June, 2008) for avoidance and mitigation measures that may be implemented based on the results of these surveys.

4.4-15 If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area. If active nests are found, a suitable construction buffer shall be established by a qualified biologist, and no work shall occur within that buffer until August 1 when young are assumed fledged. Alternatively, a qualified biologist can conduct weekly nest checks to gauge nestling/fledgling status, and construction may proceed once fledglings have dispersed from the nest provided written concurrence from CDFG. No active nest shall be impacted or removed without a depredation permit from CDFG, and a depredation permit will not be issued for impacts to Fully Protected Species such as the white-tailed kite. For activities that occur outside of the nesting season (generally September 1 through February 14), preconstruction surveys are not required. If construction is initiated outside of the nesting season and continues into the nesting season, preconstruction surveys are required if construction will occur in areas not previously accessed and/or disturbed (>300 feet from previous construction activities).

4.4-16 A preconstruction survey shall be conducted no more than 14 days prior to modification, demolition, or removal of onsite buildings. If no owls or other nesting birds are observed, then demolition or removal may proceed. If barn owls (or any other nesting birds) are observed during the preconstruction survey, a determination shall be made on whether birds are roosting or nesting. If a single owl is roosting, demolition or removal of the structure can proceed after the owl has been persuaded to move from the roost area. Non-invasive techniques include light shining into the roost space for one or two nights and days. If barn owls (or other nesting avian species) are found to be actively nesting in the barn, work on or demolition of the structure shall be postponed until one of the following conditions have been met: 1) a qualified biologist monitoring the nest determines that the owls have abandoned the nest without any outside interference or 2) a qualified biologist monitoring the nest has determined that the young have fledged and are capable of relocating and using another roost site. Once the young have fledged, non-invasive techniques may be used to encourage the owls to leave the barn. Under either scenario, the monitor shall ensure that all owls have left the building prior to construction or demolition activities. The barn owl nesting period is typically between February 15 and July 15.

Special Status Reptiles and Amphibians

The Mirvale III EIR found that given the presence of marginally appropriate habitat, both California red-legged frog (CRLF) and Western spadefoot may be present within project boundaries. If CRLF or spadefoot are present, proposed impacts to onsite agricultural basins (particularly the reservoir) would result in direct impacts to these species including "take." (i.e. loss of individuals and habitat, loss of a breeding resource, direct mortality, etc.). In addition, grading and other earthmoving activities proposed would represent an adverse effect on upland estivation habitat for these species, if present. The EIR presented mitigation measure 4.4-17 (below) to reduce impacts but determined that impacts could not be reduced to a less-than-significant level. Therefore, the EIR concluded that the project would result in a significant and unavoidable impact to a federally Threatened Species and State Species of Special Concern.

The Miravale III EIR additionally determined that the development of the majority of the onsite grassland habitat and fragmentation of remaining grassland habitat represents a significant impact to coast horned lizards, black-legless lizards, and San Joaquin coachwhip. Given the lack of unaffected portions of the grassland habitat for conservation of these species, the EIR concluded that this was a significant impact. While mitigation measures 4.4-18 through 4.4-21 would reduce impacts, it would not be to a less-than-significant level and impacts to these species were determined to be significant and unavoidable impact despite mitigation.

Mitigation Measures

4.4-17 Protocol-level CRLF surveys (USFWS, August 2005) shall be completed at each aquatic resource present within project boundaries. Protocol-level CRLF surveys would likely detect Western spadefoot, if present (Western spadefoot toad surveys are also conducted at night during winter months, preferably January through March, and therefore, overlap CRLF survey protocol requirements). The results of the survey shall be submitted for the review and approval of the City, USFWS, and CDFG. If it is determined that CRLF are present, the applicant shall coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA (e.g., applying for an Incidental Take Permit [Section 10]) and implementing the permit requirements prior to issuance of a grading permit. Any mitigation and avoidance measures required by USFWS for potential impacts to CRLF (if applicable) would likewise reduce impacts to Western spadefoot given their overlapping habitat characteristics. If CRLF is not found on-site and USFWS concurs with a negative finding, no further mitigation is required.

If it is determined that spadefoot are present, but CRLF are not, coordination with CDFG regarding appropriate mitigation to reduce impacts to this species shall be required prior to issuance of a grading permit. If the Western spadefoot toad is not found on-site, no further mitigation is required.

4.4-18 The applicant shall retain a qualified biologist to conduct a construction monitoring program for black legless lizards, coast horned lizards, and San Joaquin coachwhip which shall include procedures for capture and release. The biologist shall remain on-site during initial grading activities to salvage and relocate these species that may be uncovered during earthmoving activities. Recovered individuals shall be placed in appropriate habitat outside of the project site in accordance with the memorandum of understanding with CDFG. The biologist shall walk alongside the grading equipment in each new area of disturbance and shall have the authority to halt construction temporarily if necessary to capture and relocate an individual. Any individual captured in the grading zone shall be relocated as soon as possible to adjacent suitable habitat outside of the area of impact, pursuant to the memorandum of understanding.

4.4-19 The applicant shall conduct an employee education program for construction crew and City staff prior to construction activities. A biological monitor shall meet with the construction crew at the onset of construction to educate the construction crew on the following: 1) the appropriate access route in and out of the construction area; 2) how biological monitor will examine the area and agree upon a method which will ensure the safety of the monitor during such activities, 3) the special-status species that may be present; 4) the specific mitigation measures that will be incorporated into the construction effort; and 5) the proper procedures if a special-status animal or any other animal is encountered within the project site.

4.4-20 A representative shall be appointed by the City who will be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. The representative shall be legally responsible to notify USFWS and CDFG immediately in the event that "take" of any special-status wildlife species occurs. The representative shall be identified during the Employee Education Program and his/her contact information shall be provided to USFWS and CDFG. It is imperative that this individual will be present onsite every day and will be accessible to regulatory agency personnel.

4.4-21 All food-related and other trash shall be disposed of in closed containers and removed from the project area at least once a week during the construction period or more often if trash is attracting avian or mammalian predators. Construction

personnel shall not feed or otherwise attract wildlife to the area. These instructions to the construction crew shall be reiterated during the employee education program and during update meetings with construction crews. The instructions shall also be posted conspicuously on the site.

Wildlife Movement and Nursery Sites

The General Plan EIR identifies "adverse but not significant" impacts to wildlife movement based on the availability of the Salinas River and Arroyo Seco corridors in the project area. However, the General Plan EIR requires that portions of the Gabilan Range above 400-feet elevation be conserved as open space. Development above 400-feet elevation was proposed as a portion of the Miravale III project, significantly encroaching into an area proposed for conservation and impacting an upland wildlife movement corridor. As stated in the Preliminary BA, Miravale III "proposed 'open space' portions of the site (including the 62 acres of grasslands) are not designed or suitable as plant and wildlife conservation areas." An increase in the total number of roadways in the project site could be expected to result in an increase in the number of animals killed by vehicular traffic. The permanent onsite presence of homes, roads, and infrastructure would further fragment habitats surrounding the project site and represents an urban encroachment into the foothills of the Gabilan Range. As such, the Miravale III EIR determined that development of the proposed project, particularly above the 400 foot elevation contour, would result in a significant impact to wildlife movement. The EIR found that while mitigation measures identified in the Biological Resources section would minimize project induced impacts, they could not be reduced to a less-than-significant level.

Proposed Project Analysis

EMC Planning Group biologist Andrea Edwards performed a reconnaissance field survey at the site on April 26, 2017 to verify that conditions described in the Miravale III EIR remain accurate, to document existing plant communities and wildlife habitats, and to evaluate the potential for special-status biological resources to occur within the revised site boundary. Qualitative estimations of plant cover, structure, and spatial changes in species composition were used to determine plant communities and wildlife habitats, and habitat quality and disturbance level were noted.

Wetlands/Waters of the U.S.

A reservoir and three agricultural basins were identified and assessed in the Miravale III EIR. The revised project does not propose to disturb the reservoir, and the three agricultural basins occur west of San Vicente Road are no longer included in the project boundary. As a result, permits from the U.S. Army Corps of Engineers, California Department of Fish and Wildlife, and the Regional Water Quality Control Board will not be required.

Vegetation

The revised specific plan does not include disturbance to the grassland habitat along the eastern project boundary. The proposed project would cause temporary and permanent impacts to all agricultural fields and the vast majority of vegetation west of the grassland habitat. Temporary impacts to vegetation included grubbing and grading associated with development of the site; permanent impacts include the conversion of open vegetated areas to urban housing through placement of structures, homes, roads, driveways, etc. The Miravale III Preliminary Biological Assessment (2008) determined that a Forest Management Plan should be required because three or more native live oak trees located in the foothills and grassland areas would be impacted by the then-proposed project. However, only one oak tree is located below the 400 foot elevation contour that could be impacted with implementation of the currently proposed project. Therefore, since fewer than three oak trees would potentially be impacted by the proposed project, a forest management plan would not be required. Mitigation measure 4.4-1, which requires preparation of a forest management plan, is not applicable to the proposed project and is not required. Mitigation measures 4.4-2 through 4.4-6, which propose protection of adjacent grassland areas from disturbance, erosion, and contamination, remain applicable to the proposed project.

Special-Status Plant Species

One special-status plant species, Lemmon's jewelflower (*Caulanthus lemmonii*), was identified as having the potential to occur within grazing land in the eastern portion of the project site. Lemmon's jewelflower is a CNPS List 1B species associated with open, grassy areas; on hillside slopes and in fields, canyons, and arroyos. While the revised project no longer proposed residential development in the grassland areas, it may require the placement of infrastructure in this area which may result in limited disturbance to the grassland. Therefore, mitigation measure 4.4-7, which requires additional surveys, remains applicable.

Wildlife Movement and Nursery Sites/Wildlife Corridors

A significant and unavoidable impact to wildlife corridors was identified in the Miravale III EIR due to proposed development within the grassland area. While infrastructure improvements may be required in the grassland area, the revised project no longer includes intensive residential development within the grassland area identified in the Miravale III EIR Therefore, impacts to species and habitats occurring within grassland areas of the site are significantly reduced. The proposed project's impacts to wildlife corridors and movement would be less than significant. The specific plan requires recordation of a conservation easement for all hillside areas, within which the grassland habitat and related corridors occur. Mitigation Measure 4.4-8 is clarified to reflect the conservation easement required by the specific plan. Additionally, because development is no longer occurring above the 400 foot elevation contour, subsections a and d are removed from the mitigation measure as these address development above the 400 foot elevation contour and are not applicable to the proposed project.

In addition to the species-specific measures identified in the Miravale III EIR, Mitigation Measures 4.4-19, 4.4-20, and 4.4-21 remain applicable to address general impacts, including preparation of an employee education program, identification of a qualified biologist in the event an animal is discovered or injured during construction, and measures to prevent inadvertently attracting wildlife species.

Mitigation Measure

4.4-8 Areas above the 400 foot elevation contour shall be protected from development, excluding infrastructure and utility improvements, in perpetuity. Prior to approval of ~~each~~ the first final map, the applicant shall prepare and submit to the city for review and approval ~~draft Covenant, Conditions, and Restrictions (CC&Rs) applicable to that phase that shall~~ a draft conservation easement for all areas above the 400 foot elevation contour. The easement shall include the following:

~~a) restrict installation fencing to the immediate vicinity of residences, and where fencing is placed adjacent to open space areas and areas of natural, undisturbed habitat, fences shall be installed such that a six inch space is left between the bottom of the fence and the surface of the ground;~~

a~~b~~) prohibit recreational off-road vehicle use;

b~~c~~) prohibit illegal discharge of firearms;

~~d) prohibit the installation of road medians throughout the development.~~

~~These CC&Rs~~ The conservation easement shall be reviewed and approved by the City of Soledad prior to approval of ~~each~~ the first final map. The developer shall record the conservation easement prior to issuance of a grading permit or the onset of any other site disturbance.

Special-Status Wildlife Species

The potential for the wildlife species identified within the Miravale III EIR have the same potential to occur within the project boundary despite modifications to the project.

San Joaquin Kit Fox

A significant and unavoidable impact to San Joaquin kit fox was identified in the Miravale III EIR due to the loss of potential denning, foraging, and migratory habitat resulting from development within the grassland area. The revised project may include infrastructure improvements in the grassland area but otherwise no longer includes development within this area; therefore, impacts to species and habitats occurring there have been significantly reduced. The potential for San Joaquin kit fox to occur within the project remains, however

impacts are no longer considered significant and unavoidable with the protection of the grassland area and implementation of Mitigation Measures 4.4-9 and 4.4-10, which require obtaining Incidental Take Permits from USFWS and CDFW and preconstruction surveys and monitoring.

American Badger

A significant and unavoidable impact to American badger was identified in the Miravale III EIR due to the loss of potential denning and foraging habitat resulting from development within the grassland area and the loss of foraging habitat within agricultural areas. The revised project may include infrastructure improvements in the grassland area but otherwise no longer includes development within this area; therefore, impacts to species and habitats occurring there have been significantly reduced. The potential for American badger to occur within the project remains, however impacts are no longer considered significant and unavoidable with the protection of the grassland area and implementation of Mitigation Measure 4.4-11, which require preconstruction surveys.

Special-Status Bat Species

A less-than-significant impact with implementation of mitigation for two bat species (pallid bat and Townsend's big-eared bat) was identified in the Miravale III EIR due to the potential for direct impacts to bats and/or bat roosts (day, night, foraging, and maternity) and the loss of the vast majority of onsite foraging habitat for these species. The revised project may include infrastructure improvements in the grassland area but otherwise no longer includes development within the grassland area; therefore, impacts to species and habitats occurring there have been significantly reduced. The potential for bats to occur within the project remains, and impacts remain less-than-significant with protection of the grassland area and implementation of Mitigation Measure 4.4-12, which require preconstruction surveys.

Salinas Pocket Mouse

A significant and unavoidable impact to Salinas pocket mouse was identified in the Miravale III EIR due to the potential loss of individuals and the loss of denning, foraging, and migratory habitat resulting from development within the grassland area. The revised project may include infrastructure improvements in the grassland area but otherwise no longer includes development within this area; therefore, impacts to species and habitats occurring there have been significantly reduced. The potential for Salinas pocket mouse to occur within the project area remains, however impacts are no longer considered significant and unavoidable with the protection of the grassland area and implementation of Mitigation Measure 4.4-13, which requires preparing a mitigation and monitoring plan in coordination with CDFW.

Special-Status Bird Species

During surveys conducted for the Miravale III EIR, the following special-status bird species were observed foraging within the project site: Western burrowing owl, Northern harrier, white-tailed kite, loggerhead shrike, and Northern harrier. In addition, golden eagle, merlin, prairie-falcon, and horned lark were identified as having the potential to utilize the site for foraging. A less-than-significant impact with implementation of mitigation to bird species was identified in the Miravale III EIR due to the potential for direct impacts to birds and/or nests and the loss of the vast majority of onsite nesting foraging habitat for these species The revised project may include infrastructure improvements in the grassland area but otherwise no longer includes development within this area; therefore, impacts to species and habitats occurring there have been significantly reduced. However, the potential for bird species to occur within the project remains, and impacts remain less-than-significant with greater protection of the grassland area and implementation of Mitigation Measures 4.4-14, 4.4-15, and 4.4-16, which require protocol-level preconstruction surveys for burrowing owl and preconstruction surveys for nesting birds. Mitigation Measure 4.4-14 is edited as follows to correctly reference the current project.

Mitigation Measure

4.4-14 Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the ~~Miravale~~ Miramonte site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The survey shall conform to the CDFG 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied). Please refer to the mitigation measures regarding burrowing owl in the Preliminary BA (June, 2008) for avoidance and mitigation measures that may be implemented based on the results of these surveys.

California Tiger Salamander

No impacts to California tiger salamander were identified in the Miravale III EIR after coordination with USFWS regarding ESA jurisdiction over onsite hybrid/non-native tiger salamanders determined that tiger salamanders present at Miravale Pond 1 (onsite reservoir) are not subject to regulation under ESA and are therefore not within the regulatory jurisdiction of USFWS regulation (USFWS concurrence letter issued February 26, 2008 and presented in Appendix I of the June 2008 Preliminary BA). However, a CDFW report,

A Status Review of the California Tiger Salamander (CDFW 2010), includes a recommendation that even hybrid populations with small amounts of native genetic material should not lose their protected status. As noted in the Miravale III EIR, coordination with the CDFW will occur to determine whether the CDFW will take jurisdiction over the on-site tiger salamander population (FEIR pp. 140-141). The following mitigation measure is added for clarification of the process required to coordinate with CDFW.

Mitigation Measure

4.4-22 The applicant shall enter into consultation with CDFW to determine the appropriate course of action per the requirements of the state ESA regarding the protection of hybridized California tiger salamander populations and to determine if requirements include applying for an Incidental Take Permit (Section 2081). If an ITP is required, implement all corresponding permit requirements. No approval or issuance of a grading permit shall occur until such time as the consultation process is complete.

California Red-Legged Frog and Western Spadefoot

A significant and unavoidable impact to California red-legged frog and western spadefoot was identified in the Miravale III EIR if found within the project area. The revised project does not propose to disturb the reservoir, and the three agricultural basins occur west of San Vicente Road are no longer included in the project boundary. The revised project may include infrastructure improvements in the grassland area but otherwise no longer includes development within this area; therefore impacts to species and habitats occurring there have been significantly reduced. The potential for California red-legged frog and western spadefoot to occur within the project remains, however impacts are no longer considered significant and unavoidable with the protection of the grassland area and implementation of Mitigation Measure 4.4-17, which requires protocol-level surveys for California red-legged frog (which would also identify western spadefoot, if present, given their overlapping habitat characteristics).

Coast Horned Lizard, Black Legless Lizard, and San Joaquin Coachwhip

A significant and unavoidable impact to coast horned lizard, black legless lizard, and San Joaquin coachwhip was identified in the Miravale III EIR due to the loss of habitat resulting from development within the grassland area. The revised project may include infrastructure improvements in the grassland area but otherwise no longer includes development within this area; therefore, impacts to species and habitats occurring there have been significantly reduced. The potential for coast horned lizard, black legless lizard, and San Joaquin coachwhip to occur within the project area remains, however impacts are no longer considered significant and unavoidable with the protection of the grassland area and implementation of Mitigation Measure 4.4-18, which requires construction monitoring and a salvage and relocation plan in coordination with CDFW.

Biological Resources Conclusion

As discussed above, the proposed revision to the Miramonte I development area has significantly reduced the level of potential impact to many biological resources. Excluding development west of San Vicente Road and limiting development within the grassland area lessened impacts to biological resources. Due to the known or potential presence of many wildlife species, however, a majority of the mitigation measures proposed in the Miravale III EIR remain applicable.

3.6 CULTURAL RESOURCES

Miravale III Specific Plan EIR Analysis

Historic Resources

A Preliminary Archaeological Reconnaissance (archaeological report) was prepared for the project site by Archaeological Consulting (September 2006) to assess potential effects of the previously proposed specific plan on cultural resources. The archeological report identified the farmhouse and barn located along the southern property border at the intersection of San Vicente Road and the proposed H Street as potential historic resources. A Phase One Historic Review was prepared by Kent Seavey (October 2006) to evaluate the historical significance of these buildings. The review determined that the farmhouse, referred to as the Morris Lorentzen House, was significant under Public Resources Code Section 5024.1(a). The proposed project would require the removal of the Lorentzen House in order to accommodate project development which is a potentially significant impact due to the historical significance of structure. A CEQA Impacts Analysis and Mitigation Report was prepared by JRP Historical Consulting (July 2007) to identify impacts to the historic resource and identify appropriate mitigation for the protection of this resource. The Miravale III Specific Plan EIR concluded that implementation of the following mitigation measures identified in the JRP report and Miravale III Specific Plan EIR would ensure that project-related impacts could be minimized to a less-than-significant level.

Mitigation Measures

4.5-1 Relocation of House. The project proponent shall ensure that the design and implementation of the relocation project is consistent with the Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, and the Mitigation Monitoring and Reporting Plan (MMRP) for the project. Prior to recordation of the final map, the project applicant shall submit a relocation plan prepared by a qualified professional in accordance with the general recommendations of

Moving Historic Buildings, a publication of the National Park Service, to the City of Soledad for review and approval. The relocation plan shall discusses planning, research, and recording prior to the move. In addition, the relocation plan shall identify siting, foundation construction, building reassembly, and restoration work after a successful move. See John Obed Curtis, Moving Historic Buildings, Heritage Conservation and Recreation Service, Publication No. 9, US Department of Interior (1979) for further details. Prior to the relocation, the applicant shall provide verification of compliance with related mitigations to the City of Soledad Community Development Department Director for review and approval. In addition, the structure shall be relocated prior to the issuance of any building and/or grading permit for development within the Specific Plan area.

4.5-2 Protective Measures. The project proponent shall develop and implement measures to protect the character-defining features of the Lorentzen House building from damage by the relocation project. The features include, but are not limited to scale, massing, and layout of the house, as well as siding and wood frame fenestration. Protective measures shall be prepared by a qualified professional in accordance with the Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, Moving Historic Buildings, and the MMRP for the project. Prior to the recordation of the final map, the project applicant shall submit a relocation plan, consistent with Mitigation Measure 4.5-1, which incorporates protective measures consistent with the intent of this measure. Prior to the relocation of the structure, the applicant shall submit evidence from a qualified professional demonstrating that protective measures have been implemented, subject to the review and approval of the City of Soledad.

4.5-3 Repair of Inadvertent Damage. The project proponent shall ensure that any inadvertent damage to the character-defining features of the Morris Lorentzen House resulting from the rehabilitation project is repaired in accordance with the Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992) and California Historical Building Code. A qualified professional shall be consulted prior to any repairs. The condition of the building shall be photographed as part of the proposed recordation document and/or video documentation, prior to the start of the relocation, and this will help to establish the baseline condition for assessing inadvertent damage. The project applicant shall submit detailed documentation prepared by a qualified professional demonstrating that all repairs have been completed in accordance with applicable standards prior to the issuance of any building and/or grading permit.

4.5-4 Professional Standards. All activities regarding historical architectural resources and historic preservation carried out as part of this project shall be carried out by or under the direct supervision of persons meeting, at a minimum, the Secretary of the Interior's professional qualifications standards (48 FR 44738-9) in these disciplines. Prior to the relocation of the Lorentzen House, the applicant shall submit evidence to the City of Soledad demonstrating compliance with this measure.

4.5-5 Monitoring. The mitigation measures applying to the relocation of the Lorentzen House shall be set forth in a Mitigation Monitoring and Reporting Program (MMRP) for the project. The MMRP will guide project-specific mitigation, monitoring, and/or reporting programs for various aspects of mitigation monitoring, reporting, and enforcement in order to ensure full compliance with the conditions of project approval.

4.5-6 Coordination. The project proponent shall coordinate with and inform interested parties, including, but not limited to the Soledad Historical Society and the Monterey County Historical Society, regarding the status of its compliance with the mitigation measures set forth in the MMRP, as necessary.

4.5-7 Recordation to Historic American Building Survey standards. Prior to the start of any project work, the project proponent shall ensure that the Lorentzen House property is recorded and documented in accordance with the Level II recordation standards of the Historic American Building Survey/Historic American Engineering Record (HABS/HAER) program. This level of recordation would include:

- Archival reproduction of any existing historic images of the property and grounds;
- Archival reproduction of any existing maps, sketches, or drawings of the house;
- Production of measured architectural plans and drawings;
- Production of large-format photographs of exterior and interior views of the house, and exterior views of the house and current setting, including relationship to non-eligible outbuildings; and
- Narrative history and description of the property (based on the narrative provided in the Seavey (2006) evaluation of the property, and the Monterey County survey(s) of similar properties.

The original archival set of recordation documents and photograph prints will be submitted to the Soledad Historical Society (or its designee), and archival quality photocopies of the documentation set will be provided to the following interested parties and local repositories: the Monterey County Historical Society; the Monterey County Libraries (Soledad and Salinas branches), and the UC Santa Cruz Library Special Collections Department. The project proponent would ensure that this recordation documentation was prepared prior to carrying out any other treatment and would make the content of the document available for other mitigation measures, such as the preparation of interpretive material.

Archaeological Resources and Human Remains

A records search and field reconnaissance conducted for the Miravale III EIR did not produce evidence of archaeological resources or human remains on the project site. However, it was determined that construction of the project could potentially uncover unknown buried archaeological resources or human remains during excavation and clearing activities which is a potentially significant impact. However, the EIR concluded that implementation of the following mitigation measures would ensure this potential impact was less than significant.

Mitigation Measures

4.5-8 In order to ensure that project-impacts to potentially unknown resources are avoided, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring.

If archaeological resources or human remains are accidentally discovered during construction, work shall be halted within 150 feet (50 meters) of the find until a qualified professional archaeologist can evaluate it. Work shall not recommence until the project archaeologist has submitted documentation to the City indicating that discovered resources have been adequately salvaged and no further resources have been identified within the area of disturbance

4.5-9 In order to ensure that the proposed project does not impact buried human remains during project construction, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If buried human remains are encountered during construction, work in that area must halt and the archaeologist and the coroner immediately notified. If the remains are determined to be Native American, then the NAHC

must be notified within 24 hours as required by Public Resources Code 5097. The NAHC will notify designated Most Likely Descendants who will provide recommendations for the treatment of the remains within 24 hours. The NAHC will mediate any disputes regarding treatment of remains. Work shall not recommence until the project archaeologist, coroner, and NAHC, submit documentation to the City indicating that buried human remains have been adequately salvaged and no further remains have been identified within the area of disturbance.

Proposed Project Analysis

The currently proposed specific plan, while smaller than the previously proposed plan, would still require removal of the Lorentzen House and require site preparation and construction activities that have the potential to disturb or damage unknown archaeological resources and human remains if such are discovered. All development within the specific plan area would be subject to the mitigation measures identified in the Miravale III EIR, and noted above, with the following clarification to mitigation measure 4.5-9 regarding the timing of recommendations by designated Most Likely Descendants.

Compliance with these measures would ensure that the known historic resource and unanticipated archaeological resources and human remains are adequately protected should these resources be uncovered during construction activities.

Mitigation Measure

4.5-9 In order to ensure that the proposed project does not impact buried human remains during project construction, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If buried human remains are encountered during construction, work in that area must halt and the archaeologist and the coroner immediately notified. If the remains are determined to be Native American, then the NAHC must be notified within 24 hours as required by Public Resources Code 5097. The NAHC will notify designated Most Likely Descendants who will provide recommendations for the treatment of the remains within ~~24~~ 48 hours. The NAHC will mediate any disputes regarding treatment of remains. Work shall not recommence until the project archaeologist, coroner, and NAHC, submit documentation to the City indicating that buried human remains have been adequately salvaged and no further remains have been identified within the area of disturbance.

Compliance with these measures would ensure that the known historic resource and unanticipated archaeological resources and human remains are adequately protected should these resources be uncovered during construction activities.

Cultural Resources Conclusion

The proposed project would not result in new significant cultural resource effects or substantially increase the severity of previously identified significant effects, no changes in cultural resources related circumstances have occurred, and no new information has been identified that indicates the proposed project would have new or more significant impacts on cultural resources than were identified for the original project.

3.7 GEOLOGY, SOILS, AND MINERALS RESOURCES

Miravale III Specific Plan EIR Analysis

Several reports were completed for the Miravale III Specific Plan project including two Preliminary Geologic Hazards Investigations prepared by Nolan Associates (August 9, 1995 and an update September 27, 2006); a Geotechnical Investigation for the Preliminary Design Phase, prepared by Tharp & Associates, Inc. (August 29, 2005); and a Preliminary Soils & Foundation Investigation, prepared by Tharp & Associates, Inc. (October 19, 1995). The following analysis included in the Miravale III EIR was based, in part, on these reports.

Seismic Hazards

The Reliz-Rinconada fault zone, passes within six miles of the project site and the San Andreas Fault Zone passes within 12 miles of the site. The project could be exposed to potential adverse effects from strong seismic ground shaking that may result in damage to proposed structures which would represent a potentially significant impact. However, the EIR concluded that this impact could be reduced to a less-than-significant level with implementation of the following mitigation measures.

Mitigation Measures

4.6-1 To minimize the potential effects from strong seismic ground shaking on project components, a project-specific geotechnical analysis shall be performed by a registered professional engineer with geotechnical expertise, and all recommendations shall be incorporated into final design plans. Prior to the issuance of any building and/or grading permit, the project applicant shall submit a project-specific geotechnical analysis to the City of Soledad Public Works Director for review and approval. The project engineer shall develop project-level plans based upon and in response to the observations and recommendations made in the project specific geotechnical analysis.

4.6-2 In order to minimize potential seismic-related hazards, the project engineer shall incorporate the seismic shaking analysis contained within the Geologic Hazards Investigation Update prepared by Nolan Associates (September 2006) into project design. Prior to the issuance of any building and/or grading permits, the project applicant shall submit design level plans demonstrating that the recommendations of the Geologic Hazards Investigation Update are incorporated into project design, subject to the review and approval of the City of Soledad Public Works Director. In addition, all structures shall be designed to the most current standards of the California Building Code, at a minimum.

4.6-3 In order to minimize seismic-related hazards to new public facilities, a site-specific probabilistic seismic hazards assessment shall be incorporated into the design of any schools, hospitals, fire or police stations, or any other critical facilities planned for the project site. An individual assessment shall be performed for each site by an engineering geologist. Prior to the issuance of any grading and/or building permit for new public facilities, including but not limited to new schools, hospitals, and fire or police stations, a probabilistic seismic hazards assessments shall be prepared and submitted to the City of Soledad Director of Public Works for review and approval.

Erosion

The Miravale III EIR found that site preparation and construction activities would disturb soil and increase its susceptibility to erosion. Removal of soils by wind or water can undermine buildings, roads, and other developments, as well as contribute siltation of local streams or water bodies. Moreover, removal of existing mature eucalyptus and other tree species along San Vicente Road could result in additional erosion-related impacts. Although the Hillside Development Standards & Guidelines contained in Appendix C of the Miravale III EIR included specific erosion control regulations, the Miravale III EIR found that additional mitigation would be warranted in order to ensure that project-related impacts are reduced to a less-than-significant level. The Miravale III EIR concluded that implementation of the project could result in substantial soil erosion or loss of topsoil which is a potentially significant impact. However, it was found that this impact could be reduced to a less-than-significant level with implementation of the following mitigation measures, including Mitigation Measure 4.1-7 (refer to discussion of Aesthetic Resources, Section 3.2).

Mitigation Measures

4.1-7 A site-specific geotechnical report shall be prepared for new development on hillsides in order to ensure that the development will not cause or worsen natural hazards, such as erosion and sedimentation, and will minimize risk to life and property from slope failure, landslides, and flooding. The report shall include

erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas. Prior to the issuance of any grading and/or building permit for new development within the hillside portions of the project site, the project applicant shall submit a geotechnical report prepared by a qualified professional to the City of Soledad Department of Public Works for review and approval. The site-specific geotechnical report shall identify feasible recommendations and avoidance measures to minimize potential impacts.

4.6-4 In order to reduce wind and water erosion on the project site, an erosion control plan and Storm Water Pollution Prevention Plan (SWPPP) shall be prepared for the site preparation, construction, and post-construction periods. The erosion control plan shall incorporate best management practices consistent with the requirements of the National Pollution Discharge Elimination System (NPDES). The erosion component of the plan must at least meet the requirements of SWPPP required by the California State Water Resources Control Board. If earth disturbing activities are proposed between October 15 and April 15, these activities shall be restricted per the requirements of Soledad Municipal Code Chapter 15.08. Prior to the issuance of any permit, the project proponent shall submit detailed plans to the satisfaction of the City of Soledad Public Works Director. The components of the erosion control plan and SWPPP shall be monitored for effectiveness by City of Soledad Public Works. The following measures shall be implemented, where appropriate, to control erosion:

1. Keep construction machinery off of established vegetation as much as possible, especially the vegetation on the upwind side of the construction site;

2. Establish specific access routes at the planning phase of the project, and limits of grading prior to development, which should be strictly observed;

3. Utilize mechanical measures (i.e. walls from sand bags and/or wooden slat or fabric fences) to reduce sand movement;

4. Immediate revegetation (plus the use of temporary stabilizing sprays), to keep sand movement to a minimum; and

5. For larger-scale construction, fabric or wooden slat fences should be placed around the construction location to reduce sand movement.

4.6-5 Areas disturbed by grading shall be stabilized with adequate landscaping vegetative cover. A revegetation and landscaping plan shall be prepared by a landscape architect with experience in working with the type of soils that are

characteristic of the site, subject to the review and approval of the City of Soledad. Prior to the issuance of any certificate of occupancy and concurrent with project construction, disturbed areas shall be re-vegetated consistent with the City approved landscaping plan. All project replanting shall be continually monitored by the landscape architect for a duration of three years. The landscape architect shall submit annual monitoring reports to the City of Soledad after each successive year detailing the success of landscaping. Success shall be based on an 80% survival rate. If it is determined that the replanting has not been successful, additional replanting shall be required by the City of Soledad.

4.6-6 All drainage from improved surfaces shall be captured by closed pipe or lined ditches and carried to neighborhood storm sewers or natural drainages. At no time shall any concentrated discharge be allowed to spill directly onto the ground adjacent to structures or to fall directly onto steep slopes. The control of runoff is essential for erosion control and prevention of water ponding against foundations and other improvements. The project shall implement Low Impact Development (LID) strategies, as determined appropriate by the City of Soledad consistent with the requirements of Mitigation Measure 4.8-4. LID strategies shall be implemented in connection with the proposed project to the satisfaction of the City of Soledad. Prior to the issuance of any grading and/or building permit for each new structure, the project applicant shall submit an erosion control plan consistent with this measure, subject to the review and approval of the City of Soledad Public Works Director.

Liquefaction

The Miravale III EIR determined that the project could be exposed to localized liquefaction and collapse. This would represent a potentially significant impact that can be reduced to a less–than- significant level with implementation of the following mitigation measures.

Mitigation Measure

4.6-7 In order to reduce the risk of localized liquefaction and collapse, and allow for adequate foundation and structural fill support, grading plans shall be consistent with a project-specific geotechnical analysis. The project geotechnical engineer shall prepare a quantitative assessment of liquefaction and seismically-induced settlement potential for the project as part of a comprehensive site geotechnical evaluation, prior to the recordation of each final map. Measures to ensure adequate reduction of risk to standard acceptable levels in accordance with standard geotechnical practice shall be incorporated into project design and specifications, subject to the review and approval of the City of Soledad Public Works Director.

Landslide, Debris Flow, Lateral Spreading

The Miravale III EIR determined that development within certain areas of the project site could be exposed to potential adverse effects from on- or off-site landslides and lateral spreading that may result in damage to proposed structures, which represents a potentially significant impact. However, the EIR concluded that the impact could be reduced to a less-than- significant level with implementation of the following mitigation measures:

Mitigation Measure

4.6-8 Portions of the project located within debris flow hazard areas as described in the Geological Hazards Investigation Update prepared by Nolan Associates (September 2006, see pg. 14) shall incorporate design measures to mitigate this hazard to acceptable levels in accordance with standard engineering practices. Suitable measures include: 1) Restricting development to outside these areas; 2) Constructing artificial channels or diversion walls, designed to divert fluidized debris away from habitable structures; or 3) Constructing impact walls, designed to withstand anticipated debris flow volumes and velocities. An engineering geologist shall be retained to provide site-specific geologic design criteria for debris flow hazard areas once the final project plans are available. Diversion or retaining structures shall be designed based on recommendations by a geotechnical engineer, subject to review and approval of the City of Soledad Public Works Director. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate design measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad.

Expansive Soils

The Miravale III EIR determined that the project could be exposed to localized soil expansion, which would represent a potentially significant impact. However, the EIR concluded that the impact could be reduced to a less-than-significant level with implementation of the following mitigation measures.

Mitigation Measure

4.6-9 In order to minimize potential hazards associated with expansive soils, the expansion potential of site soils shall be evaluated as part of a site-specific geotechnical study to ensure hazards are reduced to an acceptable level of geotechnical and Uniform Building Code practices. The recommendations of a geotechnical engineer for mitigating soil shrink-swell hazards shall be incorporated into project design. These measures may include replacement of soil with engineered backfill or treatment of expansive soil with lime. Prior to the

recordation of each final map, the project applicant shall submit evidence demonstrating that adequate measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad Director of Public Works.

Proposed Project

The proposed project is reduced in size from the previously proposed plan and does not include hillside development above the 400 foot elevation contour. However, development consistent with the proposed specific plan would also be susceptible to similar geologic hazards including seismic ground shaking, liquefaction, landslide, debris flow, and lateral spreading. Due to the elimination of hillside development in the proposed plan, adherence to the Hillside Development Standards and Guidelines would not be applicable to this project, and while to a lesser degree, there remains the potential for erosion on the project site. Mitigation measure 4.1-7 (refer to Section 4.1) would still be required to address erosion impacts on hillsides below the 400-foot contour. Due to the currently proposed development's proximity to the debris flow hazard area, mitigation measure 4.6-8 is applicable to the currently proposed project. While implementation of the project would present fewer geologic hazards and result in less exposure to such hazards, the mitigation measures identified in the Miravale III EIR, and noted above would still be required to reduce geologic hazards to a less than significant level.

Geology, Soils, and Minerals Resources Conclusion

The specific plan would not result in new significant geologic impacts or substantially increase the severity of previously identified significant effects. Implementation of the plan would have a reduced potential for geologic hazards and expose fewer people to such hazards than the previously proposed plan. No new information has been identified that indicates the proposed project would have new or more significant impacts than were identified for the original project.

3.8 HAZARDS AND HAZARDOUS MATERIALS

Miravale III Specific Plan EIR Analysis

A Phase I Environmental Site Assessment was completed for the Miravale III Specific Plan project by D&M Consulting Engineers, Inc. (September 7, 2006). In addition, a Phase 1 Environmental Site Assessment was prepared for a portion of the project site in 1995 by Terratech, Inc. The following analysis contained in the Miravale III EIR was based, in part, on these reports.

Hazardous Material/Waste Sites

According to the Miravale III Specific Plane EIR, based on review of the hazardous materials database report, observations from the site reconnaissance, and results of the owner/operation managers' interviews, it was determined that the following potentially hazardous environmental conditions exist within and near the project site:

- Pesticide and metal residuals from longtime agricultural use on most of the site;
- Specific areas where agricultural chemicals were stored, and especially mixed;
- Specific areas where burning of grape stakes has occurred;
- Lead-based paint and pesticide residues around structures (both current and former);
- Soil staining in areas such as the various earthen building floors;
- Soil beneath the maintenance pit in the vineyard shop;
- Soil beneath the pole-mounted transformers that apparently malfunctioned;
- Infiltration of possible contaminants at the wash rack drain and shop leachfield; and
- Possible impacts from the closed landfill adjacent to north end of Parcel 26.

The Miravale III Specific Plan EIR determined that in addition to the above potential hazards, demolition of the on-site structures (excluding the Lorentzen house which would be relocated to avoid impacting a historically significant structure) including the barn and various agricultural buildings, could result in the exposure of construction personnel to asbestos-related hazards. The project proposed a variety of uses in areas that may be contaminated with hazardous materials, release of which could pose a health risk to construction workers and future uses on the site. This was determined to be a significant impact that could be reduced to a less-than-significant level with the following mitigation measures.

Mitigation Measures

4.7-1 Prior to the recordation of any final map, the applicant shall arrange for a Phase II Environmental Site Assessment to be prepared which assesses the localized environmental conditions described in the Phase I Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. (September 2006) and identifies any required remedial actions for the safe handling, removal and special needs for any identified materials. The Phase II Assessment shall include site-specific soil sampling in order to assess the presence of potential soil contamination and to identify special needs for soil handling during construction/grading activities and possible health risks to construction workers

and future users consistent with the recommendations contained in the Phase 1 Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. If results indicate the presence of such materials in excess of screening levels for residential, educational, or commercial uses, a Remediation Plan shall be prepared and implemented to reduce contamination to acceptable levels, maintain the safety of construction workers and future site users, and assure proper management of contaminated materials in accordance with state and local regulatory requirements. This plan shall be subject to review and approval by the Monterey County Division of Environmental Health. Prior to the issuance of any building and/or grading permit, the project applicant shall submit evidence to the City of Soledad for review and approval demonstrating compliance with this measure.

4.7-2 Prior to commencement of new development, the applicant shall obtain approval of a Soil Management Plan from the Monterey County Division of Environmental Health, which establishes management practices for handling potentially contaminated soil, if encountered, during construction/grading activities.

4.7-3 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to survey all buildings to be demolished for asbestos under the National Emissions Standards for Hazardous Air Pollutants (NESHAP) guidelines prior to demolition activities. If asbestos containing material is documented within existing on-site structures, all potentially friable asbestos shall be removed prior to building demolition in accordance with NESHAP guidelines. Prior to the issuance of a grading permit, the project proponent shall submit written evidence to the City of Soledad Director of Public Work from a qualified consultant demonstrating that all asbestos containing material, if present, has been properly removed and demolition activities may proceed without exposing construction personnel to asbestos related-hazards.

4.7-4 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to conduct a lead-based paint survey to evaluate the presence of lead-based paint residues in site soils adjacent to existing structures. If lead contamination is documented on-site, all peeling and flaking lead-based paint shall be removed and properly disposed of separately from building debris, in accordance with current Department of Toxic Substances Control policies. In addition, all existing structures within the Specific Plan area that were constructed prior to 1978 shall be surveyed for lead-based paint prior to any demolition activities. Prior to the issuance of any permit for each phase of development, the project proponent shall

submit written evidence from a qualified consultant documenting that all lead-based paint hazards have been appropriately removed and disposed of in accordance with industry standards, subject to the review and approval of the City of Soledad.

Hazardous Materials within One-Quarter Mile of School

The Miravale III EIR found that due to the proximity of the old Soledad Sanitary Landfill site to the proposed school sites, there was the potential for hazardous emissions and/or other environmental hazards to affect the health and safety of students attending new schools within the project area. Although the landfill was listed as "closed" and no known hazardous incidents had been reported, it was found that releases of emissions may, nevertheless, adversely affect the health of students which is a potentially significant impact. The EIR found that this impact could be reduced to a less-than-significant level with the following mitigation measure.

Mitigation Measure

4.7-5 If, during the course of the Phase II Environmental Site Assessment, it is determined that the existing Soledad Sanitary Landfill would expose the proposed school sites to an environmental hazard that cannot be reduced to an acceptable level through remediation, the project applicant, in conjunction with the Soledad Unified School District and the City of Soledad, shall identify new school sites within the Miravale III project area that would not be exposed to known environmental hazards, prior to the recordation of any final map. If new school locations are necessary, the applicant shall amend the Specific Plan and submit a revised tentative map demonstrating the new school locations, subject to the review and approval of the City of Soledad, prior to the recordation of any final map. Any new school site shall be coordinated with the Soledad Unified School District.

Hazardous Materials Use

The Miravale III project included residential uses along a portion of the western edge of the project site adjacent to agricultural operations. The EIR found that this could result in exposure of residents to hazardous chemicals. However, the Miravale III EIR concluded that incorporation of the mitigation measures requiring agricultural buffers identified in the Agricultural Resources section impacts would be minimized and/or avoided.

The Miravalle III project proposed new residential, commercial, recreational uses, schools and public facility sites, and a golf course. The golf course proposed would have been surrounded by residences and located near the proposed school sites. The Miravale III EIR concluded that the golf course use could expose residents and students to pesticides and other potentially hazardous materials used to control or reduce the adverse effects of

harmful insects, unwanted plants, and pathogenic organisms, which is a significant impact. However, the EIR found that with implementation of the following mitigation measure, the impact could be reduced to a less-than-significant level.

Mitigation Measure

4.7-6 The applicant shall prepare a Chemical Application Management Plan (CHAMP). This plan shall detail the procedures to construct, operate, and maintain the golf course. The CHAMP shall provide technical public disclosure regarding pesticides, fertilizers and other chemicals to be used on the golf course, as well as methods of application and handling. This plan shall be submitted to the Monterey County Environmental Health Division for review and approval. Prior to the issuance of any permit for golf course development, the project applicant shall submit documentation to the City of Soledad demonstrating that a CHAMP has been prepared and approved by the County of Monterey. The following provisions shall be included in the CHAMP:

- Drought, pest, and disease resistant grass species shall be selected.
- Pesticides shall be handled, applied, and disposed of by a licensed (State-certified) spray technician.
- Only approved and legal chemicals shall be used. All county, state, and federal guidelines must be strictly adhered to regarding storage, handling, and application of pesticides.
- Advanced technology/monitoring equipment shall be used to insure minimal application of pesticides, herbicides, and fertilizers. This equipment shall be maintained and in proper calibration.
- A controlled and designated area/facility shall be used for the proper mixing and loading of pesticides into application equipment. The facility shall consist of an impermeable pad with controlled and contained drainage, and should be at least 50 feet from open ditches, ponds, or other water bodies. Rinse water shall be properly stored and hauled for disposal at an approved facility.
- Selection of pesticides shall be based on the ability to achieve treatment goals and criteria to minimize off-site movement. Selection of less toxic, less mobile, and less persistent pesticides shall be a priority management criterion.

- Pesticide applications shall be carefully timed and combined with other pest management practices; pests shall be accurately identified and pesticide applications made only when necessary, using the least amount required for all seasons.

- Pesticides shall not be applied when soil moisture is high during the rainy season. Applications shall be restricted prior to any anticipated late or early season storm events to preclude potential impacts from runoff.

- Irrigation applications shall be consistent with turf grass evapotranspiration requirements. Over-watering shall be avoided

Proposed Project

Hazardous Materials/Waste Sites

As with the Miravale III project, the proposed project includes uses in areas that may be contaminated with hazardous materials and demolition of buildings that may contain lead paint and asbestos, release of which could pose a health risk to construction workers and future uses on the site. Mitigation measures 4.7-1 through 4.7-4 would remain applicable to the currently proposed project and would reduce impacts to a less-than-significant level.

Hazardous Materials within One-Quarter Mile of a School

The proposed school-sites are located more than a mile from the Soledad Landfill, therefore, the Miravale III EIR mitigation measure 4.7-5 is no longer applicable to the proposed project.

Hazardous Materials Use

As with the Miravale III Specific Plan, the proposed specific plan includes areas of residential development that would be sited adjacent to agricultural lands located on the northern, eastern, and western boundaries of the project site, which has the potential to result exposure of residents to hazardous chemicals. Mitigation measures identified in the Miravale III EIR requiring adequate agricultural buffers (mitigation measures 4.2. 1 through 4.2.3) remain applicable to these areas and would reduce related impacts to less than significant.

Unlike the Miravale III Specific Plan, the proposed project does not include a golf course. Therefore, the mitigation measure identified in the Miravale III EIR (4.7-6) is not applicable to the project and there would be no impacts related to the release of hazardous materials associated with golf course maintenance.

Hazards and Hazardous Materials Conclusion

The proposed project would not result in new significant hazards or hazardous materials effects or substantially increase the severity of previously identified significant effects. The

proposed project does not include the golf course that was previously proposed and would avoid these hazardous materials impacts. The mitigation measure identified in the Miravale III EIR specific to this impact is not applicable to the currently proposed project. Changes in hazards or hazardous materials related circumstances have occurred that would lessen certain impacts, and no new information has been identified that indicates the proposed project would have new or more significant hazards or hazardous materials impacts than were identified for the original project.

3.9 HYDROLOGY AND WATER QUALITY

Miravale III Specific Plan EIR Analysis

The Miravale III EIR based the hydrology and water quality analysis on existing information and data provided in the 2004 City of Soledad Urban Water Management Plan (UWMP), a Water Supply Assessment (WSA) prepared for the project (Byron Buck, August 2007), and available drainage and hydrologic information from the 2007 City of Soledad Storm Drain Master Plan (SDMP).

Surface Water/Water Quality

The Miravale III EIR concluded that construction and operation of the project could impact water quality through substantial soil erosion during grading activities, loss of topsoil, and surface runoff from the proposed development. This is a potentially significant impact that can be reduced to a less-than-significant level with implementation of mitigation measures 4.6-4 through 4.6-6 contained in the geology and soils section and the following mitigation measures.

Mitigation Measures

4.8-1 In order to ensure that impacts are minimized to the greatest extent feasible, the project shall be designed to meet the BMP standards for operational phase storm water runoff and to maintain the onsite BMPs. The project shall implement BMPs to manage water quality by providing onsite runoff treatment in line with the onsite infiltration system. Prior to the issuance of any grading and/or building permit, the project applicant shall prepare a Construction Management Plan that identifies a designated construction supervisor responsible for the continued implementation of all construction BMPs throughout the duration of project construction. Moreover, the Construction Management Plan shall also identify BMPs to be implemented as part of the project and associated monitoring activities. The Construction Management Plan shall be reviewed by the City of Soledad Public Works Director prior to the issuance of any permit.

4.8-2 In order to prevent excess sediment buildup and ensure that all percolation basins are functioning in accordance with project-level plans, the project applicant and/or his/her successor in interest, shall be responsible for the long-term maintenance of all percolation basins and related private on-site drainage improvements and shall enter into a maintenance agreement with the city to provide for such. Bi-annually a basin maintenance report shall be submitted to the City of Soledad, subject to the review and approval of the Public Works Director, demonstrating that the basins have been properly maintained and cleaned in accordance with City standards. Prior to the issuance of any building and/or grading permit, the project applicant shall enter into a maintenance agreement with the City of Soledad.

Surface Drainage/Flooding

The Miravale III EIR found that while the proposed project site is not located within a flood hazard area as delineated by the Federal Emergency Management Agency (FEMA), localized flooding had been known to occur within the project area and surrounding vicinity. Development of the proposed project, which would result in substantial grading, changes in topography, and increased impervious surface area, has the potential to result in on- and off-site flooding due to changes in existing drainage patterns. Additionally, the EIR determined that the project's preliminary design was inadequately sized and had the potential to result in additional impacts related to flooding. As a result, project specific mitigation was warranted in order to ensure that final-design level plans were consistent with adopted city standards. Implementation of the following mitigation measures were determined to be necessary to ensure that impacts would be reduced to a less-than-significant level.

Mitigation Measures

4.8-3 In order to ensure that project-induced impacts related to changes in the existing drainage patterns on the project site are minimized, the project applicant shall submit design-level improvement plans for the project's storm drainage collection and retention system. Final design-level plans shall be supported with appropriate soils and hydrologic data in accordance with City standards.

All conveyance system and retention basins shall be sized and designed in accordance with applicable City design standards and shall be appropriately sized to accommodate stormwater runoff from a 100-year storm event. Prior to the recordation of any final map, the project applicant shall submit all design-level plans and supporting details to the City of Soledad Director of Public Works for review and approval. The VTM and Specific Plan shall be revised as necessary to reflect final locations of drainage facilities, subject to the review and approval of the City of Soledad.

4.8-4 In order to reduce the extent of impervious surface coverage and potential drainage/flooding impacts, Low Impact Development (LID) strategies shall be implemented, to the maximum extent feasible, in connection with all new development within the Specific Plan area. Prior to the approval of any final map or approval of any permit for all new residential and commercial developments, the project applicant shall submit design-level site and improvement plans to the City of Soledad for review and approval that incorporate the latest approved LID strategies and best practices as applicable, and the City shall ensure that all such measures are included in the final design plans, Examples of various LID strategies and best practices are identified as follows:

- Where possible, landscaped or grassy areas shall be substituted for impervious surfaces such as building entrances, traffic medians, etc.
- Permeable pavements such as crushed aggregate, turf lock or unit pavers shall be used in place of sidewalks, walkways or overflow parking areas wherever design allows.
- Bioretention cells, planter boxes, vegetated swales, and greenbelt buffer zones shall be implemented in landscaped areas, along streets and sidewalks wherever feasible.
- Final roadway design and street layout shall convey surface water runoff and storm flows into bioretention cells and swales.
- All commercial development shall integrate bioretention into parking lot islands or filter strips distributed throughout the parking area(s) to infiltrate, store and/or convey storm water flows. In addition, permeable paving materials shall be used in spillover parking that is used only for peak demand periods.
- Alternative types of LID strategies and measures may also be approved provided evidence is submitted to the City of Soledad by a qualified engineer demonstrating that said strategies will achieve the intended result of this mitigation measure.

Proposed Project

Since the certification of the Miravale III EIR, the city revised its Urban Water Management Plan in 2016 (AKEL Engineering Group) and adopted the *Storm Drain Master Plan Update* (2015). An updated water supply assessment was also prepared for the project (AKEL Engineering Group 2017). The updated plans do not call for significant changes in the past

plans and the policies and programs of these revised and updated plans would not significantly alter the hydrology and water quality findings of the Miravale III EIR. No additional mitigations are required.

Surface Water/Water Quality

Construction and operation of the proposed project could impact water quality through substantial soil erosion during grading activities, loss of topsoil, and surface runoff similar to those identified in the Miravale III EIR, which is a potentially significant impact. While implementation of the currently proposed specific plan would require less grading than the previous proposed project, and does not include hillside development, mitigation measures 4.6-4 through 4.6-6 identified in the Geology and Soils section of the Miravale III EIR in addition to the 4.8-1 and 4.8-2 would still be required to ensure water quality impacts would be less than significant.

Surface Drainage/Flooding

The specific plan includes requirements for the provision of storm water collection and conveyance and includes policy standards for design and performance of the storm drain and storm water facilities system, and for implementation of pre- and post-construction best management practices and low impact design to capture and retain flows on the site. The proposed system consists of storm drains, collection pipes, a drainage bio-swale within the linear park, a retention basin to capture post-development runoff, and other improvements to capture, retain, and percolate storm water within the project site consistent with the requirements of the Central Coast Regional Water Quality Control Board. Storm water flows would be collected in the linear park and through an underground storm drain system and directed to a retention pond (basin) located within the southwest corner of the project site. The linear park would serve as a bio-swale, following the existing topography and leading from upper elevations to the storm water retention basin. Storm water within developed areas would be collected and conveyed in a curb, gutter and underground storm drain system to the storm water retention basin. The basin, which may serve as a dual-use facility for recreational purposes, would be sized to accept the increase in flow resulting from full buildout of the uses identified in the specific plan. The specific plan requires storm water and drainage facilities to be designed to accommodate a 100-year storm event. The preliminary design of the new storm water system within the project site is shown conceptually on Figure 2-8, Conceptual Storm Water Plan, presented earlier.

Each phase of development will incorporate infiltration-based systems to treat and retain the runoff associated with the 95th Percentile Storm. All runoff associated with storms larger than the 95th Percentile Storm may be directed to the linear park and retention basin. This approach complies with the Post Construction Stormwater Management Requirements for Development Projects in the Central Coast Region, Resolution No. R3-2013-0032, dated July 12, 2013. Should there be a storm runoff overflow from the plan area, pipes will be required

to connect with the existing Upper San Vicente drainage area, consistent with the pipe sizing and capacity improvements identified in the storm drain master plan update (City of Soledad 2015). Flows in storms of greater intensity than an approximately 100-year return period may be discharged to the downstream city storm drainage facilities consistent with the city's *Storm Water Management Plan* (2010). Any runoff that would be discharged from the storm water retention basin would be treated prior to release to existing downstream storm water facilities located on San Vicente Road, and would be released at a rate equal to or less than the historic flows of the site prior to development.

Due to the project's preliminary design of sized storm water infrastructure, elimination of hillside development, smaller area of site disturbance and potential for erosion, and reduced demand for storm water capacity, the project related impacts would be lesser than those identified in the Miravale III EIR. However, to ensure that project impacts related to changes in the existing drainage patterns on the project site are minimized the Miravale III EIR mitigation measures 4.8-3 and 4.8-4 remain applicable.

Hydrology and Water Quality Conclusion

The specific plan would not result in new significant hydrological or water quality effects or substantially increase the severity of previously identified significant effects, no changes in hydrology or water quality related circumstances have occurred, and no new information has been identified that indicates the proposed project would have new or more significant hydrology or water quality impacts than were identified for the original project.

3.10 LAND USE AND PLANNING

Similar to the project studied in the Miravale III EIR, the proposed project site adjoins the city limit and would not physically divide the community. As noted in Section 3.6 of this EIR addendum, there are no habitat or natural community conservation plans that apply to the project site. Therefore, the project would not conflict with any applicable Habitat or Natural Community Conservation Plans.

Miravale III Specific Plan EIR Analysis

The Miravale III EIR identified that the proposed project would conflict with several general plan policies intended to avoid and/or mitigate environmental impacts to biological resources and aesthetics and that this was a significant and unavoidable impact. The Miravalle III EIR also identified that the Miravale III Specific Plan has the potential to conflict with adopted planning documents pertaining to public services; however this impact could be reduced to a less-than-significant level with mitigation. These impacts are discussed in greater detail below.

Aesthetic Resources

The Miravale III EIR identified significant and unavoidable impacts due to inconsistencies with general plan policy policies L-44, L-45, L-46, C/OS-7, and policy C/OS-8, which are intended to avoid and/or mitigate environmental impacts to aesthetic resources that would result from development in the highly scenic Gabilan Mountain Range foothills, in particular areas above the 400-foot elevation contour.

The previously-proposed project included development of residential uses and related infrastructure above the 400-foot elevation contour. A number of mitigation measures are identified that would reduce the impacts to the visual quality and character of the portions of the site above the 400-foot elevation contour, but not to a less than significant level. The Miravale III EIR concluded that the project would remain inconsistent with these policies, in particular policy C/OS-7, which prohibits structures on ridgelines and steep slopes above the 400 foot elevation contour, and policy C/OS-8, which requires private development to designate hillside areas above the 400 foot elevation contour as Open Space/Grazing, Public Facility (parkland), or Agriculture.

Biological Resources

The Miravale III EIR identified significant and unavoidable impacts due to inconsistencies with general plan policy C/OS-8 which is intended to avoid and/or mitigate environmental impacts to biological resources resulting from development above the 400 foot elevation contour. The Miravale III EIR found that project development would fragment existing wildlife habitat on the site, and would encroach into the foothills of the Gabilan Mountain Range which is an important wildlife corridor, particularly in the grassland portions of the site. The Miravale III EIR identified potentially significant impacts to protected species and their habitat that would result from the proposed development of the grassland areas and portions of the site above the 400 foot elevation contour, and concluded that the impact could not be fully mitigated without project redesign. The EIR found that while implementation of identified mitigation measures (refer to Section 3.6 of this EIR addendum) would minimize the project's impacts, they could not be reduced to a less-than-significant level. Mitigation measures were identified but the impacts remain significant and unavoidable. Redesign of the project consistent with general plan policy C/OS-8 would reduce the identified impacts to less than significant.

Public Services

The Miravale III EIR identified significant impacts due to potential conflicts with then-adopted planning documents pertaining to public services and concluded that implementation of Mitigation Measure 4.9-1 would reduce the project's impact to less than significant.

Mitigation Measure

4.9-1 In order to maintain project consistency with adopted City-wide facility planning documents, the project applicant/developer shall revise Section 5.0 of the Specific Plan to incorporate revisions identified by the City of Soledad Director of Public Works, prior to project approval. The following policy revisions have been identified as necessary.

Revise Wastewater Policy 2 to read as follows, "Design and construct the wastewater treatment system for Miravale III in accordance with applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and the Recycle Water Service Ordinance No. 645.

Revise Water Policy 1 to read as follows, "Design and construct the water supply and distribution system for Miravale III that expands upon and is integrated with the City's water distribution system and which meets the needs of future project developments of the Specific Plan area consistent with the Urban Water Management Plan and the City's 2005 Water Master Plan."

Revise Stormwater Policy 5 to read as follows, "Design and construct a stormwater collection and retention system that adequate retains peak storm flows onsite, avoids aggravating or causing offsite downstream from the project site, and ensures separation of stormwater drainage from Recycled water generated within the Plan area and that is consistent with the 2007 Stormwater Management Plan, Stormwater Master Plan, and Ordinance No. 617"

Add a new policy to the Section 5.2.2 Law Enforcement and Fire Protection/Medical Services. The new policy shall read as follows:

"9. Police and fire services will be maintained with funding from a public safety benefit assessment district or similar district."

Proposed Project

Since the Miravale III EIR was certified, the city entered into a memorandum of understanding with the County of Monterey. The city also updated its urban water management plan, and storm drain master plan, and adopted a Downtown Specific Plan that will guide development and related infrastructure improvements along Front Street and other areas in the downtown. Similar to the General Plan Consistency Alternative identified in the Miravale III EIR, the proposed project would result in less intensive urban development of the project site. The proposed project reduces potential impacts to the Gabilan Mountain Range foothills, which is considered a scenic vista and contains important wildlife habitat.

Consistency with the Soledad General Plan

As previously identified, the proposed project includes several general plan amendments in order to ensure that the proposed project is consistent with the city's general plan. The necessary general plan amendments include revisions to several land use and circulation diagrams, land use descriptions of the expansion areas, modification of various tables to demonstrate the change in holding capacity, and policy modifications/revisions.

The proposed project may include infrastructure placement above the 400 foot contour consistent with the general plan Land Use Element goals, but does not otherwise include residential development above the 400 foot elevation contour, which was the source of the Miravale III Specific Plan project inconsistency with the general plan. An updated general plan consistency analysis is presented in Appendix C of this EIR addendum. Subject to approval of the necessary general plan amendments (refer to Section 2.3) the proposed project would be consistent with applicable land uses policies and regulations. No significant impacts due to inconsistency with general plan policies would occur. The following paragraphs summarize the proposed project's consistency with general plan policies intended to mitigate or avoid impacts to aesthetic and biological resources, and with planning documents intended to guide the provision of public services.

Aesthetic Resources

Grading would no longer be necessary within the foothill areas and changes to topography would be minimal. Additionally, due to the overall reduction of units, the proposed project would also reduce the extent of visual impacts associated with development of this alternative. More specifically, the development of 2,392 residential units would be less visible from adjacent public vantage points due to the reduction in developable area below the 400 foot contour line. Additionally, less commercial area would be developed and potential aesthetic impacts associated with the development of commercial uses adjacent to residential areas would also be minimized. To the extent that the project would reduce the amount of units, the proposed alternative would still result in the conversion of a previously undeveloped site into urban uses and would therefore transform the visual character of the site permanently.

Unlike the previously proposed project, the currently proposed project does not include residential development above the 400-foot elevation contour and would not significantly degrade the aesthetic value of existing visual character of the surrounding hills and mountains. As noted in Section 3.1 Aesthetics, mitigation measures identified in the Miravale III EIR addressing environmental impacts related to residential hillside development above the 400-foot elevation contour, including mitigation measures 4.1-2 and 4.1-3, are not applicable to the proposed project, since residential development is no longer proposed on

the aesthetically valuable hillsides above the 400-foot elevation contour. Project design may necessitate infrastructure improvements above the 400 foot contour, however, other development above the 400-foot contour line is no longer proposed. Therefore, the project is consistent with general plan policies L-44, L-45, L-46, C/OS-7, and policy C/OS-8.

Biological Resources

Development of the proposed project would substantially lessen potential impacts to biological resources located within the project area. By eliminating development within the foothill portions of the project site, the proposed project would not result in the loss of an area of significant biological value. This area would remain as open space consistent with the general plan policy C/OS-8 and would retain its natural features. As a result, potentially significant impacts to resources associated with the loss of open space and related habitat would be reduced to less than significant. Therefore the proposed project is consistent with general plan policy C/OS-8.

Public Services

The proposed project would require fewer services than the project studied and addressed in the Miravale III EIR. A new plan for services and updated specific plan have been prepared for the proposed project. As demonstrated by the Plan for Services, the proposed specific plan and the analysis in Section 3.13 and 3.15 of this EIR addendum, adequate public services are available to accommodate development of the proposed uses identified in the Miramonte Specific Plan. The proposed project is consistent with the applicable planning documents and has included policy provisions that incorporate the items identified in mitigation measure 4.9-1. Therefore, mitigation measure 4.9-1 is not applicable to the currently proposed project.

Consistency with LAFCO policies

Consistency with LAFCO policy guidelines are discussed in the proposed Miramonte Specific Plan Section 2.2. The discussion includes a description of the Monterey County/City of Soledad memorandum of understanding. Consistency with LAFCO Sphere of Influence policies is presented in Table 3-1, LAFCO Sphere of Influence Policy Consistency.

Annexation Policies

Consistency with LAFCO annexation policies is presented in Table 3-2, LAFCO Annexation Policy Consistency.

Table 3-1 LAFCO Sphere of Influence Policy Consistency

LAFCO Sphere of Influence Policy	Specific Plan Consistency
II-1. LAFCO intends that its Sphere of Influence determination will serve as a master plan for the future organization of local government within the county. The spheres shall be used to discourage urban sprawl; limit proliferation of local governmental agencies; encourage efficiency, economy and orderly changes in local government; promote compact, community centered urban development; and minimize adverse impacts on lands classified as prime agriculture.	The proposed sphere of influence boundary is consistent with the geographic development limits established by the memorandum of understanding between the city and Monterey County. Therefore the proposed sphere of influence accomplishes the stated purposes of this policy and is consistent with this policy.
II-2. The Sphere of Influence lines shall be a declaration of policy which shall be a primary guide to LAFCO in the decision on any proposal under its jurisdiction. Every determination made by LAFCO shall be consistent with the Spheres of Influence of the agencies affected by those determinations.	The specific plan's sphere of influence will set the geographic limits within which the city will apply to the LAFCO for annexations, consistent with this policy (see Specific Plan Land Use Goal LU-1).
II-3. Any proposal which is inconsistent with an agency's adopted Sphere of Influence shall not be approved until LAFCO, at a noticed public hearing, has considered an amendment or revision to that agency's Sphere of Influence.	The specific plan's sphere of influence will set the geographic limits within which the city will apply to the LAFCO for annexations, consistent with this policy (see Specific Plan Land Use Goal LU-1).
II-4. Inclusion within an agency's Sphere of Influence does not assure annexation to that agency. LAFCO shall evaluate boundary change proposals as they relate to all of the relevant factors listed in the [Cortese Knox Hertzberg] Act.	The specific plan's sphere of influence will set the geographic limits within which the city will apply to the LAFCO for annexations, consistent with this policy (see Specific Plan Land Use Goal LU-1). The city will phase annexations and development within the plan area consistent with the phasing parameters presented in Section 6.4, Phasing. The phased annexation is consistent with this policy.
II-7. The adopted Sphere of Influence shall reflect city and county General Plans, plans of regional agencies, growth management policies, annexation policies, resource management policies, and any other policies related to ultimate boundary or service area of an affected agency unless those plans or policies conflict with the legislative intent of the [Cortese Knox Hertzberg] Act. Where inconsistencies between plans exist, LAFCO shall rely upon that plan which most closely follows the Legislature's directive to discourage urban sprawl, direct development away from prime agricultural land and open-space lands, and encourage the orderly formation and development of local governmental agencies based upon local conditions and circumstances.	The proposed sphere of influence boundary is consistent with the geographic development limits established by the memorandum of understanding between the city and Monterey County. The memorandum of understanding acknowledges the need for development to occur beyond the present city limits, and directs that growth to those areas where that growth will have the least adverse impact on agricultural lands. The proposed sphere of influence boundary is consistent with the geographic development limits established by the memorandum of understanding, and therefore, the specific plan is consistent with this policy.
III-1. LAFCO will designate a Sphere of Influence for each local agency representing the agency's probable physical boundary within a zero to twenty year period.	The geographic limits for the city's ultimate sphere of influence are established in the memorandum of understanding, and the specific plan sphere of influence boundaries are consistent with those limits.
III-3. LAFCO may establish urban transition areas within adopted Spheres of Influence to discourage premature pressure for development. Transition areas consist of the residual lands between designated urban service areas and the ultimate Sphere of Influence boundary. This land will most likely be used for urban expansion within approximately five (5) to twenty (20) years. Territory included within urban transition areas, but not within urban service areas, generally will not be considered eligible for annexation to receive urban services within five years.	Although there are no urban transition areas included within the specific plan, the city will phase annexations and development within the plan area consistent with the parameters presented in Section 6.4, Phasing. This approach will result in the gradual and orderly conversion of land to urban uses, consistent with this policy.

LAFCO Sphere of Influence Policy	Specific Plan Consistency
III-5. Territory not in need of urban services, including open space, agriculture, recreational, rural lands or residential rural areas, shall not be assigned to an agency's Sphere of Influence unless the area's exclusion would impede the planned, orderly and efficient development of an area.	This policy is applicable to the Hillside Open Space. The specific plan includes the Hillside Open Space within the proposed sphere of influence, and anticipates eventual annexation, so that the city or an assigned entity can provide maintenance of the designated trail system, provide alternative energy, provide other recreational activities, locate infrastructure to serve the plan area (e.g. water tank), conduct fire fuel reduction as needed, and provide efficient emergency response services within the area. The area is to be placed under a conservation easement with land uses limited to those specified by this plan or further activated in a development agreement.
IV-14. For annexations and Sphere of Influence applications, Monterey County LAFCO shall consider as part of its decision whether the proposal mitigates its regional traffic impacts by, for example, monetary contribution to a regional transportation improvement fund as established by the Transportation Agency for Monterey County or otherwise.	Development within the plan area would pay the Transportation Agency for Monterey County regional traffic impact fee, and therefore is consistent with this policy.
IV-15. For annexations and Sphere of Influence applications, Monterey County LAFCO shall consider as part of its decision whether the city in which the annexation or Sphere of Influence amendment is proposed has included certain goals, policies, and objectives into its General Plan that encourage mixed uses, mixed densities, and development patterns that will result in increased efficiency of land use, and that encourages and provides planned, well-ordered, efficient urban development patterns.	Consistent with the city's general plan, which identifies the plan area as part of the Mirrasou Specific Plan Area, the specific plan includes numerous densities and types of residential units, including more than 40 percent medium and high density (up to about 23 units per acre) units, which will provide for an efficient land use development pattern. The specific plan includes more units within its boundaries than were planned for the overall Mirrasou Specific Plan Area, and includes elimination of the remaining Mirrasou Specific Plan Area as a future urban development area. The specific plan is consistent with this policy

Table 3-2 LAFCO Annexation Policy Consistency.

LAFCO Annexation Policy	Specific Plan Consistency
II-2. To the greatest possible extent, boundaries should follow existing political boundaries and natural or man-made features such as rivers, lakes, railroad tracks, and freeways. Where boundaries do not meet this standard, the proponent shall justify the reasons for non-conformance.	Exact annexation boundaries are not proposed within the specific plan, although a set of parameters are included to focus the order of land development. Boundaries are likely to follow the linear park and collector streets within the specific plan. These features will provide an interim buffer between urban development and the remaining agricultural lands. This guidance within the specific plan will ensure orderly annexation and consistency with this policy.
II-4. Whenever practicable, boundary lines of areas proposed to be annexed to cities and/or districts shall be located so that all streets and rights-of-way will be placed within the same jurisdiction as the properties which abut thereon and/or for the benefit of which such streets and rights-of-way are intended.	The plan area is bordered on the west by and served by San Vicente Road, an arterial street that provides traffic circulation to and from U.S. Highway 101. The portion of San Vicente Road adjacent to the plan area will be included in annexations, as will a strip of land to the south of the plan area necessary for ultimate expansion of San Vicente Road to four lanes. The specific plan is consistent with this policy
II-7. The following guidelines related to road right-of-way apply to all proposals submitted to LAFCO. a. The following should not be allowed: (1) City limits which include a portion of the road right-of-way. (2) Road islands of county maintained roads. (3) Islands of road caused by annexation on both sides. (4) Strip annexation roads. c. The following should be annexed to the city. These roads would have direct access to the annexing property and would serve the residents of the property: (1) Minor or local roads. (2) When the street will be used for the city sewer lines, water lines, or storm drains. (3) Piece-meal development by developer causing difficult coordination between two or more agencies. (4) Where the annexation will complicate drainage or traffic control.	The proposed sphere of influence includes the entirety of the right-of-way necessary for development of San Vicente Road, which borders the plan area to the west and provides access from the south. The specific plan boundary includes all of the local roads and utility easements necessary to serve future development within the plan area. The specific plan is consistent with this policy.
II-10. Boundaries should reasonably include all territory which would reasonably benefit from agency services.	The proposed boundaries encompass all of the areas that would need to receive services from the City of Soledad.
IV-1. Each proposal should be consistent with the appropriate city or county general and specific plans. Where the proposal does not abide by these plans, the proponent shall specify the reasons for plan non-conformance.	The specific plan includes additional residential units than proposed for the area in the General Plan. Therefore, the specific plan includes a General Plan amendment to transfer the additional units from other plan areas within the General Plan, so that overall General Plan build-out remains the same. Therefore the specific plan will be consistent with the General Plan and consistent with this policy.
VII-1. LAFCO shall discourage proposals that would have adverse financial impacts on the provision of governmental services or would create a relatively low revenue base in relationship to the cost of affected services. Applications shall describe related service	The specific plan would not have an adverse fiscal impact on the Soledad General Fund. Further, the specific plan requires the development to participate in special financing districts to fund maintenance of

LAFCO Annexation Policy	Specific Plan Consistency
and financial impacts (including revenues and expenditures) on the county, cities, and/or special districts and provide feasible measures which would mitigate such adverse impacts.	streets, storm drains, and parks providing a funding source outside of the Soledad General Fund in.
VII-3. Applications must indicate that the affected agencies have the capability to provide service. Territory shall be annexed to a city or special district only if such agency has or soon will have the capability to provide service.	The specific plan includes provision of a new fire station site, a police substation site, and parks that would facilitate cost effective provision of these services. The cost of these services is not anticipated to be substantially in excess of costs currently borne by development within the boundaries of the City of Soledad. The specific plan includes stipulations that the Miramonte development will participate in impact fee programs and special financing districts necessary to provide funding for the construction and operation of these facilities.
VII-6. LAFCO discourages proposals which will facilitate development that is not in the public interest due to topography, isolation from existing developments, premature intrusion of urban-type developments into a predominantly agricultural area, or other pertinent economic or social reason.	The plan area is contiguous to existing development on the south, and provides three street connections to the existing developed parts of the city. Urban development, excepting water tanks and trails, is kept below the 400-foot elevation contour in accordance to General Plan policies. The specific plan includes a set of phasing parameters that are designed to prevent premature conversion of agricultural land. The specific plan is consistent with this policy.
VIII-3. Proposals which contain territory which is not within a city or district's adopted urban service area and have an expected build-out extending beyond a five- to seven-year period may be considered appropriate for phasing. For the purpose of this policy, "phasing" shall be defined as a planned incremental approval of a project and "buildingout" shall be interpreted as 70 to 80 percent developed. When an exception from this policy is desired, the proponent shall justify to LAFCO the reasons why phasing is not appropriate. Included within the justification for exception, the proponent shall demonstrate the jurisdiction's ability to provide necessary public services.	The plan area is currently outside the city's sphere of influence and urban service area. Build-out of the specific plan is expected to take more than seven years. The specific plan includes a set of phasing parameters that are designed to facilitate efficient provision of services, provide for adequate circulation, and prevent premature conversion of agricultural land. Because the specific plan includes a phasing program, it is consistent with this policy.
XIII-1. For annexations and Sphere of Influence applications, Monterey County LAFCO shall consider as part of its decision whether the city in which the annexation or Sphere of Influence amendment is proposed has included certain goals, policies, and objectives into its General Plan that encourage mixed uses, mixed densities, and development patterns that will result in increased efficiency of land use, and that encourages and provides planned, well-ordered, efficient urban development patterns.	Consistent with the city's general plan, which identifies the plan area as part of the Mirrasou Specific Plan Area, the specific plan includes numerous types of residential units, including more than 40 percent medium and high density (up to about 23 units per acre) units, which will provide for an efficient land use development pattern. The specific plan includes a mixed use overlay on several parcels. The Miramonte Specific Plan represents the full residential buildout potential for the Mirrasou Specific Plan Area as well as 525 units of the identified residential potential of the Northwest Expansion Area. The specific plan effectively consolidates growth into a smaller geographic area, effectively preserving agricultural land and open space. For consistency, a general plan amendment is required to identify a reduced development potential of 525 units in the Northwest Expansion Area. The specific plan is consistent with this policy.

Preservation of Open Space and Agricultural Land

Pursuant to Government Code Section 56301, one of the primary focuses of LAFCO policy is the preservation of open space and agricultural lands located outside city boundaries. Most of the land within the plan area is designated as Prime Farmland on the Important Farmlands Map. Monterey County LAFCO uses the agricultural and open space policies presented below in assessing boundary change applications that include Prime Farmland. Consistency with LAFCO agricultural/ open space policies is presented in Table 3-3, LAFCO Agricultural/Open Space Policy Consistency.

Table 3-3 LAFCO Agricultural/Open Space Policy Consistency

LAFCO Agricultural and Open Space Policy	Specific Plan Consistency
II-1. A Proposal must discuss how it balances the state interest in the preservation of open space and prime agricultural lands against the need for orderly development. (Government Code section 56001.) Proposals that fail to discuss this balance, in the opinion of the executive officer, will be deemed incomplete. Proposals may be denied if they fail to demonstrate to the satisfaction of LAFCO that the need for orderly development is balanced against the preservation of open space and prime agricultural lands.	The memorandum of understanding acknowledges the need for development to occur beyond the present city limits, and directs that growth to those areas where that growth will have the least adverse impact on agricultural lands. The proposed sphere of influence boundary is consistent with the geographic development limits established by the memorandum of understanding. The specific plan includes a set of phasing parameters that are designed to prevent premature conversion of agricultural land. Annexation boundaries are likely to follow the linear park and collector streets within the specific plan. These features will provide an interim buffer between urban development and the remaining agricultural lands. The Miramonte Specific Plan represents the full residential buildout potential for the Mirrasou Specific Plan Area as well as 525 units of the identified residential potential of the Northwest Expansion Area. The specific plan effectively consolidates growth into a smaller geographic area, effectively preserving agricultural land and open space. For consistency, a general plan amendment is required to identify a reduced development potential of 525 units in the Northwest Expansion Area. The intensification of development within the plan area will preserve the agricultural land within the remaining Mirrasou Specific Plan, estimated to be about 30 acres, as well as additional open space below the 400-foot contour, estimated to be about 90 acres. Within the plan area, about 150 acres of hillside land above the 400-foot contour will be preserved as open space, consistent with the city's general plan. The specific plan preserves agricultural land and open space and is consistent with this policy.
II-2. A Proposal must discuss its effect on maintaining the physical and economic integrity of agricultural lands. (Government Code section 56668 (a).) Proposals that fail to discuss their effect, in the opinion of the executive officer, will be deemed incomplete. Proposals may be denied if they fail to demonstrate to the satisfaction of LAFCO that the physical and economic integrity of agricultural lands is maintained.	The specific plan will result in the preservation of about 30 acres of agricultural land to the north of the plan area by way of consolidating residential units into the plan area. On an interim basis, the phased annexation of land will include broad buffers in the form of the linear parkway and collector streets to maintain agricultural lands separate from urban uses as development occurs within the plan area.

LAFCO Agricultural and Open Space Policy	Specific Plan Consistency
	Remaining agricultural land, whether interim or permanent, will be contiguous to other agricultural land, to facilitate efficient ongoing use for agriculture. With these measures built into the specific plan, the specific plan will be consistent with this policy.
II-3. A Proposal must discuss whether it could reasonably be expected to induce, facilitate, or lead to the conversion of existing open-space land to uses other than open-space uses. (Government Code section 56377.) Proposals that fail to discuss potential conversion, in the opinion of the executive officer, will be deemed incomplete. Proposals may be denied if they fail to demonstrate to the satisfaction of LAFCO that: a) they guide development or use of land for other than open-space uses away from existing prime agricultural lands in open-space use and toward areas containing nonprime agricultural lands (Government Code section 56377 (a)); and b) development of existing vacant or nonprime agricultural lands for urban uses within the existing jurisdiction of a local agency or within the Sphere of Influence of a local agency will occur prior to the development of existing open-space lands for non-open-space uses which are outside of the existing jurisdiction of the local agency or outside of the existing Sphere of Influence of the local agency (Government Code section 56377 (b)).	The specific plan will convert the agricultural land within the plan area to urban uses. This is consistent with the memorandum of understanding which establishes geographic development limits to direct growth to locations that will have the least adverse impact on agricultural lands. The specific plan includes a set of phasing parameters that are designed to prevent premature conversion of agricultural land. The specific plan will also permanently preserve 150 acres of hillside open space, located above the 400-foot elevation contour. The specific plan includes means of preserving agricultural land on an interim basis and permanently preserves open space land, and is consistent with this policy.
II-4. A Proposal must, if applicable, provide for pre-zoning (Government Code section 56375 (a)), and must demonstrate that it is consistent with the General Plans and Specific Plans of the existing local agency and any immediately adjacent local agency (Government Code sections 56375 (a) and 56668 (g)). Proposals may be denied if they are not consistent with such plans, or, if not pre-zoned, if the Proposal does not demonstrate to the satisfaction of LAFCO that the existing development entitlements are consistent with the local agency's plans.	The specific plan includes provisions for pre-zoning of land in conjunction with annexation applications, and therefore, is consistent with this Policy.

Housing and Jobs

Table 3-4, LAFCO Housing and Jobs Policy Consistency, summarizes the project consistency with housing and jobs policies used by LAFCO when making determinations on boundary amendments.

Table 3-4 LAFCO Housing and Jobs Policy Consistency

LAFCO Housing and Jobs Policy	Specific Plan Consistency
II-1. It is the policy of LAFCO that, consistent with section 56300 (a) of the Act, Proposals must demonstrate through both quantitative and qualitative methods the relationship between the Proposal and the surplus or deficiency of local and county-wide housing supply and demand, and employment availability and creation. Additionally, the Proposal must demonstrate how its pattern of land use and transportation complements local and regional objectives and goals for the improvement of air quality and reduction of greenhouse gas (GHG) emissions and local vehicle miles traveled (VMT). These factors and their impacts, if any, shall be considered by the Commission in acting upon the Proposal.	The Association of Monterey Bay Area Governments assigned the city a Regional Housing Needs Assessment housing target of 191 units for the 2014 – 2023 time period. The specific plan includes 2,392 housing units, which more than meets this target. The specific plan also includes housing for lower income households and seniors. Development of the specific plan commercial uses and public services (e.g. schools, parks, public safety, etc.) and the increase in population resulting from new residential units creating demand, will result in the establishment of new jobs within the plan area and in the community of Soledad. The specific plan is designed to promote walking and bicycling, with an integrated trail system that connects every sub-area to each other and to the schools and commercial area. The land use and circulation pattern will promote reduced vehicle miles for shopping and school trips. The specific plan provides much needed housing, additional job opportunities, and a trail system to reduce automobile trips. The specific plan is consistent with this policy.

Monterey County/City of Soledad Memorandum of Understanding

The city entered into a memorandum of understanding with Monterey County on March 15, 2016 (included as an appendix to the Miramonte Specific Plan). The memorandum of understanding contains specific requirements regarding the conversion of agricultural land to urban uses and binds the city to a number of principles related to growth beyond the current sphere of influence. The proposed project is consistent with the provisions of the memorandum of understanding. Project consistency with the memorandum of understanding is summarized in Table 3-5, Consistency with Monterey County/City of Soledad Memorandum of Understanding.

Table 3-5 Consistency with Monterey County/City of Soledad Memorandum of Understanding

Memorandum of Understanding Provision	Specific Plan Consistency
a) To limit future long-term development within the area shown on Exhibit 'A' [see Appendix B] and designated as "Urban Growth Boundary" (the "UGB"). The purpose of the UGB is to bound and enclose the land intended for development within the 2005 Soledad General Plan.	The plan area falls within the area that the memorandum of understanding identifies for future growth. The specific plan is consistent with this provision of the memorandum of understanding.
b) To manage development of land within the UGB utilizing the best available "sustainable" practices. The intent of the city is supported by city's General Plan Policy L-2, which partially reads as follows: "Further annexations to the city may occur when a) a substantial portion of the development capacity within the	The specific plan includes about 150 acres of open space, about 35 acres of parkland, and two school sites. Scenic vistas are preserved by the provision of open space land above the 400-foot elevation contour. The specific plan is consistent with this provision of the memorandum of understanding.

Memorandum of Understanding Provision	Specific Plan Consistency
existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources..."	
c) To encourage proposals for infill development on vacant or underutilized sites within the existing city limits east of Highway 101 whenever possible, to avoid urban sprawl and postpone the conversion of agricultural land to urban uses.	Most of the annexed portion of the Miravale II Expansion Area is built out at this time, and will be further built out by the time the specific plan is adopted and entitlements are approved. The specific plan would provide additional land for future growth. The specific plan is consistent with this provision of the memorandum of understanding.
d) To require specific plans to include residential densities that ensure a compact urban form that helps protect agricultural land from premature conversion.	The specific plan includes several densities and types of residential units, including more than 40 percent medium and high density (up to about 23 units per acre) units, which will provide for an efficient land use development pattern. The Miramonte Specific Plan represents the full residential buildout potential for the Mirrasou Specific Plan Area as well as 525 units of the identified residential potential of the Northwest Expansion Area. The specific plan effectively consolidates growth into a smaller geographic area, effectively preserving agricultural land and open space. The intensification of development within the plan area will preserve the agricultural land within the remaining Mirrasou Specific Plan Area, estimated to be about 30 acres, as well as additional open space below the 400-foot contour, estimated to be about 90 acres. Within the plan area, about 150 acres of hillside land above the 400-foot contour will be preserved as open space, consistent with the city's general plan. The specific plan is consistent with this provision of the memorandum of understanding.
e) To establish a Permanent Agricultural Edge for the purpose of maintaining a clearly defined northwest and southeast boundary between the urbanized incorporated areas of city and the agricultural areas within the unincorporated County as shown on Exhibit 'A' and identified as "Permanent Agricultural Edge" [see Appendix B]. A "Temporary Agricultural Edge" is hereby established east of Bryant Canyon Road, as specifically shown on Exhibit 'A'. The Temporary Agricultural Edge may be eliminated through an amendment to this Agreement.	The Permanent Agricultural Edge identified in the memorandum of understanding is not located within or adjacent to the plan area. No Permanent Agricultural Edge, as defined in the memorandum of understanding is required in the plan area. The specific plan is consistent with this provision of the memorandum of understanding.
f) To utilize agricultural buffers within the UGB to address the compatibility between the development of urban land uses and existing or planned agricultural uses. The city's General Plan requires development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses. The county requires an agricultural buffer as typically 200 feet in width and includes other vegetation, walls, or other screening deemed necessary to ensure that property owners on both sides of the buffer may enjoy full and unencumbered use of their property for its designated use without experiencing significant deleterious effect from neighboring use.	The residential study area is the only specific plan component that is immediately adjacent to cultivated agricultural lands outside the plan area. A 100-foot wide buffer is required along the northern boundary of the residential study area site is large enough to accommodate a buffer during the site planning process. On the east side and the remainder of the north side, a buffer to the ranchland is provided by the Hillside Open Space, the dirt roadway, and rear building setbacks of the adjacent houses in Sub-area 1. On the west side, a buffer to the cultivated farmland is provided by San Vicente Road and rear building setbacks in Sub-area 10 and 11, the drainage basin/park, and landscape areas. The specific plan is consistent with this provision of the memorandum of understanding.

Memorandum of Understanding Provision	Specific Plan Consistency
g) To actively participate with the county, LAFCO and other cities within the Salinas Valley to develop a Valley-wide Agricultural Land Mitigation Program to address the loss of agricultural land due to development and conversion to urban uses.	The plan area includes Prime Farmland that would be converted to urban uses. Four options for compensation for the loss of agricultural land are provided in the memorandum of understanding, as described in the section following this table. Development within the specific plan will participate in the established mitigation program, consistent with this provision of the memorandum of understanding.
h) To utilize permanent agricultural buffers along the UGB to ensure compatibility between the development of urban land uses and agricultural uses in the unincorporated area. The city agrees to actively participate with the county, LAFCO and other cities in the Salinas Valley to develop a Valley-wide Agricultural Buffer Program to ensure compatibility of urban land use with agricultural uses in the unincorporated area.	The Permanent Agricultural Edge identified in the memorandum of understanding is not located within or adjacent to the plan area. No Permanent Agricultural Edge is required in the plan area. The specific plan is consistent with this provision of the memorandum of understanding.

The memorandum of understanding further requires that timing of annexation applications submitted for consideration by LAFCO will be based upon the approval by the city of a specific plan, which includes a phasing plan, a plan for services and public facilities and financing plans that demonstrate compliance with LAFCO standards. A plan for services has been prepared and a comprehensive fiscal analysis and financing plan are being prepared for City Council approval prior to approval of the proposed project. The proposed Miramonte Specific Plan Section 6.4, Phasing, includes phasing parameters for development.

Downtown Specific Plan

Since the Miravale III EIR was prepared, the city adopted the *City of Soledad Downtown Specific Plan* (City of Soledad 2012), which identifies the vision for the downtown area along Front Street and includes design standards for development within the city's historic downtown and adjacent residential areas. The Downtown Specific Plan boundary extends along Front Street to just south of the U.S. Highway 101/Moranda Road interchange southbound off ramp. The plan is intended to guide initiatives that capitalize on the city's unique assets with the overarching goal of revitalizing downtown and bring new life to the city's historic Front Street corridor by encouraging commercial and entertainment uses that will draw locals and visitors, and reducing development obstacles, such as environmental review, parking, and permit processing. The plan includes block and street standards calling for small town scale, walkable blocks and pedestrian-oriented streetscapes along Front Street. As shown in the Downtown Specific Plan Table 5.8b, street standards for Front Street consist of two travel lanes separated by a center landscaped median with diagonal parking, sidewalks and street trees.

Although the project is not located within or immediately adjacent to the Downtown Specific Plan area, development of the specific plan uses would generate traffic that would negatively affect a number of intersection and roadway segment operations along Front Street. Traffic

impacts to the downtown specific plan area and mitigation measures to address them are discussed in Section 3.14, Traffic and Circulation, and in Section 4.0, Cumulative Impacts. Clarifying language has been added to traffic mitigation measures to ensure consistency with the Downtown Specific Plan street standards. Subject to implementation of the revised measures, the proposed project is consistent with the Downtown Specific Plan.

Land Use and Planning Conclusion

Subject to the approval of the necessary general plan amendments by the City of Soledad City Council, and implementation of the mitigation measures identified in this EIR addendum, the proposed project is consistent with the policies of the general plan and LAFCO, and with the provisions of the memorandum of understanding. As such the proposed project eliminates the significant and unavoidable impacts resulting from the plan inconsistencies of the former project. The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant effects, no significant changes in land use planning and policy-related circumstances have occurred that would cause the project to result in new or greater significant impacts, and no new information has been identified that indicates the proposed project would have new or more significant impacts related to land use and planning than those that were identified and addressed by the Miravale III EIR.

3.11 NOISE

Miravale III Specific Plan EIR Analysis

A noise report was prepared for the Miravale III Specific Plan by Illingworth & Rodkin, Inc. in March 2007. The following analysis in the Miravale III EIR was based, in part, on this noise report.

Noise and Land Use Compatibility

The Miravale III EIR determined that future residential uses developed at the project site would be exposed to exterior noise levels greater than 65 dBA CNEL, which exceeds the noise and land use compatibility standards presented in the city's general plan. Interior noise levels would be expected to exceed 45 dBA CNEL without the incorporation of noise insulation features into the project's design. The EIR concluded that this would be a significant impact but that it could be reduced to a less-than-significant level with the mitigation below:

Mitigation Measures

4.10-1 Maintain a sufficient buffer distance between transportation noise sources and future sensitive land uses, or alternatively, construct noise barriers or create acoustically shielded outdoor use areas utilizing buildings to achieve noise

exposures of 65 dBA CNEL or less. The specific determination of necessary mitigation measures will occur during project level environmental review and design. Results of the analysis shall be submitted to the City prior to issuance of a building permit.

4.10-2 Retain a qualified Acoustical Specialist to prepare for City review and approval a detailed acoustical analysis of interior noise reduction requirements and specifications for all projects proposed within the 60 dBA CNEL contours of area roadways, in accordance with State and City standards. Interior noise levels must be maintained at or below 45 dBA CNEL. Building sound insulation requirements will include forced air mechanical ventilation in noise environments exceeding 60 dBA CNEL. Special building construction techniques (e.g., sound-rated windows and building facade treatments) may be required where exterior noise levels exceed 65 dBA CNEL. These treatments include, but are not limited to, sound rated windows and doors, sound rated exterior wall assemblies, and acoustical caulking. The specific determination of required treatments will be made on a unit-by-unit basis during project design. Results of the analysis, including the description of the necessary noise control treatments, will be submitted to the City along with the building plans prior to issuance of a building permit. Feasible construction techniques such as these would adequately reduce interior noise levels to 45 Ldn or lower.

4.10-3 Non-residential development will comply with the noise standards established in the Zoning Code at existing or planned residential properties in the vicinity. Further, efforts will be made to reduce noise impacts through the following planning and equipment requirements:

- Development site planning will be utilized in a fashion that reduces noise impacts for nearby sensitive receptors, such as by not locating loading docks near residences.
- Equipment screens, fan silencers, and engine mufflers will be used to mitigate noise from mechanical equipment.
- Noise barriers will be used to control noise from parking and vehicle circulation.
- For recreational uses, proposed development must consider impacts upon the adjacent residential development in terms of the location of active sports areas, their orientation on the site, whether or not lights are included, and speech amplification systems.

Project Generated Traffic Noise

Traffic volume information from the traffic impact analysis by Hexagon Transportation Consultants, Inc. was used in the noise report prepared for the proposed Miravale III project. According to the noise report, traffic volume increases from the project would increase traffic noise along the local roadway network. In some locations, there would be a substantial, permanent increase in noise levels at sensitive receptors. The Miravale III EIR concluded that the measures identified in the noise report that would be available to reduce the project noise level increases (repaving of area roadways, the replacement or construction of noise barriers, traffic calming, and sound insulation) involves other non-acoustical considerations. Other engineering issues may dictate continued use of dense grade asphalt. Noise barriers and sound insulation treatments must be done on private property necessitating agreements with each property owner. Therefore, it may not be reasonable or feasible to reduce project-generated traffic noise at all affected receivers. If the City determines that the mitigation measures would not be feasible, the impact would be considered significant and unavoidable.

Mitigation Measure

4.10-4 The project shall incorporate noise reduction methods, subject to the review and approval of the City of Soledad. Methods to reduce noise on the project site may include the following measures:

- Pave and re-pave streets with "quieter" pavement types, such as Open-Grade Rubberized Asphaltic Concrete, that would reduce noise levels by 2 to 3 dBA depending on the existing pavement type, traffic speed, traffic volumes, and other factors. All new and improved streets within the project area shall use quieter pavement types.

- Implement new or larger noise barriers that may reduce noise levels by 5 dBA CNEL in areas that would not impair access requirements. Final design of such barriers, including an assessment of their feasibility and reasonableness, must be approved by the City during project-specific development applications. An increase in barrier height per foot equates to approximately 1 dBA noise reduction. However, noise barriers must be considered as a last resort to alternative noise reduction methods per the City of Soledad General Plan.

- Install traffic calming measures to slow traffic and provide qualitative improvement by smoothing out the rise and fall in noise levels caused by speeding vehicles. For each 5 mph reduction in average speed, noise generation is reduced by approximately 1 dBA.

- Provide affected residences with building sound insulation, such as sound rated windows and doors on a case-by-case basis to reduce interior noise levels to below the 45 dBA CNEL noise standard. A combination of mitigation measures such as the repaving of area roadways, the replacement or construction of noise barriers, traffic calming, and sound insulation could be implemented to reduce the effects of project generated traffic noise at affected residences along identified segments of as San Vincente Road, West Street, and Main Street.

Case studies have shown that the replacement of dense grade asphalt (standard type) with open-grade or rubberized asphalt can reduce traffic noise levels along residential-type streets by 2 to 3 dBA. A possible noise reduction of 2 dBA would be expected using conservative engineering assumptions. Table 4.10-6 in the Miravale III EIR shows the expected project noise level increases assuming the replacement of existing pavement with open-grade or rubberized asphalt. Project-generated traffic noise increases along West Street, between Market Street and Gabilan Drive could be mitigated to a less-than-significant level as the mitigated traffic noise increase would be 3 dBA CNEL and the resulting noise level would be less than 65 dBA CNEL. In order to provide permanent mitigation, subsequent repaving would also have to be "quieter" pavements. As identified in the Noise Assessment, newer residential land uses constructed in the vicinity of San Vincente Road have existing noise barriers that would provide additional shielding in rear yard areas.

Exterior noise levels, although substantially increased over existing conditions, would be less than 65 dBA CNEL in the rear yards of these homes. It is likely that these recently constructed residences were planned and constructed recognizing the future development at Miravale III. Existing noise barriers in older developments may also be sufficient to reduce exterior noise levels in rear yard areas to 65 dBA CNEL or less. Even with mitigation, noise levels might still be substantially and permanently increased in nearby residential areas. Some noise reduction levels require individual homeowner cooperation; therefore, they cannot be guaranteed. The noise impact, therefore, is considered significant and unavoidable.

Construction Noise

The Miravalle III EIR found that existing and proposed noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one construction season (one year). The city considers construction noise lasting more than one year to be significant. The EIR concluded that although mitigation measures would reduce noise generated by construction, the impact would remain significant and unavoidable as a result of the extended period of time that adjacent receivers would be exposed to construction noise.

Mitigation Measures

4.10-5 Noise-generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturdays, unless otherwise approved by the City. No construction activities should occur on Sundays or holidays, including New Years and 4th of July.

4.10-6 Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment. 4.10-7 Locate stationary noise generating equipment (e.g., portable concrete crusher) as far as possible from sensitive receptors. Construct temporary noise barriers to screen stationary noise generating equipment when located near adjoining sensitive land uses.

4.10-8 Utilize "quiet" air compressors and other stationery noise sources where technology exists.

4.10-9 Route all construction traffic to and from the project site via designated truck routes where possible. Prohibit construction related heavy truck traffic in residential areas where feasible.

4.10-10 Control noise from construction workers' radios to a point that they are not audible at existing residences bordering the project site.

4.10-11 Consider the use of multiple-pile drivers to expedite construction where pile driving is required. (Although noise levels generated by multiple pile drivers would be higher than the noise generated by a single pile driver, the total duration of pile driving activities would be reduced.)

4.10-12 Use temporary noise control blanket barriers to shroud pile drivers or erect in a manner to shield the adjacent land uses. Such noise control blanket barriers can be rented and quickly erected.

4.10-13 Pre-drill foundation pile holes to minimize the number of impacts required to seat the pile. Predrilling reduces the number of blows required to seat the pile and is a standard construction noise control technique.

4.10-14 The contractor shall prepare a detailed construction management plan identifying the schedule for major noise-generating construction activities. The construction management plan shall identify a procedure for coordination with the adjacent noise sensitive facilities so that construction activities can be scheduled to minimize noise disturbance. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed construction management plan to the City of Soledad for review and approval.

4.10-15 The project applicant shall designate a "disturbance coordinator" who shall be responsible for responding to any local complaints about construction noise. The disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall require that reasonable measures warranted to correct the problem are implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule. Prior to the issuance of any grading and/or building permit, the project proponent shall provide the City of Soledad with the contact information for the designated "disturbance coordinator."

Proposed Project

Noise and Land Use Compatibility

The proposed project site, while smaller than the previously proposed site, occupies a portion of the same project site and would result in similar impacts to those identified in the Miravale III EIR. Thus, the noise impacts of the proposed project also would exceed the noise and land use compatibility standards identified in the general plan. The mitigation measures identified in the Miravale III EIR are applicable to the currently proposed project and would reduce impacts to a less-than-significant level. For clarification, mitigation measure 4.10-1 is modified as follows:

Mitigation Measure

4.10-1 Maintain a sufficient buffer distance between transportation noise sources and future sensitive land uses, or alternatively, construct noise barriers or create acoustically shielded outdoor use areas utilizing buildings to achieve noise exposures of 65 dBA CNEL or less. The specific determination of necessary mitigation measures will be included in the detailed acoustical analyses (see mitigation 4.10-2) ~~occur during project level environmental review~~ and design of future development projects within the specific plan area. Results of the analysis shall be subject to review and approval by the ~~submitted to the~~ City Planning Department and all recommendations shall be incorporated into the project prior to each final map and issuance of a building permit.

Project Generated Traffic Noise

Due to the decreased size of the project, traffic noise levels resulting from project generated traffic would be reduced. However, the project's size remains significant enough such that traffic volume increases from the project would increase noise along the local roadway network that would result in a substantial, permanent increase in noise levels at sensitive receptors.

Similar to the Miravale III project, measures available to reduce the project noise level increases (repaving of area roadways, the replacement or construction of noise barriers, traffic calming, and sound insulation) involves other non-acoustical considerations. Other engineering issues may dictate continued use of dense grade asphalt. Noise barriers and sound insulation treatments must be done on private property necessitating agreements with each property owner. Therefore, the city may determine that it is not feasible to reduce project-generated traffic noise at all affected receivers; in which case the impact would be significant and unavoidable.

The impact, therefore, is considered significant and unavoidable.

Construction Noise

The Miravale III EIR determined that existing and proposed noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one construction season. The proposed project would likely require similar construction equipment that would result in comparable noise levels during construction. Due to the reduced size of the proposed project compared to the previously proposed project and new timeline for construction, the project would result in a decreased length of time that adjacent receivers would be exposed to construction noise. However, like the Miravale III project, construction would likely continue beyond one construction season (one year). The city considers construction noise lasting more than one year to be significant. The mitigation measures identified in the Miravale III EIR are applicable to the project and would reduce noise generated by construction. However, the impact would remain significant and unavoidable as a result of the extended period of time that adjacent receivers would be exposed to construction noise.

Noise Conclusion

The specific plan would not result in new significant noise effects or substantially increase the severity of previously identified significant effects, no significant changes in noise related circumstances have occurred, and no new information has been identified that indicates the proposed project would have new or more significant noise impacts than were identified in the Miravale III EIR.

3.12 POPULATION AND HOUSING

Miravale III Specific Plan EIR Analysis

Population Growth – General Plan Residential Holding Capacity

The Miravale III Specific Plan EIR determined that implementation of the Miravale Specific Plan would result in an increase in overall residential holding capacity identified in the 2005

General Plan EIR for portions of the Mirassou, San Vincente and Northwest Expansion Areas within the project area and could be considered growth inducing if annexations and development in the remaining expansion areas exceed development potential addressed in the General Plan EIR. The Miravale III EIR concluded that this would represent a potentially significant impact; however, found that the impact could be reduced to a less-than-significant level with implementation of the following mitigation measures.

Mitigation Measures

4-11.1 Phase approval of development applications and annexations in the Mirrasou Specific Plan Area, the San Vicente West Specific Plan Area and Northwest Expansion Area to maintain holding capacity and population projections in Table 4.11-5 of the General Plan EIR. Monitor development approvals in these expansion areas to limit overall density and population growth to the holding capacity identified to ensure consistency with projections in approved City planning documents.

4-11.2 Implement General Plan policies L-2 to L-7 and other applicable policies for phased development and population growth in the project and expansion areas. General Plan policies L2 to L-7, (below) identify expansion area requirements and applicable policies for annexation of these areas:

L-2 Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council.

L-3 A specific plan shall be required for all annexations and development of properties designated Expansion Area. Specific plans shall be prepared in accordance with the standards provided in Appendix B of the General Plan.

L-4 The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services.

L-5 New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development.

L-6 New development shall pay its fair share of providing additional public services needed to accommodate such development.

L-7 Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City. The additional population increase (15,201) associated with buildout of the project site over the projected 15-20 years of project development represents approximately 54 percent of Soledad's existing (2008) population. Depending upon the timing of project development, this additional population represents a major portion of the projected City wide population of 28,000 by year 2020. This growth in population would increase demands on existing community facilities, requiring construction of new facilities that could cause significant environmental effects. The project also proposes office and commercial uses that would have a direct, economic growth-inducing impact by providing new employment. The project would generate an estimated 550 jobs at the project site. Residential development and residential-serving commercial development is included in the Land Use Plan to meet the needs of new employees.

The required fiscal analysis shall be completed by a qualified, independent consultant, utilizing realistic and verifiable assumptions concerning investment earnings, interest rates, property taxes, transient occupancy tax, projected home/property sale prices and sales rates, etc.

Population Growth- Growth Inducing Impacts

The Miravale III EIR found that the additional 15,201 people associated with buildout of the project site over the projected 15-20 years of project development represent approximately 54 percent of Soledad's 2008 population. Depending upon the timing of project development, this additional population represents a major portion of the projected citywide population of 28,000 by year 2020. The Miravale III EIR determined that this growth in population would increase demands on existing community facilities, requiring construction of new facilities that could cause significant environmental effects. The project also included office and commercial uses that would have a direct, economic growth-inducing impact by providing new employment. The project would generate an estimated 550 jobs at the project site. Residential development and residential-serving commercial development is included in the project land use plan to meet the needs of new employees. Although the project site is located in an area that has been identified for future population growth in city's general plan, based on the above discussion, the project would result in a significant growth-inducing impact through the introduction of new sources of employment and a significant

portion of the city's projected population growth, which would result in additional demands on existing facilities. This represents a significant and unavoidable impact that cannot be reduced to less-than-significant level with mitigation.

Housing Element

The Miravale III EIR found that the specific plan was inconsistent with the city's 2003 housing element as it did not fully integrate affordable housing with market rate housing as required by the housing element. This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measure.

Mitigation Measure

4.11.3 The applicant shall enter into a Development Agreement per Program 4.3 of the City's Housing Element with the City that prescribes the parameters of the development of affordable housing consistent with the City's Housing Element, Inclusionary Housing Ordinance, and the revised Specific Plan. The Development Agreement shall be reviewed and approved by the City of Soledad prior to or concurrent with project approval.

Affordable Housing - Inclusionary Housing Ordinance Compliance

The Miravale III Specific Plan proposed 454 units restricted affordable pursuant to the City of Soledad's Inclusionary Housing Ordinance which represents only 11 percent of the total 4,200 units proposed. The inclusionary ordinance requires 20 percent of the affordable units to be restricted affordable units pursuant to execution of an Affordable Housing Agreement between the developer and city. Therefore, the plan would not be consistent with the city's Inclusionary Housing Ordinance which is a potentially significant impact. The EIR concluded that this impact could be reduced to a less-than-significant level with implementation of the following mitigation measure.

Mitigation Measure

4.11-4 Prior to project approval, the Specific Plan shall be revised to provide 20% of the units proposed in each Planned Development area and the Low Density Residential area to be affordable housing units. Alternatively, the project applicant shall dedicate real property for affordable housing or submit payment of in-lieu fees in order to ensure project consistency with the requirements of the City of Soledad's Inclusionary Housing Ordinance, subject to the approval of the City of Soledad. The project's consistency with the City's Inclusionary Housing Ordinance shall be evidenced in the Development Agreement (DA) prepared for the project, subject to the approval of the City of Soledad. The DA shall be reviewed concurrently with the project's General Plan amendments, Specific Plan and the Vesting Tentative Map.

Proposed Project

Population Growth – General Plan Residential Holding Capacity

Table 3-6, General Plan Holding Capacity, below, provides a summary of the General Plan development potential or "holding capacity," which is the number of dwelling units, commercial and industrial floor space, etc., that can be accommodated based on the amount of land designated for these uses.

Table 3-6 General Plan Holding Capacity

Land Use	Within City Limits	Within Expansion Areas	Total*
Residential	4,254 dwelling units	10,317 dwelling units	14,571 dwelling units
Commercial	951,351 square feet	2,554,680 square feet	3,506,030 square feet
Parks and Open Space	278	429 acres park and 515 acres open space	707 acres park and 515 acres open space

Source: City of Soledad General Plan 2005, Table 11-1

* May vary from original 2005 source table due to rounding, or addition errors in source table

Nearly 634 acres of the 647-acre specific plan is within the Mirrasou Specific Plan Area. Approximately 1.28 acres of the specific plan are within the Northwest Expansion Area and approximately 9.71 acres are within the San Vicente West Expansion Area. Approximately 2.05 acres are located in the North Entry Commercial Specific Plan Area and Entry Commercial Expansion Area. The Mirrasou Specific Plan Area consists of 1,165 acres, of which 650 are considered developable (below the 400-foot elevation contour). The specific plan consists of 633.88 acres of the 1,165 acre Mirrasou Specific Plan Area and 488.4 of 633.8 acres specific plan are considered to be developable. A comparison of the proposed specific plan with the city and the Mirrasou Specific Plan Area holding capacity is presented in table 3-7, General Plan Holding Capacity Comparison below:

Table 3-7 General Plan Holding Capacity Comparison

Land Use	General Plan Total Expansion Area Development Potential	Mirrasou Specific Plan Area Development Potential	Miramonte Specific Plan Development Potential
Residential	10,317 dwelling units	1,867 dwelling units	2,392 dwelling units
Commercial	2,554,680 square feet	100,000 square feet	100,000 square feet
Parks and Open Space	302 acres park and 515 acres open space	50* acres park and 515 acres open space	56.18 acres park and 140.4 acres open space

Source: City of Soledad General Plan 2005, page 11-19 and Table 11-1

Note: Acreage is incorrectly listed on Soledad General Plan 2005, Table 11-1

As shown in Table 3-7, the proposed specific plan exceeds the residential unit allowance as provided in the Mirrasou Specific Plan Area by 525 units. In contrast, the general plan identifies a total development potential of 10,317 dwelling units within its four expansion areas; 6,500 of these units are identified within the Northwest Expansion Area, adjacent to the western boundary of the Mirrasou Specific Plan Area (Table II-1 of the general plan). The proposed project represents the full residential buildout potential for the Mirrasou Specific Plan Area, as well as 525 units of the identified residential potential of the Northwest Expansion Area. The proposed specific plan includes policy to utilize the development potential of the Mirrasou Specific Plan Area and reduce the development potential of the Northwest Expansion Area by 525 units. A general plan amendment is required to identify a development potential of 5,975 units in the Northwest Expansion Area (6,500 identified in the current general plan less 525 reallocated to the Mirrasou Specific Plan Area). With the approval of the general plan amendment by the City Council, development of the uses identified in the proposed specific plan would be consistent with the general plan holding capacity and phased development would not be needed. The impact is less than significant and mitigation measures 4.11-1 and 4.11-2 are not required.

Population Growth - Growth Inducing Impacts

The proposed specific plan could result in a population addition of 9,712 people at build-out. This is a reduction in growth by 36.1 percent from the previously proposed project. The Miravale III EIR determined that growth in population would increase demands on existing community facilities, requiring construction of new facilities that could cause significant environmental effects. While the proposed project would also increase demands on existing facilities, it would do so to a lesser extent than the previously proposed project. The project also includes commercial uses that would generate approximately 218 jobs, with additional employment at the schools and other public facilities. This is an approximately 60 percent reduction in jobs from the Miravale III Specific Plan that would have the potential to result in direct, economic growth-inducing impact by providing new employment than proposed by the previous project. Although the project site is located in an area that has been identified for future population growth in city's general plan and would result in 36.1 percent less growth than the previously proposed project, based on the above discussion, the project would still result in a significant growth-inducing impact through the introduction of new sources of employment and a significant portion of the city's projected population growth. Consequently, additional demand would be placed on existing facilities. This remains a significant and unavoidable impact that cannot be reduced to less-than-significant level with mitigation.

Housing Element

The specific plan ensures integration of affordable housing both through design and location. The designated affordable housing is located in the specific plan core area adjacent to a park,

the elementary school, senior housing, commercial uses, and low density residential. The housing that meets the minimum 20 unit per acre standard is likewise located in the specific plan core area. Inclusionary units would be distributed throughout the plan area. The design guidelines ensure that affordable housing will blend visually with market rate housing. Locating duets or duplexes on corner lots with building massing consistent within the neighborhood and one garage accessed off each street will give the appearance of low-density family homes. The specific plan is consistent with the housing element's integrated affordable housing requirements. However, to ensure final plan consistency mitigation measure 4.11-3 identified in the Miravale III EIR remains applicable to this project.

Affordable Housing - Inclusionary Housing Ordinance Compliance

As previously discussed, the inclusionary ordinance requires 20 percent of the affordable units to be restricted affordable units pursuant to execution of an affordable housing agreement between the developer and city. Of the 2,392 proposed residential units, the specific plan includes approximately 800 affordable units (33.4 percent of the total units); 207 units would be affordable due to deed restrictions. An additional 419 units are assumed to be affordable because they will be developed at a density of 20 or more units per acre, which the Housing and Community Development Department considers affordable to low and very low income households for purposes of meeting the Regional Housing Needs Assessment targets used in housing elements (California Department of Housing and Community Development 2012 The inclusionary ordinance requires 20 percent of the affordable units to be restricted affordable units pursuant to execution of an affordable housing agreement between the developer and city. The specific plan is consistent with the ordinance, providing approximately 218 very low, 106 low, 235 moderate. Mitigation 4.11.4 identified in the Miravale III EIR is not required.

Population and Housing Conclusion

The specific plan would not result in new significant impacts or substantially increase the severity of previously identified significant effects, no significant changes in population related circumstances have occurred, and no new information has been identified that indicates the proposed project would have new or more significant impacts related to population and housing than were identified in the Miravale III EIR.

3.13 PUBLIC SERVICES AND RECREATION

Miravale III Specific Plan EIR Analysis

Police and Fire

According to the Miravale III EIR, project development would increase the Soledad population by 15,201 persons, effectively increasing the demand for both police and fire

services. The EIR concluded that increased demand for police and fire services could result in a significant impact if the demand is such that the expansion or construction of facilities is required. The project proposed at that time included a police and fire substation, the environmental effects of which were evaluated throughout the EIR. The EIR concluded that this impact could be reduced to a less-than-significant level with implementation of the following mitigation measures.

Mitigation Measures

4.12-1 Prior to the initiation of construction for Phase 2 of the proposed development, the proposed fire and police facilities located on West Street shall be constructed and operational. The project applicant shall also be responsible for providing the necessary funding to the City of Soledad or establishing the appropriate funding mechanism to ensure the provision of adequate police and fire staffing to meet the demands of the proposed project, as determined by the City of Soledad. Prior to the issuance of any building permit for new residential and commercial development in Phase 2, the project applicant shall obtain written documentation from the Soledad Fire and Police Departments indicating that the fire and police substations are operational and adequately staffed to meet the needs of the proposed project, subject to the review and approval of the City of Soledad. This mitigation measure shall not be construed as prohibiting the implementation of infrastructure necessary to serve the proposed facility or the needs of Phase 2 of the proposed project.

4.12-2 Prior to the issuance of building permits, the applicant/developer shall pay a City Public Facilities Development Impact Fee for each type of new development in accordance with the adjusted impact fee in effect at the time of building permit issuance. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.

4.12-3 Prior to the recordation of each final map for development within areas currently designated as "State Responsibility Areas," the applicant shall submit evidence, subject to the review and approval of the City of Soledad Fire Department, demonstrating that a minimum 100-foot defensible space will be provided around any structure constructed within the foothill area. The defensible space shall be cleared of and maintained free of brush and combustible debris, and any landscaping placed within the defensible space shall be irrigated.

Schools

The Miravale III project would be served by the Soledad Unified School District. The Miravale III EIR anticipated buildout of the plan to generate 2,449 students for grades K-6,

625 students for grades 7-8, and 1,217 students for grades 9-12 (a total of 4,291 students). The collective capacity of the K-6 schools was 3,250, with 2,394 seats filled (856 seats available), the 7-8 school capacity was 652 with 630 seats filled (22 seats available), and the grades 9-12 capacity was 1,400 with 1,093 seats filled (307 seats available). Based on enrollment figures and project generated student population, project development would exceed the capacity of existing schools within the Soledad Unified School District and would require construction of new facilities. The EIR concluded that project adherence to the General Plan and Specific Plan education policies requiring that new school facilities are constructed and operational prior to the occupation of residences that require the facilities, as well as implementation of the mitigation identified below would ensure that project-related impacts were less than significant.

Mitigation Measures

4.12-4 Prior to project approval, the project applicant shall submit evidence, including a revised Specific Plan and tentative map, demonstrating that an additional two elementary school sites of sufficient size and a 40-acre high school site will be designated within the project boundaries to meet project demands, subject to the review and approval of the City of Soledad and the Soledad Unified School District. The 40-acre high school site shall be operational prior to the issuance of any certificate of occupancy for Phase II of the proposed project, unless otherwise approved by the City of Soledad and the Soledad Unified School District. In lieu of providing said high school facilities on-site, the project shall submit payment of its proportionate share of funding towards site acquisition and construction of new school facilities, prior to the recordation of any final map. Pro-rata payment of the cost of providing a second high school shall not be construed as waiver of the previous requirement that adequate high school capacity be available to meet project demands prior to occupancy of any housing constructed in Phase II of the project.

4.12-5 The applicant/developer shall pay a school impact fee for each type of development pursuant to the criteria set forth within California Government Code Section 65995. Prior to the issuance of building permits, the applicant shall pay required school mitigation fees. As indicated above, the fees set forth in Government Code Section 65996 constitute the exclusive means of both "considering" and "mitigating" school facilities impacts of projects [Government Code Section 65996(a)]. They are "deemed to provide full and complete school facilities mitigation" [Government Code Section 65996(b)].

Parks and Recreation

The Miravale III EIR determined that the project did not meet the minimum required parkland ratio of five acres per 1,000 residents and determined that additional park acreage was required. The EIR concluded that lack of sufficient park acreage was a potentially significant impact. The EIR found this impact could be reduced to a less-than-significant level with implementation of the following mitigation measure.

Mitigation Measure

4.12-6 In order to ensure adequate improved parkland is provided as part of project development, the applicant shall submit detailed plans, including a revised Specific Plan and Tentative Map, demonstrating that adequate parkland (5 acres/1,000 residents) is designated within the project boundaries consistent with the requirements of Appendix B of the General Plan, prior to project approval, subject to the review and approval of the City of Soledad. Prior to the recordation of each final map, the project applicant shall submit a comprehensive Park Master Plan to the City of Soledad for review and approval. This plan shall address park design and development consistent with the City's adopted Parks and Recreation Master Plan, along with maintenance, operation and financing components for each dedicated recreation parcel in that phase of development This plan shall also identify the appropriate types of improvements within each park parcel to meet the recreational needs of all age groups within that phase of the project.

In addition, the EIR determined that anticipated population growth of future residents of the project would also create additional demands on existing park and recreational facilities throughout the city such that physical deterioration of these facilities would occur, which is a potentially significant impact. However, the EIR concluded that this impact could be reduced to a less-than-significant level through adherence to the City of Soledad General Plan policies and the incorporation of the following mitigation measure.

Mitigation Measure

4.12-7 Prior to the issuance of any building permit, the applicant/developer shall submit payment of a Park Facilities Impact Fee in accordance with the adjusted impact fee in effect at the time of building permit issuance, if determined to be applicable. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.

Proposed Project

Police and Fire

The currently proposed specific plan would increase the population by 9,712 people, which is less than the 15,201-person population increase anticipated by the Miravale III and, would

therefore, result in lesser increase in service demand. However, this population growth would still increase the service demand such that new facilities would be required and mitigation measures 4.12-4 and 4.12-5, identified in Miravale III EIR, would remain applicable. The following changes apply to mitigation measure 4.12-1 to ensure compatibility with the project as currently proposed as the project does not include phasing that is consistent with that identified in the Miravale III project.

Mitigation Measure

4.12-1 Prior to the ~~initiation of~~ occupancy of medium density residential north of the linear park or occupancy of low density residential north of both Orchard Lane and the linear park ~~construction for Phase 2 of the proposed development~~, the proposed fire and police facilities located on ~~West Street~~ Orchard Lane shall be constructed and operational. The project applicant shall also be responsible for providing the necessary funding to the City of Soledad or establishing the appropriate funding mechanism to ensure the provision of adequate police and fire staffing to meet the demands of the proposed project, as determined by the City of Soledad. Prior to the issuance of any building permit for new medium density residential development north of linear park or low density residential north of both Orchard Lane and the linear park ~~and commercial development in Phase 2~~, the project applicant shall obtain written documentation from the Soledad Fire and Police Departments indicating that the fire and police substations are operational and adequately staffed to meet the needs of the proposed project, subject to the review and approval of the City of Soledad. This mitigation measure shall not be construed as prohibiting the implementation of infrastructure necessary to serve the proposed facility or the needs of ~~Phase 2 of~~ the proposed project.

Schools

Like Miravale III, the plan area is served by Soledad Unified School District for grades K-12. Buildout of the proposed specific plan is expected to generate 1,062 students for grades K-6, 317 students for grades 7-8, and 468 students for grades 9-12 (a total of 1,847 students). The proposed project would provide two elementary school sites. The applicant and/or developer(s) will provide an offer to dedicate the school sites (i.e. turn over fee simple title to the land to the school district). In addition to the offer to dedicate land, the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions. The proposed specific plan includes a policy that requires that an agreement be established between the developer and/or successors in interest and the Soledad Unified School District that establishes the timing of the school construction or improvements and financing obligations. The proposed specific plan would generate 602 fewer children, will provide land for two new elementary

schools, and requires the payment of impact fees; therefore, mitigation measures 4.12-4 as revised below and 4.12-5 identified in the Miravale III EIR are still applicable. With implementation of the mitigation measure as revised, impacts would be less than significant.

Mitigation Measures

4.12-4 Prior to project approval, the project applicant shall submit evidence, ~~including a revised Specific Plan and tentative map,~~ demonstrating that an additional two ~~elementary~~ school sites of sufficient size ~~and a 40-acre high school site~~ will be ~~designated~~ dedicated within the project boundaries to meet project demands, subject to the review and approval of the City of Soledad and the Soledad Unified School District.. ~~The 40-acre high school site shall be operational prior to the issuance of any certificate of occupancy for Phase II of the proposed project, unless otherwise approved by the City of Soledad and the Soledad Unified School District.~~ An agreement shall be established between the developer and/or successors in interest and the Soledad Unified School District that establishes the timing of the school construction or improvements and financing obligations.

In addition to the dedication of land, ~~In lieu of providing said high school facilities on-site, the project shall submit payment of its proportionate share of funding towards site acquisition and construction of new school facilities, prior to the recordation of any final map~~ the developer(s) will pay school impact fees as prescribed by the law in effect at the time of payment, unless otherwise dictated by a development agreement or permit conditions.

~~Pro-rata payment of the cost of providing a second high school shall not be construed as waiver of the previous requirement that adequate high school capacity be available to meet project demands prior to occupancy of any housing constructed in Phase II of the project.~~

4.12-5 The applicant/developer shall pay a school impact fee for each type of development pursuant to the criteria set forth within California Government Code Section 65995. Prior to the issuance of building permits, the applicant shall pay required school mitigation fees. As indicated above, the fees set forth in Government Code Section 65996 constitute the exclusive means of both "considering" and "mitigating" school facilities impacts of projects [Government Code Section 65996(a)]. They are "deemed to provide full and complete school facilities mitigation" [Government Code Section 65996(b)].

Parks and Recreation

The specific plan incorporates a network of parks and pathways that form a comprehensive and thoroughly interconnected system through the plan area. Several open space and

recreational opportunities are provided including soccer or other sports fields, picnic areas, playgrounds, paved trails, and unimproved open space trails that total 196.4 acres of open space/parkland within the plan area.

The city's general plan has a *goal* of parks-to-population ratio goal of five acres per 1,000 residents (Goal 2 of the parks and recreation chapter). Policy PR-Ia of the general plan *requires* three acres per 1,000 residents, which is the maximum allowed per the Quimby Act. The anticipated population with buildout of the specific plan is 9,712 residents. To meet the city's general plan parkland *requirement* of three acres of parkland for every 1,000 residents, the specific plan would need to provide 29.1 acres of parkland. To meet the city's general plan *goal* of five acres of parkland for every 1,000 residents, the specific plan would need to provide 48.56 acres of parkland.

The specific plan calls for the provision of a minimum of five acres of parkland for every 1,000 residents in addition to the 140.4 acres of open space, which exceeds the city's parkland requirement as well as the city's general plan goal. The specific plan provides 56 acres of parkland in addition to open space and supplements the current city deficit by more than 140 acres. Because the currently proposed plan meets the city's acre per population requirements for parkland, a portion of mitigation measure 4.12-6 identified in the Miravale III EIR is not applicable to this project and is therefore edited as shown below. However, similar to Miravale III, anticipated population growth associated with the project would create additional demands on existing park and recreational facilities throughout the city such that physical deterioration of these facilities may occur, which is a potentially significant impact. Therefore, mitigation measure 4.12-7 remains applicable to the project to reduce potential impacts to a less-than-significant level.

Mitigation Measure

4.12-6 ~~In order to ensure adequate improved parkland is provided as part of project development, the applicant shall submit detailed plans, including a revised Specific Plan and Tentative Map, demonstrating that adequate parkland (5 acres/1,000 residents). is designated within the project boundaries consistent with the requirements of Appendix B of the General Plan, prior to project approval, subject to the review and approval of the City of Soledad.~~ Prior to the recordation of ~~each~~ the first final map, the project applicant shall submit a comprehensive Park Master Plan to the City of Soledad for review and approval. This plan shall address park design and development consistent with the City's adopted Parks and Recreation Master Plan, along with maintenance, operation and financing components for each dedicated recreation parcel in that phase of development This plan shall also identify the appropriate types of improvements within each park parcel to meet the recreational needs of all age groups within that phase of the project.

Public Services and Recreation Conclusion

The proposed project would not result in new significant impacts to public services or substantially increase the severity of previously identified impacts. The proposed project is smaller than the previously proposed project and would create less of a demand for public facilities. No new information has been identified that indicates the proposed project would have new or more significant public services impacts than were identified for the original project.

3.14 TRAFFIC AND CIRCULATION

A traffic impact analysis was prepared for the Miravale III EIR by Hexagon Transportation Consultants (August 15, 2007) (2007 report).

The *Miramonte Specific Plan Traffic Impact Analysis* (Higgins 2017a) and supplemental letters *Miramonte Specific Plan Traffic Study Supplemental Analysis, Soledad, CA* (Higgins 2017b), and *Miramonte Specific Plan Replace Proposed Farmer's Community Use to Single-family or Apartment Residential – Traffic Impact Evaluation*, Soledad CA (Higgins 2018) provide an update to the 2007 report based on the proposed project and current conditions. The 2007 report is included as an appendix to the Miravale III EIR. The 2017 documents are included in Appendix D and are referred to collectively as "2017 report". The 2018 supplemental letter is referred to as "2018 supplemental report"). The 2017 report provides and update of existing and estimated background and cumulative local and regional traffic conditions without the project in and near the City of Soledad and includes a comparison between the traffic impacts resulting from the Miravale III Specific Plan project with the traffic impacts of the proposed project, to determine if new or greater impacts and related mitigation measures would be required for the proposed project. The 2018 supplemental report evaluates the environmental effects of development of 314 single-family or multifamily residences, which is slightly different than the Farmer's Community use evaluated by the earlier 2017 reports, for the proposed Sub-are 13, Residential Study Area. Unless otherwise noted the following discussion is based primarily on each of these reports.

Miravale III Specific Plan EIR Analysis

Background

The city's traffic impact fee program identifies fees to be collected from proposed development as conditions of project approval and used towards identified improvements to the roadway system within and serving the City of Soledad. The Soledad Municipal Code Section 14.06.080.D.1 allows adjustment of a project's required traffic impact fees in consideration of other mitigating actions taken or agreed to by the developer, which have a reasonable relationship to the construction or acquisition of traffic facilities to meet needs

created by the new development. The city may also negotiate with a developer to construct a street or signal improvement (or portion thereof) contained in the city's planned traffic improvement project plan.

Participation in the Transportation Agency for Monterey County (TAMC) Regional Traffic Impact Fee program was adopted by the City Council in 2008 and is codified in Soledad Municipal Code Section 3.56.030. The municipal code acknowledges that regional improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of regional facility improvements, the regional development impact fee program was established to address needed improvements to state highways and regional roads within Monterey County.

Trip Generation

The Miravale III EIR reports that the project would generate 34,856 vehicle trips per day.

Potentially Significant Internal Circulation Hazards

The Miravale III EIR identified potentially significant traffic hazard impacts resulting from the placement of at-grade golf cart crossings on high traffic volume collector and arterial streets. The EIR concluded that this would be a significant impact but that it could be reduced to a less-than-significant level with the mitigation below:

Mitigation Measure

4.13-1 Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings shall not be permitted along streets classified as collectors or arterials unless at a traffic light. Prior to the issuance of any building and/or grading permit for development associated with the golf course facility, the project applicant shall submit detailed design-level plans demonstrating compliance with this measure, subject to the review and approval of the Director of Public Works. Improvements shall be constructed in accordance with this measure prior to the issuance of any certificate of occupancy or final permit for development associated with the golf course.

Intersection Operations

Results of the intersection level of service analysis show that 11 study intersections would be impacted by the project according to applicable level of service standards. Two additional intersections would meet signal warrants with the addition of project traffic. Several of the impacts identified in the 2007 report involve significant physical improvements to not only intersection configurations, but also potential roadway widening. In some cases, the improvements identified below will be undesirable due to the need for right-of-way acquisition and/or create inconsistency with the city's general plan. The 2007 report revealed that several of the project's impacts could be mitigated with the construction of an extension

of Gabilan Drive that would provide an alternate route to U.S. Highway 101 as called for in the general plan. The general plan calls for Gabilan Drive to be a four-lane divided arterial extended west to U.S. Highway 101 and extension of Gabilan Drive as per the general plan will provide for a more direct route to the project site and alleviate identified impacts at several intersections. Therefore, the 2007 report recommended that rather than implement undesirable roadway widening (i.e., along Front Street), the project would instead be responsible for its fair-share towards the construction costs of the extension of Gabilan Drive to U.S. Highway 101 and widening of San Vicente Road from the project south to the Gabilan Drive extension.

The Miravale III EIR identified impacts at the following intersections that could be mitigated by compliance with standard conditions of approval:

- **West Street and Front Street.** Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met at this intersection, but would not cause unacceptable level of service operations. Signalization of the intersection and protected left-turn phasing of the signal for Front Street would improve conditions at this intersection. Participation in the city's traffic impact fee program is required for new development as a condition of approval. The project developer is responsible for the payment of the city's traffic impact fees as a condition of approval prior to issuance of a building permit. Participation in the city's traffic impact fee program mitigates the project's share of the impact to a less-than-significant level.
- **Main Street and Front Street**. Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met during the PM peak hour at the intersection of Main Street and Front Street; however, the intersection would operate at LOS D or better. However, with the construction of the Gabilan Drive extension to U.S. Highway 101, the signalization of this intersection would not be necessary. The 2007 report recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. The project developer is responsible for the payment of the city's traffic impact fees as a condition of approval prior to issuance of a building permit. Participation in the city's traffic impact fee program mitigates the project's share of the impact to a less-than-significant level.
- **San Vicente Road and Market Street**. Traffic generated by development of the Miravale III Specific Plan project would cause operations to degrade from acceptable LOS to unacceptable LOS E or worse at the intersection of San Vicente Road and Market Street during AM and PM peak hours. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and widening of San Vicente Road to accommodate

two lanes in each direction. However, with the construction of the Gabilan Drive extension to U.S. Highway 101, signalization of the intersection and widening of San Vicente Road in this vicinity would not be necessary. Therefore, the 2007 report recommends that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. The project developer is responsible for the payment of the city's traffic impact fees as a condition of approval prior to issuance of a building permit. Participation in the city's traffic impact fee program mitigates the project's share of the impact to a less-than-significant level.

- **West Street and Market Street**. Traffic generated by development of the Miravale III Specific Plan project would cause signal warrants to be met during at least one peak hour at the intersection of West Street and Market Street. The necessary improvements consist of the signalization of the intersection. However, with the construction of the Gabilan Drive extension to U.S. Highway 101, the signalization of this intersection would not be necessary. Therefore, the 2007 report recommends that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. The project developer is responsible for the payment of the city's traffic impact fees as a condition of approval prior to issuance of a building permit. Participation in the city's traffic impact fee program mitigates the project's share of the impact to a less-than-significant level.
- **East Street and Market Street**. Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met and cause operations to degrade from acceptable LOS to unacceptable LOS E or worse during at least one peak hour at the intersection of East Street and Market Street. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection. The project developer is responsible for the payment of the city's traffic impact fees as a condition of approval prior to issuance of a building permit. Participation in the city's traffic impact fee program mitigates the project's share of the impact to a less-than-significant level.

The Miravale III EIR identified additional significant operational impacts that would require mitigation in addition to standard conditions of approval at the following local intersections:

Moranda Road and Front Street: This intersection meets signal warrants with or without the project. Traffic generated by development associated with the Miravale III Specific Plan project would project would cause operations to degrade from acceptable LOS to unacceptable LOS F at the intersection of Moranda Road and Front Street. The improvement necessary to mitigate background plus project impacts at this intersection consist of the addition of a second northbound through lane and eastbound free-right-turn lane. The implementation of this improvement would require that northbound Front Street be

widened to two lanes. The roadway segment analysis also indicates the need for widening of Front Street between Moranda Road and San Vicente Road. However, with the construction of the Gabilan Drive extension to U.S. Highway 101, the improvements to Front Street described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. The 2007 report recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. The EIR determined that implementation of the following mitigation measure would reduce the project's impact to operations at the Moranda Road/Front Street intersection to a less-than-significant level.

Mitigation Measure

4.13-2 Widen northbound Front Street to two lanes, add a second northbound through lane, eastbound free-right-turn lane and widen Front Street between Moranda Road and San Vicente Road. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. Highway 101. If this alternative is chosen local roadways shall be monitored annually to ensure that are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Implementation of this mitigation measure would reduce the impact at this intersection to less than significant.

San Vicente Road and Front Street. This intersection meets the Caltrans signal warrant with or without the project. Traffic generated by development of the Miravale III Specific Plan project would cause operations to degrade from acceptable LOS C to unacceptable LOS F at the intersection of San Vicente Road and Front Street during at least one of the peak hours analyzed. The 2007 report found that improvement necessary to mitigate the project impact at this intersection would consist of the addition of two eastbound left-turn lanes and southbound free-right turn lane. The implementation of this improvement would require that northbound Front Street be widened to two lanes and northbound San Vicente Road be widened to three lanes. However, these improvements will require a significant amount of right-of-way acquisition and roadway widening of Front Street. With the construction of the

Gabilan Drive extension to U.S. Highway 101, the improvements described above would not be necessary. The 2007 report instead recommended that the project contribute towards the construction of the extension of Gabilan Drive to U.S. Highway 101 to reduce the impacts to less than significant.

With implementation of the following mitigation measure, the project's impacts would be reduced to less than significant.

Mitigation Measure

4.13-3 Widen northbound Front Street to two lanes, northbound San Vicente Road to three lanes, add two eastbound left-turn lanes and a southbound free-right-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact - fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. Highway 101. If this alternative is chosen local roadways shall be monitored annually to ensure that are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

San Vicente Road and Gabilan Drive: Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met and cause operations to degrade from acceptable LOS B to unacceptable LOS F during at least one peak hour at the intersection of San Vicente Road and Gabilan Drive. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second westbound left turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. The improvement will require the widening of southbound San Vicente Road to accommodate the dual left-turn lanes from Gabilan Drive. With the construction of the Gabilan Drive extension to U.S. Highway 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. With implementation of the following mitigation measure, the project impacts to this intersection would be less than significant.

Mitigation Measure

4.13-4 Signalize this intersection and add a second westbound left turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. SB San Vicente Road will need to be widened to accommodate the dual left-turn lanes from Gabilan. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. Highway 101. If this alternative is chosen local roadways shall be monitored annually to ensure that are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. If this alternative is selected the project applicant shall submit payment of the projects fair share towards the construction of this improvement in accordance with the traffic impact fee in effect at the time of building permit issuance for each phase of the project. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

West Street and Gabilan Drive: Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met and cause operations to degrade from acceptable LOS B to unacceptable LOS F during at least one peak hour at the intersection of West Street and Gabilan Drive. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of exclusive left-turn lanes with protected phasing on all approaches. With implementation of the following mitigation measure, the project impacts would be less than significant.

Mitigation Measure

4.13-5 Signalize the intersection and add exclusive left-turn lanes with protected phasing on all approaches. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Main Street and Gabilan Drive: Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met during at least one peak hour at the intersection of Main Street and Gabilan Drive. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive. With the construction of the Gabilan Drive extension to U.S. Highway 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. With implementation of the following mitigation measure the project's impacts to this intersection would be less than significant.

Mitigation Measure

4.13-6 Signalize the intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. Highway 101. If this alternative is chosen local roadways shall be monitored annually to ensure that are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Andalucia Drive and Gabilan Drive: Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met during at least one peak hour at the intersection of Andalucia Drive and Gabilan Drive. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive. With implementation of the following mitigation measure the project's impacts to intersection operations would be reduced to a less-than-significant level.

Mitigation Measure

4.13-7 Signalize this intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for

each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.

Orchard Land and Metz Road: Traffic generated by development associated with the Miravale III Specific Plan project would cause signal warrants to be met and cause operations to degrade from acceptable LOS C to unacceptable LOS E or worse during at least one peak hour at the intersection of Orchard Street and Metz Road. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane. With implementation of the following mitigation measure the project's impacts to intersection operations would be reduced to a less-than-significant level.

Mitigation Measure

4.13-8 Signalize this intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect that the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.

Oak Street and Front Street and Front Street and Nestles Road. Traffic generated by development associated with the Miravale III Specific Plan would cause intersection operations to decline from acceptable LOS C to unacceptable LOS E at the intersection of Oak Street and Front Street. Signal warrants are met at this intersection with or without the project. Widening Front Street to four lanes between Nestles Road and Oak Street and adding a second eastbound left-turn lane at the intersection of Nestles Road and Front Street would improve operations to LOS B in this location. With implementation of the following mitigation measure the project's impacts to intersection operations would be reduced to a less-than-significant level.

Mitigation Measure

4.13-9 Widen Front Street to four lanes between Nestles Road and Oak Street and add a second EB left-turn lane at the intersection of Nestles Road and Oak Street. Alternatively, the construction of the U.S. Highway 101/SR 146 bypass would

alleviate impacts at this intersection. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance. All fees shall be paid prior to the issuance of any building permits for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.

Regional Transportation Impacts

The Miravale III EIR determined that traffic generated by the project would affect operations on two U.S. Highway 101 ramps and four freeway segments.

Moranda Road and U.S. Highway 101 Northbound Ramps: Traffic generated by development of the project would cause unacceptable LOS D operations on the U.S. Highway 101 northbound on-ramp from Moranda Road at the Moranda Road Interchange during the AM peak hour. The necessary improvement to mitigate the project impact at this intersection will consist of the signalization of the intersection and the addition of a second northbound left-turn lane, Moranda Road to northbound U.S. Highway 101. The implementation of these improvements will require that the northbound U.S. Highway 101 on-ramp be widened to receive the two lanes. With the construction of the Gabilan Drive extension to U.S. Highway 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements created by the extension. Therefore, the 2007 report recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. The volume of vehicles bound for northbound U.S. Highway 101 indicate the need for the reconfiguration and/or reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. With implementation of the following mitigation measure the significant impacts would be reduced to a less-than-significant level.

Mitigation Measure

4.13-10 Signalize the intersection and widen the NB U.S. Highway 101 on ramp to add a second NB left-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance, including the TAMC Regional Development Impact Fees pursuant to Chapter 3.56 of the Soledad Municipal Code, in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and

approval of the City of Soledad. If the aforementioned improvements are not implemented by the time required, the project could instead contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. 101. Under this approach to mitigation, local roadways shall be monitored to ensure that are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. In addition the U.S. Highway 101 interchange at Moranda Road/Front Street will require reconfiguration/reconstruction to provide more efficient access to the project site and north Soledad in general. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

The Miravale III EIR concluded that should the proposed improvements be deemed infeasible or not part of the TAMC fee program, the impacts would be considered significant and unavoidable.

Front Street and U.S. Highway 101 Southbound Ramps: Traffic generated by development of the project would cause unacceptable LOS D operations on the U.S. Highway 101 southbound off-ramp to Moranda Road at the Moranda Road Interchange during the PM peak hour. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second lane on the off ramp. The improvement will require the widening of southbound Front Street to two lanes. The volume of vehicles exiting southbound U.S. Highway 101 at Front Street indicate the need for widening of Front Street, between U.S. Highway 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. With implementation of the following mitigation measure the significant impacts would be reduced to a less-than-significant level.

Mitigation Measure

4.13-11 Signalize this intersection, widen southbound Front Street to two lanes and add a second lane on the off-ramp. In addition, the volume of vehicles exiting southbound U.S. Highway 101 at Front Street indicate the need for widening of Front Street, between U.S. Highway 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. As this is a regional improvement, the project applicant shall contribute funding towards its implementation by

submitting payment of the TAMC Regional Development Impact Fees, pursuant to Chapter 3.56 of the Soledad Municipal Code. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the TAMC fee program, the impact should be considered significant and unavoidable. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the traffic impact fee in effect at the time of building permit issuance, including the Regional Development Transportation Impact Fees, in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

The Miravale III EIR concluded that should the proposed improvements be deemed infeasible or not part of the TAMC fee program, the impacts would be considered significant and unavoidable.

U.S. Highway 101 Freeway Segments. Traffic generated by development of the project would cause unacceptable LOS D operations on the following U.S. Highway 101 freeway segments:

- Northbound U.S. Highway 101 north of Gonzales-5th Street (AM peak hour).
- Northbound U.S. Highway 101 between Gonzales-5th Street to Gloria Road (AM peak hour).
- Northbound U.S. Highway 101 between Camphora Road and North Soledad (AM Peak Hour).
- Southbound U.S. Highway 101between North Soledad and Camphora Road (PM Peak Hour).

With implementation of the following mitigation measure the significant impacts would be reduced to a less-than-significant level.

Mitigation Measure

4.13-12 The project applicant shall be required to pay towards the city's TIF program, which includes regional improvements, and shall also pay the city's adopted Regional Development Impact Fees established in Chapter 3.56 of the Municipal Code. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the Regional Development Impact Fee and City of Soledad traffic impact fees in effect at the time of building permit issuance in order to mitigate the impacts at identified locations. The payment of fees is considered mitigation for project impacts to highway and regional facilities. All fees shall be subject to the approval of the Director of Public Works.

> Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable.

The Miravale III EIR concluded that should the proposed improvements be deemed infeasible or not part of the TAMC fee program, the impacts would be considered significant and unavoidable.

Traffic Mitigation Triggers

The Miravale III EIR also determined that due to the size of the project the two major roadway improvements, Gabilan Drive Extension and reconstruction of the U.S. Highway 101/Moranda Road interchange, which would serve to mitigate many of the project's traffic impacts, would require substantial funding that cannot be provided at the initial stages of the development or by the proposed development alone. Therefore, the 2007 report and Miravale III EIR identify development triggers that determine the level of development that could occur before implementation of the two major roadway improvement projects would be necessary to maintain acceptable traffic level of service. Traffic monitoring is included in the mitigation to assure that improvements are phased with development. The traffic monitoring shall be established and maintained by the city and funded by the developer.

Gabilan Extension Development Level Trigger

Analysis was conducted at intersections and roadway segments along San Vicente Road to determine at what development level the extension of Gabilan Drive would need to be implemented to support project traffic. The 2007 report indicated that the most critical point of constraint is the intersection of San Vicente Road and Front Street. San Vicente Road would operate at LOS D until 75 percent (approximately 26,142 daily trips) of the project traffic is added to the roadway system. However, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and traffic would spill over onto adjacent streets, such as West Street, that provide an alternate access to San Vicente Road.

The capacity of the eastbound left-turn movement, Front Street to San Vicente, during the PM peak hour is the critical movement at the intersection. Under background conditions the intersection was shown to meet traffic signal warrants. With installation of a signal the intersection would operate at LOS D. The Miravale III EIR notes that although LOS D intersection operations may be acceptable at this location, the number of left-turning vehicles under background conditions indicated the need for a second left-turn lane and subsequent widening of San Vicente Road to receive the two left-turn lanes. Until this improvement is made, the intersection would maintain LOS D operations until 50 percent (17,428 daily trips) would be maintained at the intersection with up to 50 percent of the project development traffic.

U.S. Highway 101 and Moranda Road Interchange Improvement Development Level Trigger

The Miravale III EIR analysis states that existing freeway ramps at Moranda Road and U.S. Highway 101 are not designed to accommodate existing traffic volumes and the addition of project traffic, as well as background traffic, would compound the need for improvement of the ramps. The U.S. Highway 101 southbound off-ramp to Moranda Road will be the constraint on any further development. The 2007 analysis of ramp capacities indicated that LOS D ramp operations would be maintained with up to 25 percent (approximately 8,714 daily trips) of the project traffic added to the roadway system. The intersection level of service analysis indicated that with signalization of the ramp termini intersections, up to 50 percent (17, 428 daily trips) of the project development traffic could be accommodated; however, even with the signalization of the intersections, the ramps would continue to operate an unacceptable level of service.

Proposed Project

The 2017 report evaluated peak-hour signal warrants and roadway and freeway level of service analysis based on PM peak-hour levels of service. The AM peak hour is not analyzed because the previous study documented that the PM peak hour was the higher volume, controlling condition. In other words, no future impacts would be experienced during the AM peak hour that are not already experienced during the PM peak hour. The levels of service in the current study were prorated where appropriate based on current volumes and forecasts. The 2018 supplemental report adjusts the 2017 report conclusions to account for a slight increase in overall project trips that would result from development of sub-area 13 with low- to medium-density residential uses instead of a "Farmers Community". According to the 2017 report and the 2018 supplemental report, traffic from the proposed project would affect the same intersections and traffic facilities identified and addressed in the certified Miravale III EIR, although to a somewhat lesser extent.

Existing Setting

The 2017 report found that the background traffic volumes resulting from currently approved development traffic added to 2017 volumes are about 8.5 percent higher than those predicted in the 2007 report. This means that much of the background traffic assumed in the 2007 report is now on area roadways as part of the existing conditions scenario in the 2017 report. Since the Miravale III EIR was certified, the city adopted the City of Soledad Downtown Specific Plan that includes block and street standards calling for small town scale, walkable blocks and pedestrian-oriented streetscapes along Front Street (City of Soledad 2012). As shown in the Downtown Specific Plan Table 5.8b, street standards for Front Street consist of two travel lanes separated by a center landscaped median with diagonal parking, sidewalks and street trees.

Off-site Regional Improvements

In the vicinity of Soledad, three regional improvement projects are identified since the Miravale III EIR was certified. The State Route 146 Bypass (Pinnacles Parkway) project and improvements to the U.S. Highway 101 North and South interchanges are included in the 2014 Monterey County Regional Transportation Plan (TAMC 2014). The north interchange project will modify the north Soledad interchange and construct related northbound and southbound ramp improvements, which could accommodate future widening of U.S. Highway 101 to six lanes. It is assumed that planned improvements to the north interchange will also include design considerations for connection to the future extension of Gabilan Drive, which is identified in the Soledad general plan.

The south interchange project will modify the south Soledad interchange and construct related ramp improvements to accommodate possible future widening of U.S. Highway 101 to six lanes. The Pinnacles Parkway project would extend Los Coches Road from U.S. Highway 101 to Metz Road. The latter project is identified as a priority street improvement for the City of Soledad in the TAMC Measure X investment program. Measure X is a three-eighths cent Monterey County sales tax measure that voters approved in November 2016. The City of Soledad is projected to receive approximately $12,000,000 over the next 30 years, which will be supplemented by city and regional development fees. Measure X funds should be able to attract additional state and federal funds for local and regional facility improvements.

Similar to the formerly proposed project, access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane (refer to Figure 2-5). West Street and Orchard Lane currently terminate at the northern city limit adjoining the project site. The former project included modifications to San Vicente Road by the developer, and the roadway would have been realigned west of its current location and widened to meet city standards for collector streets. The proposed project also includes widening San Vicente Road along the western boundary of the site and city limit from the site to Gabilan Drive as part of a city-desired circulation improvement that would provide access from the site to U.S. Highway 101 via the Gabilan Drive extension once the extension is constructed. The extension of San Vicente Road as a collector route would ultimately provide access to the future Gabilan Drive extension to U.S. Highway 101. A potential roadway alignment is shown on Figure 2-5, Miramonte Specific Plan Land Use Diagram. Other long term future access also will be provided via planned roadways to Camphora/Gloria Road when other development associated with the general plan buildout is completed several decades from now.

San Vicente Road

The existing 40 foot right of way for San Vicente Road extends south following the existing City limit line from the southwest corner of the project. This includes two right angle turns. To approximate the capacity of this alignment each right angle can be considered an intersection. According to the 2017 report, level of service calculations indicate that each right angle turn would operate at acceptable LOS A, with about 9.3 seconds of average delay. The total delay would be approximately 18 seconds. Although the overall level of service would be acceptable, traversing this segment will be circuitous and slow, which could be a disincentive to use this access route and cause additional volumes on West Street and Orchard Lane.

The proposed alignment and modification includes an "S" curve (refer to Figure 2-5) that would reduce travel time along San Vicente Road and is recommended as its preferred alignment. Assuming that this feature has 300-foot radius curves it can be designed to accommodate a speed of about 30 miles per hour. This curve would operate satisfactorily with proper curve warning and advisory speed signing. The city's proposed modifications to San Vicente Road occur within the boundary of the former project studied in the Miravale III EIR.

This section provides clarification of previously-identified impacts and mitigation measures in the certified EIR including those that address the facilities along San Vicente Road for which the construction of improvements and/or collection of traffic impact fees was previously proposed by the applicant and that would now be the responsibility of the project developer.

Existing and Background Traffic Scenarios

All study intersections analyzed in the Miravale III EIR currently operate at an acceptable LOS D or better. Five of the unsignalized study intersections evaluated in the 2007 report have since been signalized:

- San Vicente Road and Front Street;
- Front Street and Nestles Road;
- Front Street and U.S. Highway 101 northbound Ramps;
- West Street and Gabilan Drive; and
- Oak Street and Front Street.

Similar to the previously proposed project, signal warrants are met during at least the PM peak hour at several intersections under 2017 report background conditions without the project. Intersection operations under background conditions and the improvements necessary to correct the deficiencies are as follows:

- Moranda Road and Front Street. The intersection is projected to operate at unacceptable LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second eastbound right-turn lane. Intersection operation levels would improve to LOS C with implementation of these improvements.
- East Street and Front Street. The intersection is projected to operate at unacceptable LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second southbound left-turn lane and exclusive westbound right-turn lane. Intersection operation levels would improve to acceptable LOS C with implementation of these improvements.
- East Street and North Street/Metz Road. The intersection is projected to meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Metz Road.

All three intersections also met peak hour signal warrants in 2007 under existing or background conditions without traffic from the formerly proposed project.

The following projects have been built and occupied since 2007:

- Gabilan Square – 9,960 square feet of commercial space and 183 Townhomes/Apartments, located south of Gabilan Drive at Orchard Lane.
- Monterey Street Public Housing Facility – 52 multi-family units, located along the north side of Monterey Street between First and Second streets.
- Benito Street Public Housing – 143 units, located between West and Benito streets, and Gabilan Drive and North Street.

Several other projects, including AutoZone, ARCO Gas Station and Los Coches Mini Storage were approved but not complete at the time of traffic counts for the current study. These projects will impact the vicinity of the U.S. Highway 101/South Front Street interchange. The traffic generated by these projects was added to the existing conditions to estimate background conditions in that part of the study area.

The 2017 report found that all study roadway segments, including San Vicente Road north of Gabilan Drive, and study freeway segments operate at an acceptable LOS C or better under existing and background conditions without the project. Traffic volumes under existing conditions were obtained from 2017 traffic counts at each of the interchange intersections and were found to be greater than historical Caltrans ramp counts, but all freeway ramps

continue to operate at LOS B or better, although the report confirms that the ramp design deficiencies identified in the 2007 report are outdated and as aligned are insufficient to adequately feed large ramp volumes into the greater traffic volumes on the freeway.

Trip Generation and Distribution

For the purposes of this report proposed project trip generation includes trips generated by the eventual development of Sub-area 13 (Residential Study Area) with low-density residential uses, which generate more trips per day. A higher density use could result in fewer daily trips; the specific plan identifies 314 low- to medium-density residential units in the Residential Study Area, and the plan includes policies and standards that allow the number to change if traded to other Sub-areas. For example, if a greater number of mixed use or multi-family dwelling units are developed within the plan area core, the increase in units for core areas would not affect the total number of residential units within the plan area because the number of dwelling units allowed in Sub-area 13 would be decreased by that amount. To be conservative, the following discussion addresses traffic volumes that include development of Sub-area 13 with single-family uses.

The proposed project would generate a total of 20,888 daily net vehicle trips (Higgins 2018, page 2) with approximately 14,142 trips generated by the proposed residential uses and 6,747 trips generated by proposed commercial uses. The commercial component is expected to primarily serve the residents within and immediately adjacent to the specific plan area and residential trips are adjusted to accommodate internal trips.

The overall trip generation of the proposed project represents 13,968 (approximately 40 percent) fewer daily trips than the 34,856 trips that would have been generated by the Miravale III Specific Plan project. The proposed project trip distribution patterns and percentages are identical (Higgins 2017a, Figure 8) to those identified in the 2007 report. All reports show that 10 percent of project-generated trips would utilize the local street network while 70 percent of project traffic would use northbound U.S. Highway 101 and 20 percent would use southbound U.S. Highway 101. Residential uses would be expected to generate the largest amount of traffic on area roadways.

Traffic Mitigation Triggers

The 2017 report and 2018 supplemental report update the development level trigger points identified in the general plan and the 2007 report for two future major roadway improvements that would provide mitigation for many traffic facility impacts caused by any growth into the general plan expansion areas or, by or contributed to by the proposed project: Gabilan Drive Extension, and reconstruction of the U.S. Highway 101/Moranda Road interchange. An estimate of timing for San Vicente Road realignment/widening improvements is included in this discussion as it relates to the trigger points for the two major off-site facility improvements. However, implementation of the three improvements

would require substantial funding that cannot be provided at the initial stages of the development or by the proposed development alone. The trigger points identified in the reports identify the levels of development within the plan area that can occur before implementation of the three major transportation facility improvement projects would be necessary to maintain acceptable traffic levels of service at study intersections. The number of building permits and certificates of occupancy issued for proposed residential uses would be limited by the amount of project traffic that can be accommodated by acceptable levels of service. The anticipated costs of these improvements and the project's proportionate share of costs of construction will be identified in the comprehensive financing plan prepared as part of the required development conditions on the tentative map, the results of which will be implemented through a development agreement subject to the review and recommendations of city staff and approval of the City Council.

Similar to the conclusions of the Miravale III EIR, the 2017 report finds that the effectiveness of the planned Gabilan Drive extension and proposed widening of San Vicente Road to a collector roadway are predicated on the volume and operational capacity of the U.S. Highway 101/Moranda Northbound interchange, which currently operates at LOS C and is expected to operate at LOS F under background plus project conditions without the Gabilan Drive extension.

Both reports note that widening Front Street to four lanes or construction of the Gabilan Drive extension would sufficiently alleviate impacted intersections. As noted previously, the city in 2012 adopted a downtown specific plan with standards that would not allow widening Front Street to the extent necessary to reduce the project impacts. Widening Front Street within the downtown specific plan boundary would require amendment to the block and street standards of the downtown specific plan. Instead, City staff recommend that the Gabilan Drive Extension mitigate the project impacts (Brent Slama, personal communication, August 29, 2017). With implementation of the Gabilan Drive Extension called for in the general plan, roadway widening along the city's visually quaint and pedestrian-oriented core would not be necessary. The 2017 report also found that implementation of the planned Pinnacles Parkway would provide an additional access connecting U.S. Highway 101 south of the Front Street interchange and Los Coches business park with the northern and western portions of Soledad. According to the 2017 traffic report, about half of the Miramonte traffic using this section of Front Street via East Street will likely be diverted to Pinnacles Parkway under the cumulative plus project scenario. Construction of the Pinnacles Parkway would eliminate the need to widen Front Street to four lanes between East Street and Nestles Road.

The 2017 report confirms the Miravale III EIR determination that existing freeway ramps at Moranda Road and U.S. Highway 101 are not designed to accommodate existing traffic volumes and the addition of project traffic, as well as background traffic, would compound the need for improvement of the interchange and reconfiguration of the ramps..

Consequently, the U.S. Highway 101 southbound off-ramp to Moranda Road will be the constraint on any further development in the City of Soledad. The 2018 analysis of ramp capacities indicates that LOS D ramp operations would be maintained until 38 percent of the project traffic, or approximately 7,937 vehicle trips generated by the project are added to the system.

Necessary improvements to the U.S. Highway 101/Moranda Road interchange improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway interchange reconstruction, the TAMC regional development impact fee program has been established for state highways and regional roads within Monterey County. The payment of fees is considered mitigation for project impacts to freeway facilities.

Clarifying language has been added to mitigation measures to reflect the steps necessary for their implementation based on the reduction in anticipated traffic volumes generated by the project and anticipated trigger points that would require construction of improvements to maintain acceptable facility operations.

Gabilan Extension Development Level Trigger

The Gabilan Drive extension will provide a four-lane arterial for a more direct route to the northern portion of the city and to the specific plan site. The extension would alleviate project impacts at several intersections within the current city limits, and would serve as an incentive to divert traffic from the more circuitous routes through existing surface streets that lead to the freeway via Front Street. Figure 12 of the 2017 report shows the change in travel patterns of the project that would result with the extension of Gabilan Drive to U.S. Highway 101. The diagram illustrates that the extension would minimize or even avoid impacts to the intersection of San Vicente Road and Front Street, funnel northbound traffic more directly to U.S. Highway 101 and points north, which would reduce the traffic volumes along Front Street as well. Therefore, similar to the conclusions of the Miravale III EIR the 2017 report recommends that rather than implement undesirable roadway widening along Front Street within the downtown specific plan area, that the project impacts are instead mitigated by either constructing or contributing fair-share of costs towards the construction costs of the extension of Gabilan Drive.

According to the 2017 roadway segment analysis, the segment of San Vicente Road from the project site to Front Street would operate at LOS D and accommodate all project traffic that would use this route if the Gabilan Drive extension is not completed. If modified, the segment would operate at an acceptable LOS A without the Gabilan Drive extension. However, the 2017 report confirms that the most critical point of constraint will be the

intersection of San Vicente Road and Front Street, which would operate at LOS D until about 75 percent of project traffic (approximately 15,581 daily trips) is added to the roadway system. However, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and traffic would spill over onto adjacent streets within the current city limits, such as West Street and Front Street, that provide an alternate access to the site. The report notes that although LOS D roadway segment and intersection operations may be acceptable, a second left-turn lane on Front Street and subsequent widening of San Vicente Road between Front Street and Gabilan drive would be necessary to receive the two left-turn lanes.

However, as noted above, this traffic volume would also impact the operations and capacity of the southbound exit ramp at the US Highway 101/Moranda Road interchange, which, as noted previously is projected to accommodate only 38 percent of project traffic before reconfiguration and improvement would be needed. Construction of the Gabilan Drive extension would eliminate the need for additional lanes, but would also require interchange improvements to connect to the U.S. Highway 101/Moranda Road interchange. Construction of a new US Highway 101/Moranda Road interchange in addition to the Gabilan Drive extension would minimize impacts to all intersections along Front Street, and avoid the need for undesirable widening of this thoroughfare within the Downtown Specific Plan area.

Construction of the Gabilan Drive extension or participation in the city's traffic impact fee program toward its construction would mitigate many of the project impacts to local intersections (discussed in greater detail later in this section) within the city limit and would eliminate the need for undesirable widening of Front Street. Clarifying language is added to the applicable mitigation measures identified in the Miravale III EIR to reflect the interrelated traffic patterns between the Gabilan Drive extension and the U.S. Highway 101/Moranda Road interchange, the reduced traffic volumes of the project, development triggers that would require construction of improvements, and the level of monitoring required to ensure that development is phased with necessary improvements.

San Vicente Road Development Level Trigger

The San Vicente Road realignment along the westerly boundary of the project site to Gabilan Drive would operate at an acceptable LOS A once modified, and at LOS D prior to modification. Both traffic reports estimate that San Vicente Road would carry 22 percent of the proposed project traffic at buildout of the specific plan.

According to the proposed specific plan (Chapter 6) the first phases of development are expected to occur south of the linear park in Sub-areas 1 – 4, and north of the park in Sub-area 10 (refer to Figure 2-5). Development of the specific plan uses in these Sub-areas would consist primarily of low and medium density single family residential uses and would accommodate about 617 dwelling units excluding secondary units. Access to these areas

would be provided by West Street and Orchard Lane. According to the specific plan, Section 6.4, Phasing, subsequent development of single-family uses in the northern portion of the plan area (Sub-areas 11 - 14, or 15) requires three connections to San Vicente Road by the time three of these Sub-areas are developed. The specific plan further calls for completion of the San Vicente Road re-alignment during the initial phases of development at the time the second connection to San Vicente Road is made. The roadway alignment improvement would be expected to occur upon the city's acquisition of sufficient right of way, at minimum with construction of the fifth Sub-area, which could consist of as few as approximately 168 additional dwelling units. Combined with the first four Sub-areas, this represents approximately 785 units or about 33 percent of the proposed residential development. However, even if the roadway realignment improvement is not made at this point in time, the operations along San Vicente Road would continue to operate at LOS D, which is a less than significant impact.

It is assumed that the project will be developed over many years with access initially provided by extensions of West Street and Orchard Lane into the site, and the near-term improvements to San Vicente Road identified above. About 70 percent of the project uses (1,865 dwelling units, or approximately 14,468 overall trips) can be developed on the site before San Vicente Road begins carrying higher volumes of project traffic and "offloading" West Street and Orchard Lane to the extent that operations along these roadways and related intersections would degrade to unacceptable levels. However, as noted previously, operations at the intersection of San Vicente Road and Front Street and at the U.S. Highway 101/Moranda Road interchange would reach an unacceptable and likely unsustainable level F at 38 percent (7,938 vehicle trips) of project development (Higgins 2018). Realignment of San Vicente Road, construction of the Gabilan Drive extension to U.S. Highway 101 and reconfiguration to the U.S. Highway 101/Moranda Road interchange and ramps would mitigate these impacts and many of the project's impacts to other local intersections (identified and discussed later in this section). Therefore, the 2017 report recommends that the project coordinate its proposed improvements to San Vicente Road with construction of the Gabilan Drive extension and related U.S. Highway 101/Moranda Road interchange improvements.

In the interim, the specific plan calls for the developer to construct several improvements to San Vicente Road, including all of the east-side improvements adjacent to the specific plan boundary, as well as southbound turn lanes and adjacent median where needed to serve the plan area, the eastern half of the median including curb and landscaping (except in locations where a northbound turn lane will be needed, and a temporary asphalt curb should be provided), and the southbound travel lane in its ultimate position. Between the north end of the storm water basin parcel and the point about 300 feet north of Vista del Soledad, the specific plan developer will upgrade San Vicente Road in its existing alignment to include two 13-foot lanes with two-foot shoulders for temporary use until the city's desired roadway modifications can be implemented.

Development Trigger Summary

A conceptual example of development levels across residential product types based on the development trigger evaluations of the 2017 report and 2018 supplemental report are summarized in Table 3-8, Summary of Residential Development Triggers.

Table 3-8 Summary of Residential Development Triggers[1,2]

Development Levels by Type	Size	38 Percent	70 Percent	75 Percent
		Units	Units	Units
Single-family Detached Housing[3]	1,318 units	501	923	989
Multifamily[3]	626 units	238	439	470
Senior Housing Detached	134 units	51	94	101
Residential Study Area[3,4]	314 units	120	220	236
Total [4]	2,392 units	910	1,676	1796

SOURCE: Higgins (2017a; 2108); EMC Planning Group 2018

NOTE:

1. Numbers may vary due to rounding.
2. Conceptual only.
3. Affordable units are dispersed in Sub-areas.
4. Assumes single-family units. Duplex, triplex, or fourplex development and/or trading units between higher density areas such as the mixed uses in the plan area core result in fewer trips.

Regional Transportation Impacts

The 2017 report determined that although traffic volumes would be reduced by about 40 percent from the volumes studied in the Miravale III EIR, the traffic generated by the proposed project would also affect operations on the two U.S. Highway 101 ramps at U.S. Highway 101/Moranda Road, and four freeway segments.

Moranda Road and U.S. Highway 101 NB Ramps: Traffic generated by the proposed project would cause LOS F operations on the U.S. Highway 101 northbound on-ramp from Moranda Road at the Moranda Road Interchange. This is a significant impact. The necessary improvement to mitigate to return operations to acceptable levels would consist of signalization of the intersection and the addition of a second northbound left-turn lane, Moranda Road to northbound U.S. Highway 101. Implementation of these improvements will require that the northbound U.S. Highway 101 on-ramp be widened to receive the two lanes. With the construction of the Gabilan Drive extension to U.S. Highway 101 and related roadway widening improvements to San Vicente Road, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements created by the extension. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101.

This impact was identified in the Miravale III EIR as a potentially significant and unavoidable impact despite implementation of Mitigation Measure 4.13-10, which identifies the above-described improvements. Changes or alterations to this intersection that would address service level deficiencies are within the responsibility of Caltrans and already are included in planned interchange improvements identified in the regional traffic impact fee program. The proposed project would be required to pay for its proportionate fair share toward the costs of the improvement. Participation in the regional traffic impact fee program would reduce the proposed project's impact to existing operations at this intersection to less-than-significant. Implementation of the following mitigation measure ensures that the significant impacts would be reduced to a less-than-significant level. Clarification is provided in the mitigation measure to reflect the updated regional transportation plan list of projects covered under the regional transportation impact fee program.

Mitigation Measure

4.13-10 ~~Signalize the intersection and widen the NB U.S. Highway 101 on ramp to add a second NB left-turn lane.~~ The project developer shall contribute its fair share of costs towards the construction improvements to the U.S. Highway 101 interchange at Moranda Road. Prior to the issuance of any building permit for each phase of development, the project ~~applicant~~ developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance, including ~~the~~ TAMC Regional Development Impact Fees for the project's proportionate share of costs to construct improvements to the intersection and northbound ramps of U.S. Highway 101 interchange at Moranda Road. The improvements may include signalization of the intersection and widening the northbound U.S. Highway 101 on ramp to add a second northbound left turn lane. Implementation of these improvements would require widening the northbound ramp to accommodate two lanes. ~~to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.~~ If the aforementioned improvements are not implemented by the time required, the project could ~~instead~~ either construct or contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. Highway 101. Under this approach to mitigation, local roadways shall be monitored by the city at the developer's expense to ensure that ~~LOS~~ levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. In addition the U.S. Highway 101 interchange at Moranda Road/Front Street will require reconfiguration/reconstruction to provide more efficient access to the project site and north Soledad in general. However, improvements to this interchange are

within the jurisdiction of Caltrans and not under the control of the city. ~~should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should would be considered significant and unavoidable.~~ All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Front Street and U.S. Highway 101 SB Ramps: Traffic generated by the proposed project would cause LOS F operations on the U.S. Highway 101 southbound off-ramp to Moranda Road at the Moranda Road Interchange during at least one peak hour. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second lane on the off ramp. The improvement will require the widening of southbound Front Street to two lanes. The volume of vehicles exiting southbound U.S. Highway 101 at Front Street indicate the need for widening of Front Street, between U.S. Highway 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. According to the development trigger analysis the improvements would be required to accommodate greater than 38 percent of trips generated by development of the specific plan area, without exceeding operational levels of service at this interchange. As noted earlier, improvements to this interchange are included in the regional transportation plan and the payment of regional transportation fees would mitigate the project's impact to this regional facility.

However, with the construction of the Gabilan Drive extension to U.S. Highway 101 and related roadway widening improvements to San Vicente Road, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements created by the extension. Therefore, the 2017 report recommends that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101. However, since the necessary improvements are under the jurisdiction of Caltrans and not under the control of the city, should the interchange improvements not be undertaken in time to address the project's impact, this impact would be significant and unavoidable.

This impact to the regional facility was identified in the Miravale III EIR as a potentially significant and unavoidable impact despite implementation of Mitigation Measure 4.13-11, which includes the above-described improvements. Clarification is provided in the mitigation measure to reflect the updated regional transportation plan list of projects covered under the regional transportation impact fee program. With implementation of the following revised mitigation measure the significant impacts would be reduced, but not to a less-than-significant level.

Mitigation Measure

4.13-11 ~~Signalize this intersection, widen southbound Front Street to two lanes and add a second lane on the off-ramp. In addition, the volume of vehicles exiting southbound U.S. Highway 101 at Front Street indicate the need for widening of Front Street, between U.S. Highway 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the U.S. Highway 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. As this is a regional improvement, t~~The project ~~applicant~~ developer shall pay the project's fair share of TAMC regional development Impact fees ~~te funding towards its implementation~~ for the construction of interchange improvements that may include signalization of the intersection the addition of a second lane on the off- ramp and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street. Widening Front Street (a city traffic facility) to two lanes southbound, between US 101 and Moranda Road is also necessary, to provide more efficient access to the project site and north Soledad in general. ~~by submitting payment of the TAMC Regional Development Impact Fees, pursuant to Chapter 3.56 of the Soledad Municipal Code. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the TAMC fee program, the impact should be considered significant and unavoidable.~~

However, improvements to the interchange are within the jurisdiction of Caltrans and not under the control of the city. Should the improvement of the interchange be deemed infeasible by the Caltrans, or the widening of Front Street be deemed infeasible by the city, the impact would be considered significant and unavoidable. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the traffic impact fee in effect at the time of building permit issuance, including the Regional Development Transportation Impact Fees, in order to mitigate the impact at this location. All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

U.S. Highway 101 Freeway Segments. Traffic generated by development of the project would cause unacceptable LOS D operations on the following U.S. Highway 101 freeway segments:

- Northbound U.S. Highway 101 north of Gonzales-5th Street (AM peak hour).
- Northbound U.S. Highway 101 between Gonzales-5th Street to Gloria Road (AM peak hour).

- Northbound U.S. Highway 101 between Camphora Road and North Soledad (AM Peak Hour).
- Southbound U.S. Highway 101between North Soledad and Camphora Road (PM Peak Hour).

The Miravale III EIR identified this impact as less than significant with implementation of Mitigation Measure 4.13-12; however, with implementation of Mitigation Measure 4.13-10 and Mitigation Measure 4.13-11, the significant impacts to the interchanges and affected roadway segments would be reduced to a less-than-significant level. As noted previously, the two projects would widen portions of U.S. Highway 101 to six lanes in the vicinity of the northbound and southbound interchanges, which would alleviate traffic congestion on these freeway segments. Payment of the project's proportionate share of regional traffic impact fees would reduce the project's impact to the regional system to less than significant. Implementation of Mitigation Measure 4.13-12, as revised, ensures that the proposed project pays the appropriate regional traffic impact fee to cover the costs of its proportionate share of the impact to the freeway segments.

Mitigation Measure

4.13-12 ~~The project applicant shall be required to pay towards the city's TIF program, which includes regional improvements, and shall also pay the city's adopted Regional Development Impact Fees established in Chapter 3.56 of the Municipal Code.~~ Prior to the issuance of any building permit for each phase of development, the project ~~applicant~~ developer shall submit payment of the Regional Development Impact Fee in effect at the time of building permit issuance in order to mitigate the project's impacts ~~at identified locations~~ to the identified freeway segments. The payment of fees is considered mitigation for project impacts to highway and regional facilities. All fees shall be subject to the approval of the Director of Public Works. ~~Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable.~~

Internal Circulation Hazards

The proposed project does not include a golf course; therefore no internal circulation conflicts between vehicles and golf carts would occur. There would be no impact and mitigation measure 4.13-1 is no longer necessary.

Local Intersection Operations

The 2017 report and 2018 supplemental report determined that although background plus project scenario traffic volumes will generally be lower than the same scenario analyzed in the 2007 report, the results show that no new impacts or impacts of greater magnitude would result from the proposed project that were not already identified and addressed by the 2007

report and Miravale III EIR. Similar to the conclusions of the Miravale III EIR, the 2017 report identified significant impacts that can be mitigated to a less than significant level through compliance with standard conditions of approval at the following local intersections:

- **West Street and Gabilan Drive**: According to the 2017 report, traffic volumes would be reduced by 18 percent at this intersection, but the impact would still be significant. Also, since the Miravale III EIR was prepared, the intersection has since been signalized. The 2018 supplemental report confirms that with the addition of project traffic, including traffic generated bydevelopment of 314 single-family residential units instead of farmworker housing, the intersection would operate at an acceptable LOS B; therefore proposed project's impact to this intersection would be less than significant and no mitigation is required. Implementation of Mitigation Measure 4.13-5 identified in the Miravale III EIR is not required for the proposed project. Participation in the city's traffic impact fee program is required for new development and would further reduce the project's impacts to this intersection. Compliance with the city's traffic impact fee program is required for the proposed project as a condition of project approval with fees to be paid prior to issuance of building permits.
- **West Street and Front Street.** According to the 2017 report, traffic volumes would be reduced by about 2.9 percent at this intersection, but the impact would still be significant. The Miravale III EIR determined that participation in the city's traffic impact fee program would reduce the impacts to this intersection to less than significant. The 2018 supplemental report confirms that traffic generated by the proposed project, including traffic generated by development of 314 single-family residential units instead of farmworker housing,would not result in a new or greater impact to this intersection that was not already identified and addressed in the certified Miravale III EIR. Compliance with the city's traffic impact fee program is required for the proposed project as a condition of project approval with fees to be paid prior to issuance of building permits.
- **Main Street and Front Street**. According to the 2017 report, traffic volumes would be reduced by about 9.7 percent at this intersection, but the impact would still be significant. The Miravale III EIR determined that participation in the city's traffic impact fee program would reduce the impacts to this intersection to less than significant. The 2018 supplemental report confirms that traffic generated by the proposed project, including traffic generated by development of 314 single-family residential units instead of farmworker housing, would not result in a new or greater impact to this intersection that was not already identified and addressed in the certified Miravale III EIR. Compliance with the city's traffic impact fee program is required for the proposed project as a condition of project approval with fees to be paid prior to issuance of building permits.

- **East Street and Front Street.** According to the 2017 report, traffic volumes would be reduced by about 10.6 percent at this intersection, but the impact would still be significant. The Miravale III EIR determined that participation in the city's traffic impact fee program would reduce the impacts to this intersection to less than significant. The 2018 supplemental report confirms that with the addition of project traffic, including traffic generated by development of 314 single-family residential units instead of farmworker housing, the proposed project would not result in a new or greater impact to this intersection that was not already identified and addressed in the certified Miravale III EIR. Compliance with the city's traffic impact fee program is required for the proposed project as a condition of project approval with fees to be paid prior to issuance of building permits.
- **San Vicente Road and Market Street**. According to the 2017 report, traffic volumes would be reduced by about 22.1 percent at this intersection, but the impact would still be significant. The Miravale III EIR determined that participation in the city's traffic impact fee program would reduce the impacts to this intersection to less than significant. The 2018 supplemental report confirms that traffic generated by the proposed project, including traffic generated by development of 314 single-family residential units instead of farmworker housing, would not result in a new or greater impact to this intersection that was not already identified and addressed in the certified Miravale III EIR. Compliance with the city's traffic impact fee program is required for the proposed project as a condition of project approval with fees to be paid prior to issuance of building permits.
- **West Street and Market Street**. According to the 2017 report, traffic volumes at this intersection would be reduced by about 20.2 percent, but the impact would still be significant. The Miravale III EIR determined that participation in the city's traffic impact fee program would reduce the impacts to this intersection to less than significant. The 2018 supplemental report confirms that traffic generated by the proposed project, including traffic generated by development of 314 single-family residential units instead of farmworker housing, would not result in a new or greater impact to this intersection that was not already identified and addressed in the certified Miravale III EIR. Compliance with the city's traffic impact fee program is required for the proposed project as a condition of project approval with fees to be paid prior to issuance of building permits.
- **East Street and Market Street**. According to the 2017 report, traffic volumes at this intersection would be reduced by about 12.2 percent, but the impact would still be significant. The Miravale Specific Plan EIR determined that participation in the city's traffic impact fee program would reduce the impacts to this intersection to less than significant. The 2018 supplemental report confirms that traffic generated by the

proposed project, including traffic generated by development of 314 single-family residential units instead of farmworker housing, would not result in a new or greater impact to this intersection that was not already identified and addressed in the certified Miravale III EIR. Compliance with the city's traffic impact fee program is required for the proposed project as a condition of project approval with fees to be paid prior to issuance of building permits.

The proposed project would result in significant operational impacts requiring mitigation at the following local intersections:

Moranda Road and Front Street: Although traffic volumes would be reduced by approximately 17 percent at this intersection, traffic generated by the proposed project would cause operations to degrade from acceptable LOS C to unacceptable LOS F (Higgins 2018a; 2018). This is a significant impact. This intersection meets signal warrants with or without the proposed project, and the additional improvement necessary beyond those identified under background conditions to mitigate the project impact at this intersection would consist of adding a second northbound through lane and eastbound free-right-turn lane. The implementation of this improvement would require that northbound Front Street be widened to two lanes. The roadway segment analysis also indicates the need for widening of Front Street between Moranda Road and San Vicente Road or constructing the Gabilan Drive extension to improve intersection levels of service to LOS B or better.

Construction of the Gabilan Drive extension would eliminate the need to add lanes to Front Street and the improvements to the intersection of Moranda Road and Front Street described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, the 2017 report recommends that the project impacts would be mitigated by construction of or payment of the project's fair share of traffic impact fees towards the construction of the extension of Gabilan Drive to U.S. Highway 101. As reported in the discussion of development triggers, improvements to the U.S. Highway 101/Moranda Road interchange would also be necessary to accommodate the Gabilan Drive extension; however, the interchange is a Caltrans facility and not under the jurisdictional authority of the city.

This impact was identified in the Miravale III EIR as less than significant with mitigation. The necessary improvements to mitigate project impacts are identified in mitigation measure 4.13-2 of the Miravale III EIR. No additional mitigation is required; however, the language of mitigation measure 4.13-2 has been revised for clarification based on the roadway improvements called for in the proposed specific plan, the reduced project size, the configuration of allowable uses under the specific plan, and the analysis of traffic "triggers" discussed earlier in this section. Clarification of a monitoring regime is necessary because a number of roadway improvements, including the Pinnacles Parkway, may be operational

before the implementation phase of the proposed project has been completed. These improvements could affect traffic patterns and distribution of project traffic over the 35-year timeframe for project implementation.

Implementation of the following revised Mitigation Measure 4.13-2 in addition to implementation of revised Mitigation Measure 4.13-10 and revised Mitigation Measures 4.13-11, would reduce the project's impact to this intersection to less than significant.

Mitigation Measure

4.13-2 Widen northbound Front Street to two lanes, add a second northbound through lane, eastbound free-right-turn lane and widen Front Street between Moranda Road and San Vicente Road orconstruct the Gabilan Drive Extension. This improvement is necessary with or without the project. The Moranda Road/Front Street intersection would operate at LOS B with construction of the Gabilan Drive Extension.

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:

Prior to the issuance of any building permit for each phase of development, the project ~~applicant~~ developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the construction of the Gabilan Drive Extension in order to mitigate the project's share of impacts at this location or construct the Gabilan Drive Extension.

~~No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad~~

~~Alternatively, the project can contribute its fair share towards the construction of extension of Gabilan Drive to U.S. Highway 101, If this alternative is chosen l~~ The project developer shall also be responsible for monitoring the intersection of Moranda Road/Front Street to determine when the improvement identified above is necessary. Local roadways shall be monitored ~~annually~~ by the city at the developer's expense to ensure that ~~LOS~~ acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. ~~All fees shall be paid prior to the issuance of any building permit for each phase of development.~~ Monitoring shall commence upon issuance of the first building permit and shall be conducted in at least three stages or until the

intersection improvements or Gabilan Drive Extension are complete: prior to issuance of the 700th, 1,000th, and 1,865th residential building permit (excluding secondary units). Monitoring shall include the following:

a. Conduct analyses of all applicable traffic operations based on field-measured data;

b. Study prevailing traffic and roadway conditions;

c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.

The project developer shall install the required improvements at the intersection if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement. The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.

All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension or necessary intersection improvements are installed, subject to the review and approval of the City of Soledad Director of Public Works.

In the alternative, if the City of Soledad Director of Public Works determines that the improvements to the intersection of Moranda Road and Front Street the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, or if the City of Soledad does not approve the installation of the traffic signal, the project developer shall comply with the following.

If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension. The developer may choose to construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad.

Traffic facility improvement plans or traffic impact fees ~~and~~ shall be subject to ~~the~~ review and approval ~~of~~ by the Director of Public Works.

San Vicente Road and Front Street. Although traffic volume would be reduced, traffic generated by the proposed project would cause operations to degrade from acceptable LOS B to unacceptable LOS F at the intersection of San Vicente Road and Front Street during at least one of the peak hours analyzed (Higgins 2017a; 2018). This is a significant impact. As noted previously, this intersection is expected to operate at acceptable levels of service until about 75 percent of project traffic is added to the system. The 2017 report found that the improvement necessary to mitigate the project impact at this intersection would consist of the addition of two eastbound left-turn lanes and southbound free-right turn lane. Construction of this improvement would require widening northbound Front Street to two lanes and northbound San Vicente Road widened to three lanes, which would require a significant amount of right-of-way acquisition. With the construction of the Gabilan Drive extension to U.S. Highway 101, the improvements described above would not be necessary. The 2017 report instead recommends that the project either construct, or contribute towards the construction of, the extension of Gabilan Drive to U.S. Highway 101 to reduce the impact to less than significant.

This impact was identified in the Miravale III EIR as less than significant with mitigation. The intersection has since been signalized. The necessary improvements to mitigate the project's share of impacts are identified in mitigation measure 4.13-3 of the Miravale III EIR. No additional mitigation is required; however, the language of mitigation measure 4.13-3 has been revised for clarification based on the roadway improvements called for in the proposed specific plan, the reduced project size, the configuration of allowable uses under the specific plan, and the analysis of traffic "triggers" for the timing of improvements to San Vicente Road and the extension of Gabilan Drive discussed earlier in this section. Clarification of a monitoring regime is necessary because a number of roadway improvements, including the Pinnacles Parkway, may be operational before the implementation phase of the proposed project has been completed. These improvements could affect traffic patterns and distribution of project traffic over the 35-year timeframe for project implementation. With implementation of the following revised Mitigation Measure 4.13-3, the proposed project's impacts to the intersection of San Vicente Road and Front Street would be reduced to less than significant.

Mitigation Measure

4.13-3 The intersection of San Vicente Road and Front Street would operate at LOS B with the construction of the Gabilan Drive extension or by widening. ~~Widen~~ northbound Front Street to two lanes, northbound San Vicente Road to three lanes, add two eastbound left-turn lanes and a southbound free-right-turn lane.

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:

Prior to the issuance of any building permit for each phase of development, the project ~~applicant~~ developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the construction of the intersection improvements or the Gabilan Drive Extension in order to mitigate the project's share of impacts at this location. Alternatively, the developer may construct the Gabilan Drive Extension.

The project developer shall be responsible for monitoring the intersection of San Vicente Road and Front Street to determine when the improvement identified above is necessary. Local roadways shall be monitored ~~annually~~ by the city at the developer's expense to ensure that ~~LOS~~ acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. ~~All fees shall be paid prior to the issuance of any building permit for each phase of development.~~ Monitoring shall commence at issuance of the first building permit and shall be conducted in at least three stages, prior to issuance of the 600th, 900th, and 1,800th residential building permit (excluding secondary units) or until the intersection improvements are complete. Monitoring shall include the following:

a. Conduct analyses of all applicable traffic operations based on field-measured data;

b. Study prevailing traffic and roadway conditions;

c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.

The project developer shall commence to construct the Gabilan Drive Extension if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement. The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.

All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension or necessary intersection improvements are installed, subject to the review and approval of the City of Soledad Director of Public Works.

In the alternative, if the City of Soledad Director of Public Works determines that the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, the project developer shall comply with the following.

If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. The developer may choose to construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension.

Traffic facility improvement plans or traffic impact fees ~~and~~ shall be subject to ~~the~~ review and approval ~~of~~ by the Director of Public Works.

San Vicente Road and Gabilan Drive: Although traffic volumes would be reduced, traffic generated by the proposed project would cause signal warrants to be met and cause operations to degrade from acceptable LOS B to unacceptable LOS F during at least one peak hour at the intersection of San Vicente Road and Gabilan Drive. This is a significant impact. The necessary improvements to mitigate project impacts at this intersection consist of signalizing the intersection and adding a second westbound left turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. The improvements will require the widening of southbound San Vicente Road to accommodate the dual left-turn lanes from Gabilan. The proposed 80-foot width of San Vicente Road right-of-way would be sufficient to accommodate the improvements to Gabilan Drive. However, with the construction of the Gabilan Drive extension to U.S. Highway 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements. Therefore, the 2017 report recommends that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101.

The Miravale III EIR identified this impact as less than significant with mitigation. The necessary improvements to mitigate project impacts are identified in mitigation measure

4.13-4 of the Miravale III EIR. No additional mitigation is required; however, the language of mitigation measure 4.13-4 has been revised for clarification. With implementation of the following mitigation measure, the project impacts to this intersection would be less than significant.

Mitigation Measure

4.13-4 Signalize this intersection and add a second westbound left turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. SB San Vicente Road will need to be widened to accommodate the dual left-turn lanes from Gabilan. Alternatively, the developer could construct the Gabilan Drive Extension.

The intersection of San Vicente Road and Gabilan Drive would operate at LOS A with the construction of the Gabilan Drive extension.

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:

Prior to the issuance of any building permit for each phase of development, the project ~~applicant~~ developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the construction of the Gabilan Drive Extension in order to mitigate the project's share of impacts at this location, construct the improvement, or construct the Gabilan Drive Extension.

The project developer shall be responsible for monitoring the intersection of San Vicente Road and Gabilan Drive to determine when the improvement identified above is necessary. Local roadways shall be monitored ~~annually~~ by the city at the developer's expense to ensure that ~~LOS~~ acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. ~~All fees shall be paid prior to the issuance of any building permit for each phase of development.~~ Monitoring shall commence at issuance of the first building permit and shall be conducted in at least three stages, prior to issuance of the 600^{th,} 900th, and 1,800th residential building permit (excluding secondary units) or until the intersection improvements are complete. Monitoring shall include the following:

a. Conduct analyses of all applicable traffic operations based on field-measured data;

b. Study prevailing traffic and roadway conditions;

c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.

The project developer shall commence to construct the Gabilan Drive Extension if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement. The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.

All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension or necessary intersection improvements are installed, subject to the review and approval of the City of Soledad Director of Public Works.

In the alternative, if the City of Soledad Director of Public Works determines that the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, the project developer shall comply with the following.

If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. The developer may choose to construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension.

Traffic facility improvement plans or traffic impact fees ~~and~~ shall be subject to ~~the~~ review and approval ~~of~~ by the Director of Public Works.

Main Street and Gabilan Drive: Although traffic volumes would be reduced, traffic generated by development associated with the proposed project would cause signal warrants to be met during at least one peak hour at the intersection of Main Street and Gabilan Drive (Higgins 2017a, 2018). This is a significant impact. The necessary improvements consist of signalizing the intersection with protected left-turn phasing along Gabilan Drive. However,

with the construction of the Gabilan Drive extension to U.S. Highway 101, signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to U.S. Highway 101.

The Miravale III EIR determined that impact to this intersection would be less than significant with mitigation. The necessary improvements or actions to mitigate project impacts are identified in mitigation measure 4.13-6 of the Miravale III EIR. No additional mitigation is required; however, the language of mitigation measure 4.13-6 has been revised for clarification. With implementation of the following mitigation measure, as revised, the project's impacts to this intersection would be less than significant.

Mitigation Measure

4.13-6 ~~Signalize the~~ The intersection of Main Street and Gabilan Drive will operate at LOS A with signalization and protected left-turn phasing along Gabilan Drive. With the construction of the Gabilan Drive extension to U.S. Highway 101, signalization of this intersection would not be necessary.

The project developer is responsible for the project's fair share contribution of costs to mitigate the project's impact to this intersection. The developer shall mitigate the project impacts to this intersection in one of the following ways:

Prior to the issuance of any building permit for each phase of development, the project ~~applicant~~ developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance for the construction of the Gabilan Drive Extension in order to mitigate the project's share of impacts at this location or construct the Gabilan Drive Extension.

The project developer shall be responsible for monitoring the intersection of Main Street and Gabilan Drive to determine when either improvement identified above is necessary. Local roadways shall be monitored ~~annually~~ by the city at the developer's expense to ensure that ~~LOS~~ acceptable levels of service are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. ~~All fees shall be paid prior to the issuance of any building permit for each phase of development.~~ Monitoring shall commence at issuance of the first building permit and shall be conducted in at least three stages, prior to issuance of the 600^{th,} 900th, and 1,800th residential building permit (excluding secondary units) or until the improvements are complete. Monitoring shall include the following:

a. Conduct analyses of all applicable traffic operations based on field-measured data;

b. Study prevailing traffic and roadway conditions;

c. Report the results to the City of Soledad Director of Public Works, who shall determine if and when the improvement is necessary to maintain acceptable levels of service at this intersection.

The project developer shall commence to construct the Gabilan Drive Extension if directed in writing to do so by the City of Soledad Director of Public Works and so long as the city issues any required permits. The developer's costs associated with the required improvements may be subject to partial reimbursement; however, the developer's obligation to install the improvements shall not be dependent on receipt of any reimbursement. The developer shall be obligated to install the identified improvements promptly upon notification from the city of the need to do so.

All required traffic impact fees shall be paid prior to the issuance of any building permit for each phase of development. No certificates of occupancy shall be issued for any development warranting the improvement until the Gabilan Drive extension or necessary intersection improvements are installed, subject to the review and approval of the City of Soledad Director of Public Works.

In the alternative, if the City of Soledad Director of Public Works determines that the Gabilan Drive extension is not needed at the time of issuance of the building permit for the project's 1,800th residential unit, the project developer shall comply with the following.

If the Gabilan Drive Extension is expressly covered in the city's then-current traffic impact program, then the developer's payment of the applicable traffic impact fee shall constitute a fair share contribution toward the improvement of Gabilan Drive. The developer may choose to construct the improvement and may be subject to partial reimbursement at the discretion of the City of Soledad. If the Gabilan Drive Extension is not expressly covered in the then-current traffic impact fee program, the developer shall pay its fair share contribution (based on its pro rata contribution of trips) of costs to the City of Soledad for the construction of the Gabilan Drive extension.

Traffic facility improvement plans or traffic impact fees ~~and~~ shall be subject to ~~the~~ review and approval ~~of~~ by the Director of Public Works.

Andalucia Drive and Gabilan Drive: Traffic generated by the proposed project would cause signal warrants to be met during at least one peak hour at the intersection of Andalucia Drive and Gabilan Drive (Higgins 2017a, 2018). This is a significant impact, which was also identified in the Miravale III EIR as less than significant with mitigation. The necessary

improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive. These improvements are identified in mitigation measure 4.13-7 of the Miravale III EIR. No additional mitigation is required; however, the language of mitigation measure 4.13-7 has been revised for clarification. With implementation of the following mitigation measure, as revised, the project's impacts to intersection operations would be reduced to a less-than-significant level.

Mitigation Measure

4.13-7 ~~Signalize this~~ The intersection of Andalucia Drive and Gabilan Drive will operate at unacceptable level of service with protected left-turn phasing along Gabilan Drive. The project developer is responsible for the construction of this improvement. ~~Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. All intersection fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.~~ No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the ~~City of Soledad~~ Director of Public Works.

Orchard Lane and Metz Road: Although traffic volumes would be reduced at this intersection, traffic generated by the proposed project would cause signal warrants to be met and cause operations to degrade from acceptable LOS C to unacceptable LOS E or worse during at least one peak hour at the intersection of Orchard Street and Metz Road (Higgins 2017a; 2018). The necessary improvements to mitigate project impacts are identified in mitigation measure 4.13-8 of the Miravale III EIR. No additional mitigation is required; however, the language of mitigation measure 4.13-8 has been revised for clarification. With implementation of the following mitigation measure, as revised, the project's impacts to intersection operations would be reduced to a less-than-significant level.

Mitigation Measure

4.13-8 ~~Signalize this~~ The intersection of Orchard Lane and Metz Road will operate at an acceptable LOS with signalization and protected left-turn phasing on Metz Road and split phasing on Orchard Lane. The project ~~applicant~~ developer is responsible for the construction of ~~shall~~ the improvement. ~~submit payment of the City of Soledad traffic impact fee in effect that the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be~~

~~subject to the approval of the Director of Public Works.~~ No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the ~~City of Soledad~~ Director of Public Works.

Oak Street and Front Street and Front Street and Nestles Road. Although traffic volumes would be reduced at this intersection, traffic generated by proposed project would cause intersection operations to decline from acceptable LOS C to unacceptable LOS E (Higgins 2017a; 2018). This is a significant impact. Widening Front Street to four lanes between Nestles Road and Oak Street and adding a second eastbound left-turn lane at the intersection of Nestles Road and Front Street would improve operations to LOS B in this location.

This impact was identified in the Miravale III EIR as less than significant with mitigation. At that time signal warrants were met at this intersection with or without the project. A signal has since been installed. Also, at the time the Miravale III EIR was prepared, the city was in early discussions of a bypass route to provide an alternative connection between U.S. Highway 101 and State Route 146 (Los Coches Road extension), but regional traffic facility improvements associated with Measure X had not yet been identified. Clarification is provided in the mitigation below; which, if implemented would reduce the project impacts to a less-than-significant level.

Mitigation Measure

4.13-9 Construction of the Pinnacles Parkway project would improve intersection operations to acceptable levels of service: ~~Widen Front Street to four lanes between Nestles Road and Oak Street and add a second EB~~ eastbound ~~left-turn lane at the intersection of Nestles Road and Oak Street~~. The project developer is responsible for the project's fair share contribution of costs to mitigate the impact to this intersection. The project ~~applicant~~ developer shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance. ~~Alternatively, the construction of the U.S. Highway 101/SR 146 bypass would alleviate the impacts at this intersection. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance.~~ All fees shall be paid prior to the issuance of any building permits for each phase of development and shall be subject to the approval of the Director of Public Works. ~~No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad~~.

~~Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. Highway 101, If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete.~~

Transit and Pedestrian Analysis

The 2017 report assumes up to a three percent transit mode share, which is probably the highest that could be expected, yields an estimate of 57 PM transit trips during each of the peak hours. This demand along with existing and other future demand for transit service will justify the need for establishing a plan and expansion of the transit system serving the City of Soledad.

Pedestrian facilities in the project area will consist primarily of sidewalks along the streets. Sidewalks will be provided along virtually all streets and at intersections within the project area. There are no existing bicycle facilities that can be extended into the project area. The residential uses of the project along with existing and future Sub-areas will justify the need for a continuous bicycle facility system throughout the City of Soledad. All pedestrian and bicycle lanes of the project should provide for future connection to existing sidewalks and streets.

Traffic and Circulation Conclusion

The proposed project would result in fewer traffic impacts than the previously proposed Miravale III Specific Plan project. Mitigation Measure 4.13-1 is not relevant to the proposed project, and Mitigation Measure 4.13-5, which required signalization of the intersection of West Street and Gabilan Drive is no longer necessary, as the intersection has since been signalized and as a result the proposed project's impact to this intersection is less than significant. No additional mitigation measures are required for any development scenario. The proposed project would not result in new significant traffic impacts or substantially increase the severity of previously identified significant impacts. No changes in transportation-related circumstances have occurred and no new information has been identified that indicate the proposed project would have new or more significant traffic impacts than were identified for the original project.

3.15 Utilities and Service Systems

Miravale III Specific Plan EIR Analysis

Water Supply

A Water Supply Assessment (WSA) and Verification of Supply was prepared for the Miravale III project by the City of Soledad and Byron Buck & Associates (August 2007).

The WSA determined that project development would result in an annual water demand of approximately 2,521.21 acre feet per year (AFY). Net consumptive demand after considering the use of recycled water was estimated at approximately 1,566.3 AFY. Taking into account historical agricultural uses on the project site, development of the proposed project would result in an overall net reduction in groundwater extraction of 501.2 AFY. Actual water demands, however, would vary depending on the ultimate mix of specific uses, water use behavior, and landscape development/maintenance practices. In any given year, consumption is expected to vary depending on weather and precipitation. However, as identified in the WSA, the City of Soledad has sufficient water available to accommodate project generated demand during normal, single dry and multiple dry years.

The EIR concluded that payment of water impact fees as required by the City would further ensure that project-related impacts are less-than-significant.

Water System

According to the city's 2005 Water Master Plan prepared by Schaaf & Wheeler (City of Soledad 2005c), the City-operated water distribution system requires a number of improvements to address system deficiencies. In addition to requiring improvements, the EIR determined that the existing system would need to be extended to provide water services to the project area. As such, additional on-site infrastructure improvements would be warranted. Moreover, development of the proposed project would result in the introduction of new residences and commercial uses outside of the two existing pressure zones previously described above. In order to accommodate the Miravale III project a new pressure zone, Zone C, would be necessary to accommodate development outside of the existing pressure zones. The Miravale III project would allow the development of 4,200 units, in addition to commercial and public uses. Based on the assumed buildout of 3,000 units, the Soledad Water Master Plan determined that the water distribution system would be insufficient to meet maximum day demand and at least two additional wells would need to be drilled, permitted, and connected to the existing system.

Additionally, new and/or upgraded booster pump stations would also be warranted in Zone B and the new pressure zone, "Zone C." Additional storage tanks would also be necessary to accommodate project development. Preliminary estimates identified in the Soledad Water Master Plan determined that a 1.2 million gallon tank in Zone B would be necessary.

Project development would also require the construction of additional distribution and storage systems, transmission mains and improvements. According to the EIR, potential significant environmental effects could result from construction of the facilities if not planned and constructed consistent with City-wide infrastructure improvement plans. The EIR concluded that this was a potentially significant impact that could be reduced to a less-than-significant level with implementation of the following mitigation measures.

Mitigation Measures

4.14-1 Design and construct the water supply and distribution system for the project that is integrated with the City's water distribution system and consistent with the Urban Water Management Plan and the City's 2005 Water Master Plan. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-2 All water and recycled water facilities and infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works. 4.14-3 All water and recycled water pipelines shall be placed underground and in the utilities right-of-way and constructed to comply with all applicable state and local standards. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-4 The project shall be required to construct new infrastructure that is of adequate capacity to serve the project's projected water and fire flow demand in addition to the provider's existing commitments. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.

Wastewater

The City of Soledad would be responsible for providing sanitary sewer services within the project area and the collection system would be extended to provide services to the project site. New wastewater infrastructure (i.e. distribution lines, treatment facility, etc.) would need to be constructed in order to provide services to the project area. According to the City's Long-Term Wastewater Management Plan, the City's total permitted wastewater treatment and disposal capacity was 4.1 mgd and infrastructure would need to be expanded in order to support projected growth. At the time of the Miravale III EIR, the City was in the process of expanding its existing treatment capacity to 5.5. mgd with a 4.3 mgd disposal capacity increasing the treatment capacity to 6,160 AFY with approximately 4,816 AFY of disposal capacity. The Miravale III EIR determined that development of the project would potentially exceed existing and planned wastewater treatment capacity which would be a potentially significant impact. However, the EIR determined that the following mitigation measures would reduce the impact to a less-than-significant level.

Mitigation Measures

4.14-5 In order to ensure that the proposed wastewater treatment system is consistent with the applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and Chapter 13.11 Recycled Water Service, the project applicant shall submit detailed design-level plans in accordance with these requirements, prior to approval of the first Final Map, subject to the review and approval of the City of Soledad Public Works Director.

4.14-6 Prior to the approval of the first final map within the Specific Plan area, all required permits for the on-site recycled water facility, including, but not limited to, a Waste Discharge Permit from the Regional Water Quality Control Board and approval of the system design, shall be obtained. The project applicant shall submit written evidence to the City of Soledad documenting compliance with this measure.

4.14-7 In order to ensure that adequate wastewater treatment is available to accommodate each phase of project development, the treatment capacity for the on-site recycled water facility shall be increased to accommodate each phase of the project prior to the final approval of the first building permit or occupancy permit for each of the respective project phases as appropriate. Subject to the review and approval of the Director of Public Works, excess treatment capacity and related infrastructure shall be added to the plant and disposal facilities, as needed, for each phase of the project, to accommodate future increases in wastewater flow rates, based on estimates of future development. In addition, flows shall be metered and records of the flows shall be provided to the City for review and approval. No building permits shall be issued unless sufficient capacity exists to accommodate additional phases of development.

4.14-8 Prior to the issuance of any building permit, the applicant/developer shall submit payment of the current City Development Impact Fee for each type of development in accordance with the adjusted impact fee in effect at the time of building permit issuance. Additionally, the applicant/developer shall submit payment of all fees necessary to fund the construction of the expansion of the treatment plant located within the project site, as required by the City of Soledad. All fees shall be subject to the review and approval of the Director of Public Works.

Development of the proposed project would require or result in the construction of new water or wastewater treatment facilities and expansion of existing facilities, including the construction of water and wastewater facilities, transmission mains and improvements

which could cause significant environmental effects through construction of the facilities if not planned and constructed consistent with Citywide infrastructure improvement plans. This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.

Mitigation Measures

4.14-9 All water and wastewater infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building and/or grading plan, the project applicant shall submit detailed evidence, including but not limited to design level infrastructure plans, consistent with the requirements of this mitigation, subject to the approval of the Director of Public Works.

4.14-10 All wastewater pipelines shall be placed underground and in the utilities right-of-way. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-11 The project would be required to construct new infrastructure that is of adequate capacity to serve the project's projected demand. Prior to the issuance of any building permit, the project applicant shall submit detailed design level documentation, in addition to written documentation from the City of Soledad, documenting that design-level plans are in accordance with City standards and requirements, as well as documenting that the City has sufficient capacity to accommodate project demands in addition to existing commitments, subject to the approval of the Director of Public Works.

Solid Waste

According to the Miravale III EIR, the Salinas Valley Solid Waste Authority identified solid waste generation averages for its service area as approximately 5.0 pounds per capita per resident per day. Based on a solid waste generation rate of 5.0 pounds per person per day, upon buildout, the project would generate about 76,005 pounds of solid waste per day, or 13,870 tons per year. According to Salinas Valley Solid Waste Authority, project generated solid waste would be disposed of primarily at the Johnson Canyon Landfill, which is permitted to receive 300 tons of solid waste per day. In 2000, the facility received an average of 132 tons of solid waste per day from six jurisdictions. Development of the proposed project would contribute an additional 38 tons of solid waste per day.

The EIR determined that the Johnson Canyon Landfill had adequate capacity to serve its service area, including the development of the proposed project site, however, found that project construction would result in significant construction-generated waste. The following mitigation was identified by the Salinas Valley Solid Waste Authority to ensure that all construction-generated waste is recycled to the greatest extent feasible to minimize impacts to existing facilities within their jurisdiction. The EIR concluded that this was a potentially significant impact that could be reduced to a less-than-significant level with mitigation.

Mitigation Measure

4.14-12 Prior to the commencement of construction related activities, the applicant/developer shall prepare and submit a Construction and Demolition Diversion Plan consistent with the requirements of the City's adopted Diversion Plan Ordinance, subject to the review and approval of the Salinas Valley Solid Waste Authority and the City of Soledad. This plan shall identify ongoing implementation measures for the diversion and separation of construction waste to ensure that all construction-generated solid waste is recycled to the greatest extent possible.

Energy

The Miravale III EIR determined that development of the proposed project would increase demands on electricity (30.2M kWh).and natural gas (0.000094 T Btu per year). To ensure that project impacts related to increased energy consumption were minimized to the extent feasible, the Miravale III Specific Plan included policies to reduce energy consumption, minimize the wasteful use of energy, and ensure that planning and building efforts are coordinated to maximize energy conservation. In addition, the City of Soledad implements Title 24 requirements as part of their building code to ensure that energy conservation measures are incorporated into project design. The Miravale III EIR found that while adherence to existing Title 24 requirements generally reduce project-induced impacts, the increased energy consumption, albeit relatively insignificant from a regional perspective, would still result in the permanent commitment of a non-renewable resource which is a significant impact. The implementation of additional project-specific mitigation would ensure that energy use is minimized to the greatest extent feasible and thereby ensure that project-impacts would be considered less-than-significant.

Mitigation Measure

4.14-13 In order to prevent the wasteful use of energy, all new residential, commercial, and hospitality oriented structures shall incorporate the principles of passive solar design to the maximum extent feasible. Typical passive solar design principles may include the following; 1) large south-facing windows; 2) tile, brick, or other thermal mass material used in flooring or walls to absorb natural heat; 3)

improved insulation; 4) building orientation that takes advantage of the sun, shade, and wind; and 5) energy efficient building materials. For new structures that are unable to incorporate these principles, the project applicant shall submit detailed evidence, such as site plans, landscape plans, and similar, to the City of Soledad Public Works Director demonstrating that there are no viable design alternatives to accommodate these principles. Prior to the issuance of each individual building permit for new structures, the project applicant shall submit evidence, including but not limited to, site plans, proposed building materials, and landscape plans, to the City of Soledad Public Works Director for review and approval.

Proposed Project

Water Supply

According to the updated water supply assessment (AKEL Engineering Group 2017, page 3) the water demand for the specific plan is 980 afy. This amount is 99 afy greater than the water demand of 881 afy identified in the city's 2005 water master plan for a similarly-sized use using 2005 water demand coefficients. However, the water supply assessment also notes that the existing agricultural water demand on the site is approximately 1,568 afy. When compared with the existing water demand on the site, the net water demand from the proposed project would be 587 afy less than the approximately 1,568 afy water demand for the existing agricultural use of the site (AKEL Engineering Group 2017, page 4). The Miravale III EIR identified that buildout of the Miravale project would have a water demand of 2,521.21 afy, which would be reduced to 1,566.3 afy, through the use of recycled water. Therefore, the proposed project, with a projected water demand of 980 afy would demand 587 fewer afy than the existing agricultural use on the site, and 586.3 fewer afy than the Miravale III project.

As noted in the urban water management plan (page 6-15) the City's groundwater supply has been adequate to meet the City's historical demands. In order to meet growing demand for new development not annexed into the City's sphere of influence, the urban water management plan concludes that new groundwater wells will have to be constructed and paid for by future development applicants. The City intends to continue to use groundwater as the sole source of supply. However, domestic water supplies would be augmented by the city's recycled water distribution system, which is expected to come online in 2020 (AKEl Engineering 2016). The proposed project would connect to the municipal water distribution system. The reliable supply will serve a projected 2035 demand of 143,250 afy (AKEL Engineering 2018). The development of the plan area will contribute to this demand but would be accommodated by the city's supply once project and planned infrastructure improvements are made to connect to the current municipal distribution system.

Water System

Future development of the plan area will connect to the municipal water system and be served by Zone C, D, or greater. Two existing on-site agricultural wells, with a combined capacity of 3,600-3,900 gpm, are located on the east side of the plan area and may be retained to provide non-potable irrigation water for use on public parks and open space areas (Nader Agha, telephone conversation, June 7, 2017). To serve the plan area, new domestic wells will need to be constructed, including a back-up well. An additional one million gallon storage tank will also need to be placed on the site above the 400-foot elevation, possibly adjacent to the two existing city-owned storage tanks to meet the future water demands. Furthermore, supplemental pumps are required to provide service to the development on the northeastern side of the plan area that is above the 340-foot contour line. The new water system would be gravity fed with the water tank(s) located within the plan area and distributed throughout the area by a system of underground water mains. The underground water main distribution system will involve pipes with a 12-inch diameter extending throughout the commercial and multi-family areas. The residential areas will be provided with 8-inch diameter pipes, the city's required minimum, as well as fire hydrants distributed throughout the plan area. In the southeast corner of the plan area two existing water pipes that currently serve Miravale II and La Cuesta Views, one of these pipes is 12 inches in diameter and one is 16 inches in diameter and shall remain in place.

As a standard condition of approval and prior to recordation of the first final map for development of the uses consistent with the specific plan, a project-specific water master plan is required to be prepared consistent with city specifications to identify infrastructure improvements and performance standards for the necessary water supply and distribution infrastructure. The plan is subject to review and approval by the Director of Public Works.

The mitigation measures identified in the Miravale III EIR remain applicable to the current project and guide the preparation of the required water master plan. Mitigation measures 4.14-1, 4.14-2 and 4.14-3 shall be modified as follows as the project no longer includes a recycled water facility.

Mitigation Measures

4.14-1 Design and construct the water supply and distribution system for the project that is integrated with the City's water distribution system and consistent with the Urban Water Management Plan and the City's ~~2005~~ Water Master Plan. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-2 All water ~~and recycled water~~ facilities and infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.

4.14-3 All water ~~and recycled water~~ pipelines shall be placed underground and in the utilities right-of-way and constructed to comply with all applicable state and local standards. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

Wastewater

Once the permitting process is complete, the water reclamation facility will have sufficient capacity to accommodate the addition of this plan area's wastewater, because the water reclamation facility upgrade was originally designed to accommodate developments outside of the city limits. Since the water reclamation facility upgrade, little or no development has occurred outside of the city limits creating an abundance of available capacity for the plan area (AKEL Engineering Group 2016). Existing flows consist of 1.2 mgd from within the City of Soledad and approximately 1.2 mgd for the California Department of Corrections facilities for a capacity total of approximately 2.4 mgd through the city's water reclamation facility (Donald Wilcox, email message, June 8, 2017). Bestor Engineers calculated the sewage generation for the project site based on a previous version of the project that had a larger projected population. Therefore, the following analysis based on these calculations may be conservative and could over estimates the potential sewage generation., The sewage projected to be generated by the plan area at buildout is approximately 1.5 mgd (Patrick Ward, email submission to consultant, May 5, 2017). The current flow of 2.4 mgd with the addition of the projected flow from the plan area of 1.5 mgd would result in a total wastewater flow to the plant of 3.9 mgd which is well under the total facility treatment capacity of 5.7 mgd.

The City of Soledad Public Works Department, along with the city's Water Quality Control Division, is in control of the management and preservation of the city's sanitary sewer system and the water reclamation facility (Regional Water Management Group 2012). Known line capacity of sanitary sewer collection facilities in the city are based on operational observations made by city staff. The city is currently developing a wastewater collection system master plan that will identify existing and necessary line sizes and capacity upgrades for future development including the project site. Design and construction of the new sewer system within the plan area will be designed, funded, and constructed by the developer,

with plans subject to the review and approval of the City Engineer. All development impact fees applicable at the time of issuance of a building permit are required, but may be offset by developer designed, funded, and constructed wastewater system improvements.

The proposed project no longer includes a recycled water facility and thus mitigation measures 4.14-5, 4.14-6, and 4.14-7 identified in the Miravale III EIR are not applicable to the proposed project. Mitigation measure 4.14-8 has been revised to eliminate reference to an on-site treatment plant. The remainder of the mitigation measures are still applicable and would ensure that impacts related to construction of the sewer system within the plan area would be less than significant.

Mitigation Measure

4.14-8 Prior to the issuance of any building permit, the applicant/developer shall submit payment of the current City Development Impact Fee for each type of ~~development~~ land use in accordance with the adjusted impact fee in effect at the time of building permit issuance~~. Additionally, the applicant/developer shall submit payment of all fees necessary to fund the construction of the expansion of the treatment plant located within the project site, as required by the City of Soledad. All fees shall be~~, subject to the review and approval of the Director of Public Works.

Solid Waste

According to CalRecycle, Soledad produces an average of 1.9 pounds of solid waste per person per day (CalRecycle 2017). Future development of the plan area will consist of 2,392 residential units in total, with an approximate population of 9,712 people. This increase in population would generate about 18,452.8 pounds per day, or approximately 3,367.6 tons per year of solid waste from the plan area. Considering the maximum amount of 185,000 tons of solid waste received annually at the Johnson Canyon Landfill and the 3,367.6 tons of solid waste projected to be generated annually by the plan area at buildout, the total solid waste the landfill will receive annually at buildout is approximately 188,367.6 tons. With the current capacity of 13,871,250 tons, the landfill will have the availability to serve the disposal needs of the plan area at buildout. However, mitigation measure 4.14-12 identified in the Miravale III remains applicable to the project to ensure a reduction in construction-generated solid waste so as not result in significant environmental impacts.

Energy

The proposed project is smaller than the previously proposed project and would thus require less energy and natural gas. However, it would still result in a significant increase in energy and natural gas demand which is a potentially significant impact. Implementation of Mitigation Measure 4.3-3, which requires the preparation of an Emissions Reduction Plan will require the identification of energy-efficiency measures to reduce emissions from on site

and down-stream energy consumption for on-site water, heating and electricity. The required Emissions Reduction Plan includes a Transportation Demand Management program that will identify the measures to be incorporated into the project that will reduce emissions from vehicle miles travelled, which will also reduce energy consumption of vehicle fuels. Like Miravale III, the specific plan includes policies to promote energy conservation and discourage waste. Specific plan policy LU – F states that prevailing winds, shade trees, window and door orientation, and the positioning of buildings on the site should all be coordinated to maximize energy conservation. Passive solar heating and cooling shall be demonstrated in construction drawings and the Title 24 energy calculations, and shall achieve at least 50 percent of the heating load within each Sub-area will be reduced. Compliance with this policy and with many of the reduction measures that will be implemented as part of Mitigation Measure 4.3-3 address a portion of Mitigation Measure 4.13-1. The following revised Mitigation Measure 4.13-1 remains applicable to the project to ensure energy consumption impacts would be reduced to a less-than-significant level.

Mitigation Measure

4.14-13 In order to prevent the wasteful use of energy, all new residential, commercial, and hospitality oriented structures shall incorporate the principles of passive solar design to the maximum extent feasible. Typical passive solar design principles may include the following; 1) large south-facing windows; 2) tile, brick, or other thermal mass material used in flooring or walls to absorb natural heat; 3) improved insulation; 4) building orientation that takes advantage of the sun, shade, and wind; and 5) energy efficient building materials. ~~For new structures that are unable to incorporate these principles, the project applicant shall submit detailed evidence, such as site plans, landscape plans, and similar, to the City of Soledad Public Works Director demonstrating that there are no viable design alternatives to accommodate these principles.~~ Prior to the issuance of each individual building permit for new structures, the project applicant shall submit evidence, including but not limited to, site plans, proposed building materials, and landscape plans, to the City of Soledad Public Works Director for review and approval.

Utilities and Service Systems Conclusion

The specific plan would not result in new significant effects related to utilities and service systems or substantially increase the severity of previously identified significant effects, no significant changes in utilities related circumstances have occurred, and no new information has been identified that indicates the proposed project would have new or more significant impacts than were identified in the Miravale III EIR.

4.0
Cumulative Impacts

Section 15130 of the State CEQA Guidelines requires an EIR to generate impacts that may be individually limited, but could be significant when taken together with other similar projects in the area (cumulative impacts). As defined by Section 15355 of the State CEQA Guidelines, a cumulative impact is an impact that is created as a result of the combination of the proposed project and related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

4.1 Miravale III Specific Plan EIR Analysis

The Miravale III EIR determined that development of the Miravale II Specific Plan project would contribute to a number of potentially significant cumulative impacts. Mitigation for impacts included implementation of mitigation measures identified in the EIR and adherence to applicable general plan policies. The level of significance after mitigation was determined to be reduced to a less-than-significant level for cumulative impacts to geology and soils, utilities and service systems. However, significant unavoidable cumulative impacts would remain for aesthetics, agricultural resources, air quality, biological resources, and transportation and traffic.

4.2 Proposed Project

The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant cumulative impacts previously identified in the Miravale III EIR and would be mitigated to the maximum extent practicable by the incorporation of all feasible and applicable mitigation measures.

Traffic reports have been prepared for the proposed specific plan: *The Miramonte Specific Plan Traffic Impact Analysis* (Higgins 2017a) and supplemental letter *Miramonte Specific Plan Traffic Study Supplemental Analysis, Soledad, CA* (Higgins 2017b) (collectively "2017 report"), and *Miramonte Specific Plan Replace Proposed Farmer's Community Use to Single-family or Apartment Residential – Traffic Impact Evaluation*, Soledad CA (Higgins 2018) provide an update to the 2007 report based on the proposed project and current conditions. The 2007 report is

included as an appendix to the Miravale III EIR. The 2017 documents are included in Appendix D and are referred to collectively as "2017 report". The 2018 supplemental letter is referred to as "2018 supplemental report). The 2017 report provides and update of existing and estimated background and cumulative local and regional traffic conditions without the project in and near the City of Soledad and includes a comparison between the traffic impacts resulting from the Miravale III Specific Plan project with the traffic impacts of the proposed project, to determine if new or greater impacts and related mitigation measures would be required for the proposed project. The 2018 supplemental report evaluates the environmental effects of development of 314 single-family or multifamily residences, which is slightly different than the Farmer's Community use evaluated by the earlier 2017 reports, for the proposed Sub-area 13, Residential Study Area. As the cumulative scenario included updated project conditions, the cumulative traffic impacts are discussed in specific detail below.

The 2017 and 2018 reports assume that the roadway network and intersection configurations under cumulative no project conditions would be the same as described under background conditions with improvements, with the exception of conditions at the following two intersections:

- Moranda Road and Front Street. Under the cumulative scenario an additional east leg would be necessary at this intersection to provide access to the proposed Soledad Plaza Shopping Center project site. The 2017 report notes that, although the application for the Soledad Plaza Shopping Center project is inactive, it is included as a cumulative project because it is reasonable to assume that a future project similar to the Soledad Plaza Shopping Center has a high probability of occurring in this location, and therefore, is reasonably foreseeable.
- San Vicente Road and Gabilan Drive. The cumulative scenario assumes that a west leg will be needed at this intersection to serve development of the Soledad Plaza Shopping Center project site.

The 2017 and 2018 reports analyzed the respective project contributions to cumulative conditions with and without the Gabilan Drive extension to U.S. Highway 101 identified in the general plan.

The cumulative traffic volumes in the 2017 and 2018 reports include trips associated with the three projects described below. City staff provided the list of cumulative developments.

- The Village at Soledad. 140,000 square foot shopping center and a 68-room hotel, located along the east side of Nestles Road south of Los Coches Drive.
- Soledad Plaza Shopping Center. 536,224 square foot shopping center, located along the west side of San Vicente Road between Moranda Road and Gabilan Drive.

- 263 Front Street. 12,200 square foot retail center and 102 apartments/condominiums, located along the north side of Front Street between West Street and Benito Street.

Traffic volumes for cumulative conditions were estimated by adding traffic associated with pending developments to background traffic volumes for the cumulative without project scenario and the proposed project for the cumulative with project scenario. The magnitude of traffic added to the roadway system by each of the pending developments is estimated by multiplying the applicable trip generation rates to the size of the development.

The 2017 report estimates that these cumulative projects would generate a combined total of 30,731 daily trips. The type of land use, size, and trip estimates of each development is presented in Table 22 of the 2017 report. Cumulative growth traffic volumes with the project are shown on Figure 13 of the 2017 report. Comparison of cumulative plus project traffic estimates in 2017 report with the 2007 forecasts reveals that the 2017 network forecasts are about 13.2 percent less than the network forecasts reported in the 2007 cumulative plus project scenario. As noted in Section 3.14, Traffic and Circulation, the Pinnacles Parkway project that will extend Los Coches Road and Palm Ave to Metz Road will provide additional access connecting the southern U.S. Highway 101 / Front Street interchange and Los Coches business park with the northern and western portions of Soledad. According to the 2017 traffic report, about half of the Miramonte traffic using this section of Front Street via East Street may be diverted to the Pinnacles Parkway under the cumulative plus project scenario. Construction of the Pinnacles Parkway would preclude the need to widen Front Street to four lanes between East Street and Nestles Road. The 2018 supplemental report confirms the findings of the 2017 report with the addition of 2,338 project trips if Sub-Area 13 is developed with single-family residences instead of the Farmers Community described in the 2017 report.

Cumulative Intersection Impacts

Miravale III EIR

The Miravale III EIR found that under cumulative conditions, all study intersections would operate at an acceptable LOS C and D with and without the project. Signal warrants are met at the intersection of Moranda Road and U.S. Highway 101 Northbound Ramps and the intersection of San Vicente Road and Market Street under cumulative conditions. However, the necessary improvements to correct LOS deficiencies that would occur under background plus project conditions (refer to Section 3.14) included signalization of these intersections or the payment of city and regional development impact fees (refer to related discussion in Section 3.14), which would also address the warrants for these intersections under cumulative conditions with and without the project. Therefore, implementation of Mitigation Measure 4.13-10 (presented in Section 3.14of this EIR addendum) would reduce the project

impacts to the intersection of Moranda Road and U.S. Highway 101 Northbound Ramps to less than significant. Compliance with municipal code requirements for the payment of traffic impact fees as conditions of project approval would also reduce the project's contribution to San Vicente Road and Market Street to less than significant. Therefore, no additional mitigation is required.

The Miravale III EIR determined that the project would contribute to cumulative impacts from operational deficiencies at the intersection of Moranda Road and Front Street and the intersection of San Vicente Road and Gabilan Drive that would occur with or without the project. The project's contribution was found to be cumulatively considerable, but the Miravale III EIR determined that implementation of Mitigation Measure 4.13-13 and Mitigation Measure 4.13-14 would reduce the project's contribution to the cumulative impact to less than cumulatively considerable.

Mitigation Measures

4.13-13 Moranda Road and Front Street: Addition of an east leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.

4.13-14 San Vicente Road and Gabilan Drive: Addition of a west leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.

Proposed Project

The proposed project would cause signal warrants to be met at the intersection of Moranda Road and U.S. Highway 101 Northbound Ramps and the intersection of San Vicente Road and Market Street under cumulative conditions (Higgins 2017a, Table 24).The 2017 report also determined that the reduced traffic volumes would cause the intersection of Moranda Road and U.S. Highway 101 to operate at LOS A with the Gabilan Drive extension (Higgins 2017a, Table 23). The 2018 supplemental report confirmed that no new impacts or impacts greater than those identified and addressed in the Miravale III Specific Plan would occur if the Farmers Community analyzed in the 2017 report was replaced with single-family uses (314 units). As noted in Section 3.14, improvement of the intersection of Moranda Road and

U.S. Highway 101 Northbound Ramps is identified in the Monterey County Regional Transportation Plan and is included in the regional traffic impact fee program. With implementation of revised Mitigation Measure 4.13-10 (refer to Section 3.14) the cumulative impact to this intersection resulting from the proposed project would be less than cumulatively considerable. No additional mitigation is required.

With the proposed project, the intersection of San Vicente Road and Market Street would operate at LOS A with and without the Gabilan Drive extension. Compliance with general plan policies and with implementation of Mitigation Measures 4.13-10, 4.13-11, and with the payment of required local and regional traffic impact fees prior to building permit issuance, the project's cumulative impact to this intersection is less than cumulatively considerable.

The 2017 report confirms that the proposed project despite having lower traffic volumes also would contribute to cumulative impacts from operational deficiencies at the intersection of Moranda Road and Front Street and the intersection of San Vicente Road and Gabilan Drive. The 2017 report notes that implementation of Mitigation Measure 4.13-13 and Mitigation Measure 4.13-14 identified in the Miravale III EIR would reduce proposed project's contribution to the cumulative impact to less than cumulatively considerable. The 2018 supplemental report confirmed that no new impacts or impacts greater than those identified and addressed in the Miravale III Specific Plan would occur if the Farmers Community analyzed in the 2017 report was replaced with single-family uses (314 units).

The proposed project would not result in new or greater impacts to intersection operations that were not already identified and addressed in the Miravale III EIR.

Cumulative Roadway Segment Impacts

Miravale III EIR

According to the 2007 roadway segment analysis all of the studied roadway segments were projected to operate at LOS D or better during both peak hours under cumulative no project conditions, with the exception of Front Street, between East Street and Nestles Road (westbound). This roadway segment would operate at LOS E with or without the project. The 2007 roadway segment analysis for cumulative conditions indicated that the addition of project traffic would cause three roadway segment operations to deteriorate to LOS E or worse during at least one peak hour under the cumulative plus project conditions at the following four roadway segments:

- Front Street - between Moranda Road and San Vicente Road (eastbound).
- Front Street - between East Street and Nestles Road (eastbound).
- San Vicente Road-between Market Street and Gabilan Drive (northbound & southbound).

The 2007 report notes that degradation of the Front Street roadway segment levels of service indicates the need for roadway widening or construction of the Gabilan Drive extension identified in Mitigation Measures 4.13-2 - 4.13-4, and/or the U.S. Highway 101/State Route 146 Bypass (Los Coches Road extension) identified in Mitigation Measure 4.13-9 to reduce the impacts to less than significant. At the time, the Los Coches Road extension was not an identified roadway improvement project included in either the city or regional traffic impact fee program. As a consequence, the Miravale III EIR determined that if the improvements were not constructed and the payment of traffic impact fees only would be required, the impact would be reduced, but not to a less-than-significant level and the project's contribution to the cumulative impact would be cumulatively considerable and significant and unavoidable.

Proposed Project

According to the 2017 report, the reduced traffic volumes generated by the proposed project would result in LOS E or worse operations on only two roadway segments: the segment of Front Street between East Street and Nestles Road would degrade from an acceptable LOS D to unacceptable LOS F, and the segment of San Vicente Road between Gabilan Drive and Market Street would degrade from acceptable LOS A to unacceptable LOS E. All other study roadway segments would operate at acceptable LOS D or better.

Construction of the Gabilan Drive extension identified in the Miravale III EIR Mitigation Measures 4.13-2 - 4.13-4, and/or the U.S. Highway 101/State Route 146 Bypass (Los Coches Road extension) identified in Mitigation Measure 4.13-9 would reduce the project's contribution to cumulative impacts to less than cumulatively considerable. Construction of the Gabilan Drive extension, and/or the U.S. Highway 101/State Route 146 Bypass (Los Coches Road extension) would reduce the need for roadway widening on each segment.

Since the Miravale III EIR was certified, the Pinnacles Parkway improvement project has been added to the Monterey County Regional Transportation Plan and is identified as a priority project for partial funding through revenues generated by Measure X. As discussed in Section 3.14, payment of the project's proportionate share of city and regional traffic impact fees would mitigate the project's impact to the roadway segments and intersections along Front Street segment to a less-than-significant level and roadway widening would not be required. Mitigation Measures 4.13-2 – 4.13-4 and 4.9 have been revised to reflect the change in regional improvement projects and funding availability (refer to Section 3.14) and with implementation of these mitigation measures, the project's contribution to cumulative impacts at on the Front Street segment between East Street and Nestles Road is less than cumulatively considerable and less than significant.

With the proposed project, operations along the affected segment of San Vicente Road would improve from the LOS F operations identified in the Miravale III EIR; however, without the project this roadway would operate at LOS B or better under the cumulative conditions. Therefore, the project's traffic volumes on this segment would still be cumulatively considerable. However, with construction of the Gabilan Drive extension (identified in Mitigation Measures Mitigation Measures 4.13-2 – 4.13-4, 4.13-6, and 4.13-9) volumes would be reduced. Payment of the project's proportionate share of city traffic impact fees would mitigate the project's impact to the San Vicente Road segment. With implementation of Mitigation Measures 4.13-2 – 4.13-4, 4.13-6, and 4.13-9 the project's cumulative impact to this segment is less than cumulatively considerable. No additional mitigation is required.

Cumulative Freeway Segment Impacts

Miravale III EIR

The 2007 freeway segment analysis indicates that all but one of the studied roadway segments are projected to operate at acceptable LOS C or better during both peak hours under cumulative no project conditions. The freeway segment analysis indicates that under cumulative plus project conditions the following U.S. Highway 101 freeway segment operations would deteriorate to unacceptable LOS D during at least one peak hour:

1. North Gonzales and Gonzales-5th Street (AM Peak Hour).
2. Gonzales-5th Street and Gloria Road (AM Peak Hour).
3. Camphora and North Soledad (AM and PM Peak Hours).

The Miravale III EIR concluded that implementation of Mitigation Measure 4.13-12 (payment of regional traffic impact fees) would mitigate the project's contribution to cumulative freeway segment impacts to a less than significant level.

Proposed Project

The Miravale III EIR identified this impact as less than significant with implementation of Mitigation Measure 4.13-12. With implementation of Mitigation Measure 4.13-10 and Mitigation Measure 4.13-11, the significant impacts to the interchanges and affected roadway segments would be reduced to a less-than-significant level. As noted previously, the two planned regional interchange improvement projects would accommodate widened portions of U.S. Highway 101 to six lanes in the vicinity of the northbound and southbound interchanges, which would alleviate traffic congestion on these freeway segments. Mitigation Measure 4.13-12 has been revised for clarification to reflect the changes to regional improvement projects and funding availability (refer to Section 3.14). Payment of the project's proportionate share of regional traffic impact fees would reduce the project's contribution to cumulative impacts to the regional system to less than cumulatively

considerable. Implementation of Mitigation Measure 4.13-12, as revised, ensures that the proposed project pays the appropriate regional traffic impact fee to cover the costs of its proportionate share of the impact to the freeway segments. With implementation of this mitigation measure, the project's contribution to cumulative impacts to the affected freeway segments would be less than cumulatively considerable.

Year 2035 Long-Term Analysis

Both the 2007 and 2017 reports found that long-term traffic analysis of the proposed development levels for the originally-proposed project and the current proposed project in addition to growth identified in the general plan and in the region would contribute to significant cumulative traffic impacts identified in the City of Soledad General Plan EIR for to regional and local facilities serving the city. Although lesser in magnitude than the previously proposed project studied in the Miravale III EIR, The proposed project's contributions to the cumulative traffic impacts is cumulatively considerable. Implementation of the Miravale III EIR mitigation measures as revised in this EIR addendum would reduce the project's contribution to traffic impacts on regional and local traffic facilities serving the city, but not to a less than significant level. Therefore, similar to the conclusion of the Miravale III EIR, the project's contribution to these impacts is cumulatively considerable and significant and unavoidable. Nonetheless, the proposed project as well as other development projects within the City of Soledad will be required to contribute to the regional development impact fee program as described under near-term project conditions.

Conclusion

The proposed project would not result in new or greater cumulatively considerable contributions to cumulative traffic impacts that were not already identified and addressed in the Miravale III EIR. According to the 2017 report, the cumulative impacts and project contributions will either be less than cumulatively considerable or reduced to a less-than-cumulatively-considerable level with implementation of standard conditions of project approval and implementation of the mitigation measures identified in this section.

Cumulative Impact Conclusion

The proposed project would not result in new significant impacts or substantially increase the severity of previously identified significant cumulative impacts previously identified in the Miravale III EIR and would be mitigated to the maximum extent practicable by the incorporation of all feasible and applicable mitigation measures.

1.0 INTRODUCTION

1.1 BACKGROUND

In November 2008, the City of Soledad, as Lead Agency, circulated a Draft Environmental Impact Report (Draft EIR or DEIR) prepared under the California Environmental Quality Act (CEQA), Public resources Code §§21000 et seq. The Draft EIR was prepared to analyze the potential environmental impacts associated with implementation of the proposed Miravale III Specific Plan and Vesting Tentative Map (the "proposed project"). The Draft EIR was circulated for a 45-day public review period, between November 4, 2008, and December 18, 2008, and public comments were received.

The purpose of the public review process under CEQA includes sharing expertise, disclosing agency analysis, checking for accuracy, detecting omissions, discovering public concerns, and soliciting counter proposals (CEQA Guidelines §15200). This Final EIR contains a list of the comments submitted on the Draft EIR, copies of the comment letters received on the Draft EIR during the 45-day public review period, responses to the points raised in those comments, and various revisions to the Draft EIR made as a result of the public review process. In accordance with CEQA Guidelines Section 15132, this document has been prepared to address the comments received during the public review periods and, together with the Draft EIR, constitutes the Final Environmental Impact Report for the Miravale III Specific Plan .

The Miravale III EIR addresses the potential environmental effects of implementation of the Miravale III Specific Plan at a program level of review, and Vesting Tentative Map at a project level. The Miravale III Specific Plan provides a guide for the physical development of the approximately 920-acre site. The Draft EIR was prepared to inform the public of the significant environmental effects of the proposed project, identify possible ways to minimize the significant effects, and describe a reasonable range of project alternatives. The following subsections provide a general overview of the proposed project, methods that public input was solicited during the CEQA process, and report organization.

1.2 PROJECT OVERVIEW

The proposed project consists of the development and implementation of the Miravale III Specific Plan and preliminary Vesting Tentative Map. Approval of the proposed Miravale III Specific Plan and Vesting Tentative Map would result in the construction of 1,470 single-family residential units, 116 duplex/small lot single-family residential units, 2,614 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. The project would also include three school sites (two elementary schools and one middle school), a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system.

The project is located within unincorporated lands of Monterey County on the northern edge of the City of Soledad, approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of the San Francisco Bay Area (refer to Figure 3-2). The 920-acre project site is generally between San Vicente Road and Orchard Lane and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east.

The project site consists primarily of undeveloped land. The site's topography is comprised of a natural slope from the southwest corner of the site to the northeast with steeper slopes located at the eastern boundary. The majority of the site ranges in elevation between approximately 180 and 600 feet above mean sea level. The site generally drains to the southwest toward Miravale Road and a large detention basin is proposed at the golf practice range just south. Several small drainages occur in the eastern and western portions of the site. Site vegetation can be characterized primarily with areas of open annual

grassland and minimal trees. Existing trees are located near two single family homes, and a row of eucalyptus trees line one side of San Vicente Road.

1.3 Public Participation

In accordance with CEQA Guidelines §15088.5(d) and 15088.5(f)(3), the City of Soledad notified all responsible and trustee agencies, interested groups, and individuals that the Draft EIR had been completed and was available for public review and comment. The City used the following methods to solicit input during the preparation of the Draft EIR and RDEIR. The following is a list of the actions taken during the preparation, distribution, and review of the Draft EIR.

- The Notice of Preparation (NOP) was filed with the State Clearinghouse on August 24, 2006. The California State Clearinghouse assigned the Clearinghouse Number 2007011069 to the Draft EIR. The NOP was distributed by the City to responsible and trustee agencies, and interested groups, organizations and individuals. The NOP 30-day comment period closed on September 22, 2006. A total of 12 NOP comments were received from agencies and the public; several of which were received after the close of the pubic comment period. Although some comments were received outside of the 30-day comment period, these comments were still considered during the preparation of the Draft EIR.

- A scoping meeting was held on September 7, 2006 to receive input on the Draft EIR.

- The Draft EIR was distributed for a 45-day public review period to responsible and trustee agencies, interested groups, and individuals on November 4, 2008. The public review period for the Draft EIR ended on December 18, 2008. A total of fourteen comment letters were received on the Draft EIR, of which five were received outside of the public review period.

- On December 11, 2008 a public meeting was held before the Planning Commission to receive public comments on the Draft EIR. Notice of this scheduled meeting was included in the Notice of Completion sent to public agencies, organizations and individuals following completion of the Draft EIR.

1.4 Report Organization

This Final EIR is organized into the following four sections:

- **Section 1.0, "Introduction,"** contains this introduction to the FEIR, including a discussion of the background of the environmental review, a description of the contents of the Final EIR, and a summary of the project decision-making process.

- **Section 2.0, "List of Comments on the Draft EIR,"** contains a list of all written comments received on the RDEIR.

- **Section 3.0, "Comments and Responses on the Draft EIR"** contains copies of all comment letters received on the DEIR, and appropriate responses to each comment.

- **Section 4.0, "Revisions to the Draft EIR,"** contains revisions to the text of the DEIR in response to the public comments.

- This volume, together with the Draft EIR, constitutes the Final Environmental Impact Report for The Miravale III Specific Plan. This volume consists of an introduction, comment letters received during the 45-day public review period, responses to comments, and revisions to the Draft EIR.

2.0 LIST OF COMMENTS ON THE DRAFT EIR

2.1 Introduction

This section provides responses to comments on the Draft EIR in accordance with Section 15088 of the CEQA Guidelines.

2.2 List of Comment Letters

Following is a list of comment letters received on the Draft EIR and the dates these letters or facsimiles were received:

State Agencies	**Date**
A. California Governor's Office of Planning & Research	December 31, 2008*
B. California Regional Water Quality Control Board	January 26, 2009*
C. California Department of Transportation	December 22, 2008*
D. California Department of Fish & Game	December 18, 2008
E. California Native Heritage Commission	December 8, 2008

Local Agencies	**Date**
F. Local Agency Formation Commission (LAFCO) of Monterey County	December 15, 2008
G. LAFCO of Monterey County	February 25, 2009*
H. Monterey Bay Unified Air Pollution Control District	December 18, 2008
I. Transportation Agency for Monterey County	December 18, 2008
J. Soledad Unified School District	December 16, 2008
K. Monterey County Resource Management Agency	December 18, 2008

Individuals/Organizations	**Date**
L. David Baker	December 19, 2008*
M. RRM Design Group	December 18, 2008
N. Bestor Engineers, Inc.	December 17, 2009

*Received after close of the public review period.

This page left intentionally blank.

3.0 COMMENTS AND RESPONSES ON THE DRAFT EIR

3.1 INTRODUCTION

CEQA Guidelines §15132(b) requires that a Final EIR include the comments and recommendations received on the draft EIR either verbatim or in summary. In accordance with these requirements, this section contains all of the comments received on the Draft EIR. CEQA Guidelines §15132(d) further requires that the Final EIR contain responses from the Lead Agency to significant environmental issues raised in the public review process. This section provides detailed responses to each of the individual comments received on the Draft EIR. A list of the comment letters is presented in **Section 2.2**, and copies of each of the comment letters are included in this section, with responses to each comment provided following the letter.

3.2 COMMENT LETTERS AND RESPONSES TO COMMENTS

Each letter received on the Draft EIR, as identified in **Section 2.2**, is presented in this section. The individual comments within each letter are numbered, and numbered responses to each of the corresponding comments are provided immediately following each comment letter. In those instances in which a comment states an agency position or opinion and does not comment on issues relevant to the environmental analysis presented in the Draft EIR, a detailed response is not required under CEQA. In those instances, the sentence "The comment is acknowledged" is provided and, where necessary, the comment is referred to decision-makers. In some instances, comments may express an opinion that is directed at the City of Soledad regarding the decision on the project. In those cases, those comments are referred to decision-makers for further consideration and the sentence "The comment is referred to the decision-makers for their consideration" is provided; typically, these comments do not raise issues relevant to the environmental analysis. Where the response notes an addition or deletion to the text, tables, or figures in the Draft EIR, a brief description of the change is provided, and the reader is directed to **Section 4.0, Revisions to the Draft EIR**. The comments identified during the public review period have not raised any new significant information under CEQA; revisions have been incorporated to clarify and amplify the analysis contained in the Draft EIR.

PLANNING DEPARTMENT

Subject: Miravale Phase III Specific Plan
SCH#: 2006081129

Dear Susan Hilinski:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on December 18, 2008, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Terry Roberts

Dear Ms. Hilinski:

DRAFT ENVIRONMENTAL IMPACT REPORT, MIRAVALE III DRAFT SPECIFIC PLAN, SOLEDAD, MONTEREY COUNTY, SCH# 2006081129

Thank you for the opportunity to review the above-referenced document. The Central Coast Regional Water Quality Control Board (Water Board) is a responsible agency under the California Environmental Quality Act (CEQA). Water Board staff understands that the project includes development of approximately 2,600 single-family residential units, 1,600 multi-family residential units, 300 senior housing units, 120 hotel rooms, 18-hole golf course and 250,000 square feet of retail commercial space. As discussed in our August 29, 2008 letter for the project's Notice of Preparation, we again recommend you require the development to incorporate Low Impact Development principles.

Low Impact Development strives to maintain natural infiltration of rainfall by minimizing impervious cover and distributing stormwater controls throughout a development. Maintaining natural infiltration rates is essential in Soledad and the rest of the Salinas Valley, in order to maintain groundwater resources and stream base flow. As currently proposed, this development will greatly increase impervious land cover, and the proposed percolation/retention ponds will not likely maintain natural infiltration rates or patterns.

The proposed development site condition contains several small drainages that would be eliminated under the proposed development. The proposed development must preserve these existing drainages, even if they are only ephemeral in nature, by requiring development to be setback from these features.

The proposed stormwater system consists of an underground piping system to collect stormwater and convey it to two conventional retention basins. Soledad should provide an incentive for decentralized infiltration and treatment in lieu of centralized basins. For example, some jurisdictions have reduced stormwater fees for developments that include decentralized infiltration and treatment, because this kind of stormwater

management generally reduces need for additional capacity or repair to downstream storm drain systems and watercourses.

We'd appreciate your response to these comments in the EIR for this project. If you have questions, please contact **Jennifer Epp at (805) 594-6181**, or Matt Thompson at (805) 549-3159.

Sincerely,

MThompson

S:\Shared\CEQA\Comment Letters\Monterey County\Miravale III Draft Specific Plan-Soledad.doc

LETTER B: CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD (CRWQCB)

B1: This comment recommends that the City of Soledad require that the proposed project incorporate the principles of Low Impact Development (LID) to minimize the extent project induced impacts as a result of increased impervious surface coverage. The City of Soledad is committed to implementing LID principles in connection with this project. In order to ensure that LID principles will be implemented as part of the proposed project, revisions have been incorporated into this EIR. Please refer to **Section 4.0 Revisions to the Draft EIR** for more information.

B2: This comment identifies that there are several small drainages that would be eliminated in connection with the proposed project. This comment suggests that all development should be set back from these drainage features. As identified in the Draft EIR and supporting technical analyses (see Nolan, 1995), existing on-site drainage occurs by overland sheet flow towards shallow ephemeral drainages. These drainages do not typically carry surface water except during peak rainfall events. The project has proposed a series of drainage improvements, including the enlargement of two existing agricultural ponds, to accommodate stormwater runoff associated with the proposed project. While the project, as currently proposed, would eliminate several small drainages on the project site as noted in this comment, post-project drainage would be accommodated through a storm drain system that would reduce project runoff to pre-project conditions. Mitigation measures contained in this EIR, as modified, have been developed to ensure that LID principles are implemented in connection with the proposed project in order to minimize potential impacts associated project drainage. The Draft EIR found that development of the project site as proposed would include storm drain facilities not currently sized to be consistent with Storm Drain Master Plan requirements. However, with mitigation, the project's storm drain facilities will be in accordance with all local and state regulations, and would not result in significant impacts to hydrology or flooding conditions. In addition, the Draft EIR specifically evaluated several project alternatives, including the General Plan Consistent Alternative and Reduced Project Alternative, that would avoid the elimination of several small drainages. These alternatives would substantially lessen the extent of project impacts related to existing on-site drainage by avoiding and/or minimizing the extent of development on the hillside portions of the site. Please refer to **Section 4.0 Revisions to the Draft EIR, Section 6.0 Alternatives,** for more information regarding project alternatives. While the proposed project would still nonetheless eliminate these drainages and mitigation measures have been identified to reduce the extent of this impact, this comment is forwarded to City decision-makers for further consideration during the project review process. If determined appropriate, the City of Soledad could require that a policy be added to the Specific Plan that requires all development to be setback a sufficient distance from all existing drainages to more specifically comply with the request of the comment

B3: This comment identifies that the proposed project's stormwater system consists of an underground piping system to collect and convey stormwater to two conventional retention basins. This comment suggests that the City of Soledad should consider providing incentives to encourage a decentralized infiltration and treatment system versus a conventional centralized system. As identified in the Draft EIR, the proposed project will be required to comply with the applicable provisions of the 2007 Storm Drain Mater Plan (SDMP) in order to ensure that post-project run-off is at or below pre-project conditions. Future development of the project site as proposed by the Miravale III Specific Plan would include storm drain facilities not currently sized to be consistent with Storm Drain Master Plan requirements. However, with mitigation, the project's storm drain facilities will be in accordance with all local and state regulations, and would not result in significant impacts to hydrology or flooding conditions. This comment to encourage a decentralized infiltration and treatment system versus a conventional centralized system is forwarded to the City of Soledad for further consideration as part of the review process.

Dear Ms. Hilinski:

COMMENTS TO MIRAVALLE III DRAFT EIR

The California Department of Transportation (Caltrans), District 5, Development Review, has reviewed the Miravalle III Specific Plan and summary of impacts on transportation facilities.

First, the traffic study (an engineering report) prepared by Hexagon Consultants lacks the required signature and stamps of a licensed professional engineer per the Business and Professions Code sections 6735, 6735.3, 6735.4, and Board Rule 411. In general, these laws require documents (both interim and final) containing such things as signal warrant analysis or sychro-files bear the name and license number of the professional engineer involved. In addition to being legally required, this also serves to protect both Caltrans and the City of Soledad from any potential litigation resulting from inaccurate information or assurances outlined in the document. The signature and stamp indicates that a competent engineer in "responsible charge" of the work stands behind the report and its' conclusions. Without the stamp, the conclusions cannot be considered valid.

Notwithstanding the above, the following comments are based on our review of information provided.

Trip Generation

- Trip generation for the golf course, schools, and the park were not included in counts. (4.13-22) It should not be assumed that all of these trips are internal and from the project.

- Fifty percent of the trips for Retail B are expected to be from the project. (4.13-22). However, Retail B is described as "commercial and/or **hotel**." (3.01-1, 5). If 'hotel' is the option, then 50% is exceedingly high from internal circulation. Related to this, Retail A anticipates 90% internal trips, yet an even minimal detail of Retail A is not provided. (4.13-22)

- Commercial land designation totals 1.74 million square feet, yet only 275,000 square feet is accounted for in trip generation numbers. (4.1-13)

Ramps

- For existing conditions (4.13-11) all of the Highway 101 ramps are shown to be operating at Level of Service (LOS) B or above. This is not correct. For example, ramp merge existing conditions for northbound Highway 101 and Moranda Road are currently at LOS D. Further, an unrelated (yet pertinent) letter dated October 3, 2008 from the City of Soledad to the Transportation Agency for Monterey County (TAMC) seeking program support states that "there is traffic congestion and backups at the intersection of Highway 101 and 146" (not LOS B).

- It is indicated that alignments on all of the ramps are deficient; however, there is no explanation of those deficiencies. (4.13-11)

- Ramp LOS methodologies are incorrect, and Highway Capacity Manual (HCM) is significantly misapplied. One example is by indicating that 1,500 vehicles per hour per lane (VPHPL) capacity is the standard to which ramp LOS is identified. (Figure 4.13-6). This is not correct. Ramp LOS is characterized by mainline and ramp density, not a specific capacity. (HCM 25-5). Capacity of a ramp is a function of the nodes, and not the ramp alone (i.e., merge points or intersections).

Freeway Segments

- There is a misrepresentation of the HCM by indicating that 2,400 VPHPL is the standard to which freeway segments are compared to determine LOS. (Figure 4.13-5). Freeway capacity is based on many factors, including geometry, driver behavior, etc., and not simply passenger vehicles. Because of such things as physical roadway constraints, Caltrans is aware and has documented that freeway capacity for District 5 is no more than 2,000 VPHPL.

Mitigation

- Caltrans is concerned that discussions of cumulative and regional mitigation mostly contain vague language with regard to the projects' financial obligations. For example, there is a statement that "the City of Soledad has not committed to collecting the TAMC fees" for regional improvements (4.13-14). There is also the statement that the reconfiguration of Highway 101/Moranda interchange is a "regional" improvement to "provide efficient access to...Soledad in general." Rather, the need to reconfigure the Moranda interchange is to provide 'efficient access' to this development and the proposed retail super center, not the public in general.

- By indicating that the Moranda interchange project should "be the responsibility of TAMC" (4.13-36) and paying the City's adopted TIF fee is acceptable in-lieu of, this project has avoided its' obligations to mitigate regional impacts outside of the boundaries of the City of Soledad. Miravalle III is a large-scale project of regional significance that will have impacts to the north as commuters travel to workplace centers. By participating in the TAMC Regional Fee Program (as adopted by the City of Soledad) those impacts are mitigated.

Summary/Requests

- Definitive language that the project will mitigate cumulative impacts through payment of TAMC Regional Fee Program. Discounts may be given when there is project overlap with the City's traffic fee ordinance.

- A merge and diverge analysis conducted at Highway 101 ramp locations within the City. This analysis should be performed in accordance with HCM Chapter 25 methodology.

- Freeway segments should be reanalyzed using HCM Chapter 23 methodology.

- Elaborated information where ramp deficiencies are observed.

- The revised traffic study will include the signature and stamp of a licensed professional engineer.

If you have any questions, or need further clarification on items discussed above, please don't hesitate to call me at (805) 542-4751.

Sincerely,

JOHN J. OLEJNIK
Associate Transportation Planner
District 5 Development Review Coordinator

LETTER C: CALIFORNIA DEPARTMENT OF TRANSPORTATION (CALTRANS)

C1: This comment states that the traffic impact analysis prepared by Hexagon Transportation Consultants, Inc. must bear the signature and stamps of the licensed professional engineer that was responsible for preparing the analysis. In the opinion of the commenter, absence of this information the conclusions contained in the traffic analysis cannot be considered valid. A copy of the final signed and stamp traffic analysis is available at City Hall.

C2: This comment asserts that the trip generation for the golf course, schools, and parks were not included in the traffic counts. As part of the process for development of the traffic impact analysis prepared by Hexagon, the City Public Works Department and their consulting engineer independently reviewed the trip generation estimates and conclusions in the analysis. Hexagon traffic engineer Robert Del Rio, who prepared the analysis, reviewed the Caltrans comment and indicated that the trip rates and resulting trip generation estimates utilized for the proposed residential units include trips to employment and other complimentary land uses such as schools, parks, and retail. Additionally, the size of the proposed development in relation to the existing number of units within the City of Soledad creates a demand on schools, parks, and retail within the City that cannot be met by existing facilities. Thus, the residents of the proposed development are expected to be served nearly exclusively by internal ancillary land uses of the project. Also see **Response to Comment C3**, below.

C3: This comment states that the trip internalization rate of 50 percent for traffic associated with the retail uses and hotel on the "Retail B" site is considered high, and that the high (90%) trip internalization rate for the area identified as "Retail A" is not supported by detail concerning the types of uses associated with this site. Because of the "Retail A" site's central location in the project area and the fact that the proposed retail uses are intended to be neighborhood serving under the Specific Plan, the majority of trips generated by the retail uses of the project will be those already accounted for within the trip estimates for the proposed residential uses of the project. The high internalization rate is, therefore, considered reasonable in this case. With the exception of hotel visitor-related traffic, the "Retail B" parcel located along the project boundary will likely attract patrons from existing surrounding residential areas in Soledad. Those trips that are generated externally, outside the project boundaries, would likely originate from with the City of Soledad, since the retail is not intended to be regional serving. As with the proposed residential units, existing residential land uses have already accounted for trips to retail. Thus, the majority of any external trips generated by the proposed retail will be a redistribution of existing retail trips within Soledad, hence the higher than typical internalization reduction rate However, even assuming a lower internalization rate of 40 or 30 percent for the Retail "B" site, the increased number of trips external to the project would not be significant i.e., 440 to 886 additional external daily trips, and would not affect the significance level of related impacts or mitigations. Also see **Response to Comment C2**, above.

C4: This comment identifies that approximately 1.74 million square feet of commercial use is proposed as part of the project, but only 275,000 square feet is accounted for in the trip generation numbers. As correctly described in the Draft EIR, implementation of the proposed project would result in the construction of a maximum 275,000 square feet of commercial uses. Based on the information contained in the Specific Plan, commercial use is limited to a maximum 275,000 square feet. Development of additional commercial uses beyond the maximum 275,000 square feet would be subject to additional environmental review as required pursuant to CEQA.

C5: This comment asserts that existing ramp operations for northbound Highway 101 and Moranda Road are operating at a Level of Service (LOS) D not B as stated in the Draft EIR. However, a separate analysis of existing ramp operations, completed as part of the Project Study Report (PSR) supporting technical analysis for the planned North Front Street Interchange improvements, indicates that the existing peak hour ramp operations for the Northbound Off-ramp to Moranda Road/Front Street are currently at LOS

"B," while the Northbound On-ramp from Moranda Road/Front Street functions at LOS "B" (p.m. peak hour) and "C" (a.m. peak hour). This analysis was completed by Omni-Means Engineers for the City of Soledad in October 2008 and largely substantiates the conclusions of the Draft EIR regarding existing LOS of the North Front Street/Highway 101 ramps. However, the Omni-Means analysis does conclude that the northbound 101 onramp from Moranda Road currently operates at LOS "C," rather than "B," during the morning peak hour. In response to this comment, the Final EIR has corrected the LOS for ramp operations for the northbound on-ramp from Moranda Road/Front Street; please refer to **Section 4.0 Revisions to the Draft EIR, Traffic and Circulation, Section 4.13.**

C6: This comment identifies that the Draft EIR determined that the existing ramp alignments are considered deficient, yet no explanation of those deficiencies is provided in the Draft EIR. A brief explanation of the ramp configurations can be found on page 4.13-11 of the Draft EIR; no further response is required.

C7: This comment contends that the LOS volume-to-capacity ramp methodology used in the traffic analysis is incorrect and the Highway Capacity Manual (HCM) has been significantly misapplied in certain instances. Specifically, this comment identifies that the Ramp LOS is characterized by mainline and ramp density, not a specific capacity as used in the traffic analysis. Capacity, according to the comment, is a function of the nodes and not the ramp alone. Although the described methodologies can be applied to the analysis of the completed traffic study, the analysis will result in the same mitigation measures as those already presented in the traffic study (i.e., payment of TAMC regional impact fees).

C8: This comment states that the Draft EIR and thereby the traffic analysis misrepresented the HCM by indicating that 2,400 vehicles per hour per lane (VPHPL) is the standard to which freeway segments are compared to determine LOS. Due to physical roadway constraints, this comment notes that the documented freeway capacity for Caltrans District 5 is no more than 2,000 VPHPL. The capacity is based on number factors and not simply passenger vehicles.

C9: This comment expresses specific concerns related to the cumulative and regional mitigation language contained in the Draft EIR concerning the project's financial obligation. The comment specifically identifies that the mitigation language related to the City of Soledad's commitment to collecting TAMC fees is vague. In addition, this comment also identifies that the reconfiguration of the Highway 101/Moranda interchange is intended to improve access to the proposed project and the unrelated regional commercial project on San Vicente Road and Moranda Road. At the time the Draft EIR was prepared it was unknown whether the City of Soledad was going to collect the TAMC fees for regional improvements. The City has since adopted the Regional Transportation Impact Fees and the EIR has been revised to reflect this situation. In addition, the EIR has also been revised to add information on the reconfiguration of the Highway 101/Moranda interchange and the proposed project. Please refer to **Section 4.0 Revisions to the Draft EIR, Traffic and Circulation, Section 4.13,** for more information.

C10: This comment asserts that the payment of City of Soledad adopted Transportation Impact Fee does not avoid the project's obligation to mitigate regional impacts outside of the boundaries of the City of Soledad. This comment notes that the City's participation in the TAMC Regional Impact Fee Program mitigates the project's regional cumulative impacts. At the time the Draft EIR was prepared it was uncertain whether the City would participate in the TAMC Regional Fee Program. As noted in the prior comment, the City does participate in this program. The text of the Draft EIR has been revised to clarify that the City currently collects TAMC fees. Please refer to **Section 4.0 Revisions to the Draft EIR, Traffic and Circulation, Section 4.13,** for more information.

C11: This comment requests that definitive language be incorporated into the EIR to ensure that the project will mitigate cumulative impacts through the payment of TAMC Regional Fee Program. The EIR has been revised to clarify that the proposed project will be required to mitigate cumulative impacts to

regional facilities through the payment of applicable TAMC fees. Per CEQA Guidelines § 15130(a)(3), payment of fees is an equitable and typical method for collecting the necessary funds to implement transportation improvements. Please refer to **Section 4.0 Revisions to the Draft EIR, Traffic and Circulation, Section 4.13,** for more information; see also **Responses C9** and **C10**.

C12: This comment requests that a merge and diverge analysis be conducted at Highway 101 ramp locations within the City in accordance with HCM Chapter 25 methodology. Please refer to **Responses C5 and C7** for a response to this comment.

C13: This comment requests that the freeway segments be reanalyzed using HCM Chapter 23 methodology. Please refer to **Response C8** for a detailed response to this comment.

C14: This comment requests that additional information be provided in the EIR regarding ramp deficiencies. Please refer to **Response C6** for a detailed response to this comment.

C15: This comment requests that the revised traffic analysis include the signature and stamp of the licensed professional engineer that was responsible for preparing the analysis. Please refer to **Response C1** for a detailed response to this comment.

Subject: Draft Environmental Impact Report (DEIR) for the Miravale III Specific Plan (SCH No. 2006081129)

Dear Ms. Hilinski:

The Department of Fish and Game has reviewed the City of Soledad's (City) Miravale Phase III Specific Plan (Project) DEIR. The Project consists of developing and implementing the Miravale III Specific Plan. The specific plan calls for 1,470 single-family residential units, 2, 370 multi-family residential units, 120 hotel rooms, 275,000 square feet of commercial space, an 18-hole golf course, a fire and police substation, a recycled water plant, three school sites, and 75 acres of open space. The total Project site is 920 acres. D-1

Please be aware that the Federal threatened California tiger salamander may become a candidate for State listing imminently. The Department has yet to determine whether the California Endangered Species Act (CESA) would regulate "take" of the hybridized salamanders present on this Project site if the species becomes State-listed. D-2

The Department has substantial concerns about the proposed Project's unmitigated special status species impacts and "take" of the Federal endangered and State threatened San Joaquin kit fox (*Vulpes macrotis mutica*). This DEIR would not support our issuance of the required Incidental Take Permit for San Joaquin kit fox. The DEIR defers the formulation of mitigation measures for kit fox, seven other special status species, and three general biological resource impacts until after Project approval. Deferred surveys for several species creates a lack of baseline data for informed decision making. Because of the deferred resource inventories and mitigation, it is unclear how the significance determinations were made for this Project. D-3

In addition, the DEIR should recognize that filling the reservoir on-site may warrant mitigation and require a Lake or Streambed Alteration Agreement (LSAA) with the Department. As described below, we believe that the Final Environmental Impact Report (FEIR) prepared for this Project would be significantly strengthened by addressing these issues in a substantive manner. D-4

California Environmental Quality Act (CEQA) and CESA Authority: The Department is a Trustee Agency with the responsibility under CEQA for commenting on projects that could impact fish and wildlife resources, including plants. Pursuant to Fish and Game Code Section 1802, the Department has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable D-5

populations of those species. As a Trustee Agency for fish and wildlife resources, the Department is responsible for providing, as available, biological expertise to review and comment on environmental documents and impacts arising from project activities, as those terms are used under CEQA. D-5 cont.

The Department is a Responsible Agency when a subsequent permit or other type of discretionary approval is required from the Department, such as an Incidental Take Permit, pursuant to CESA, or an LSAA issued under Fish and Game Code Section1600 et seq. It appears that this Project is likely to require both an Incidental Take Permit and an LSAA. D-6

The Department's issuance of an Incidental Take Permit or LSAA is also considered a "project" subject to CEQA (CEQA Guidelines Section15378). The Department typically relies on the Lead Agency's CEQA compliance to make findings, pursuant to CEQA Guidelines Section 15091. A Statement of Overriding Considerations for significant State-listed species impacts will not legally support State Incidental Take Permit issuance. For the Lead Agency's CEQA document to suffice for permit issuance, it must fully describe the potential project-related impacts to State-listed species and commit to measures to avoid, minimize, and fully mitigate impacts to these resources. If the CEQA document for this Project does not contain these commitments, the Department may need to act as a Lead CEQA Agency and complete a subsequent CEQA document to support permit issuance. This could significantly delay permit issuance and, subsequently, Project implementation. D-7

San Joaquin Kit Fox: The DEIR states that the presence of the Federal endangered and State threatened San Joaquin kit fox (*Vulpes macrotis mutica*) is assumed based on suitable habitat and location within historic range. The DEIR also documents an active natal den on-site (page 4.4-12 of Volume I, and page 23 of Appendix T-3) and that the Project would result in direct mortality, loss of habitat, and loss of dens. A likely Federal Incidental Take Permit requirement is identified. The DEIR does not discuss State Incidental Take Permit requirements. Based on the information present in the DEIR, the Department has concluded that this Project is likely to result in "take" of San Joaquin kit fox and that a State Incidental Take Permit is required to comply with CESA, which is described in Fish and Game Code Section 2081 et seq. D-8

The DEIR describes the Project's kit fox impacts as significant and unavoidable. As discussed above, a Statement of Overriding Considerations for significant State-listed species impacts does not support State Incidental Take Permit issuance. The Department would not be able to provide an Incidental Take Permit for this Project, based on the mitigation measures included in this DEIR. In order for the Department to issue an ITP, impacts to the species must be fully mitigated. While Incidental Take Permits generally include additional mitigation measures beyond those described in the CEQA document, at a minimum, the CEQA document should fully describe the potential project-related impacts to San Joaquin kit fox and commit to measures which avoid, minimize, and mitigate those impacts. D-9

Full mitigation would consider direct "take" of individual kit fox during construction, mortality caused by the loss of 920 acres of habitat, increased mortality resulting from increased traffic, reduced habitat connectivity, and potentially other factors not considered in the DEIR. The D-10

Project would further isolate suitable habitat north and south of the Project site. We would like to work with the City and its applicant to develop a full mitigation strategy for San Joaquin kit that can be included in the FEIR, or preferably, to select an alternative that would avoid or substantially reduce the habitat impacts and avoid "take." D-10 cont.

The selection of an alternative in the FEIR must consider the fact that feasible alternatives are presented which may substantially lessen kit fox impacts. However, the DEIR does not establish whether any of the alternatives would avoid "take" of San Joaquin kit fox. This should be determined in the FEIR. The Project and all alternatives which displace kit fox habitat should include feasible compensatory measures to reduce the habitat impacts to less than significant levels regardless of take permit requirements D-11

Botanical Inventories: Appendix T-3 of the DEIR states that "The plants present within the project site were surveyed on more than one occasion." Neither Appendix T-3 nor any other part of the DEIR provides botanical survey dates, times, or other information required to determine whether the surveys would have detected rare plant species. D-12

The DEIR does disclose that the surveys would not have detected Lemmons' jewelflower. Considering that this species blooms March through May, it appears that insufficient surveys were performed during the season when most rare grassland species on the Central Coast are detectable and identifiable. Without floristic surveys during the spring blooming season, it is not possible to determine or disclose this Project's potential impacts to special status plant species. D-13

Botanical surveys should follow guidelines developed by the Department (http://www.dfg.ca.gov/biogeodata/cnddb/pdfs/guideplt.pdf) and the United States Fish and Wildlife Service (http://www.fws.gov/ventura/speciesinfo/protocols_guidelines/docs/botanicalinventories.pdf). Botanical surveys should cover the entire property and should be timed appropriately to detect all species which may occur on the property before CEQA analysis occurs to establish a baseline for impact analysis. Use of reference sites is recommended for species which are known to occur in the vicinity or which otherwise have a high potential of occurring on-site. D-14

Lack of Baseline Data for Special Status Species: The courts have repeatedly not supported conclusions that impacts are mitigable when essential studies, and therefore impact assessments, are incomplete (*Sundstrom v. County of Mendocino* (1988) 202 Cal. App. 3d. 296; *Gentry v. City of Murrietta* (1995) 36 Cal. App. 4th 1359; *Endangered Habitat League, Inc. v. County of Orange* (2005) 131 Cal. App. 4th 777). The DEIR discloses a lack of studies for species which are likely to occur on-site, yet determines that the impacts to these species are mitigated to less than significant levels by means of pre-construction surveys and formulation of mitigation plans after the public review process. For the following species, it is unclear how significance determinations were made, given that no baseline data was collected: the California Native Plant Society List 1B.2 species Lemmon's jewelflower (*Caulanthus coulteri* var. *lemmonii*), and the California Species of Special Concern Townsend's big-eared bat (*Corynorhinus townsendii*), pallid bat (*Antrozous pallidus*), and western mastiff bat (*Eumops perotis*). Additional special status plant species for which significance findings were not made may also occur on-site but would not have been detected during surveys for this Project. D-15

The DEIR also documents that no surveys were performed, and therefore presence was undetermined, for additional species that may occur in suitable habitat documented on-site. Despite the lack of baseline data, the DEIR concludes that the Project would significantly and unavoidably impact the Federal threatened California red-legged frog (*Rana draytonii*) and the California Species of Special Concern Western spadefoot toad (*Spea hammondii*). Determining whether and to what extent these species occur on-site is essential to formulating mitigation and making significance findings in the FEIR. D-16

Deferred Mitigation: CEQA Guidelines (§15126.4 (a)(1)(B)) stipulates that mitigation measures should not be deferred to a future time. The Court of Appeal in *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645 struck down mitigation measures which required formulating management plans developed in consultation with State and Federal wildlife agencies after project approval.

For eleven of the significant biological impacts identified, the DEIR defers the formulation of mitigation measures to resource-agency consultation and/or permit application, after the public review process and Project approval. Table 1 lists these resources and impacts. It is unclear how the significance findings were made without the formulation of mitigation measures. We recommend completing surveys for these species prior to Project approval to facilitate informed decision making and to comply with CEQA. D-17

Table 1. Significant Biological Impacts for Which Mitigation is Deferred

Impact or Common Name	Scientific Name	Status*	DEIR Determination
San Joaquin kit fox	*Vulpes macrotis mutica*	ST, FE	Class I
pallid bat	*Antrozous pallidus*	SSC	Class II
Townsend's big-eared bat	*Corynorhinus townsendii*	SSC	Class II
Western mastiff bat	*Eumops perotis*	SSC	Class II
Lemmon's jewelflower	*Caulanthus coulteri* var. *lemmonii*)	CNPS 1B.2	Class II
California red-legged frog	*Rana draytonii*	FT, SSC	Class I
Western spadefoot toad	*Spea hammondii*	SSC	Class I
Salinas pocket mouse	*Perognathus inornatus psammophilus*	SSC	Class I
wildlife movement and nursery sites	N/A	N/A	Class I
habitat fragmentation	N/A	N/A	Class I
vegetation/oak tree removal	N/A	N/A	Class II

*ST: State Threatened; FE: Federal Endangered; SSC: California Species of Special Concern; FT: Federal Threatened; CNPS 1B.2: California Native Plant Society rare, threatened, or endangered in California and elsewhere.

California Tiger Salamander: The Federal Threatened California tiger salamander may become a candidate for State listing imminently. The Department has yet to determine whether the hybridized population present on this Project site would be regulated if the species becomes State-listed. D-18

Wetland Mitigation and LSAA Requirements: Pursuant to Fish and Game Code Section1600 et seq., the Project would require Notification to the Department prior to filling the reservoir and any streambeds identified on-site. The DEIR does not identify any LSAA requirements.

The DEIR states that 0.17 acres of wetland would be lost, but that this loss is less than significant based on the fact that undescribed golf course ponds and storm water features would offset the impacts. This approach would be expected to lead to a determination that impacts are less than significant with mitigation (although deferred) incorporated, yet the DEIR concludes that the impact is less than significant. The loss of 0.17 acres of wetland would require mitigation according to Fish and Game Commission policy. The FEIR should clarify whether wetlands are associated with the reservoir. We recommend that the applicant request a jurisdictional determination from the United States Army Corps of Engineers to determine whether the reservoir and associated wetlands are subject to Clean Water Act regulation. D-19

As discussed in the DEIR, this reservoir supports a hybridized California tiger salamander population and may support California red-legged frog and Western spadefoot toad. The presence of these species may warrant additional mitigation measures that would affect the conditions of an LSAA. The FEIR should determine the presence of these species and formulate appropriate mitigation. D-20

Regardless of species presence, the FEIR should include a plan to ensure no net loss of wetland and riparian habitat values and acreage if it is to support issuance of the potential LSAA. The FEIR should include a plan to replace the total *area* of wetland and riparian habitat lost, if those losses are unavoidable. Fish and Game Commission policy states that for every acre of wetland lost, no less than one acre of wetland must be created from non-wetland habitat. The policy further describes that the compensatory mitigation must at least duplicate the fish and wildlife habitat values that are lost to project implementation. Mitigation sites should include buffers of sufficient width to eliminate potential disturbance from noise, human activity, feral animal intrusion, and any other potential sources of disturbance. In-kind, on-site mitigation is generally the most acceptable. The Department strongly prefers mitigation which would both expand wetland acreage and enhance wetland habitat values, while avoiding impacts to other classes of sensitive resources. D-21

Avoidable Wildlife Impacts from Erosion Control Mesh Products: Due to this Project site's extensive wildlife habitat interface, the Department recommends that erosion control and landscaping specifications allow only natural-fiber, biodegradable meshes for use in erosion control mats, blankets, and straw or fiber wattles. "Photodegradable" and other plastic mesh products have been found to persist in the environment, ensnaring and killing terrestrial and aquatic wildlife. Herpetofauna kills are well-documented (Barton and Kinkead 2005, Walley et D-22

al. 2005, Washington State Department of Transportation 2005). Plastic mesh erosion control products would likely cause unanticipated, avoidable impacts including "take" of terrestrial and aquatic species. D-22 cont.

Thank you for the opportunity to comment on the Miravale Phase III DEIR. If you have any questions regarding these comments, please contact Dave Hacker, Environmental Scientist, at 3196 Higuera Street, Suite A, San Luis Obispo, California 93401, by telephone at (805) 594-6152, or by e-mail at dhacker@dfg.ca.gov.

Sincerely,

Jeffrey R. Single, Ph.D.

LETTER D: CALIFORNIA DEPARTMENT OF FISH & GAME (CDFG)

D1: Comment acknowledged. No response necessary.

D2: This comment identifies that the Federally threatened California tiger salamander may become a candidate for State listing imminently and that CDFG has yet to determine whether the California Endangered Species Act (CESA) would regulate "take" of the tiger salamanders present on the project site. The California Fish and Game Commission voted on March 3, 2010, to list the California tiger salamander (CTS) as "threatened" under the CESA. Similar to the Federal Endangered Species Act (ESA), the CESA generally prohibits anyone from "take" of a species listed as threatened or endangered without authorization. The CESA authorizes the Fish and Game Commission to list a species as threatened if it finds that absent the special protection of the CESA, the species is likely in the foreseeable future to be in serious danger of becoming extinct throughout all, or a significant portion, of its range due to loss or change of habitat, overexploitation, predation, competition, or disease. Much like the ESA authorizes federal wildlife agencies to authorize take of listed species in prescribed circumstances, the CESA authorizes the California Department of Fish and Game (CDFG) to do likewise under similar, though not identical, criteria. Additional text has been added to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4,** with this information.

As noted in the Draft EIR, the Shaffer Lab conducted genetic testing on 23 larval CTS tissue samples collected at the reservoir and reports that these animals range between highly hybridized to completely non-native (22 samples were successfully analyzed). The "nativeness" of these animals is summarized by the Shaffer Lab Report (**Appendix E** of the June 2008 Preliminary BA) which concludes that 89-100% are non-native and that no genotyped individual can be described as "pure native." After consultation with USFWS regarding ESA jurisdiction over the non-native tiger salamanders was initiated by DD&A on November 6, 2007, the USFWS Ventura Office determined that the tiger salamanders present at Miravale Pond 1 (on-site reservoir) are not subject to regulation under ESA and are, therefore, are not afforded protection under the ESA (USFWS concurrence letter issued February 26, 2008 and presented in Appendix I of the June 2008 Preliminary BA). As discussed in **Responses to Comments D2** and **D4**, on page 4.4-17 of the Draft EIR, and in the letter provided by the USFWS (Appendix I of Appendix T-3), the tiger salamanders found in the reservoir are non-native and a threat to other wildlife species, specifically native special-status amphibian species, including the California red-legged frog and Western spadefoot toad.

Revisions have been incorporated into the Draft EIR to update the status of the CTS listing in response to this comment; please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4,** for more information. As noted in the revisions, the CDFG may determine that authorization under the CESA is required for "take" of onsite tiger salamanders if CDFG decides to exert jurisdiction over the tiger salamanders. The CDFG has concurred with the USFWS determination that a threat to California tiger salamander is hybridization with non-native salamanders as described in a DFG report, *A Status Review of the California Tiger Salamander* (January 11, 2010), which recommends the listing of the species under the CESA. The CDFG report recommends as a management measure that the DFG "in cooperation with the USFWS, determine what level of CTS x NNTS [California tiger salamander and non-native tiger salamander] hybridization warrants management actions such as eradication or control." Also, as discussed in the CDFG report, Fitzpatrick and Shaffer (2007) recommend that slightly introgressed populations should not lose their protected status. However, as summarized in the genetic study conducted for this project by the Shaffer Lab, the tiger salamander population on-site is highly introgressed, and the USFWS determined that this population is not afforded protection under the federal ESA. Coordination with the CDFG will occur to determine whether the CDFG will take jurisdiction over the on-site tiger salamander population. It should be noted that the CESA currently enables those who have already obtained "take" authorization under the Federal ESA to obtain a like authorization under the CESA; however, there is no known comparable process when the Federal Agency (USFWS) has

determined "no take." Additional text has been added to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4,** with this information.

D3: This comment reflects CDFG's concerns regarding unmitigated impacts to special status species and "take" of the Federal endangered and State threatened San Joaquin kit fox (*Vulpes macrotis mutica*). This comment is a summary of later comments (Comments D-8 through D-11). A master response to all these comments is included herein.

This comment (also stated in Comment D-8) identifies that a State Incidental Take Permit will likely be required for impacts to the San Joaquin kit fox and that the EIR should address actions necessary to comply with the CESA. The Draft EIR has been revised to indicate that the project will be required to comply with applicable CDFG requirements related to the CESA and to provide further background on permit requirements. Please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4.**

Specifically, this comment (also stated in Comment D-9) states that the analysis in the Draft EIR would not support the CDFG's issuance of an Incidental Take Permit for San Joaquin kit fox.

CEQA Guidelines section 15065 lists certain conditions which are considered to be mandatory findings of significance whereby the lead agency must find that a project may have a significant effect on the environment and thereby require an EIR for the project. One such condition is if "[t]he project has the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of an endangered, rare, or threatened species." (Guidelines, § 15065(a)[1].) Guidelines section 15380 defines the terms "species," "endangered," "threatened" and "rare."

Applying the facts of the project to these biological resource considerations under CEQA provides for the following:

Based on the analysis contained in the Preliminary Biological Assessment and supporting technical analysis, the proposed project site was identified as being located within the historic distribution of San Joaquin kit fox and the proposed project would, therefore, represent an encroachment into a known San Joaquin kit fox corridor. In addition, based on the analysis contained in the General Plan EIR, the project site was also identified as potential foraging habitat for special-status species, including San Joaquin kit fox. Although the proposed project site is not located within San Joaquin kit fox critical habitat, the Draft EIR, based on the City of Soledad's determination in the General Plan EIR, assumed that San Joaquin kit fox habitat was present on the project site since critical habitat is located within 2 km of the project site. Additionally, at the time of the Draft EIR preparation, information showed a natal den was observed on-site. Since the release of the Draft EIR, it has been determined that no natal den was found on site (Biosearch, personnel communication, 2010; identification of the natal den was incorrectly reported in Biosearch Report). A San Joaquin Kit Fox Early Evaluation Report was prepared by Biosearch biologists, although full protocol-level surveys were not completed for the proposed project based on the determination of the City of Soledad. Based on USFWS Ventura Office review of the early evaluation report prepared by Biosearch, San Joaquin kit fox northern-range protocol-level surveys were recommended (pers. comm. Roger Root, USFWS). The Draft EIR states that a finding of "no take" of the species can only be confirmed by completing the protocol-level survey for this species and having a negative finding in consultation with USFWS and the CDFG. Since protocol-level surveys for this species have not yet been conducted, the Draft EIR assumed kit fox presence. As a result, the Draft EIR, in order to be as conservative as possible, assumed impacts were considered significant because the proposed project would encroach into the grassland habitat area above the 400-foot elevation contour of the Gabilan Range, which is identified in the General Plan EIR as an important wildlife corridor, and

General Plan policies specifically prohibit development within that area to avoid impacts to biological resources.[1]

This comment (also stated in Comment D-9) contends that the Draft EIR defers the formulation of mitigation measures for kit fox as well as several other species. This comment also contends that there is a lack of baseline data and that therefore it is difficult to determine how significance determinations were made for this project.

In response to the comment regarding deferral of mitigation, CEQA requires that Environmental Impact Reports determine the level of significance of impacts to environmental resources and to identify appropriate mitigation approaches. Requiring the development of detailed mitigation plans at a later date, which would be subject to review and approval by other state and federal regulatory agencies, is standard and not inconsistent with CEQA Guidelines (Section 15126.4[a][1][b]). This is not considered deferral and does not render the present CEQA analysis inadequate or incomplete as mitigation measures commit the City to implementation and performance standards are identified. Final approval of the mitigation plan would be made by the USFWS and CDFG during the State and Federal permitting process. The USFWS and CDFG will likely place further restrictions on the project regarding impacts to upland biological resources. In *Defend the Bay v. City of Irvine* 2004 119 CA 4th 1261, 1275, 15 CR3d 176, the court found no improper deferral of mitigation even though future investigations and consultation with regulatory agencies were required because the City was committed to implement the measures and specific criteria were identified.

In response to this comment, the Draft EIR has been revised to clarify the extent of impacts to San Joaquin kit fox and provide additional mitigation and performance standards; please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4,** for more information.

D4: This comment states that the Draft EIR should be revised to identify that the filling of the on-site reservoir may warrant mitigation and require a Lake or Streambed Alteration Agreement (LSAA) with CDFG. As described in the Draft EIR (see Draft EIR page 4.4-17), the proposed project would permanently impact 0.17 acres of wetland habitat that exist as a thin band of emergent vegetation on the fringe of four small man-made agricultural ponds and reservoirs. The impacts to the wetlands were determined to be less-than-significant for the reasons described below from page 4.4-17 of the DEIR:

> "The function and value of these mad-made wetland resources are marginal as a result of on-going disturbance from agricultural uses. In addition, the value of the existing reservoir located in the uplands portions of the site as wildlife habitat is limited as it supports a non-native predatory amphibian: the barred tiger salamander. This salamander is known to prey on native special status amphibian species such as the California tiger salamander and the California red-legged frog when present. In addition, hybridization between the non-native barred salamander and the native tiger salamander has been identified by the U.S. Fish and Wildlife Service as a significant threat to the native California tiger salamander.

[1] [1] The analysis contained in the Draft EIR is tiered from the City's 2005 General Plan EIR which identified a number of expansion areas to accommodate future growth. The proposed project site is located within portions of several of the identified expansion areas. The analysis in the General Plan EIR determined that General Plan buildout would result in a number of significant and unavoidable impacts to biological resources, specifically special-status species (i.e. San Joaquin kit fox). While the proposed project is located within several of the designated expansion areas, the level of intensity of development associated with the proposed project would exceed the estimates contained in the General Plan EIR. Specifically, the proposed project would result in the development of new urban features, including infrastructure, residences, and other features above the 400-foot elevation contour, which was identified as an area of particular biological sensitivity.

> Although development of the proposed project would impact approximately 0.17 acres of fringe wetlands of marginal habitat value, impacts are considered to be less-than-significant as development of the proposed project would entail the construction of a number of aquatic resources as a component of golf course development, and storm water drainage facilities. More specifically, as identified in Section 5.1.3 of the Specific Plan, two of the existing retention ponds would be converted to storm water facilities as part of project development. While formal plans have not been submitted at this time for development of the golf course, future on-site ponds and other resources would significantly exceed the size of the existing on-site aquatic resources."

It is acknowledged that a LSAA may be required for the project prior to filling of the on-site reservoir. As described above, the wetland resources are marginal and constitute a threat to native listed wildlife species and, therefore, impacts to these wetlands are considered less-than-significant under CEQA. However, in addition to the CEQA process, it is understood that the project is subject to the regulations pursuant to Fish and Game Code Section 1600 et seq. The project is required to comply with these regulations and will provide DFG Notification prior to filling the reservoir. Subsequently, if CDFG determines any additional mitigation is required, the project applicant would be required to implement those measures. Additional text has been added to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4,** to discuss the LSAA requirements and that the project may require a LSAA with CDFG.

D5: Comment acknowledged. No response necessary.

D6: Comment acknowledged. No response necessary.

D7: This comment contends that a Statement of Overriding Considerations for significant impacts to State-listed species is not considered adequate by the CDFG to support the issuance of a State Incidental Take permit or LSAA. The comment notes that in order for the City as the Lead Agency to complete a CEQA analysis that would satisfy CDFG permitting requirements, the EIR must fully describe potential project-related impacts, identify avoidance and/or mitigation measures, and fully mitigate impacts to these species.

The Draft EIR and supporting technical analyses clearly describe the extent of biological impacts associated with the proposed project. Moreover, mitigation measures have been identified, wherever feasible, to reduce the extent of those impacts. The Draft EIR found that some impacts associated with the proposed project cannot, however, be reduced to a less-than-significant level. As described throughout the Draft EIR, the project, as currently proposed, would result in the development of an area that has previously been identified in the General Plan and General Plan EIR as an important wildlife habitat corridor. Accordingly, the General Plan limits development within that area to avoid impacting sensitive biological resources. Specifically, the Draft EIR found that, absent the required survey work in accordance with the USFWS and CDFG protocols to prove "no take" of the San Joaquin kit fox and associated consultation based upon completion of the protocol-level surveys, the conservative finding of significant unavoidable impact occurs. The habitat for kit fox is found primarily in the grassland habitat, consistent with the 400-foot elevation contour identified by the City General Plan as wildlife habitat corridor. Therefore, since the proposed project includes development above the 400-foot elevation contour, an area identified as a wildlife corridor, and protocol-level surveys have not been conducted to provide evidence that the kit fox will not be harmed, the Draft EIR found the proposed project would significantly and unavoidably impact this species by introducing new urban elements within a previously undeveloped area resulting in direct mortality, loss of habitat, habitat fragmentation, and loss of dens. This impact cannot be avoided under the current design of the proposed Specific Plan without elimination of development within that area of the project site or, alternatively, a concurrence of "no take" and negative finding from both the USFWS and CDFG.

The CDFG states that they will not be able to issue an Incidental Take Permit relying on the CEQA findings of the Draft EIR, and that CDFG may need to act as Lead CEQA agency and complete a subsequent CEQA document to support permit issuance. The Draft EIR found that the impacts to the San Joaquin kit fox could not be mitigated to less than significant with the proposed plan and project description. This comment is acknowledged and as discussed in **Responses to Comments D10** and **D11**, the Draft EIR identifies two alternatives that reduce the significant and unavoidable impacts to wildlife species and habitat to a less-than-significant level. Further, the Final EIR amplifies this discussion and provides an analysis of a sub-alternative that would also would substantially lessen potential impacts to biological resources located within the project area by eliminating both development within the foothill portions of the project site as well as eliminating the golf course project. The Draft and Final EIR found that development of these alternatives would substantially lessen project impacts to kit fox to less than significant. While specific mitigation would still be warranted, biological resource impacts could potentially be reduced to a less-than-significant level. Please note that the Draft EIR did not find impacts to wetlands significant and unavoidable, thus there is no need for a Statement of Overriding Considerations for this impact and the CDFG could rely on the City's CEQA findings to support issuance of a LSAA.

D8: This comment identifies that a State Incidental Take Permit will likely be required for impacts to the San Joaquin kit fox and that the EIR should address actions necessary to comply with the CESA. The Draft EIR identifies that the project will be required to comply with applicable CDFG requirements related to CESA. A discussion of the CESA is included in the Draft EIR under *"State Laws and Regulations, California Endangered Species Act."* Additional information on the CESA and further background on permit requirements has been added to this Final EIR; please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4,** and Appendix L of this **FEIR** for further information on the CESA. Also refer to **Response to Comment D3**.

D9: This comment contends that the analysis in the Draft EIR is inadequate to support the issuance of a State Incidental Take Permit for impacts to San Joaquin kit fox. Projects that would result in impacts to a State listed species must obtain an "incidental take" permit pursuant to §2081 of the Fish and Game Code. The letter indicates that CDFG issues incidental take permits only under certain conditions. Specifically, this comment states that impacts must be fully mitigated in order for CDFG to issue a State Incidental Take Permit. As described in **Responses to Comments D3** and **D7,** potential impacts to San Joaquin kit fox cannot be fully mitigated with the project as currently designed. The proposed project would result in the development of new residential structures and project infrastructure in an area that is identified in the General Plan and General Plan EIR as an important wildlife corridor. In order to ensure potential impacts to biological resources were minimized, the General Plan EIR identified mitigation and policy to restrict the extent of development within this area. As a result, the Draft EIR found that the impacts from the proposed project on the San Joaquin kit fox cannot be fully mitigated. As described in **Response D7**, a number of project alternatives would substantially lessen the extent of impacts by avoiding development within these areas. The Final EIR has clarified and amplified the residual impact of these alternatives on the kit fox. Please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources** in this Final EIR. Also refer to **Response to Comment D10 and D11**.

This comment also contends that the Draft EIR must fully describe potential project impacts to San Joaquin kit fox and identify mitigation measures to minimize the extent of those impacts. The Draft EIR and supporting technical analyses clearly describe the extent of impacts to San Joaquin kit fox. As described previously, the analysis contained in the Draft EIR is consistent with the General Plan EIR, which determined that buildout of the General Plan would result in significant impacts to special-status species, including the San Joaquin kit fox, due to the loss of foraging habitat.. The analysis contained in this EIR has been supplemented with addition specifics to the mitigation measures identified.

D10: Comment acknowledged. The Draft EIR identifies these potential impacts on page 4.4-16, Impacts and Mitigation, and in the impact discussions on pages 4.4-19 and 4.4-20 describing impacts to special-

status wildlife and the San Joaquin kit fox. The Draft EIR also identifies two alternatives that avoid any development in the upland area of the project site (above the 400 foot contour); these alternatives both reduce these impacts to a less-than-significant level. In addition, the Final EIR provides another variation of an alternative (eliminating the golf course and also the avoidance of the upland area) that also reduces these impacts to less than significant. Please refer to **Section 4.0 Revisions to the Draft EIR, Alternatives**, in this Final EIR. Please also see **Response to Comment D11** for more information regarding the alternative.

D11: The comment requests an alternative be identified that substantially lessens kit fox impacts. Please also refer to **Response to Comment D10**, above. The Draft EIR identified two alternatives that reduce the significant and unavoidable impacts to kit fox wildlife species and habitat to a less-than-significant level. In addition, the Final EIR provides another variation of an alternative that also reduces these impacts to less than significant. Specifically, the Draft EIR identifies the General Plan Consistency Alternative and the Reduced Density Alternative in **Section 6.3 and 6.4, under Biological Resources,** and finds that development of these proposed alternatives would substantially lessen potential impacts to biological resources located within the project area by eliminating development within the foothill portions of the project site. As stated in the Draft EIR, under the Reduced Density Alternative: "As identified in the biological resources section of this EIR, impacts associated with the loss of Open Space was identified as a potentially significant impact that would affect a number of federally listed species. This alternative would eliminate potential impacts to badgers, borrowing owl, Salinas pocket mouse, kit fox, and other species identified as special status. The grassland habitat located in the foothill portion of the Gabilan Range is considered a biologically sensitive area of the project site. Development of this alternative would substantially lessen project impacts. While specific mitigation would still be warranted, impacts could potentially be reduced to a less-than-significant level."

The Draft EIR also discussed and evaluated the General Plan Consistency Alternative, an alternative that is consistent with existing General Plan policy by avoiding development in the upland grassland (above 400 foot contour). The Draft EIR found that this alternative also reduces the extent of biological impacts, including impacts to kit fox. Please see **Section 6.0** of the Draft EIR for an analysis of those alternatives. In particular, this General Plan-consistent alternative, by limiting development to below the 400-foot elevation contour and significantly reducing the amount and extent of development, avoids development within upland habitat and significantly reduces habitat fragmentation. As a result, this alternative is found to effectively reduce impacts to San Joaquin kit fox to a less-than-significant level.

The mitigation measures identified in the Draft EIR, as modified, are also considered adequate to ensure the proposed project would mitigate project impacts to the extent feasible. These mitigation measures are considered adequate for the purposes of CEQA; please see **Response to Comment D3** regarding issues associated with deferral of mitigation under CEQA. Also **Refer to Response to Comment D17.** Also, additional information has been added to the Final EIR to clarify alternatives that would reduce impacts to the kit fox, per the letter request. Please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources and Alternatives Sections**, in this Final EIR.

D12: The comment requests more detail regarding the botanical survey conducted for the project. The botanical survey was conducted on July 28, 2006, by DD&A Senior Environmental Scientist, Josh Harwayne. The methodology for determining the potential presence of special-status species is described on page 3 of Appendix T-3 of the Draft EIR. In summary, California Natural Diversity Database (CNDDB) occurrence records for the Soledad quad and all surrounding quads (9 quads total) were reviewed in order to determine which special-status species are known or have the potential to occur at the proposed project site. In addition, the USFWS list of federally protected species known to occur in County was reviewed. DD&A also contacted other knowledgeable biologists familiar with the region for any additional occurrence information that may not appear in the CNDDB.

From these sources, combined with personal knowledge and experience, a list of special-status plant and wildlife species known, or with the potential to occur, in the vicinity of the project site was compiled. Appendix F of the DEIR lists these species along with their legal status, habitat requirements, and a brief statement of the likelihood to occur.

In addition to the above, page 6 of Appendix T-3 in the Draft EIR describes the methodology for conducting the botanical survey, including data sources for plant habitat and distribution, nomenclature, and habitat characterization. The entire project site was surveyed for botanical resources following the applicable guidelines outlined in *Guidelines for Conducting and Reporting Botanical Inventories for Federally listed, Proposed and Candidate Plants* prepared by the USFWS (January 2000), *Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened, and Endangered Plants and Natural Communities prepared by CDFG* (revised May 8, 2000), and *CNPS Botanical Survey Guidelines* prepared by the California Native Plant Society (revised June 2, 2001). The "Methods" discussion from the Biological Assessment has been inserted with clarifications in response to this comment. Please refer to **Section 4.0 Revisions to Draft EIR, Biological Resources, Section 4.4,** for more information.

D13: In Appendix F, Table of Special-status Species Potentially Present in the Project Vicinity, of the Draft EIR, the likelihood to occur statement for each special-status plant species states that the project site either lacked suitable habitat or the species was identifiable at the time of survey (e.g., a conspicuous species) with the exception of Lemmon's jewelflower. Therefore, the botanical survey was conducted at a time considered sufficient to identify potential impacts to special-status plant species. Page 4.4-11 of the DEIR states that the only special-status plant species with the potential to occur within the project site is Lemmon's jewelflower. Please also refer to **Response to Comment D12** above for additional information regarding survey methodology.

D14: This comment identifies survey protocols that should be implemented for botanical inventories. Please refer to **Response to Comment D12** above.

D15: The comment requests clarification regarding how significance findings were made given the lack of baseline surveys for the Lemmon's jewelflower, Townsend's big-eared bat, pallid bat, and western mastiff bat. In accordance with CEQA Guidelines, significance findings were made utilizing the Thresholds of Significance on page 4.4-16 of the Draft EIR based on the results of the botanical survey and wildlife surveys, literature review, and professional experience (see **Response to Comment D12** regarding methodology).

As stated in **Response to Comment D12**, it was determined during the botanical survey on July 28, 2006, that there was marginally appropriate habitat for the Lemmon's jewelflower within the mixed grassland habitat on the project site (above the 400-foot elevation contour). Because of the presence of only marginally appropriate habitat, distance from the nearest documented occurrence (approximately 10 miles away), and its legal status (not listed under ESA or CESA), it was determined that the species had a moderate likelihood to occur within the mixed grassland habitat on the project site. Therefore, potential impacts to this species may occur, if present, and were identified and considered less-than-significant with the implementation of the mitigation measure identified in the Draft EIR. Mitigation Measure 4.4-7 of the Draft EIR, which has been revised per comments received from CDFG (please refer to **Biological Resources, Section 4.4, Revisions to the Draft EIR**), includes the requirement to conduct pre-construction surveys to determine presence, and if present, quantify the extent and prepare and implement a mitigation management plan in consultation with CDFG.

Bats are considered a cryptic species and can occupy a site at any time. Although no bats were observed during the field surveys, the field surveys did observe marginal roosting and foraging habitat for the Townsend's big-eared bat, pallid bat, and western mastiff bat within the project site (page 4.4-12 of the Draft EIR). The marginal roosting habitat within the project site includes trees, rocky outcrops, barns, and out-buildings, all of which are limited in number. Because of the presence of only marginal roosting

habitat, distance from the nearest documented occurrences (between 6 and 10 miles away), and their legal status (none of these species are listed under ESA or CESA), it was determined that the three bat species had a moderate likelihood to occur on the site. Therefore, potential impacts to these species may occur, if present, and were identified and considered less-than-significant with the implementation of the mitigation measure identified in the Draft EIR Mitigation Measure 4.4-12 of the Draft EIR, which has been revised per comments received from CDFG (please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4,** includes the requirement of a pre-construction survey of potential roosting habitat no more than 30 days prior to impacting any potential roosting habitat.

Although the comment suggests that additional special-status plant species other than Lemmon's jewelflower may occur on-site, pages 4.4-11 and 4.4-18 of the Draft EIR state that no other special-status plant species have the potential to occur on the project site for reasons of lack of suitable habitat and not observed (conspicuous species). Please also see Appendix F of the Draft EIR and **Response to Comment D12** above.

D16: The comment requests clarification regarding how significance findings were made given the lack of baseline surveys for the California red-legged frog and Western spadefoot toad. In accordance with CEQA Guidelines, significance findings for these species were made utilizing the Thresholds of Significance on page 4.4-16 of the Draft EIR based on the results of the botanical survey and wildlife surveys, literature review, and experience (see **Response to Comment D12** regarding methodology). Extensive aquatic surveying was done within the agricultural ponds and reservoir; however, no California red-legged frogs or Western spadefoot toads were observed during any the aquatic surveys. The details of the aquatic sampling effort outlined in Appendix T-3 have been added to the text of the Draft EIR (please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources**).

As stated on page 4.4-13 of the Draft EIR, the on-site reservoir and associated upland habitat provide potential breeding and estivation habitat for the California red-legged frog. In addition, the project site is located within the historic range of this species and the CNDDB reported several occurrences within 8 km of the project site. In the absence of conducting protocol-level surveys as outlined in the *Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog* (USFWS, August 2005), it was determined that there was the potential for the California red-legged frog to occur within the project site. As identified on page 4.4-24 of the Draft EIR, the proposed removal of a potential breeding site and grading of upland estivation habitat (specifically the mixed grassland habitat above the 400-foot contour) were determined to be significant and unavoidable impacts to the California red-legged frog without the results of a presence/absence survey.

Additionally, although the Western spadefoot toad has no listing status and is not protected under the Federal or State ESAs, the project site contains potential breeding habitat (i.e., the reservoir) and upland habitat (i.e., the mixed grassland habitat above the 400-foot contour) and is within the range of the species. As identified on page 4.4-24 of the Draft EIR, the proposed removal of a potential breeding site and grading of upland estivation habitat (specifically the mixed grassland habitat above the 400-foot contour) were determined to be significant and unavoidable impacts to the Western spadefoot toad without the results of a focused survey. Although numerous aquatic surveys were conducted at the project site, the surveys occurred a little late in the toad's breeding period (typically January to May) and, therefore, there is the potential that the toad could not have been identified. Mitigation Measure 4.4-17 of the Draft EIR has been revised to clarify the amphibian survey protocol (please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4.**

D17: The comment states that the Draft EIR defers the formulation of mitigation measures to resource-agency consultation and/or permit application citing a case where the Court of Appeal struck down mitigation measures which required formulating management plans developed in consultation with State and Federal wildlife agencies after project approval. Mitigation Measures in the Draft EIR have been

revised to clarify mitigation and timing of the mitigation (please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources, Section 4.4, Mitigations.**

The comment also states that it is unclear how the significance findings were made for the eleven significant impacts identified without the formulation of mitigation measures. This comment was repeated for seven of these impacts and is addressed in the following responses: for the San Joaquin kit fox, please refer to **Response to Comment D3**; for the pallid bat, Townsend's big-eared bat, western mastiff bat, and Lemmon's jewelflower, please refer to **Response to Comment D15**; and for the California red-legged frog and Western spadefoot toad, please refer to **Response to Comment D16**. The mitigation measures associated with these species (Mitigation Measures 4.4-7, 4.4-9, 4.4-10, 4.4-12, and 4.4-17) have been revised to strengthen the commitment of the City and clearly identify performance standards. The remaining significant biological impacts identified in the comment are addressed in this response below.

Salinas pocket mouse: A comprehensive small mammal trapping study was conducted for this project, and a Salinas pocket mouse was identified within the mixed grassland habitat (above the 400-foot contour) and presence of this species was confirmed within the project site (please refer to page 4.4-11 of the Draft EIR and Appendix B of Appendix T-3 of the Draft EIR). As described on page 4.4-21 of the Draft EIR, due to the loss of habitat and direct and indirect mortality that would occur as a result of constructing the project as designed, impacts to the Salinas pocket mouse were determined to be significant and unavoidable. Although the impact can not be reduced to a less-than-significant level due to current project design, a mitigation measure was identified to reduce the impact to the greatest extent feasible. The mitigation measure (Mitigation Measure 4.4-13) has been revised to strengthen the commitment of the City and clearly identify performance criteria. Please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources.**

Wildlife Movement and Nursery sites: As described on page 4.4-25 of the Draft EIR, the General Plan EIR was reviewed for the significance determination for impacts to wildlife movement and nursery sites. The General Plan EIR identifies "adverse but not significant" impacts to wildlife movement based on the availability of the Salinas River and Arroyo Seco River corridors in the project area. The General Plan, field surveys, analysis of biological impacts, review of project plans, and professional experience were the basis of the significance determination. The impact was determined to be significant and unavoidable primarily due to the project's proposed development above the 400-foot contour and because the General Plan EIR requires that the portions of the Gabilan Range (an important wildlife corridor) above the 400-foot elevation contour be conserved as open space. Although the mitigation measures identified in the Biological Resources section of the Draft EIR would minimize this impact to the greatest extent feasible, the impact found the project's impacts to wildlife movement and nursery sites to be significant and unavoidable. Even with the revisions to these mitigation measures (please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources**, this impact remains significant and unavoidable without project redesign to avoid impacts to the habitat above the 400-foot contour.

Habitat Fragmentation: Page 4.4-19 of the Draft EIR identifies the habitat fragmentation impact as significant and unavoidable. The General Plan, field surveys, analysis of biological impacts, review of project plans, and professional experience were the basis of the significance determination. As described on page 4.4-19 of the Draft EIR, the project development would divide and disrupt the vast majority of the wildlife on the project site and would represent an urban encroachment into the foothills of the Gabilan Range. Although mitigation measures were identified to minimize the habitat fragmentation impact to the greatest extent feasible, the impact remained significant and unavoidable without project redesign to avoid impacts to the habitat above the 400-foot contour.

Vegetation/oak tree removal: On page 4.4-18, the Draft EIR identifies the potential impacts to vegetation and tree removal and determines that the impacts are less-than-significant with the implementation of the mitigation measures identified. As described on pages 4.4-1 and 4.4-6, the biological impact analysis

included field surveys to characterize and map the habitats within the 920-acre project site (Please note that the details of the survey methodology outlined in the Appendix T-3 have been added to the text of the Draft EIR. Please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources**). The data collected during field surveys, literature review, and professional experience were the basis for the significance determination for impacts to vegetation. The project site contains mostly active and fallow agricultural land (approximately 777 acres, or 84% of the project site), and it was determined that the vegetation on-site, although mostly man-made and disturbed, was extensive and provided biological value. Therefore, impacts to vegetation on the project site were determined to be less-than-significant with the implementation of the mitigation measures identified (Mitigation Measures 4.4-3 through 4.4-6). These are standard mitigation measures implemented during the construction phase of the project to protect the vegetation not planned for removal. None of these mitigation measures defer the formulation of mitigation until after project approval; however, in response to the comment, revisions were made to these measures to clarify the intent, ensure the commitment to implementation and clearly identify performance criteria

Since the specific locations of all homes and buildings were not known at time of the field surveys and during the biological analysis, it was assumed that all trees within the project site would be removed, which was considered a potentially significant impact. Due to the presence of many non-native trees and the requirement to comply with General Plan policies, it was determined that the impact could be reduced to a less-than-significant level with the implementation of the mitigation measures identified (Mitigation Measures 4.4-1 and 4.4-2) requiring the preparation of a Forest Management Plan.

D18: Please refer to **Response to Comment D2** above.

D19: Comment acknowledged. As stated in **Response to Comment D4**, additional text has been added to **Section 4.0 Revisions to the Draft EIR, Biological Resources,** to discuss the LSAA requirements and that the project may require a LSAA with CDFG. As discussed on page 4.4-17 of the Draft EIR, the CEQA analysis determined that impacts to wetlands associated with the man-made agricultural ponds and reservoir were considered less-than-significant due to their low function and value and because they support a population of non-native salamanders that threaten native wildlife including other special-status amphibian species – not because the proposed golf course features and stormwater facilities would offset impacts. Therefore, no mitigation is required under CEQA. Prior to filling the reservoir, the project applicant is required to notify the CDFG pursuant to LSAA regulations and determine whether a LSAA with CDFG is required. If a LSAA is required, the project applicant will be required to implement any additional mitigation measures identified in the permit. Further, since the Draft EIR did not find impacts to wetlands significant and unavoidable, thus necessitating a Statement of Overriding Considerations, the CDFG could rely on the City's CEQA findings to support permit issuance. Page 4.4-17 of the Draft EIR includes a discussion of the jurisdiction of the wetlands on the project site. It was determined that the wetlands are not contiguous with other jurisdictional wetlands and/or waters of the U.S and do not have any hydrologic connectivity or abut any permanent water body. The U.S. Army Corps of Engineers (Corps) do not regulate wetlands that are hydrologically isolated and geographically distinct from other jurisdictional resources in the vicinity. As a result, the fringe wetlands identified on site are not under the jurisdiction of the Corps under the Clean Water Act. However, as recommended by this comment, the project applicant will request a jurisdictional determination from the Corps to verify this conclusion. Additional text has been added to **Section 4.0 Revisions to the Draft EIR, Biological Resources,** to discuss the LSAA requirements and that the project will request a jurisdictional determination from the Corps.

D20: As described on page 4.4-24 of the Draft EIR, the project proposes to fill the reservoir within the project site. Although aquatic sampling was conducted numerous times within the reservoir at different times of the year, no California red-legged frogs or Western spadefoot toads were observed. Mitigation Measure 4.4-17 of the Draft EIR, which has been revised per comments received from CDFG (please refer to **Section 4.0 Revisions to the Draft EIR, Biological Resources,** requires that protocol-level

surveys be conducted for California red-legged frogs and Western spadefoot toad at each aquatic resource on the project site prior to issuance of any grading permits. If either species is determined, the project applicant will be required to comply with any additional conditions of the LSAA that pertain to these species. Please refer to **Response to Comment D-16** for more information regarding determining the presence of California red-legged frog and Western spadefoot toad within the project site.

D21: As discussed in **Responses to Comments D4** and **D19**, if a LSAA is required, the project applicant will be required to implement any additional mitigation measures identified in the permit, including preparation and implementation of wetland mitigation plan that includes the criteria described in the comment. As described on page 4.4-17, it is expected that the proposed aquatic features of the golf course and stormwater detention basins will provide equal or better habitat function and value than the man-made agricultural ponds and reservoir. Additional text has been added to **Section 4.0 Revisions to the Draft EIR, Biological Resources,** to discuss the LSAA requirements and that the project may require a LSAA with CDFG.

D22: Additional text has been added to Mitigation Measure 4.4-5 to address this comment. Please refer to **Section 4.0 Revisions to Draft EIR** for more information.

RE: SCH#~~2006061129~~ 200608129 Miravale III Draft Specific Plan; Monterey County.

Dear Ms. Hilinski:

The Native American Heritage Commission (NAHC) has reviewed the Notice of Completion (NOC) referenced above. The California Environmental Quality Act (CEQA) states that any project that causes a substantial adverse change in the significance of an historical resource, which includes archeological resources, is a significant effect requiring the preparation of an EIR (CEQA Guidelines 15064(b)). To comply with this provision the lead agency is required to assess whether the project will have an adverse impact on historical resources within the area of project effect (APE), and if so to mitigate that effect. To adequately assess and mitigate project-related impacts to archaeological resources, the NAHC recommends the following actions:

- ✓ Contact the appropriate regional archaeological Information Center for a record search. The record search will determine:
  - If a part or all of the area of project effect (APE) has been previously surveyed for cultural resources.
  - If any known cultural resources have already been recorded on or adjacent to the APE.
  - If the probability is low, moderate, or high that cultural resources are located in the APE.
  - If a survey is required to determine whether previously unrecorded cultural resources are present.
- ✓ If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
  - The final report containing site forms, site significance, and mitigation measurers should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure.
  - The final written report should be submitted within 3 months after work has been completed to the appropriate regional archaeological Information Center.
- ✓ Contact the Native American Heritage Commission for:
  - A Sacred Lands File Check. **USGS 7.5 minute quadrangle name, township, range and section required.**
  - A list of appropriate Native American contacts for consultation concerning the project site and to assist in the mitigation measures. **Native American Contacts List attached.**
- ✓ Lack of surface evidence of archeological resources does not preclude their subsurface existence.
  - Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, per California Environmental Quality Act (CEQA) §15064.5(f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities.
  - Lead agencies should include in their mitigation plan provisions for the disposition of recovered artifacts, in consultation with culturally affiliated Native Americans.
  - Lead agencies should include provisions for discovery of Native American human remains in their mitigation plan. Health and Safety Code §7050.5, CEQA §15064.5(e), and Public Resources Code §5097.98 mandates the process to be followed in the event of an accidental discovery of any human remains in a location other than a dedicated cemetery.

Sincerely,
Katy Sanchez
Katy Sanchez
Program Analyst

CC: State Clearinghouse

LETTER E: CALIFORNIA NATIVE AMERICAN HERITAGE COMMISSION (NAHC)

E1: This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

E2: This comment identifies that the appropriate regional archaeological Information Center should be contacted to conduct a record search to determine if 1) the project site has been previously surveyed, 2) if any known cultural resources have already been recorded on or adjacent to the site, 3) the probability of cultural resources being present on site, and 4) if a survey is considered required to determine the presence of previously unrecorded cultural resources. As identified in **Section 4.5 Cultural Resources** in the Draft EIR, the proposed project site has been the subject of extensive archaeological and historical evaluation. As described in the Draft EIR, a Preliminary Archaeological Reconnaissance, Phase One Historic Review, and CEQA Impact Analysis and Mitigation Report were prepared in support of the Draft EIR. These analyses included a records search of files at the Northwest Regional Information Center and no previously listed archaeological sites were identified.

E3: This comment suggests that, if an archaeological inventory survey is required, then a professional report detailing and findings and recommendations of the records search and field survey should be prepared. A Preliminary Archaeological Reconnaissance was prepared for the proposed project by Archaeological Consulting. Based on Archaeological Consulting's records search and site reconnaissance, they determined that the proposed project should not be delayed for archaeological reasons. Moreover, Archaeological Consulting determined that the project area does not contain surface evidence of potentially significant archaeological resources or any other archeological site of significance.

E4: The City has submitted a request to the Native American Heritage Commission for a Sacred Lands File Check.

E5: This comment identifies that the lack of surface evidence of archeological resources does not preclude their subsurface existence. As a result, this comment suggests that the City should include provisions for the identification and evaluation of accidentally discovered archaeological resources. In addition, the comment also states that measures should be include to ensure that the appropriate culturally affiliated Native American tribe is contacted regarding the disposition of recovered artifacts and human remains. Mitigation Measures 4.5-8 and 4.5-9 contain provisions consistent with the contents of this comment.

RE: Notice of Preparation for the Draft Environmental Impact Report for Miravale Phase III Specific Plan

Dear Ms. Hilinski:

Thank you for the opportunity to review and comment on Draft Environmental Impact Report (DEIR) for the Miravale III Specific Plan.

As you are aware, LAFCO has the statutory responsibility to make determinations regarding changes in local government boundaries. For purposes of CEQA compliance, we are a responsible agency for the Miravale III project. In this role, on September 29, 2006, LAFCO commented on the Notice of Preparation for this environmental document. F-1

As outlined in our September 2006 letter LAFCO will need to consider the Miravale III proposal in light of any other Sphere of Influence amendments and subsequent annexation proposals anticipated by the City. We continue to extend an invitation to the City of Soledad to participate in LAFCO's preliminary review process as a way to promote informal dialogue, understanding and cooperation. The preliminary review process would consist of an informal presentation and discussion about the City's comprehensive growth plans as identified in the City's adopted General Plan. The Miravale III project would be part of that discussion. We encourage the City to take part in the preliminary review process prior to formal submittal of Soledad's comprehensive Sphere of Influence amendment proposal and annexation proposals to LAFCO. F-2

The September 2006 letter also noted the statutory requirement for early consultation between the City and County (Government Code Section 56425b) before the formal Sphere of Influence amendment is submitted to LAFCO. Consultations with other cities have included discussion of the preferred direction of city growth, agricultural buffers, mitigation for the loss of agricultural land, and regional transportation issues. This consultation is in addition to the requirements for the City to consult with the County regarding a tax transfer agreement in accord with Revenue and Taxation Code Section 99. F-3

Regarding the specifics of the Draft Environmental Impact Report, LAFCO has the following comments:

- Page 3.0-9: We suggest that the description of the approvals required from LAFCO include a closing statement that: "This required LAFCO approval would include detachment of Miravale III from the Mission Soledad Rural Fire Protection District and the Resource Conservation District of Monterey County." F-4

- Page 4.2-6: The section on "Cortese-Knox Capability Classification" outlines the process for classifying prime agricultural lands under the Cortese-Knox-Hertzberg Local Government Reorganization Act, but does not state the number of acres that are classified as "prime" by this process. Please state the number of acres classified as prime utilizing the Cortese-Knox-Hertzberg definition. F-5

- Pages 4.2-12 through 15: The DEIR states that "the Monterey County Agricultural Commissioner generally recommends at least a 200 foot buffer between agricultural and non-agricultural uses." [page 4.2-13] The DEIR then outlines the project plans for a 60 foot buffer on Miravale III's western border and 50 feet on the north and east, without any discussion of the feasibility of implementing the recommended 200 foot buffer. Please examine the effectiveness of the proposed buffers, particularly on the western edge of the proposed development, which is noted to be adjacent to a large area of "row crops used for vegetable production." It should also be noted that the western, northern, and eastern borders of the proposed Miravale III development are adjacent to lands that are not within the City's approved Sphere of Influence. F-6

- Page 4.13-35: Under the section on "Regional Transportation Impacts" it is stated that "at this time ... the City of Soledad has not committed to collecting the TAMC [Transportation Agency of Monterey County] fee." Conversations with TAMC staff have indicated that the City has executed the Joint Powers Agreement approving the Monterey County Regional Development Impact Fee Agency and that this agreement commits the City to the collection of TAMC Regional Development Impact Fees. Please clarify. F-7

- Page 5.0-12: The DEIR states that the project would constitute a significant cumulative impact to agricultural resources and states that "currently there are no formal mitigation fee and/or conservation easement policies in place" and "no measures are available to fully mitigate the loss of prime agricultural land." F-8

The DEIR should examine the feasibility of the City, or developer, developing and implementing a local mitigation fee and/or conservation easement program. This type of program was developed by the City of Salinas as a part of its 2007 application for an expansion of the its Sphere of Influence. While such a program is not likely to "fully mitigate" the loss of prime agricultural land, the Guidelines of the California Environmental Quality Act (Section 15091[a]) require that significant environmental effects be lessened even if they can not be fully avoided or mitigated. F-8 cont.

- Appendix E: Please include the entire February 21, 2007 letter from AMBAG regarding compliance with the Air Quality Management Plan. Only the first page of this letter is included in the document. F-9

We appreciate the opportunity to provide comments on the Draft Environmental Impact Report of the Miravale III Specific Plan. Our comments are designed to ensure project compliance with the California Environmental Quality Act and to support the findings that LAFCO must make, pursuant to state law, before it can approve a Sphere of Influence update and annexation. F-10

These staff comments are tentative and are subject to review and approval by the Commission. We anticipate that the Commission will consider this matter at the next regular meeting on January 26, 2009.

Please contact me, or Senior Analyst Thom McCue, if you have any questions regarding this letter.

Sincerely,

Thomas A McC for

Kate McKenna, AICP
Executive Officer

Cc: LAFCO Chair Dennis Donohue and Members of the Commission

LETTER F: LOCAL AGENCY FORMATION COMMISSION (LAFCO) OF MONTEREY COUNTY

F1: This comment does not raise an environmental issue that warrants a response under CEQA. No response necessary.

F2: This comment states that LAFCO will need to consider the proposed project in light of any Sphere of Influence (SOI) amendments and subsequent annexation proposals anticipated by the City. This comment reiterates previous comments identified in LAFCO's September 2006 NOP comment letter regarding LAFCO's preliminary review process as a way to promote informal dialogue. This process is typically designed to discuss the City's comprehensive growth plans as identified in the City's adopted General Plan. This comment does not raise an environmental issue under CEQA and is referred to the City for further consideration. No response is necessary.

F3: This comment identifies that the applicable statutory requirements related to early consultation between City and County governments before the submittal of the formal SOI amendment to LAFCO. This comment does not raise an environmental issue under CEQA and is referred to the City for further consideration as part of their preparation for future SOI amendments associated with the proposed project. No further response is necessary.

F4: This comment identifies specific requests for revisions to the text of the EIR regarding LAFCO approvals. In response to this comment, revisions have been incorporated into the EIR; please refer to **Section 4.0 Revisions to the Draft EIR,** for more information.

F5: This comment requests that the Draft EIR state the number of acres classified as prime farmland according to the Cortese-Knox-Hertzberg definition. The text of the EIR identifies the amount of prime farmland per each classification criterion of the definition. Additional text has been added to clarify the analysis of lands classified as prime farmland. Please refer to **Section 4.0 Revisions to the Draft EIR, Agricultural Resources, Section 4.2,** for more information.

F6: This comment requests that the EIR examine the effectiveness of the proposed agricultural buffers. As noted in the comment and the Draft EIR, the County of Monterey Agricultural Commissioner generally recommends a minimum 200' agricultural buffer. The proposed project, however, includes a 60 foot buffer along the project sites western border and a 50 foot buffer on the north and east boundaries of the site. The comment contends that in the absence of an evaluation of the feasibility of the proposed buffers their effectives cannot be ascertained. As discussed in the Draft EIR (see page 4.2-1) an Agricultural Resources Report was prepared for the proposed project by Buchanan Associates, which evaluated the efficacy of the proposed agricultural buffers, in addition to other agricultural issues associated with the proposed project. Consistent with the evaluation contained in that report, the Draft EIR recommended a minimum 50 foot wide buffer along the northern and eastern boundaries of the project site as adequate based on adjacent land uses and uses proposed as part of the Miravale III Specific Plan project; please refer to the Agricultural Resources Report contained in Appendix T-1 for further information. In order to ensure the adequacy of future agricultural buffers located on the western project boundary, the Agricultural Resources Report did recommend a 200 foot buffer noting that "the prevailing wind direction and duration which increase the likelihood for potential conflict between agricultural and residential land uses." While the Draft EIR determined that adequate vegetative screening of the Project's proposed combined with substantial physical barriers (such as an 8 foot high wall) could adequately protect human health, Mitigation measures 4.2-1, 4.2-2, and 4.2-3 have nonetheless been revised to require that the agricultural buffer along the western project boundary be increased to meet the minimum distance requirements recommended by the County of Monterey Agricultural Commissioner. A larger agricultural buffer, in combination with physical barriers in areas where residential or commercial structures will be located, is considered adequate to mitigate potential impacts to a less-than-significant

level. Please refer to **Section 4.0 Revisions to the Draft EIR, Agricultural Resources, Section 4.2 ,** for the complete text of these revisions.

F7: This comment requests that statements contained in the Draft EIR regarding the City's commitment to collecting the Transportation Agency of Monterey County (TAMC) fee for regional improvements be clarified. At the time that the Draft EIR was prepared the City was in the process of determining whether they would collect the TAMC fee and at that point the City had not made a determination. This was reflected in the Draft EIR. As noted elsewhere in this FEIR, the City of Soledad adopted the TAMC Regional Fee Program by ordinance on June 4, 2008. In order to mitigate regional impacts, the proposed project will be subject to the TAMC fee. The EIR has been revised accordingly; please refer to **Section 4.0 Revisions to the Draft EIR,** for more information.

F8: This comment requests that the Draft EIR examine the feasibility of mitigating cumulative level impacts associated with the conversion of prime farmland through the payment of a local mitigation fee and/or a conservation easement program. As identified in the Draft EIR, the proposed project would result in the permanent conversion of farmland into urban uses. The permanent loss of farmland was identified as a significant and unavoidable impact. This determination was based in part on the analysis contained in the Agricultural Resources Report prepared by Buchanan Associates. Consistent with the analysis contained in the City of Soledad General Plan EIR this was identified as a significant and unavoidable cumulative level impact that cannot be reduced to a less-than-significant level. As described on page 5.0-12 of the Draft EIR and the Agricultural Resource Report contained in Appendix T-1, the City of Soledad does not have an adopted mitigation program for agricultural impacts. The proposed project site was identified in the General Plan's Land Use Element as an area of future urban expansion and the cumulative loss of agricultural land was previously considered in the General Plan EIR. The proposed project would not result in additional environmental impacts beyond those previously identified in the General Plan EIR. As described in **Section 1.0 Introduction,** the analysis contained in this EIR is tiered from the General Plan EIR prepared in 2005, which identified significant and unavoidable cumulative level impacts associated with the permanent loss of agricultural lands. No feasible mitigation measures were identified at that time to reduce and/or minimize cumulative level impacts. While the proposed project cannot mitigate the extent of its contribution towards this cumulative level effect, an agricultural educational facility is proposed by the draft Specific Plan,, as described in **Section 3.0 Project Description.** At this time, the City of Soledad does not have an agricultural mitigation program in place to address cumulative impacts due to the permanent loss of farmland. Accordingly, this comment is referred to the City of Soledad decision-makers for further consideration.

F9: This comment contends that the Association of Monterey Bay Area Government's (AMBAG) consistency determination with the Air Quality Management Plan (Appendix E) was not included in its entirety. AMBAG's consistency determination was previously included in its entirety as part of Appendix E. Please see Appendix E of the Draft EIR for more information.

F10: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

Re: Draft Environmental Impact Report for Miravale Phase III Specific Plan

Dear Ms. Hilinski:

This letter is a supplement to LAFCO's letter dated December 15, 2008, which provided comments on the Draft Environmental Impact Report for the Miravale Phase III Specific Plan. At its meeting of January 26, 2009, the Commission affirmed the comments contained in that letter. In addition, the Commission reserved its right to submit further comments to be submitted to the City before or at hearings where the City will consider certification of the Final Environmental Impact Report.

Also on January 26, Commissioners expressed concerns about the timing of the environmental proceedings given the necessity of City/County negotiations. This negotiation process is required prior to the submittal to LAFCO of a Sphere of Influence Amendment proposal (Government Code Section 56425 (b)). The results of those discussions will have an impact on the analysis in the Draft Environmental Impact Report. The Commission encourages the City to engage in that negotiation process at the earliest possible time.

I am also taking this opportunity to remind you of LAFCO's preliminary review process and to encourage the City's participation in that process prior to formal submittal of a comprehensive Sphere of Influence amendment proposal and annexation proposals.

We appreciate this opportunity to provide further comments on the Draft Environmental Impact Report, and look forward to working with the City of Soledad. Please notify me when the Final Environmental Impact Report is available for the Miravale Phase III Specific Plan, and of the proposed public hearing schedule to certify the report. If you have any questions, please contact Senior Analyst Thom McCue or me.

Sincerely,

Kate McKenna

Kate McKenna, AICP
Executive Officer

LETTER G: LOCAL AGENCY FORMATION COMMISSION (LAFCO) OF MONTEREY COUNTY

G1: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

G2: This comment reflects concerns expressed by LAFCO commissioners regarding the time of environmental proceedings given the necessity of City/County negotiations. This comment notes that consultation between the City and County is required prior to the submittal to LAFCO of a Sphere of Influence (SOI) amendment pursuant to the requirements of California Government Code § 56425(b). The comment contends that the results of those discussions may impact the analysis contained in the Draft EIR. The analysis in the Draft EIR is specific to the potential environmental effects associated with the proposed project. This comment further suggests that the City initiate the consultation process as soon as possible. The County of Monterey has provided written comments on the Draft EIR and those comments are addressed in detail in this EIR. If, as a result of future conversations with the County, additional changes are requested and the project is changed in a fundamental way such that additional environmental impacts would occur, further environmental review in accordance with CEQA would be required. This comment is referred to decision-makers for further consideration.

G3: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

G4: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

City of Soledad
P. O. Box 156
Soledad, CA 93960

SUBJECT: DRAFT EIR FOR MIRAVALE III SPECIFIC PLAN

Dear Ms. Hilinski:

The Air District submits the following comments for your consideration:

Consistency Determination
Please request a consistency determination from AMBAG for the 4,200 residential units that could be accommodated by the project. H-1

Construction Impacts: Fugitive Dust and Mitigation 4.3-1. Page 4.3-16.
In addition to the measures listed on page 4.3-16, the Air District suggests that the following be added: H-2

- Haul trucks shall maintain at least 2'0" of freeboard; and
- Cover all trucks hauling dirt, sand, or loose materials.
- Plant tree windbreaks on the windward perimeter of construction projects if adjacent to open land.
- Install wheel washers at the entrance to construction sites for all exiting trucks.
- Pave all roads at construction sites.

Mitigation Measure 4.3-2. Page 4.3-17.
The measure should be written to specify that "Projects developed under the specific plan ~~should~~ shall be evaluated for individual construction period air quality impacts. Project-specific mitigation measures ~~would~~ shall be identified at that time to reduce impacts to a less-than-significant impact, if feasible. However, the following mitigation measures ~~should~~ shall be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment: H-3

Substitute the measure specified on pages 4-3-17 and 4.3-18 with the following:

The following equipment may be used without control devices or additional mitigation measures, without causing acute adverse health effects:

No engines greater than 750 HP are used; and

Engines between 501 HP and 750 HP are model years 2002 and newer; and

Engines between 251 HP and 500 HP are model years 1996 or newer; and

Engines between 175 HP and 250 HP are model years 1985 or newer.

The following equipment may be used without causing acute adverse health effects, if retrofitted with a catalyzed diesel particulate filter (CDPF):

Engines greater than 750 HP, if model year 2006 and newer; and

All engines less than 749 HP, regardless of model year.

If construction equipment uses B99 biodiesel, no acute adverse health effect would be expected in the following:

Engines between 501 HP and 750 HP, if model years 2002 or newer; and

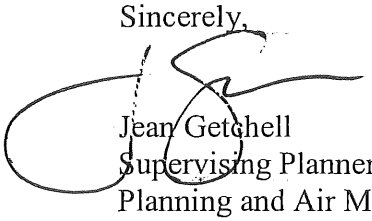
Engines between 250 HP and 500 HP, if model years 1996 and newer; and

Any engine less than 250 HP.

H-4

Plan Generated Operational Impacts. Page 4.3-18.
The 920 acre Specific Plan site is too large for URBEMIS to accurately estimate emissions unless the individual components are analyzed and then totaled.

H-5



Mitigation Measure 4.3-3. Page 4.3-20.
Given the potentially significant impacts of carbon monoxide and particulates, the Air District appreciates the recommended mitigation measure to prohibit wood-burning fireplaces and stoves. It further suggests the following measure be made a condition of project approval, which would address the installation and operation of wood-burning stoves and fireplaces, and provide enforcement of this mitigation measure.

Natural Gas Hearths / No Wood-Burning Fireplaces or Wood-Burning Stoves
"Fireplaces and stoves shall be gas-fired and meet U. S. Environmental Protection Agency certification requirements. The installation or operation of a wood-burning fireplace or a wood-burning stove shall be prohibited in perpetuity on all residential properties in the Miravale III Specific Plan Development. This restrictive covenant shall be recorded on the title of all parcels in the Miravale III Specific Plan and shall run with the land."

H-6

Thank you for the opportunity to review the document.

Sincerely,

Jean Getchell
Supervising Planner
Planning and Air Monitoring Division

David Roemer, AMBAG

LETTER H: MONTEREY BAY UNIFIED AIR POLLUTION CONTROL DISTRICT (MBUAPCD)

H1: This comment requests that a consistency determination from AMBAG be obtained. A consistency determination was previously obtained from AMBAG for the proposed project. A copy of that determination was included as an appendix to the Draft EIR; please see Appendix E of the Draft EIR for more information. As evidenced in that correspondence, AMBAG determined that the proposed project is consistent with the 2004 regional forecasts and the Air Quality Management Plan.

H2: This comment requests that Mitigation Measure 4.3-1 be revised to include additional requirements to address potential fugitive dusts associated with project construction. Mitigation Measure 4.3-1 has been revised in response to this comment; please refer to **Section 4.0 Revisions to the Draft EIR, Air Quality, Section 4.3,** for more information.

H3: This comment requests specific revisions to Mitigation Measure 4.3-2 in order to make sure that compliance with that measure is obligatory. Mitigation Measure 4.3-2 has been revised in response to this comment; please refer to **Section 4.0 Revisions to the Draft EIR, Air Quality, Section 4.3,** for more information.

H4: This comment recommends additional revisions to Mitigation Measure 4.3-2 to specify certain types of construction equipment that may be used during project construction. Mitigation Measure 4.3-2 has been revised in response to this comment; please refer to **Section 4.0 Revisions to the Draft EIR, Air Quality, Section 4.3,** for more information.

H5: This comment contends that the project site is too large for URBEMIS to accurately estimate project emissions unless the individual components of the project are analyzed and then totaled. The URBEMIS modeling used phasing (four phases) to limit the acreage of development considered in each model analysis and provide a quantitative estimate of future emissions. It is acknowledged that true future emissions are better estimated with URBEMIS at a project-level. Regardless, operational emissions of regional air pollutants were identified as a significant and unavoidable impact on page 4.3-20 of the Draft EIR. Mitigation Measure 4.3-3 has been revised to require project applicants/proponents to implement all feasible mitigation measures to reduce GHG and regional air pollutant precursor emissions in accordance with State CEQA Guidelines. A revised version of the mitigation measure restricting fireplaces is provided separately as a new Mitigation Measure (#4.3-4). In addition, new mitigation measures have been added: 4.3-5 requiring the provision of transit-support facilities (turn-outs and bus shelters), and 4.3-6 requiring all development under the Specific Plan to adhere to the most current standards of the California Building Code pertaining to reduction of air quality impacts and GHG emissions, such as the California Green Building Standards that becomes effective in January 2011. Please refer to **Section 4.0 Revisions to the Draft EIR, Air Quality, Section 4.3,** for more information.

H6: This comment recommends that an additional mitigation measure be required as a condition of project approval to ensure that the installation and operation of wood-burning stoves and fireplaces be prohibited in perpetuity to address significant and unavoidable project impacts due to increases in long-term operational emissions of ozone precursor pollutants. In response to this comment Mitigation Measure 4.3-3, has been revised. Please see **Section 4.0 Revisions to the Draft EIR, Air Quality, Section 4.3,** for more information.

Letter I

TAMC
TRANSPORTATION AGENCY
FOR MONTEREY COUNTY

Regional Transportation Planning Agency • Congestion Management Planning
Local Transportation Commission • Monterey County Service Authority for Freeways & Expressways

December 18, 2008

RECEIVED
DEC 18 2008
PLANNING DEPARTMENT

Ms. Susan Hilinski
City of Soledad
Community Development Department
P.O. Box 156
Soledad, California 93960

SUBJECT: Comments on the Draft Environmental Impact Report for the Miravale III Specific Plan

Dear Ms. Hilinski:

The Transportation Agency for Monterey County is the Regional Transportation Planning Agency and Congestion Management Agency for Monterey County. Transportation Agency staff has reviewed the Draft Environmental Impact Report for the Miravale III Specific Plan.

The proposed project consists of a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units, 120 hotel rooms, 275,000 square feet of retail commercial space, and an 18-hole golf course located within unincorporated Monterey County on the northern edge of the City of Soledad. Transportation Agency staff offers the following comments for your consideration: I-1

Regional Roads & Highways

1. The draft document indicates that the project applicant will be required to pay the City of Soledad's Transportation Impact Fee as mitigation for both project-specific and cumulative transportation impacts by stating:

   The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The TAMC fee is levied against new developments within local member jurisdictions of TAMC, including the City of Soledad. At this time, however, the City of Soledad has not committed to collecting the TAMC fee. In order to address regional improvement, the City of Soledad has incorporated local TAMC improvements projects into their adopted TIF program. Therefore, the collection of impact fees as part of the City's TIF program will include regional improvements and will be in-lieu of payment of an independent TAMC fees. I-2

This information is incorrect and contradicts an earlier section of the document, which notes that traffic impact fees will be imposed upon the project by both the City of Soledad and the Transportation Agency. The Regional Development Impact Fee Program, which is based on the *2007 Regional Impact Fee Nexus Study Update* available on our agency's website, was approved and adopted by ordinance by City of Soledad Council on June 4, 2008, making all new development in Soledad subject to the regional fee. The Transportation Agency supports the payment of the City of Soledad's comprehensive Traffic Impact Fee as mitigation for impacts to local streets and roads; however this does not address cumulative impacts or mitigation. I-2 cont.

Cumulative impacts can be mitigated through a contribution to our agency's regional fee program. Payment of the regional development impact fee is supported by Caltrans and allows new development to adequately mitigate cumulative impacts to state highways and regional roads and remain California Environmental Quality Act-compliant. This method is also consistent with the City of Soledad General Plan Policy C/T-13, which calls for the City to ensure that new development pays its fair share of costs of circulation improvements through a combination of traffic fees and other funding mechanisms. Mitigation measures 4.13-10 through 4.13-14 should be revised to indicate that collection of the Transportation Agency's regional impact fees is the appropriate mitigation measure for cumulative transportation impacts. I-3

Pedestrian & Bicycle Facilities

2. The Transportation Agency supports accommodation of alternative forms of transportation (rail, bus transit, bicycle and pedestrian transportation), both through the design of transportation facilities, and through the design and orientation of land uses. The Transportation Agency supports the City's policies related to alternative transportation that call for facilities that promote the inclusion of bicycle lanes, pedestrian and hiking trails, park-and-ride lots and facilities for public transportation, as well as requiring new development to provide bike lanes and storage facilities.

   To accommodate this policy, our agency appreciates that the project will seek to maintain and promote non-automotive travel within the community by providing adequate bicycle and pedestrian facilities, connecting sidewalks to surrounding developments, and ensuring sufficient right-of-way. Our agency requests that existing bicycle and pedestrian facilities, proposed facilities, and facilities that the project applicant will construct be interconnected, particularly to the bike lanes on Front Street between East Street and Nestles Road, Gabilan Drive from San Vicente Road to West Street, and Orchard Lane from the project boundary to Gabilan Drive. In addition, The Transportation Agency recommends that bicycle racks and lockers be installed and made publicly available in the development, particularly at the planned open space area. Adequate lighting should be provided at these locations to improve safety and visibility I-4

3. The circulation map included with the document depicts that the project will include 70 foot wide collector streets with bicycle facilities. The Transportation Agency requests that any on-street parking will not restrict access to non-motorized vehicle I-5

facilities. Also, street markings or signage should be included to allow for safe use of this space by bicyclists as well as for motor vehicles. I-5 cont.

4. Our agency discourages the use of cul-de-sacs in site designs, as they impede and discourage the use of bicycle and pedestrian travel by creating longer travel times and blocking access to surrounding portions of the development. The circulation map shows that the proposed development will heavily rely on the use of cul-de-sacs. While the map shows that a portion of these will include "neighborhood connectors" to allow access to adjacent parts of the development, there are areas where the map shows blocked access. The Transportation Agency recommends that access be provided to bicyclists and pedestrians through all cul-de-sacs by including bike or pedestrian walkways to adjoining parts of the development or by eliminating the reliance on cul-de-sacs in the site design. I-6

Transit Travel

5. As the document notes, the existing transit system in the City of Soledad is limited, with current service including a stop in Soledad on Line 23 (King City to Salinas) and on-demand taxi service. Monterey-Salinas Transit is in discussion with the South County cities on the possibility of assuming transit service in these areas. While the development may only anticipate that up to 3% of project trips could be made by transit, our agency recommends that the development work closely with the City of Soledad and Monterey-Salinas Transit to ensure that the development will provide adequate access to any planned transit facilities as well as to the facilities that currently exist for Lines 23 and 53. I-7

6. In addition, our agency appreciates that the Miravale III Specific Plan includes a policy to include bus stops in logical locations and that the circulation map shows potential stops. The project applicant should utilize Monterey-Salinas Transit's *Designing for Transit* Guideline Manual as a resource for accommodating any future transit access to the project site. I-8

Thank you for the opportunity to review this document. If you have any questions, please contact Michael Zeller of my staff at (831) 775-0903.

Sincerely,

Debra L. Hale
Executive Director

Ed Kendig, Monterey Bay Unified Air Pollution Control District

LETTER I: TRANSPORTATION AGENCY FOR MONTEREY COUNTY (TAMC)

I1: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

I2: This comment notes that in order to mitigate regional impacts the proposed project must contribute towards TAMC's Regional Development Impact Fee Program in order to address cumulative impacts. This comment contends that the payment of the City of Soledad adopted Traffic Impact Fee is inadequate mitigation for cumulative level impacts. Please note that at the time the traffic analysis was completed, the City of Soledad had not committed to collecting the TAMC Regional Development Impact Fee. As a result, the City had identified regional facilities that would be provided funding through the payment of the City's adopted TIF. Since that time, however, the City has committed itself to collecting the TAMC fee as a method to address regional and cumulative level impacts. The Draft EIR has been revised in order to clarify the City's responsibility to mitigate cumulative impacts as it relates to the TAMC fee. Please refer to **Section 4.0 Revisions to the Draft EIR** for more information.

I3: This comment requests that Mitigation Measure 4.13-10 through 4.13-14 be revised to indicate that collection of TAMC's Regional Impact Fees are the appropriate mitigation measures for cumulative level impacts. Mitigation Measures 4.13-10 through 4.13-12 have been revised in response to this comment; please refer to **Section 4.0 Revisions to the Draft EIR,** for more information. The improvements identified in Mitigation Measures 4.13-13 and 4.13-14 are not included in the list of regional transportation project impacts funded by the TAMC Regional Development Impact Fee as adopted by the City of Soledad. As these improvements are not identified as regional level improvements, payment of City transportation impact fees is necessary to mitigate the impact at the two intersections at Moranda Road & Front Street and San Vicente Road & Gabilan Drive

I4: This comment requests that existing bicycle and pedestrian facilities, proposed facilities, and facilities associated with the proposed project will be interconnected. The comment specifically requests that the bike lanes on Front Street between East Street and Nestles Road, Gabilan Drive from San Vicente Road to West Street, and Orchard Lane from the project boundary to Gabilan Drive be interconnected. This comment also recommends that bike racks and lockers be installed and made publicly available in the development, especially in areas adjacent to open space. The comment also requests that adequate public lighting be provided at these locations to improve safety and visibility. This comment is referred to the City for further consideration as part of the deliberative process and it is recommended that the proposed project be conditioned to require that all pedestrian and bicycle facilities are interconnected, provide adequate lighting for security purposes, and bike racks and lockers are made available throughout the development, as recommended by the comment.

I5: This comment expresses a specific request by TAMC that on-street parking on proposed 70' wide collector streets be designed so as not to restrict access by non-motorized vehicles. This comment further requests that appropriate street markings and signage be provided to allow for the safe use of this space by bicyclists. As required by the City of Soledad, appropriate street marking and signage will be provided to ensure the safety of cyclists traveling along collector streets. All final design plans will be required to meet the specifications of the City of Soledad and will be required to implement pedestrian and cyclist safety measures consistent with this comment.

I6: This comment requests that pedestrian and cyclist connections be provided through all cul-de-sacs by including bike of pedestrian walkways to adjoining parts of the development or through the elimination of cul-de-sac as part of the site design. The project, as currently proposed, relies heavily on cul-de-sacs as part of the site design and numerous neighborhood connectors have been provided throughout the

Specific Plan consistent with this comment. Nevertheless, this comment is referred to the City of Soledad for further consideration.

I7: This comment requests that the City of Soledad work closely with Monterey-Salinas Transit to ensure that the proposed project provides adequate access to existing and planned transit facilities. Comment noted. A new Mitigation Measure 4.3-4 has been added to the FEIR require the provision of bus shelters and turn-outs to service each development phase of the Specific Plan as may be recommend by the Transit District. See **Section 4.0 Revisions to the Draft EIR.**

I8: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

Subj.: Miravale III Project – School District Impact

Dear Ms. Hilinski,

We would like to express our serious concerns as to the insufficiency of adequate school sites set aside in this development. The hearing draft dated January, 2008 received by us in November 2008 specifies 1,470 single-family residential units, 2,730 multi-family including 500 senior housing units.

Using the same methodology as our School Facility Consultants in the attached letter, we are arriving at the following numbers:
4,200 homes less 500 senior units = 3,700 homes x 1.16 SGR (Student Generation Rate) = 4,292 students.

J-1

By Grade Level:
K-6 = 3,700 x 0.662 = 2,450 Students = 4 new elem. schools
7-8 = 3,700 x 0.169 = 625 Students = 1 new middle school
9-12 = 3,700 x 0.329 = 1,217 Students = 1 new high school

The plan as submitted only includes 2 elementary schools and 1 middle school. **In order to accommodate student growth the plan should include 2 additional elementary schools and one new high school.**

We also need to confirmation that the selected proposed school sites are not located on any land previously used as a land fill.

J-2

Please feel free to contact me for any additional information.

Sincerely,
for Gertrud Robinson
Jorge Guzman

TO: Mr. Jorge Guzman
Soledad Unified School District

FROM: Kevin Sullivan
School Facility Consultants

SUBJECT: **Review of the District's Analysis of the Impact of the Miravale III Specific Plan**

CC: Ms. Gertrud Robinson, Soledad Unified School District
Alexander R. Murdoch, School Facility Consultants
Matt Pettler, School Facility Consultants
Master File

In response to your request to review the District's analysis of the impact of the Miravale III Specific Plan, we have observed the following:

The District's identified Student Generation Rate (SGR aka, Student Loading Factor), is valid and based on United States Census data from the year 2000. It compares the total number of students in the District in the year 2000 with the total number of occupied households, resulting in each household generating approximately 1.16 pupils.

Application of the total SGR of 1.16 is based on the weighting of the District's current 2006/07 CBEDS enrollment over the elementary, middle and high school grades. This allocates the total SGR of 1.16 into the following grade groups:

Breakdown of Student Generation Rate	
K-6	0.662
7-8	0.169
9-12	0.329
Total	**1.160**

Applying this generation rate to the 4,200 proposed new dwelling units included in the Miravale III Specific Plan results in the generation of the following students:

Anticipated Student Yield of Proposed Development (Miravale III)			
Grade Groups	**K-6**	**7-8**	**9-12**
Student Yield Calculation	4,200 x 0.662 = 2,782	4,200 x 0.169 = 709	4,200 x 0.329 = 1,382
Total Students	**2,782**	**709**	**1,382**

The District has advised that these student yields will require the District to construct elementary schools of approximately 700 pupils, along with middle and high school campuses to serve the new development.

As a result, the District will be required to build four new elementary schools, one new middle school and a second high school. The District will also likely need to expand its current community school/continuation high school program to accommodate increases to the anticipated student population. The District has advised that it plans to construct a new Community Education Center/ Continuation School within the proposed development area in order to accommodate the anticipated growth. J-3 cont.

It is hoped that this review of the District's analysis is helpful in addressing the District's facility planning needs. Please call with any questions.

LETTER J: SOLEDAD UNIFIED SCHOOL DISTRICT (SUSD)

J1: This comment states that the proposed project has inadequate school facilities to accommodate project generated demands and that an additional two (2) elementary schools and one (1) high school will be necessary to serve the proposed project. Consistent with the student projections contained in this comment, the Draft EIR determined that the proposed project would provide inadequate school facilities to accommodate project demands. This was identified as a potentially significant impact in the absence of mitigation. In order to mitigate this potentially significant impact and thereby ensure adequate school facilities, Mitigation Measure 4.12-4 of the Draft EIR, page 4.12-14, requires that the project applicant submit a revised Specific Plan and tentative map demonstrating that an additional two (2) elementary schools and one (1) high school will be provided in conjunction with the proposed project. In the event that these facilities are not provided in conjunction with this project, additional facilities will need to be provided elsewhere in the City of Soledad to accommodate full buildout. Mitigation Measure 4.12-4 has been revised to indicate that in lieu of providing additional on-site facilities, the project may submit payment of its proportionate share of funding towards the acquisition and construction of new school facilities. In order to ensure that adequate capacity is available to serve the various phases of development, development would be restricted until such time that the City of Soledad and the Soledad Unified School District are satisfied that the necessary facilities are available consistent with the requirements of General Plan Policy S-23. Compliance with this mitigation measure and existing General Plan requirements will ensure that: (a) adequate school facilities will be provided in connection with the proposed project, or (b) adequate funding will be provided to allow SUSD to acquire additional school sites need to serve project area residents and construct said facilities. Additionally, the proposed project would be required to pay applicable school impact fees for each type of new development as required pursuant to Mitigation Measure 4.12-5.

J2: This comment requests confirmation that the proposed school sites are not located on any land previously used as a landfill. As described in **Section 4.7 Hazards and Hazardous Materials** of the Draft EIR, the former Soledad Sanitary Landfill is located along the northern boundary of the project site. The Soledad Sanitary Landfill is listed as a closed facility and was primarily used for the purposes of municipal waste disposal. As identified in the Draft EIR, the Soledad Sanitary Landfill site is located within approximately 1,500 feet of several proposed school facilities located along San Vicente Road. While none of the proposed school sites are located on land previously used as a landfill, these school sites could be exposed to hazardous materials and/or emissions as a result of the former landfill use. As a result, the Draft EIR identified Mitigation Measure 4.7-5 as necessary to ensure that the proposed facilities and future students would not be exposed to hazardous conditions. Please see **Section 4.7 Hazards and Hazardous Materials** of the Draft EIR for more information.

J3: Comment acknowledged. This comment is a copy of correspondence provided to SUSD from School Facility Consultants regarding student projections. This correspondence was previously submitted to the City of Soledad and the EIR consultant during the course of preparing the Draft EIR. This comment does not raise an issue related to the analysis contained in the Draft EIR and is part of the administrative record. No response necessary.

Soledad, CA 93960

Subject: Miravale III Specific Plan Draft EIR

The Monterey County Resource Management Agency (RMA) has compiled the following comments from the County's land use agencies (Planning Department, Water Resources Agency, Public Works Department, Parks Department, Environmental Health Division, Agricultural Commissioner) regarding the Miravale III Specific Plan Draft EIR: K-1

General Comments

There is a statutory requirement for early consultation between the City and County (Government Code Section 56425b) before the Sphere of Influence amendment is submitted to LAFCO. In addition, referral of the proposed General Plan Amendments to the County and consultation with the County for consistency with the County's General Plan are required in accordance with Government Code Sections 65352 and 65454. Prior to any action by the City, we request that the City meet with representatives of the Resource Management Agency (RMA), Agricultural Commissioner, and Assessor to discuss issues including the proposed direction of city growth, agricultural buffers, mitigation for the loss of agricultural land and regional transportation impacts and County revenue. K-2

Planning Department

Grading (Page 3.0-5) - The EIR should indicate the total quantity (in cubic yards) of grading that is proposed, the number of truck trips (if any) and whether the grading is proposed to be phased or completed all at once. A construction management plan should identify hauling routes that are then evaluated in the EIR relative to impact on sensitive receptors (schools, hospitals, etc) and air quality impacts. K-3

General Plan Amendments Page 3.0-8 – The DEIR states that the project includes modification of Land Use Policy L-45 to allow exceptions to the restriction on ridgeline development. However, this policy is not referenced or addressed in the Aesthetics Chapter of the DEIR. At a minimum, the EIR should explain why the ridgeline policy cannot be satisfied by the proposed project, the impacts on not satisfying the policy, alternatives and proposed mitigation measures. As noted above, a General Plan action requires consultation with abutting agencies (County) and evaluation of consistency with the County General Plan. K-4

Agencies (Page 3.0-9) – In listing the required permits and approvals, the EIR does not include the requirement for the City to enter into a tax transfer agreement with the County pursuant to Revenue and Taxation Code Section 99. K-5

Aesthetics (Pages 4.1-9 - 4.10 and 4.1-14 – 4.1-16) – The DEIR should indicate the level of significance after mitigation for the aesthetic impacts. K-6

Agricultural Buffers (Page 4.2-13) – The DEIR states "the Monterey County Agricultural Commissioner generally recommends at least a 200 foot buffer between agricultural and non-agricultural uses." The DEIR then outlines the project plans for a 60-foot buffer on the site's western border and 50 feet on the north and east, without any discussion of the feasibility of implementing the County's 200 foot buffer. The Agricultural Commissioner has indicated that the proposed 50-foot and 60-foot buffers are inadequate. Any new development adjacent to agricultural areas should include well-defined buffer zones as set forth in Section 21.66.030.F.2 of the County Zoning Ordinance (Title 21). The areas to be utilized as buffer zones shall be placed in permanent easements required as conditions of project approval. The County ordinance requires that development adjacent to "F", PG" or "RG" zoning districts, shall have a 200 foot wide easement or wider where necessary to mitigate adverse impacts between agricultural and adjacent land uses. If 200 foot buffers and not to be provided, the EIR should discuss why this cannot be accomplished and discuss the impacts of not providing the required 200-foot buffers. Alternately, physical barriers should be considered to increase the effectiveness of reduced buffers. K-7

Discussion of buffers must address consistency with the County's General Plan. Evaluation of impacts on agricultural lands needs to distinguish between permanent edges (no future growth) and temporary edges (allow for possible future growth). The County's draft General Plan (Policy AG-1.2) removes specific set back distance, and requires a project to justify set backs based on criteria including, but not limited to:

a. Wind direction and intensity. . Set backs larger than 200 feet may be necessary to allow aerial spraying of adjacent agricultural properties.

b. Topography

c. Impact on agricultural operations must be fully mitigated on the development properties. Reduced buffer for areas adjacent to lands under Williamson Act contract would be a significant impact.

K-8

Buffers may not include improvements that are incompatible with the agricultural operations. For example, open space that is not properly maintained could result in weeds or rodents that can impact food safety. Buffers must be adequate sized such that they completely mitigate any potential impact. If not, the EIR should conclude significant growth inducing impact and impacts can be feasibly mitigated by increasing buffers.

Loss of Prime Farmland (Page 5.0-12) – The DEIR states that the project would constitute a significant cumulative impact to agricultural resources and states that "currently there are no formal mitigation fee and/or conservation easement policies in place" and "no measures are available to K-9

fully mitigate the loss of prime farmland." However, CEQA requires that all feasible mitigation measures be applied. The County's General Plan (Policy AG-1.12) requires mitigation and without a program established, the City should consult the County in order to establish an acceptable mitigation program for this project. What are the alternatives to converting this amount of prime agricultural land or alternatively how the City will provide for permanent protection of prime agricultural land elsewhere in the County prior to proceeding with the proposed development? In addition, there needs to be a quantifying of the financial loss to the County/region from the conversion of agricultural to the proposed uses, including a discussion of how the agricultural jobs that will be replaced will compare to those created. K-9 cont.

Cultural Resources (Chapter 4.5) – The DEIR does not acknowledge that, since General Plan Amendments are proposed, the City is required to consult with local Native Americans pursuant to Government Code Section 65350 et seq). K-10

Land Use and Planning (Chapter 4.9) – The County's 2007 Draft General Plan encourages city-centered growth (Policies LU-2.15 through LU-2.20). The EIR needs to address how the proposed project is consistent with planned growth both under the County's adopted and Draft General Plan as well as the City's growth plans. Analysis should include justification for a large expansion versus in-fill development opportunities (Policy LU-2.19). Specifically, the EIR needs to include analysis regarding how the project meets County General Plan policies LU-2.18.1 and AG-1.1. K-11

Water Resources Agency

4.8 Hydrology and Water Quality

Surface Water Resources and Water Quality (Page 4.8-1) - The section states that, "Drainage of the surface water in the vicinity of the project generally occurs by overland sheet flow towards shallow ephemeral drainage courses on the site. The drainages on the property typically do not carry surface water except during peak rainfall events." The Agency recommends all development be setback 50 feet from the "top of bank" of any watercourse. As defined by Monterey County, top of bank means the intersection of a plane beginning at the toe of the bank and sloping 1.5 (horizontal): 1 (vertical) with the generally level ground along the watercourse. K-12

Flooding (Page 4.8-3) - The section states that, "Although the City is not located within the 100-year floodplain, flooding has occurred in the downtown portion of the City and a portion of the project site." The Agency extended the Soledad Drainage Improvement Project upstream of Metz Rd, in 2002. These improvements were sized for the 100-year storm event for the Bryant Canyon watershed, but additional flows from adjacent watersheds impact the channel. Additional improvements need to be made to provide flood protection for the surrounding area. The EIR should be updated to include this information. K-13

Surface Drainage/Flooding (Page 4.8-10) - The *Hydraulic Analysis of the proposed storm drain system for the Miravale III Subdivision* included in the DEIR does not provide sufficient details to determine potential impacts. The EIR should include a preliminary drainage analysis that clearly defines watersheds, numeric design criteria, and recommended mitigation measures. The analysis should include supporting maps, calculations, and technical evidence to support all assumptions and K-14

recommendations. The EIR should include a preliminary drainage plan, prepared by a registered civil engineer, showing the location, size, and type of all major drainage facilities. K-14 cont.

If on-site retention is recommended, the EIR should include a geologic investigation performed at the site of the proposed retention facilities. The investigation should determine the suitability of subsurface materials for stormwater retention and aquifer recharge, as well as, potential impacts to geologic hazards. In accordance with the State of California Board for Geologists and Geophysicists *Guidelines for Engineering Geologic Reports*, the analysis should include one or more of the following subsurface investigations:

a. Trenching and any other excavation (with appropriate logging and documentation) to permit detailed and direct observation of continuously exposed geologic units and features.

b. Borings drilled, test pits excavated, and groundwater monitoring wells installed to permit the collection of data needed to evaluate the depth and types of materials and subsurface water. Data points sufficient in number and adequately spaced will permit valid correlations and interpretations. K-15

Geophysical surveys conducted to facilitate the evaluation of the types of site materials and their physical properties, groundwater conditions and any other pertinent site conditions. The types of equipment and techniques used, such as seismic refraction, magnetic, electric resistivity, seismic reflection and gravity, and the name of the geologist or geophysicist responsible for the work.

Depending on the results, the mitigation measures may need to be rewritten to incorporate the recommendations of the geologic investigation.

Public Works Department

This development proposal would provide residential, retail services, school, parks and golf courses that would be available to the entire community, and this project is expected to generate additional regional as well as local trips. Consequently there is the potential for impacts to the regional transportation system. The project developer is responsible for addressing these regional and local impacts, and may do so through payment of the Transportation Agency for Monterey County (TAMC) regional development impact fee and city of Soledad's Traffic Impact fee to address cumulative regional traffic impacts of development throughout the county. K-16

The traffic study for this project identifies impacts and mitigations along Highway 101. Project-specific and cumulative impacts are identified and mitigations developed within this traffic study. The applicant is still responsible for mitigating the impacts of this development proposal, and shall implement direct project-specific mitigation measures prior to completion of the proposed development. Mitigations and improvements within the State right-of-way are subject to Caltrans' review, and implementation of these mitigations shall also be coordinated with Caltrans. K-17

Currently a portion of San Vicente Road from Soledad City limits northerly to its terminus is a County Road. Portions of this County road are within the limits of this development project. K-18

Because this roadway will be primarily serving this development area this roadway should be included in the annexation of the project area to the City of Soledad. K-18 cont.

Parks Department

Historic Structure (Page 4.9-35 of Table 4.9-2) - It is stated that the single historic structure is located on the site and mitigation is achieved by relocating the structure from its current location, consistent with the City of Soledad General Plan Land Use Policies. If the house is considered eligible for listing by the National Historic Register, the proposal to move the house to a new location must be reconsidered. Therefore, the County requests a PHASE I HISTORICAL ASSESMENT for the LORENTZEN HOUSE by a County-certified architectural historian to determined if the structure is eligible for National, State or local listing as a significant historical structure. K-19

Park Requirements - On page 3.0-8 under the proposed "General Plan Amendments," there is stated the need for an exception to the requirement that the development provide its fair share of public park and recreation opportunities (3 acres/1,000 residents):

- By including approximately 8 acres of trails and park connections; and
- on page 2-14 under "Summary of Environmental Impacts and Mitigation," by submitting detailed plans, including a revised Specific Plan and Tentative Map, demonstrating adequate parkland.

On page 4.9-6 of Table 4.9-2, it is stated that as currently proposed, the project includes approximately 45.60 acres of parkland, including 24.27 acres of parkland to be provided in conjunction with the development of the multi-family Village Residential areas. In addition, the proposed project also includes an approximately 1,590 acre golf course, in addition to approximately 62 acres of open space. It is not clear what the request for an exception to the park requirements is referring, unless it is requesting that a later detailed, revised Specific Plan will meet the minimum park requirements of 3 acres/1,000 residents for public park and recreation opportunities. But it must be understood that the minimum 3 acres/1,000 residents is required by both the County (Title 19, Monterey County Subdivision Ordinance, Section 19.12.010) and the State (Quimby Act, Government Code Section 66477 (a) (2)). K-20

The on-site acreage is required by the County's Title 19 Ordinance (Section 19.12.010 F) reflecting the State's Quimby Act (Government Code Section 66477 (a) (7)) when the subdivision proposal consists of 50 or more dwelling units, not withstanding that the parcels may be less than 50 as in the case of multi-family units. In the case of the Miravalle III Specific Plan park requirements, the on-site park requirements based on the 920 acre site and a total of 4,316 dwelling units (1,702 single family dwelling units and 2,614 multi-family units) would be a minimum of 31.7862 acres of parkland. The calculations are as follows: K-21

- 1,470 detached sfd;
- 232 duplex sfd

1,702 sfd

.003 (acres/person) multiplied by 3 (persons/dwelling unit) multiplied by 1,702 (1,470 detached sfd and 116 duplex sfd units) = 15.318 (acres of land required for dedication).

- 2,614 multi family dwellings

.003 (acres/person) multiplied by 2.1 (persons/dwelling unit) multiplied by 2,614 (number of multi-family dwelling units) = 16.4682 (acres of land required for dedication).

15.318 acres of land required for single family households
+16.4682 acres of land required for multi-family households
31.7862 acres of land required for active recreation

K-21 cont.

Note that the 31.7862 acres of land is the minimum acres of land required to provide the land for functional, active recreational units on a local level of service which reasonably serves the subdivision or neighborhood service. Title 19 does not provide credit "...for common open space areas, dedicated scenic easements, dedicated hiking or riding trails or other passive space recreational uses." Active recreational uses include but are not limited to tot lots, play field lots, playgrounds, playfields, and other specialized recreational facilities that may serve the family group and also senior citizens and child care activities. (The proposed semi-private golf course would not be sufficient to reasonably serve the recreational needs of all age groups). This County regulation again reflects the State Quimby Act by insistence upon active recreation improvements of dedicated parkland within new subdivision.

K-22

Title 19 also allows the payment of park in-lieu frees, particularly for projects involving 50 units or less. Where there are public park and recreation facilities within close proximity to a new subdivision (about a ¼ mile, but not greater than a ½ mile walking distance), the Parks Department considers the use of in-lieu fees for projects of a larger size.

K-23

Subsection 19.12.010 (I) of the Subdivision Ordinance allows credit for recreation improvements to dedicated parkland. It states that if a subdivider dedicates parkland, "...the value of the improvements together with any equipment located thereon shall be a credit against the payment of fees or dedication of land required by this section." But in practice, the County has never given credit pursuant to this section. This is because the County's park dedication requirement is at the statutory minimum and, in order to meet the primary intent of the Subdivision Ordinance Section 19.12.010, enough land needs to be provided and active recreational facilities need to be constructed to meet the needs of the future residents of the new subdivision. Anything less than the 3 acres per 1,000 person park standard is viewed to be insufficient to meet the purpose and intent of the County's Ordinance.

K-24

In summary, it appears that the subdivision as currently proposed includes approximately 45.60 acres of parkland, including 24.27 acres of parkland to be provided in conjunction with the development of the multi-family Village Residential areas. The County accepts this proposal when it is demonstrated

a. that the Applicant shall comply with the Recreation Requirements contained in Section 19.12.010 (B) – Requirements, County Subdivision Ordinance, Title 19, Monterey County Code, by providing dedicated land of no less that 31.7862 acres for park and active recreation purposes reasonably serving all age groups residing within the subdivision;

b. that revised Specific Plans do indicate that the parkland is adequately distributed throughout the subdivision serving the various neighborhoods;

K-25

c. that the dedicated parkland complies with Section 19.12.010 (D) – Standards and Formula for Dedication of Land – by providing the County Parks Department with a Master Park and Recreation Plan which includes a development, maintenance, operation and financing component for each dedicated recreation parcel. The Plan shall also delineate the types of improvements within each dedicated park parcel for serving the appropriate recreational needs for all age groups residing within the subdivision.

K-25 cont.

d. that the Master Park and Recreation Plan shall address the park and recreational needs for individuals covered under the American with Disabilities Act.

Environmental Health Division

Hazards and Hazardous Materials (4.7) - As stated in Mitigations 4.7-1 through 4.7-4, a Remediation Plan will be submitted to EHD for review and approval.

Mitigation 4.7-5 speaks to the concerns of the proximity of the closed landfill to proposed school sites. If during the Phase II Environmental Site Assessment it is determined that if any hazards exist that cannot be reduced to an acceptable level through remediation, the applicant in conjunction with the school district will identify new school sites.

K-26

Noise (4.10) – All concerns that EHD were discussed and the appropriate mitigations are in place.

Utilities and Services (4.14) – Water Supplies and Storage - The city's water supplies and storage/distribution system will be expanded to encompass the new development. Also, the city water system is regulated by the California Department of Health Services (DHS), which has oversight and permitting of all aspects of the quality and delivery of potable water. The city is in the Monterey County Zone2C area of the Salinas valley so a long-term sustainable water supply is available.

K-27

Wastewater: the existing two treatment plants will be expanded and upgraded to be able to treat wastewater to California Code of Regulation (CCR) Title 22 standards, specifically Sections 60304 and 60310.for use of recycled wastewater. The California Regional Water Quality Control Board, Central Coast Region (RWQCB), and to a lesser extent the, Monterey County Health Department, Environmental Health Division (EHD), regulate and permit the wastewater treatment facility.

In the Soledad Municipal Code a specific discuses regarding the construction of infrastructure and the use of recycled water to meet State of California Water Code Section 13510, 13550, 461 and CCR 65602(e) for water conservation. On June 6, 2007 the city adopted Ordinance No 645, which amended the Municipal Code to include Chapter 13.11, governing use of recycle water within the City's service area. Sections 13.11.010 through 13.11.190 establish procedures, specifications, limitation and the regulation set forth by the County, State and Federal governmental codes for the safe use and operation of recycled water facilities and systems. A cope of this ordinance must be included in the final EIR.

K-28

Mitigation measures 4.14-1 through 4.14-4 speak to water supply, distribution systems, recycled water facilities and infrastructure construction and means for over site.

Mitigation measures 4.14-5 through 4.14-8 speaks to the wastewater treatment system, permitting and over site.

K-29

Mitigation measures 4.14-9 through 4.14-11 speaks to water and wastewater infrastructure design, placement, permitting and capacity.

With these Mitigation measures in place, these impacts will be less than significant. K-29 cont.

Solid Waste: all concerns that EHD have been discussed and the appropriate mitigations are in place. K-30

EHD will work with the RWQCB as well as the City of Soledad in implementing and overseeing the rules and regulation regarding the use of recycled water to protect the health and well being of the people of Monterey County. K-31

Thank you for the opportunity to comment on the Draft EIR. Feel free to call me or Bob Schubert at (831) 755-5183 if you have any questions.

Sincerely,

LETTER K: MONTEREY COUNTY RESOURCE MANAGEMENT AGENCY (MCRMA)

K1: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

K2: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. This comment is referred to decision-makers for further consideration as part of the deliberative process. No response is necessary.

K3: This comment requests that the EIR identify the total quantity of cubic yards of grading proposed in connection with the project, identify the number of truck trips (if any), and whether grading is proposed to be phased or completed all at once. Grading for roads, other infrastructure improvements and related development would be phased based on the proposed phasing plan contained in the Specific Plan. According to preliminary estimates provided by the applicant's representative, development of the proposed project would entail approximately 2.05 million cubic yards of cut/fill. These are considered preliminary estimates and final cut/fill calculations will be based on project-level detail as individual applications and improvement plans are submitted to the City of Soledad for development within the Specific Plan area. As identified in the Draft EIR, this EIR is a programmatic level document and future proposals within the Specific Plan area may require additional environmental review if they are inconsistent with the analysis contained in this EIR.

This comment also identifies that a construction management plan should identify proposed haul routes that are evaluated in the Draft EIR for impacts to sensitive receptors and potential air quality impacts. The Draft EIR clearly evaluates potential impacts associated with construction generated traffic, including associated air quality impacts; please refer to Draft EIR **Section 4.3 Air Quality** for further discussion. The analysis in the Draft EIR identifies potential impacts associated with construction traffic and mitigation measures have been identified to address impacts to sensitive receptors, where appropriate (see Mitigation Measures 4.3-1 and 4.3-2 as revised in **Section 4.0 Revisions to the Draft EIR**). Moreover, the analysis in the Draft EIR is at a programmatic level and future projects within the Specific Plan will be reviewed by the City of Soledad to determine whether additional environmental review is warranted under CEQA.

K4: This comment identifies that the proposed project includes a General Plan amendment to allow exceptions to City of Soledad General Plan Land Use Policy L-45, which prohibits ridgeline development. This comment contends that this policy is not addressed or referenced in **Section 4.1 Aesthetics** and the Draft EIR should identify 1) why the proposed project cannot satisfy this policy, and 2) the corresponding environmental impacts of failing to comply with this policy.

As discussed in detail in **Section 4.1 Aesthetics,** the proposed project would result in significant and unavoidable aesthetic-related impacts due to development above the 400' elevation contour, which for the purposes of this EIR would constitute ridgeline development. Although not specifically identified in **Section 4.1 Aesthetics**, the Draft EIR clearly identifies in **Section 4.9 Land Use and Planning**, that the proposed project would be inconsistent with General Plan Land Use Policy L-45 since the proposed project would result in development above the 400 foot elevation contour. Numerous mitigation measures have been identified in the Draft EIR to minimize the extent of visual impacts associated with ridgeline development; however, not to a less-than-significant level. In addition, the proposed Specific Plan contains specific Hillside Development Standards to minimize potential adverse impacts associated with ridgeline development; copies of these standards are contained in Appendix C of the Draft EIR. Additional mitigation measures have been identified in the Draft EIR to further ensure that potential impacts are minimized to the extent feasible given the nature of the proposal project. In order to provide additional clarification regarding the extent of aesthetic impacts, revisions have been incorporated into the

Draft EIR in response to this comment. Please refer to **Section 4.0 Revisions to the Draft EIR** for more information.

This comment also suggests that the Draft EIR should evaluate a project alternative that would entail the proposed project complying with applicable General Plan policies, particularly those policies related to ridgeline development. The Draft EIR clearly evaluates an alternative to the proposed project that would be consistent with the City's 2005 General Plan; please see **Section 6.0 Alternatives** for further discussion. As described in that section, this alternative would avoid a number of significant project impacts and would ensure project consistency with the General Plan thereby eliminating the need to amend the 2005 General Plan.

K5: This comment states that the EIR does not include the requirement for the City to enter into a tax transfer agreement with the County as requirement pursuant to Revenue and Taxation Code Section 99. The text of the Draft EIR has been revised to reflect this comment; please refer to **Section 4.0 Revisions to the Draft EIR.**

K6: This comment contends that the text of the Draft EIR should be revised to identify the level of significance after mitigation has been incorporated for aesthetic-related impacts. The Draft EIR clearly identifies that the proposed project would represent a significant and unavoidable impact that cannot be mitigated to a less-than-significant level in regards to a scenic vista and the visual character of the site and surrounding area. Even with the incorporation of mitigation measures these impacts cannot be reduced to a less-than-significant level. Please see Draft EIR **Section 4.1 Aesthetics** for more information; see also Table 2-1 which summarizes that level of significance after mitigation.

K7: This comment identifies specific concerns regarding the adequacy of the proposed agricultural buffers. A detailed response to this comment is provided in **Response F6.** As discussed in that response, the agricultural buffers were evaluated in the Agricultural Resources Report prepared by Buchanan Associates. Based on the analysis contained in that report it was determined that the proposed northern and eastern buffers were adequate based on existing and proposed land uses; please refer to Appendix T-1 for more information. Mitigation Measures 4.2-1, 4.2-2, and 4.2-3 were revised to ensure that the proposed western buffer include adequate buffer and appropriate physical barriers to further minimize potential conflicts with agricultural uses Please refer to **Section 4.0 Revisions to the Draft EIR,** for more information.

K8: This comment states that the proposed agricultural buffers must be analyzed for consistency with Monterey County General Plan policy AG-1.2, which identifies certain specifications for determining the appropriate size of agricultural buffers. The analysis contained in the Draft EIR regarding the proposed agricultural buffers summarizes the findings of the Agricultural Resources Report prepared by Buchanan Associates, which evaluated the proposed buffers in accordance with Monterey County General Plan policy AG-1.2. Based on the analysis contained in that report (see Appendix T-1), it was determined that the proposed northern and eastern agricultural buffers were adequate. Mitigation measures were incorporated into the Draft EIR, based in part on the recommendations of the Agricultural Resources Report, to ensure that the proposed buffers were supplemented by physical barriers, where appropriate, to ensure that the proposed project would not significantly impact existing agricultural operations. The proposed 60 foot western buffer, however, was determined to be inadequate and additional buffer area combined with a physical barrier was identified as necessary. The Draft EIR has been revised to reflect this requirement; please see **Section 4.0 Revisions to the Agricultural Resources, Section 4.2.**

This comment also states that if the proposed buffers are determined to be inadequate then the Draft EIR must conclude that this would represent a significant growth-inducing impact. As described above, the Draft EIR and supporting Agricultural Resources Report evaluated the proposed buffers and determined that mitigation measures were necessary to ensure that the proposed project would not significant impact

existing agricultural operations. Based on the analysis contained in the Draft EIR, as modified in **Section 4.0 Revisions to the Draft EIR,** this would not represent a growth-inducing impact.

K9: This comment recommends that the City of Soledad consider developing a farmland mitigation program in order to address the loss of prime farmland associated with buildout of the General Plan and this project in particular. As identified in the Draft EIR, the proposed project would result in the permanent conversion of farmland into urban uses. The permanent loss of farmland was identified as a significant and unavoidable impact. This determination was based in part on the analysis contained in the Agricultural Resources Report prepared by Buchanan Associates. Consistent with the analysis contained in the City of Soledad General Plan EIR, this was identified as a significant and unavoidable cumulative level impact that cannot be reduced to a less-than-significant level. As described on page 5.0-12 of the Draft EIR and the Agricultural Resource Report contained in Appendix T-1, the City of Soledad does not have an adopted mitigation program for agricultural impacts at this time. The proposed project site was identified in the General Plan's Land Use Element as an area of future urban expansion and the cumulative loss of agricultural land was previously considered in the General Plan EIR for which Statements of Overriding Considerations were adopted. The proposed project would not result in additional environmental impacts beyond those previously identified in the General Plan EIR. As described in **Section 1.0 Introduction,** the analysis contained in this EIR is tiered from the General Plan EIR prepared in 2005, which identified significant and unavoidable cumulative level impacts associated with the permanent loss of agricultural lands. No feasible mitigation measures were identified at that time to reduce and/or minimize cumulative level impacts. While the proposed project cannot mitigate the extent of its contribution towards this cumulative level effect, an agricultural educational facility is proposed in connection with this project, as described in **Section 3.0 Project Description.** This comment raises a number of additional questions related to City efforts to preserve farmland in the future and recommends that financial loss to the County/region from the loss of agricultural jobs should be evaluated. These comments do not generally relate to an environmental issue that warrants a response under CEQA or reflect policy decisions that can only be made by City officials. Accordingly, this comment is referred to the City of Soledad decision-makers for further consideration.

K10: Comment acknowledged. As suggested in this comment, the City of Soledad is required to consult with the appropriate Native American tribe pursuant to Government Code Section 65350 prior to project approval. In accordance with this requirement, the City sent consultation letters to representatives of four Native American tribes in the region in March of 2008; to date, no responses have been received. These letters are available for public review at the Community Development Department at the City Hall.

K11: This comment states that the Draft EIR needs to address how the proposed project is consistent with planned growth under the County's adopted and Draft General Plan as well as the City's growth plans. The comment specifically requests that the proposed project be evaluated for consistency with Draft Monterey County General Plan policies LU-2.18-1 and AG-1.1.

As described in detail in the Draft EIR (see **Section 4.9 Land Use and Planning**) the proposed project is located within several areas designated as Expansion Areas under the City's existing General Plan. The City of Soledad previously determined that these areas within the General Plan Planning Area represent a logical expansion of the City's existing boundaries and are suitable for urban expansion The impacts of this expansion and future growth of the City were previously analyzed in the City of Soledad General Plan EIR at a programmatic level (September 2005; SCH #2005032722). The General Plan EIR contains a detailed analysis of the General Plan's relationship with Monterey County City Centered Growth policies and that analysis determined that the 2005 General Plan was consistent with those principles. While the Draft EIR for the Miravale III Specific Plan determined that the proposed project would conflict with a number of policies contained in the General Plan for the purposes of avoiding and/or mitigating an environmental effect, the proposed project would nevertheless occur within an area that is considered suitable for urban expansion. Mitigation identified in the Draft EIR ensures that the overall

level of development intensity proposed in the expansions area would not increase as a result of the proposed project.

The General Plan EIR also analyzes the consistency of the General Plan with applicable Monterey County General Plan policies related to agricultural resources. The General Plan EIR recognizes that potential land use compatibility issues could arise at the interface between urban uses and farmlands as the City continues to expand. Mitigation Measures identified in this EIR ensure that potential land use compatibility issues associated with agricultural and urban uses would be minimized to a less-than-significant level by ensuring that adequate agricultural buffers are incorporated into the project design. Please refer to **Response F6** and **K7** for more information. An analysis of the proposed project's consistency with Draft Monterey County General Plan would be inappropriate since the General Plan has not been adopted by the County.

K12: This comment recommends that all development be setback 50' from the top of bank of any ephemeral drainage courses on the site. As discussed in **Response B2**, the project, as currently proposed, would eliminate a number of existing on-site drainage features to accommodate the project. As identified in the Draft EIR and supporting technical analyses (see Nolan, 1995), existing on-site drainage occurs by overland sheet flow towards shallow ephemeral drainages. These drainages do not typically carry surface water except during peak rainfall events. The project has proposed a series of drainage improvements, including the enlargement of two existing agricultural ponds, to accommodate stormwater runoff associated with the proposed project. While the Draft EIR determined that the proposed drainage system, as currently designed, is inadequate to meet project demands, the City of Soledad has determined that proposed storm drainage facilities can be improved to meet project demand and comply with the City's adopted Storm Drain Master Plan (SDMP), which analyzed the storm drain improvements necessary to serve the proposed Miravale III Specific Plan.. In addition, the Draft EIR specifically evaluated several project alternatives, including the General Plan Consistent Alternative and Reduced Project Alternative, that would avoid the elimination of several small drainages. These alternatives would lessen the extent of project impacts related to existing on-site drainage by avoiding and/or minimizing the extent of development on the hillside portions of the site. Please refer to **Section 4.0 Revisions to the Draft EIR** for more information regarding project alternatives. While the proposed project would still nonetheless eliminate these drainages and mitigation measures have been identified to reduce the extent of this impact, this comment is referred to City decision-makers for further consideration during the deliberative process. If determined appropriate, the City of Soledad could require that a policy be added to the Specific Plan that requires all development be setback a sufficient distance from all existing drainages consistent with this comment.

K13: This comment states that the Draft EIR should be updated to identify that the Monterey County Water Resources Agency completed drainage improvements upstream of Metz Road in 2002 as part of the Soledad Drainage Improvement Project. This comment identifies that additional drainage improvements need to be implemented in order to provide flood protection to the surrounding area. In response to this comment, revisions have been incorporated into the Draft EIR to amplify the background discussion regarding flooding hazards within the City of Soledad and surrounding area; please refer to **Section 4.0 Revisions to the Draft EIR, Hydrology and Water Quality, Section 4.8,** for more information.

K14: This comment contends that the hydraulic analysis of the proposed storm drain system does not provide sufficient details to determine the potential effects associated with project development. This comment contends that the EIR should be revised to include a preliminary drainage analysis that clearly defines 1) watersheds; 2) numeric design criteria; and 3) recommended mitigation measures. The comment further contends that the Draft EIR should include a preliminary drainage plan prepared by a registered civil engineer showing the proposed drainage facilities.

As described in the Draft EIR, Bestor Engineers, Inc. submitted technical documentation to the City of Soledad addressing drainage features associated with the proposed project. Proposed drainages features are depicted on the Vesting Tentative Map and supporting calculations and correspondence were submitted to the City of Soledad for consideration as part of the Draft EIR. This documentation was subsequently reviewed by RM Associates on the behalf of the City of Soledad Public Works Department. RM Associates evaluated the proposed system using HYDRA software. According to that analysis, which is included as an appendix to the Draft EIR (see Appendix G), the proposed system failed to meet a number of design criteria established in the City's Storm Drain Master Plan (SDMP).

The City of Soledad Public Works Department has undertaken a number of City-wide planning efforts to ensure that adequate public facilities will be provided throughout the City. These studies are intended to ensure that existing system deficiencies are adequately addressed and that future development provides adequate facilities to the specifications of the City. The purpose of the 2007 SDMP is to ensure that storm drainage improvements are planned in a comprehensive manner that accounts for existing needs and future improvements necessary to accommodate additional growth and development as contemplated in the City's 2005 General Plan. The 2007 SDMP ensures that adequate storm drain facilities will be available throughout the City and future expansion areas. As part of the 2007 SDMP, the City evaluated the proposed project to determine whether the proposed facilities were considered adequate based on City standards and the intensity of development associated with the proposed project. Based on that analysis, the City determined that the proposed facilities were inadequate to serve anticipated demand; however, the City also concluded that the facilities could be enlarged and enhanced to meet the requirements of the 2007 SDMP. According to the City of Soledad Public Works Department, compliance with the 2007 SDMP would ensure that the proposed project has adequate drainage facilities to ensure that post-project stormwater runoff will be at pre-project conditions. This analysis is reflected in the Draft EIR and was supported by technical evidence prepared by RM Associates. Mitigation measures were developed based on comments received from the City of Soledad Public Works Department and RM Associates to ensure that the proposed project will provide sufficient drainage facilities to meet project demands. Revisions have been incorporated into the Draft EIR to provide additional clarification regarding the relationship of the SDMP and the proposed project; please refer to **Section 4.0 Revisions to the Draft EIR, Hydrology and Water Quality, Section 4.8,** for more information.

K15: This comment recommends that a geologic investigation of the proposed retention facilities is incorporated into the Draft EIR in accordance with the State of California Board for Geologist and Geophysicists *Guidelines for Engineering Geological Reports.* The City of Soledad Public Works Department has gone to extensive lengths to ensure that adequate public facilities will be available to serve the City's existing needs, in addition to full-buildout as envisioned in the General Plan. The City of Soledad prepared a Storm Drain Master Plan (SDMP) in 2007 to ensure that storm drainage improvements are planned in a comprehensive manner that accounts for existing needs and anticipated future improvements to accommodate additional growth and development as contemplated in the City's 2005 General Plan. The 2007 SDMP ensures that adequate storm drain facilities will be available throughout the City and future expansion areas. As explained in prior **Response K14**, the City evaluated the proposed project as part of the 2007 SDMP to determine whether the proposed facilities were considered adequate based on City standards and the intensity of proposed development. Although the City determined that the proposed facilities were inadequate to serve anticipated demand, it found that that the facilities could be enlarged and enhanced to meet the requirements of the 2007 SDMP.

According to the City of Soledad Public Works Department, compliance with the 2007 SDMP would ensure that the proposed project has adequate drainage facilities to ensure that post-project stormwater runoff will be at pre-project conditions. At the time that final design-level engineering plans are submitted to the City a supporting geological investigation will be submitted as required by the City. Such analysis is considered unnecessary at this time since the 2007 SDMP determined that sufficient facilities could be accommodated on-site to meet project demands and ensure that post-project flows would be at pre-project conditions. Additionally, the Draft EIR is a programmatic level analysis, and final design of all proposed

drainage facilities will be required to comply with existing regulatory requirements as required by the State of California and the City of Soledad.

K16: This comment identifies that the proposed project would result in increased traffic which could result in impacts to regional facilities. As a result, the comments identifies that the proposed project is responsible for mitigating these impacts, and may do so through the payment of TAMC's regional impact fee. The Draft EIR has been revised to clarify that the proposed project will be subject to the TAMC regional impact fee; please refer to **Section 4.0 Revisions to the Draft EIR, Traffic and Circulation, Section 4.13,** for further discussion.

K17: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

K18: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

K19: This comment identifies that the proposed project would result in the relocation of the Lorentzen House in order to mitigate project impacts to a historical structure. The comment notes that the City should prepare a Phase 1 Historical Assessment of the Lorentzen house to determine whether the house is eligible for National, State or local listing as a significant historical structure. As described in **Section 4.5 Cultural Resources,** a Phase 1 Historical Assessment of the Lorentzen House was completed by Kent Seavey. Based on that analysis, it was determined that the Lorentzen house is eligible for listing on the California Register. A copy of that analysis is contained in Technical Appendix T-4. No further response is necessary.

K20: This comment requests that additional clarification be provided regarding the identified General Plan amendments that are considered to be necessary in order to accommodate the project as proposed. Specifically, the comment requests that additional clarification be provided regarding the project's obligation to provide parkland. Based on the City of Soledad's review of the Draft Specific Plan, the City identified that a number of General Plan amendments would be necessary in order to accommodate the project as proposed. One of those amendments included an exception from current City requirements related to parkland since the proposed project failed to provide an adequate amount of parkland in accordance with the City's adopted standards. The Draft EIR has been clarified to identify that these amendments were identified in order to accommodate the project as proposed. In addition, Mitigation Measure 4.12-6 has been revised to ensure that the proposed project provides an adequate amount of parkland (5 acres/1,000 residents) consistent with provisions of Appendix B of the General Plan, which establishes standards and policies for specific plans completed for the designated Expansion Areas. As identified in Mitigation Measure 4.12-6, a revised Specific Plan must be submitted to the City of Soledad demonstrating compliance with this measure. Please refer to **Section 4.0 Revisions to the Draft EIR,** for more information.

K21: This comment identifies the minimum required parkland contribution pursuant to Title 19 of the Monterey County Municipal Code. Please see **Response K20** above. As discussed above, the proposed project fails to meet the minimum parkland requirements according to Appendix B of the General Plan. The project applicant will be required to submit a revised Specific Plan demonstrating that adequate parkland is provided in accordance with City requirements. Mitigation Measure 4.12-6, as modified herein, will ensure that adequate parkland will be provided in connection with the proposed project as required pursuant to Appendix B of the General Plan. This mitigation will ensure that the proposed project will provide additional parkland opportunities to future residence beyond the requirements of the County of Monterey and the Quimby Act.

K22: Comment acknowledged. Mitigation Measure 4.12-6 as revised specifically requires that the proposed project provide improved parkland in order to meet the active recreational needs of future residents. Please see **Section 4.0 Revisions to the Draft EIR.**

K23: This comment notes that the County of Monterey also allows the payment of in-lieu fees as mitigation for potential impacts to parkland. The proposed project will be required to provide adequate parkland as discussed in **Response K20** and **K21**. The proposed project will also be required to pay Park Facilities Impact fee as required by the City of Soledad. Please see Mitigation Measure 4.12-6 and 4.12-7 for more information. Please also refer to **Section 4.0 Revisions to the Draft EIR, Public Services and Recreation, Section 4.12,** for more information.

K24: This comment identifies that a parkland contribution less than three acres/1,000 residents is considered inadequate to meet the requirements of the County for parkland contribution. As detailed in **Response K20** and **K21**, the proposed project will be required to contribute a minimum of five acres/1,000 residents in accordance with Appendix B of the General Plan; please see those responses for more information. Please also refer to **Section 4.0 Revisions to the Draft EIR, Public Services and Recreation, Section 4.12,** for more information**.**

K25: This comment identifies that the County is supportive of the mitigation and approach identified in the Draft EIR provided that: 1) the applicant comply with the recreation requirements contained in Section 19.12.010(B) of the County Municipal Code; 2) that a revised Specific Plan indicate that parkland is distributed throughout the subdivision; 3) a Master Park and Recreation Plan is provided to the County demonstrating that the dedicated parkland complies with Section 19.12.010(D) of the County Municipal Code; and 4) the Master Park and Recreation Plan addresses that park and recreational needs for individuals covered under the American with Disabilities Act.

As described in the preceding responses, the City of Soledad requirements for a Specific Plan exceeds the minimum parkland contribution required by the County of Monterey. The proposed project will be required to provide a minimum parkland ration of five acres/1,000 residents. Mitigation Measure 4.12-6 has been revised to require that a Master Park and Recreation Plan be prepared for each phase of development prior to the recordation of a final map consistent with the facility standards of the City's General Plan and adopted citywide Parks and Recreation Master Plan, which requires that new parks facilities be ADA compliant. Please refer to **Section 4.0 Revisions to the Draft EIR, Public Services and Recreation, Section 4.12,** for more information.

K26: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No further response is necessary.

K27: This comment identifies that the project site is located within the Zone 2C area of the Salinas Valley and that a long-term sustainable water supply is available to accommodate project demands. This comment does not require a response under CEQA.

K28: This comment states that a copy of Ordinance No. 645, adopted by the City Council in 2007, must be included in the Final EIR. A brief synopsis of the requirements of Ordinance No. 645, which amended the Soledad Municipal Code to include Chapter 13.11- Water Recycling Service is provided on page 4.14-9 of the Draft EIR, and it is unnecessary to include a copy of the full ordinance as part of the Final EIR. As proposed by the draft Specific Plan and described in the Draft EIR, the proposed project will be required to comply with the requirements of this ordinance.

K29: This comment identifies that the mitigation measures provided in **Section 4.14 Utilities and Service Systems** are adequate to ensure that project impacts will be less-than-significant. No response is necessary. Comment acknowledged.

K30: Comment acknowledged. No response is necessary.

K31: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No further response is necessary.

Letter L

A Public Comment on the EIR
for the Miravale III Proposal

David Baker
300 Market St.
Soledad, CA 93960
Dec. 16, 2008

RECEIVED
DEC 19 2008
PLANNING DEPARTMENT

The Miravale III project is exactly the opposite of what Soledad needs: 20,000 more residents without local jobs. Soledad already has a severe imbalance in its jobs-to-housing ratio. There is already a very large number of commuters (and a lot more houses already approved) in proportion to the number of local jobs. Many workers are forced to drive 60 to 180 mile round-trips every work day. The impact of millions of miles of collective commuting per year is enormous: millions of dollars of hard-earned wages going out the exhaust pipes; countless hours of family time, precious parenting time, lost forever. "Bed room community" is a contradictory expression because a real community, a healthy community, even a sense or feeling of community is almost impossible when you build a commuters suburb. The EIR is completely lacking in its performance when it comes to making an honest assessment of these potentially significant social impacts.

L-1

Alternatives to this over-sized project need to be studied. For example, a policy of first building jobs and then adding housing only as jobs increase might have more economic and social benefits.

Sincerely,
David Baker

David Baker, 12-17-08

LETTER L: David Baker

L1: This comment asserts that the Draft EIR is inadequate because it fails to analyze the social impacts associated with the proposed project, specifically impacts related to a jobs-housing imbalance. This comment contends that these social impacts would represent a significant impact under CEQA. This comment also suggests that Draft EIR should consider an alternative to the proposed project that would entail more job creation.

An impact under CEQA is only considered significant when the impact would result in a physical impact to the environment. As identified in CEQA Guidelines § 15131(a), economic or social effect of a project shall not be treated as significant effects on the environment. Social effects may be considered significant, if and when, it can be demonstrated that those effects would result in significant physical changes in the environment. The analysis in the Draft EIR has clearly evaluated the potential environmental effects associated with the proposed project and mitigation measures have been identified to lessen the extent of those impacts, where feasible. The potential social effects identified in this comment would not result in any additional environmental effects beyond those already identified in the Draft EIR.

The Draft EIR evaluated a range of project alternatives consistent with the requirements of CEQA as described in **Section 6.0** of the Draft EIR. The Buildout Consistent with the General Plan Alternative would result in considerably less residential use while still providing commercial uses at the scale proposed as part of this project. Although the proposed project itself would not necessarily result in a balanced jobs-housing ratio, buildout as envisioned in the General Plan would result in a more balanced distribution of land uses. Please refer to the analysis in the Draft EIR for more information.

Re: Miravale III Specific Plan Draft Environmental Impact Report

Dear Ms. Hilinski,

RRM Design Group has carefully reviewed the October 2008 DEIR for the Miravale III Specific Plan. As a result of that review we have submitted comments on the DEIR.

Please review the attached table that identifies the applicant's response to each proposed mitigation measure. If you have questions regarding any of the proposed mitigations or other attachments, please do not hesitate to contact us to discuss the analysis and other information that led to the mitigated plan. Thank you for your attention to this matter.

M-1

Sincerely,
RRM DESIGN GROUP

Debbie Rudd
Principal Planner

SOLEDAD MIRAVALE III

Acceptability of Mitigation Measures Recommended in the DEIR

December 16, 2008

DEIR MITIGATION MEASURE	ACCEPTABLE	NOT ACCEPTABLE	ACCEPTABLE WITH REVISIONS	NOTES...	
4.1 Aesthetics					
4.1-1	X				
4.1-2	X				
4.1-3			X	Measure should acknowledge Appendix A of the Miravale III Specific Plan - Hillside Development Standards. Is the intent for each lot to demonstrate the extent of proposed development with staking and flagging or can a typical lot be identified?	M-2
4.1-4	X				
4.1-5	X				
4.1-6	X				
4.1-7	X				
4.1-8	X				
4.1-9	X				
4.1-10			X	Measure should acknowledge page 2-48 of the Miravale III Specific Plan. This page includes gateway design guidelines.	M-3
4.1-11			X	Measure should acknowledge Chapter 2 of the Miravale III Specific Plan contains village residential design guidelines which address this measure. The applicant already revised the Specific Plan per City Council and staff direction on integrating the affordable housing. Affordable lots have been sprinkled into the single family neighborhoods per their direction. Table 6-1 in the Specific Plan delineates the number of affordable units per phase and per Village Residential neighborhood. This table illustrates that the affordable units are adequately dispersed.	M-4
4.1-12			X	Measure should acknowledge page 2-26 of the Miravale III Specific Plan which contains development standards relating to landscaping and open space areas.	M-5
4.1-13	X				
4.1-14			X	Measure should acknowledge page 2-45 of the Miravale III Specific Plan which includes commercial lighting standards.	M-6
4.1-15			X	Measure should acknowledge page 2-50 of the Miravale III Specific Plan which includes lighting design guidelines.	M-7

DEIR MITIGATION MEASURE	ACCEPTABLE	NOT ACCEPTABLE	ACCEPTABLE WITH REVISIONS	NOTES...	
4.1-16			X	Measure should acknowledge page 2-45 of the Miravale III Specific Plan which includes commercial lighting standards.	M-8
4.2 Agricultural Resources					
4.2-1	X				
4.2-2	X				
4.2-3	X				
4.2-4	X				
4.2-5	X				
4.3 Air Quality					
4.3-1		X		2.5 acres/day is not reasonably feasible and is not consistent with the standard of operation for grading. 2.5 acres is not enough area to accommodate both the cut and fill activities for a large property. This will force the contractor to stock pile soil from the grading which will cause more dust instead of reducing the dust. The other mitigation measures will effectively reduce dust. The multiple movements of earth resulting from this 2.5 acre/day requirement will result in more air quality impact from both dust and emissions.	M-9
4.3-2			X	Two minutes is too short.	M-10
4.3-3			X	Onsite child care is only applicable when there is a large employer (500+ full-time employees). This is not applicable to Miravale III. Applicant is willing to consider if it is warranted.	M-11
4.4 Biological Resources					
4.4-1	X				
4.4-2	X				
4.4-3	X				
4.4-4	X				
4.4-5	X				
4.4-6	X				
4.4-7	X				
4.4-8		X		Medians offer a safe place for refuge for people and wildlife as they cross the street. In order to make Miravale III a more sustainable project, more trees and landscaping should be encouraged to reduce the heat island effect. Medians also encourage reduced vehicle speeds by narrowing the ROW which is again a sustainable solution and encourages walking. The applicant feels this measure is unreasonable.	M-12
4.4-9	X				
4.4-10	X				
4.4-11	X				
4.4-12	X				
4.4-13	X				

DEIR MITIGATION MEASURE	ACCEPTABLE	NOT ACCEPTABLE	ACCEPTABLE WITH REVISIONS	NOTES...	
4.4-14	X				
4.4-15	X				
4.4-16	X				
4.4-17	X				
4.4-18	X				
4.4-19	X				
4.4-20	X				
4.4-21	X				
4.5 Cultural Resources					
4.5-1		X		Measure should also allow for the option for proponent/developer to retain the historic structure.	M-13
4.5-2	X				
4.5-3	X				
4.5-4	X				
4.5-5	X				
4.5-6	X				
4.5-7	X				
4.5-8	X				
4.5-9	X				
4.6 Geology, Soils and Mineral Resources					
4.6-1	X				
4.6-2	X				
4.6-3	X				
4.6-4	X				
4.6-5	X				
4.6-6		X		Measure should be revised to allow for sustainable/LID solutions such as bio swales to be incorporated.	M-14
4.6-7	X				
4.6-8	X				
4.6-9	X				
4.7 Hazards and Hazardous Materials					
4.7-1	X				
4.7-2	X				
4.7-3	X				
4.7-4	X				
4.7-5	X				
4.7-6	X				
4.8 Hydrology and Water Quality					
4.8-1	X				
4.8-2	X				
4.8-3	X				

rrmdesigngroup
creating environments people enjoy®

DEIR MITIGATION MEASURE	ACCEPTABLE	NOT ACCEPTABLE	ACCEPTABLE WITH REVISIONS	NOTES...	
4.9 Land Use and Planning					
4.9-1			X	The January 2008 Draft Miravale III Specific Plan has incorporated these comments. This measure should be removed as these comments have already been addressed in the Specific Plan.	M-15
4.10 Noise					
4.10-1			X	Insert the word "exterior" before "noise exposure."	M-16
4.10-2	X				
4.10-3	X				
4.10-4		X		It also needs to be quantified i.e. shall incorporate noise reduction methods where noise levels are above the existing interior level requirement of 45dBA.	M-17
4.10-5	X				
4.10-6	X				
4.10-7	X				
4.10-8	X				
4.10-9	X				
4.10-10	X				
4.10-11	X				
4.10-12	X				
4.10-13	X				
4.10-14	X				
4.10-15	X				
4.11 Population and Housing					
4.11-1	X				
4.11-2	X				
4.11-3			X	Not true. The January 2008 Draft of the Miravale III Specific Plan is in compliance with the Housing Element of the General Plan. Specific Plan Figures 2-3 & 2-4 illustrate how the applicant intends to fully integrate market rate housing. The applicant already revised the Specific Plan per City Council and staff direction on integrating the affordable housing. Affordable lots have been sprinkled into the single family neighborhoods per their direction. It has also been integrated into each Village Residential neighborhood. Table 6-1 in the Specific Plan delineates the number of affordable units per phase and per Village Residential neighborhood. This table illustrates that the affordable units are adequately dispersed.	M-18

rrmdesigngroup
creating environments people enjoy®

DEIR MITIGATION MEASURE	ACCEPTABLE	NOT ACCEPTABLE	ACCEPTABLE WITH REVISIONS	NOTES...	
4.11-4			X	Not true. The January 2008 Draft of the Miravale III Specific Plan illustrates compliance with the Inclusionary Housing Ordinance in Figure 2-4, table 2-3, and table 6-1. Figure 2-4 illustrates the location of affordable housing and the percentage of Village Residential units dedicated to affordable housing. Table 6-1 in the Specific Plan delineates the number of affordable units per phase and per Village Residential neighborhood. This table illustrates that the affordable units are adequately dispersed.	M-19
4.12 Public Services and Recreation					
4.12-1		X		The developer is donating a 1.3 acre site for a public safety facility. The construction costs should be covered by the project impact fees. The actual construction and operation of the facility will be out of the developer's control and should not be part of the mitigation.	M-20
4.12-2			X	The impact fees should be adjusted/credited to reflect any property donation.	M-21
4.12-3	X				
4.12-4		X		The developer will work with the City and the school district to develop the needed number of schools. The needed number will be less than currently projected due to the developer's desire to incorporate 1,500 senior housing units and 1,000 studio units. The project is expected to be developed over 15 to 20 years.	M-22
4.12-5			X	School impact fees should be adjusted/credited to reflect any property donation.	M-23
4.12-6		X		Not true. The January 2008 Draft of the Miravale III Specific Plan is in compliance with the City's General Plan requirement to provide 3 acres of parkland per 1,000 residents. Table 4-2 illustrates compliance. State specific plan guidelines do not require formal design plans for future parks to be included in a specific plan. Therefore, village parks have been noted with an asterisk symbol on figure 4-2 to illustrate their general location. Actual placement of village parks will be determined in their respective Village Rresidential devolvement plans. Park acreage for each of the village parks has been identified on figure 4-2 based on their respective projected populations. Village residential development plans will be required to incorporate the minimum parkland acreage identified on figure 4-2.	M-24

DEIR MITIGATION MEASURE	ACCEPTABLE	NOT ACCEPTABLE	ACCEPTABLE WITH REVISIONS	NOTES...	
4.12-7	X				
4.13 Traffic and Circulation					
4.13-1			X	Insert "unless at a traffic light" after "at grade golf cart crossings shall not be permitted along streets"	M-25
4.13-2		X		The mitigation should clearly state that the project will contribute its fair share toward offsite improvements and the traffic impact fees will be credited accordingly. Insert "associated with the phase being constructed" at the end of sentence "...submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact" This will link the impact fees to the phase being constructed. Fully constructing the improvements should not be part of the mitigation.	M-26
4.13-3		X		See comment above.	
4.13-4		X		See comment above.	
4.13-5		X		See comment above.	
4.13-6		X		See comment above.	
4.13-7		X		See comment above.	
4.13-8		X		See comment above.	
4.13-9		X		See comment above.	
4.13-10		X		See comment above.	
4.13-11		X		See comment above.	
4.13-12		X		See comment above.	
4.13-13		X		See comment above.	
4.13-14		X		See comment above.	
4.14 Utilities and Service Systems					
4.14-1	X				
4.14-2	X				
4.14-3	X				
4.14-4	X				
4.14-5	X				
4.14-6	X				
4.14-7	X				
4.14-8			X	Development impact fees should be adjusted/credited to reflect any property donation or construction of facilities.	M-27
4.14-9	X				
4.14-10	X				
4.14-11	X				
4.14-12	X				
4.14-13	X				

Additional Comments

1. Page 3.0-3 Section 3.3 The Specific Plan shows a minimum lot size of 5,000 sf not 6,000 sf as stated. M-28

LETTER M: RRM DESIGN GROUP, APPLICANT REPRESENTATIVE

This comment letter generally reflects the applicant's opposition to mitigation measures developed as part of the Draft EIR on a variety of grounds. The mitigation measures contained in the Draft EIR have been specifically developed to address project-related impacts in order to reduce those impacts to a less-than-significant level wherever possible. The individual comments contained in this letter do not typically raise an issue on environmental grounds that would warrant a response under CEQA. To the extent possible, individual responses are provided below. For the most part, however, these comments are referred to decision-makers for further consideration as part of the deliberative process.

M1: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No further response is necessary.

M2: This comment requests specific revisions to Mitigation Measure 4.1-3 to reflect the proposed Hillside Development Standards contained in Appendix A of the Miravale III Specific Plan. MM 4.1-3 is intended to minimize the visual impact of all hillside residential construction above the 400 foot contour line, while the Hillside Development Standards would apply, as proposed, only to those lots with an average slope of 30 percent or more. The requested revision is, therefore, considered unnecessary and would not change the intent or meaning of the proposed mitigation measure. All future development within the Specific Plan will be required to comply with the provisions of the Specific Plan as supplemented by this measure.

M3: The comment requests specific revisions to Mitigation Measure 4.1-10 that does not relate to an environmental issue under CEQA. The requested revision is unnecessary and would not change the intent or meaning of the proposed mitigation measure. The requested revision is referred to decision-makers for further consideration as part of the deliberative process. All future gateway development within the Specific Plan area will be required to comply with the provisions of the adopted Specific Plan as supplemented by this measure.

M4: This comment requests specific revisions to Mitigation Measure 4.1-11 to acknowledge the residential design guidelines contained in Chapter 2 of the Specific Plan. The requested revision is unnecessary and would not change the intent or meaning of the proposed mitigation measure. All future development within the Specific Plan will be required to comply with the provisions of the adopted Specific Plan as supplemented by this measure.

M5: This comment requests specific revisions to Mitigation Measure 4.1-12 to acknowledge the usable open space standards of Table 2-5 of the draft Specific Plan. The requested revision does not relate to an environmental issue under CEQA and would not change the intent or meaning of the proposed mitigation measure. All future development within the Specific Plan will be required to comply with the provisions of the Specific Plan as supplemented by this measure.

M6: The commenter is requesting specific revisions to Mitigation Measure 4.1-14 to reference the lighting guidelines contained in the Specific Plan. However, the requirements contained in the Specific Plan are merely guidelines, whereas this mitigation identifies specific standards related to lighting requirements that all development will be required to comply with. Standards are necessary to ensure that lighting will meet certain minimum requirements to ensure project impacts will be minimized to a less-than-significant level. The requested revision is, therefore, considered unnecessary and would not change the intent or meaning of the proposed mitigation measure. All future development within the Specific Plan will be required to comply with the provisions of the Specific Plan as modified pursuant to this measure.

M7: The commenter is requesting specific revisions to Mitigation Measure 4.1-15 to reference the lighting guidelines contained in the Specific Plan. Please refer to **Response M6** above for further discussion.

M8: The commenter is requesting specific revisions to Mitigation Measure 4.1-16 to reference the lighting guidelines contained in Section 2.11 of the draft Specific Plan. Please refer to **Response M6** above for further discussion.

M9: This comment reflects the applicant's opposition to the requirements of Mitigation Measure 4.3-1 related to grading limitations. This comment contends that the proposed grading requirements would cause increased emission of dust and particulate matter. Mitigation Measure 4.3-1 was determined to be necessary in order to minimize construction-related impacts to the extent possible. The limitation of earth disturbing activities is considered standard practice to minimize the emission of dust and particulate matter. Contrary to the suggestions of the commenter, Mitigation Measure 4.3-1 clearly contains provisions to allow increased grading as more detailed construction information is available. Since this comment generally reflects the applicant's opposition to this mitigation measure, this comment is referred to decision-makers for further consideration as part of the deliberative process.

M10: This comment states that certain requirements contained in Mitigation Measure 4.3-2 are unacceptable. Mitigation Measure 4.3-2 has been revised to specifically reflect requested revisions requested by the MPUAPCD. Mitigation Measure 4.3-2 as revised by this Final EIR specifies the types of diesel construction equipment that will be permitted during construction to ensure compliance with current air quality standards. This revised mitigation measure is necessary to ensure project impacts are reduced to a less-than-significant level.

M11: This comment reflects the applicant's opposition to certain provisions of Mitigation Measure 4.3-3 related to child care centers for large employers. Specifically, this comment identifies that this requirement is not applicable to the proposed project since no larger employers are currently proposed. As identified in Mitigation Measure 4.3-3 components of a Transportation Demand Management Program may include such elements as providing onsite or near site child care centers for large employment centers. Other measures may also be considered. This requirement is only applicable to the extent large employment centers may be located within the boundaries of the project. Since this comment generally reflects the applicant's opposition to certain requirements contained in this mitigation measure, this comment is referred to decision-makers for further consideration as part of the deliberative process.

M12: This comment questions the need for specific mitigation related to medians at the project site. Per the Draft EIR, Mitigation Measure 4.4-8 prohibits the use of medians throughout the project. This was required due to potential California Tiger Salamander (CTS) potential issues. Since the CTS are identified as hybrids, this requirement may not be applicable. However, the Draft EIR maintains this condition and refer the review of requirements of mitigation measure 4.4-8 regarding medians to the City at the project level.

M13: This comment contends that Mitigation Measure 4.5-1 is unacceptable and that the applicant should have the option to retain the historic structure. The analysis contained in the Draft EIR was based on the project as currently proposed, which would include creating new structures, infrastructure and other urban elements that would necessitate the removal of this historic structure. If the project does not result in the removal of the Lorentzen House then the mitigation measures related to the removal and subsequent relocation of the structure would not be applicable.

M14: This comment contends that Mitigation Measure 4.6-6 should be revised to allow for sustainable/low impact development solutions such as bio swales and similar. Please refer to **Section 4.0 Revisions to the Draft EIR** for more information, including the addition of Mitigation Measure 4.8-4 regarding the use of Low Impact Development practices.

M15: This comment contends that Mitigation Measure 4.9-1 should be eliminated since the project applicant has submitted a revised Specific Plan that incorporates these comments. However, it is appropriate for the City to retain this mitigation measure and ensure compliance with its components as part of their review and consideration of the Specific Plan.

M16: The commenter is requesting specific revisions to Mitigation Measure 4.10-1. The requested revision is unnecessary and would not change the intent or meaning of the proposed mitigation measure. The mitigation measure is clearly related to exterior noise levels and this revision is considered unnecessary. No further response is necessary.

M17: The commenter is requesting specific revisions to Mitigation Measure 4.10-4. As described in the Draft EIR (see Draft EIR pages 4.10-12 through 4.10-13), Mitigation Measure 4.10-4 is necessary in order to ensure that exterior noise levels are 65 dBA CNEL or less and/or interior noise levels are within 45 dBA CNEL. The requested revision is unnecessary and would not change the intent or meaning of the proposed mitigation measure. The mitigation measure is clearly related to exterior noise levels and this revision is considered unnecessary. No further response is necessary.

M18: This comment reflects the applicant's opposition the requirements of Mitigation Measure 4.11-3. This mitigation measure reflects the requirements of General Plan program 4-3, which requires that each subdivision approved within a specific plan area be bound by a development agreement with the City of Soledad that prescribes the proportion of very low, low, and moderate-income housing to be built in the project, the location of these units within the subdivision, and the qualifying incomes of families to which the sale and re-sale of the units shall be limited. This is an existing City requirement and the proposed project will be required to adhere to these requirements as specified in Mitigation Measure 4.11-3.

M19: See **Response M18** above.

M20: This comment contends that Mitigation Measure 4.12-1 is unacceptable because the construction and operation of the proposed fire and police facilities are outside the control of the developer. As described in the Draft EIR, this mitigation measure is necessary in order to ensure that adequate public facilities are available to accommodate project demand. These facilities must be operational prior to the initiation of Phase 2 of the proposed project; otherwise there would be inadequate public services available to meet the demands of subsequent phases of development, including Phase 2. In the absence of this mitigation measure, this would constitute a significant and unavoidable impact. Since this comment generally reflects the applicant's opposition to certain requirements contained in this mitigation measure, this comment is referred to decision-makers for further consideration as part of the deliberative process.

M21: Comment acknowledged regarding the applicant's request for a credit to required impact fees. This comment does not raise an environmental issue that warrants a response under CEQA. This comment is referred to decision-makers for further consideration as part of the deliberative process.

M22: This comment contends that Mitigation Measure 4.12-4 is unacceptable. This comment further contends that the needed number of schools will be considerably lower based on the developer's desire to incorporate 1,500 senior housing units and 1,000 studio units. The analysis contained in the Draft EIR is based on the project as currently proposed in the Specific Plan and comments provided by the Soledad Unified School District regarding the required number of school facilities necessary to meet project demands. Since this comment generally reflects the applicant's opposition to certain requirements contained in this mitigation measure, this comment is referred to decision-makers for further consideration as part of the deliberative process.

M23: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. This comment is referred to decision-makers for further consideration as part of the deliberative process.

M24: This comment contends that the Specific Plan is in compliance with General Plan requirements to provide three acres/1,000 residents. The proposed project is not in compliance with applicable General Plan requirements related to the dedication and improvement of parkland in the City's future growth areas for which Specific Plans must be completed and adopted. As described in Appendix B of the General Plan, the standard for parkland for Specific Plan areas is five acres per 1,000 residents. Mitigation Measure 4.12-6 has been revised to reflect this requirement; please see **Section 4.0 Revisions to the Draft EIR**.

M25: This comment requests specific revisions to Mitigation Measure 4.13-1 to allow at-grade golf cart crossings on collectors or arterials where safe crossings are allowed by traffic signals. In response to this comment, Mitigation Measure 4.13-1 has been revised; please refer to **Section 4.0 Revisions to the Draft EIR**.

M26: This comment states that Mitigation Measures 4.13-2 through 4.13-14 are unacceptable to the developer and that the mitigation measures should be revised to indicate that the project will contribute its fair share toward offsite improvements and that traffic fees will be credited accordingly. This comment contends that fully constructed improvements should not be considered part of these mitigation measures. Payment of applicable City of Soledad Traffic Impact Fees will ensure that the proposed project contributes its proportional share towards these improvements. In order to ensure that project-generated traffic does not result in additional transportation-related impacts, the mitigation measures contained in the Draft EIR require that the necessary traffic improvements be operational prior to the issuance of an occupancy permit for new residential or commercial developments within the project boundaries that require those improvements. Since this comment generally reflects the applicant's opposition to certain requirements contained in these mitigation measures, this comment is referred to decision-makers for further consideration as part of the deliberative process.

M27: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. This comment is referred to decision-makers for further consideration as part of the deliberative process.

M28: This comment identifies that the Specific Plan allows a minimum lot size of 5,000 square feet, not 6,000 square feet, as stated in the Draft EIR. The Draft EIR has been revised to reflect this comment; please see **Section 4.0 Revisions to the Draft EIR**.

Attn: Susan Hilinski

Re: Draft – Environmental Impact Report
Miravale III Specific Plan

Dear Susan:

Comments and concerns are listed below and in accompanying documents, letters and reports for the Draft Environmental Impact Report for the Miravale Phase III Specific Plan State Clearing House #2006081129, prepared for the City of Soledad Planning Department by Denise Duffy & Associates, October 2008. N-1

Cover Sheet, Draft EIR

- The work "Phase" should be removed from "Miravale Phase III Specific Plan" to avoid confusion. All other documents are Miravale III. N-2

Page 1-1

Third paragraph, "This EIR addresses implementation of Miravale III Specific Plan..." N-3
- Insert "and Vesting Tentative Map."

Last sentence, "...agricultural land to the north and east..." N-4
- "East" should be "west".

Last sentence,"...Gabilan Mountain Range to the west." N-5
- "West" should be "east".

Page 2-9

Mitigation 4.2-4, Isn't the existing access to the Braga property on Braga land? Is there an existing easement on Miravale III to be maintained for access? N-6
- No.

Mitigation 4.3-1, Does existing agriculture produce dust? Does farming stop when the winds exceed 15 mph and dust is not contained onsite? What is the dust difference between farming and construction and at buildout? Less? How much less? N-7
- Grading limited to 2.5 acres would preclude grading to one fairway at a time. Is this major grading only? What are the requirements for finish grading? 8.0 acres?

Page 2-10

Mitigation 4.3-1, first line, "Cover truck hauling trucks..." N-8

- Clarify.

Page 2-11

Mitigation 4.3-2, third sentence, "Diesel equipment standing idle for more than two minutes shall be turned off..." N-9

- Two minutes is unreasonable. Five minutes? Ten minutes?

Page 2-33

Mitigation 4.9, Land Use and Planning, second paragraph, "Stormwater Management Plan, Stormwater Master Plan." N-10

- The Stormwater Management Plan and Stormwater Master Plan both have areas that do not adequately or appropriately address Miravale III and offsite drainage. See accompanying correspondence.

Page 2-34

Mitigation 4.10-4, How will mitigation be monitored to "reduce noise levels" by 2 to 3dBA depending on the existing pavement type, traffic speed, traffic volumes and other factor. All new and improved streets within the project area shall use quieter pavement types. N-11

- Which streets would need to be repaved? How many? Extent? How will increase be determined? How will the project be determined for responsibility if several projects contribute to traffic? When will repaving be triggered? How will costs and extent be determined? What are other factors? Offsite repaving will reduce the significant project traffic fees?

Page 2-39

Mitigation 4.12.1, Public Services and Recreation, "Prior to initiation of construction for Phase 2 of the proposed development, the proposed fire and police facilities located on West Street shall be constructed and operational." N-12

- "The facilities are located within Phase 2." They cannot be operated without construction of Phase 2 improvements. What happens if the city doesn't have the money to build or operate the facility after it's built or decides to fund other infrastructure?

Page 2-40

Mitigation 4.12-4, "...demonstrating that an additional two elementary school sites of sufficient size and a 40-acre high school site will be designated within the project boundaries to meet project demands...." N-13

- Appendix A, Notice of Preparation, and comments on the NOP letter from the Soledad Unified School District dated 9/18/06
  - "1. The Miravale III subdivision has two elementary, one middle school/adult education...; considering the loading factors that are being used and the schools that will be constructed district-wide, adequacy for facilities should be sufficient."
  - "2. ...It is my recommendation...to have future developers designate a 40-acre additional high school site in the northwest or future expansion areas."

BESTOR ENGINEERS, INC. 9701 BLUE LARKSPUR LANE MONTEREY, CALIFORNIA 93940

A small portion of Miravale III is within the Northwest Planning Area. The letter from the district is evidence. Why are the two additional elementary and 40-acre high school site the district is asking for in future development in the northwest areas included in Miravale III? Phase II is too early for requirement none-the-less. Development to sustain school site to be operational, but site is not requested by the district. N-13 continued

Page 2-42

Mitigation 4.13-3, second sentence, "..., add two EB left-turn lands...." N-14

- "Lands" should be "lanes".

Page 2-43

Mitigation 4-13, Traffic & Circulation, 4.13-2, 4.13-3, 4.13-4, 4.13-5, 4.13-6, 4.13-7, 4.13-8 and 4.13-9.

- Requirements should be constructed when required, not prior to any occupancy. How will the requirements for the implementation of the improvements be determined? Fees submitted are "in order to mitigate the impact at this location." Developer should not also be subject to the improvements being fully constructed. Partial impact and payment of fees may not allow construction of improvements as determined by the city. N-15

Page 2-45 & 2-46

Mitigation 4.13-10 and 4.13-11

- The TAMC fee would mitigate the project's impact. If city fee includes regional improvements, the TAMC fee should not be required. N-16

Page 2-49

Mitigation 4.14-8

- Fees to cover the existing sewer plant improvements should be waived if the developer pays to construct the treatment plant within the project site (scalping plant). N-17

Page 2-50

Mitigation 4.14-11

- Developer should not be required to construct new infrastructure to serve "...in addition to the wastewater providers existing commitments." Determination of existing commitments, time and date to prevent extensive commitments just prior to development. How will Miravale III commitments be protected? N-18

Page 3.0-2

Section 3.1, Project Location

- In the second paragraph add "There is existing high voltage transmission line along existing San Vicente Road." N-19

BESTOR ENGINEERS, INC. 9701 BLUE LARKSPUR LANE MONTEREY, CALIFORNIA 93940

Page 3.0-3

Section 3.3, Project Characteristics – Single Family Residential, last sentence, "Lot sizes range from 6,000 square feet to ...."

- Vesting Tentative Map shows a minimum of 5,000 square foot lots with a mixture of 5,000 square foot and 6,000 square foot minimum lots.

N-20

Page 3.0-4

Table 3.0-1, Land Use

- Williamson Act properties acres shown as "104.8". Williamson Act properties through Appendix D area is 108 acres.

N-21

Page 3.0-6

Sanitary Sewer System, fourth sentence, "The existing treatment plant will need to be enlarged and improved."

- Supplemented by an onsite reclamation plant, distribution and irrigation systems (scalping plant).

N-22

Page 3.0-7

Project Implementation, last sentence

- Shouldn't application be for "multiple" spheres of influence amendments?

N-23

Page After 3.0-9

Figure 3.1

- Should show all 11 sheets. The maps are too small; no detail for review.

N-24

Page 4.0-1

Regional Settings, first paragraph, "...north and west, and existing residential subdivision..."

- Should be "...existing residential subdivision to the south...."

N-25

Page 4.2-12

Impact and Mitigation, Conversion of Farmland Due to Changes in Existing Environment, last paragraph, "According to a study by the California Department of Conservation, conversions of farmland to urban uses...."

- No reference, data or footnotes on California Department of Conservation Study. Provide study documentation.

N-26

Page 4.3-2

Setting, fourth paragraph, "The project site is located east of Highway 101 on the eastern border of the City of Soledad...."

- The project is north and west of the City of Soledad.

N-27

BESTOR ENGINEERS, INC. 9701 BLUE LARKSPUR LANE MONTEREY, CALIFORNIA 93940

Page 4.4-20

Mitigation 4.4-9d, "Prohibit road medians throughout the development." N-28

- Does this belong here at all? Reason?

Page 4.6-2

Topography, third sentence, "The elevation ranges from 200 to 600 feet above the sea level." Fifth sentence, "Surface slopes on the alluvial portion of the site are approximately 5 to 8 percent gradient...." N-29

- The elevation range should be 178 to 742 feet. The gradient percentages should be 2.0% to 3.5%.

Page 4.6-5

Geology, Soils & Mineral Resources, Local Requirements, City of Soledad General Plan, b.2 N-30

- The 109 full or partial lots above the elevation 400 provide a more aesthetic quality. Figure II-7 on Page II-19, "Mirrisou Specific Plan Area of the Soledad General Plan" shows six areas of single family residential and estates lots located above the 400-foot contour.

Page 4.7-9

Figure 4.7-1, Soledad Sanitary Landfill Buffer Zone N-31

- The landfill footprint is not correct. The city has a specific limit of 19 acres. This affects the landfill buffer and restrictions.

Page 4.8-1

Setting, paragraph two, third sentence, "Surface slopes on the alluvial portion of the site are approximately 5 to 8 percent gradient." N-32

- Slopes on the alluvial portion are actually 2% to 3.5%.

Page 4.8-9

Impacts and Mitigations, Surface Water/Water Quality, third paragraph, last sentence, "The project would also be required to pay fees to the City to fund maintenance costs for onsite BMP's." N-33

- Are these fees supposed to be assessments for a maintenance district? What would the fees be and who will be doing the maintenance? See page 4.8-10

Page 4.8-10

Mitigation, 4.8-2, first sentence, "...the project applicant and/or his/her successor in interest, shall be responsible for the long term maintenance of all percolation basins and related private on-site drainage improvements and shall enter into a maintenance agreement with the City to provide for such." N-34

- Will maintenance be part of assessment to maintain facilities?

BESTOR ENGINEERS, INC. 9701 BLUE LARKSPUR LANE MONTEREY, CALIFORNIA 93940

Page 4.11-4

Inclusionary Housing Ordinance, 17.41.050, A-5

- Can't inclusionary units be smaller and more affordable by design like the workforce housing? See first paragraph under heading "Miravale III Specific Plan" on page 4.11-5.

N-35

Inclusionary Housing Ordinance, 17.41.140, under (2), "...no inclusionary units should be located to or in the immediate vicinity of another inclusionary housing development."

- What does "located to" mean? This requirement is unworkable, unfair and will not work. What if property can't be rented at market rate? What about apartments, townhome projects, etc. next to each other?

N-36

Page 4.11-5

Population & Housing, Miravale III Specific Plan, paragraph four, "Sprinkle....", sentence one

- If lots are fenced, smaller lots do not appear larger. In paragraph five, "Locate Duets", most single family units will have double or triple garages. Are corner lots a necessary location for duets?

N-37

Population & Housing, Relevant Project Characteristics, first paragraph

- 15 to 20 year buildout assumes 280 to 210 units per year. Is this reasonable?

N-38

Relevant Project Characteristics, second paragraph, "The overall gross density at buildout would average 10.8 units per acre."

- What is the definition of gross? 4,200 units/920 acres = 4.56 units/acre, not 10.8.

N-39

Page 4.12-5

Policy, S-32, "...pay its fair share..."

- Isn't this a fee, either impact or development?

N-40

Page 4.12-9

Impacts & Mitigation, Police and Fire, third paragraph, next to last sentence

- There is no reference to the paying of a fee for this impact. Construct, fund or pay fee.

N-41

Page 4.12-14

Parks & Recreation, second paragraph

- The golf course is not included as parkland because access is restricted. Other park facilities are also restricted, such as fields (for different teams to play at specific times) and large barbeque areas (also typically reserved for date and time). The golf course should be intended as parkland. The residents are scheduling the use of the course to achieve the full benefits and enjoyment just as in the play fields for soccer and baseball. Revise mitigation 4.12-6.

N-42

BESTOR ENGINEERS, INC. 9701 BLUE LARKSPUR LANE MONTEREY, CALIFORNIA 93940

Page 4.14-17

Mitigation 4.14, "...adjusted impact fee in effect at the time of building permit issuance."

- See Subdivision Map Act, Article 5, Section 66483(a), "The ordinance in effect at the time of building permit issuance has been in effect for a period of at least 30 days prior to the filing of the tentative map or parcel map if no tentative map is required." N-43

Page 6-10

6.6 No Golf Course, Utilities and Service Systems.

- No golf course alternative will have a substantial effect of sewer facilities with no place to spray recycled water and effecting the development of storm drain facilities.

  Annual Water Demand from Table 4.14-3 within the golf course would be 1,925.25 AF/yr without the course and using the recycled water the demand is 1,566.70 AF/yr. Recycled water production in a no golf course project would not be feasible. Wastewater produced would be 958.50 AF/yr with 114.6 AF for park and school use. Recycled water plant and infrastructure to irrigate parks and school fields would not be feasible. It would also add 843.9 AF/yr to the Soledad Treatment Plant and city sewer infrastructure. N-44

  Project could inject reclaimed water on site to reduce impact for no golf course alternative.

Appendix B, General Plan Analysis

Chapter VII, Public Services and Facilities

- S-39: Policy S-35 is not negatively affected.
- S-35: Policy is missing. N-45

Appendix D, Miravale III Williamson Act Contract Information

Exhibit A

- Parcel I is 100.00 acres, Parcel 2 is 38.26 acres minus 30 acres for a total of 108.26 acres. The report states 100 acres plus seven-acre parcels. N-46

Appendix G, City of Soledad Storm Drain Master Plan Appendix B and Engineering Reports of the RM Associates, Storm Drain and Hydra Hydraulic Analysis for Miravale III

Map

- Map not included. Recurrence, rainfall intensity, coefficients of runoff are different than pervious reports accepted and adopted by the city which were prepared by Bestor Engineers, Schaaf & Wheeler and Hanna & Brunetti. See accompanying documents. N-47

Appendix J, Traffic Impact Analysis

Figure 8

- Project Trip Distributions has 0% residential distribution for Miravale III and numerous other areas within the existing Soledad limits. There is no node at Orchard and Gabilan. N-48

BESTOR ENGINEERS, INC. 9701 BLUE LARKSPUR LANE MONTEREY, CALIFORNIA 93940

Specific Plan

Page 2-12, Table 2-3

- Proposed locations are designated PD 1, 2, 3, 4, 5 and 6. Shouldn't PD be VR (Village Residential)? N-49

Page 3-7, Hillside Road Section

- As shown the section has no provision for slopes. Slopes would have to be in easements on lots. N-50

Page 6-2, Section 6.2.2, Existing Development, second sentence, "Should ownership of these parcels...." N-51

- Should read "this parcel".

See the following previously submitted documents for questions and concerns regarding Miravale III drainage, traffic, sewer, water and reclaimed water facilities and submitted reports as part of the Draft Miravale III EIR. N-52

These documents are submitted as a reference for previous concerns and questions and to reiterate them here for comments on the Draft Miravale III EIR.

Sincerely,
BESTOR ENGINEERS, INC.

James A. Wurz

Re: Miravale III – Stormwater Flow

Dear Cliff.

My earlier editions of Drainage Analysis report for Miravale III included a discussion of the proposed relief drain from the main detention/percolation pond to be replacement, or relocation of the existing 18-inch culvert at the bend in San Vicente Road. On further study I see that the actual system, as it now exists, could pick up as much as the full capacity of the existing 48-inch RCP, plus gutter flow at substantially more (see attached 1"=40' topographic map, based on 2003 photos).

The existing water shed is actually approximately 2,400 acres, including the natural creek flowing in at our proposed Orchard, as well as 15 or 20 acres west of San Vicente. Even accepting a lesser coefficient of 20% for the 100-year factor, and a 1.2 iph intensity, including the 1.2 miles of only "flat fields" at only about 3% grade within Miravale boundary. There is 2,400 acres x 1.2 inches x 0.20 coefficient = 570 cfs peak 100-year flow (1,070 at 30%). There also is a CMP culvert at the driveway to the farm that can carry at most 40 cfs. The road crown passes some, but the curbed 1.2% half section carries at least 4.5 sf x 6 cfs = 27 cfs and the inlet at the bend will have at least two feet of submergence, hence will accept at least 20% to 30% more than the 24 cfs that I previously ascribed to regarding the crown overflow. I imagine it to be spread at least 100 to 150 feet to the south, hence something more than a few tenths deep at the first cross street, meaning some overflow south, causing catch basin inflow for several blocks.

Consequently, I feel sure that you (the City of Soledad) would presently receive at least 50 cfs, and probably more like 56 cfs – not the 24 cfs I previously said. So our relief line, at elevation 185 and above, should be at least 36 inches, with a 44 cfs capacity (your San Vicente storm drain is 54 inches at 0.3% with 85 cfs capacity, so ours would cause it to flow only about half full, and it doesn't start until local peak is long gone). This would accept a trickle until pond is well above 85 (probably about 25 or 30-year flow); not enough to even lift the mandatory flap gate. And it could accept a maximum (7 cfs) flow up to about elevation 88.6, which is the doomsday spillway. This would be less than the present situation San Vicente flow (50 to 56 cfs), reducing the Braga discharge by an equal amount. We would still put in full capacity elevation 82 pipes, valved, to Braga – but considerably less than present discharge potential of up to 500 cfs (less the effect of however much remains of our present 10 AF ponding capacity).

Your comments are requested.

Sincerely,
BESTOR ENGINEERS, INC.

MIRAVALE III
DOWNSTREAM FLOOD EFFECT
W.O. 6310.00
19 October 2006

Miravale III will contain approximately 18 AF in the north pond plus south pond at the start of discharge (elevation 182.0) of 23 + 52 = 75 (+18 upper) = 93 acre feet. Discharge is then controlled to capacity of four x 12" pipes at 8cfs each, totaling 48cfs.

The existing "pond" at the southwest corner captures natural runoff of 0.84 feet average x 19.6 acres = 16.4 acre feet, controlled by the existing farm road on Braga. This farm road is shown at a low point of 180.4 feet in 2002 areal topo (HJW) in an unsurfaced "weir" of perhaps 50 to 80 feet. When overtopped, this unsurfaced road will rapidly erode to allow sheet flow of part of the 16.4 AF contained volume, after which it will stabilize with the natural inflow from approximately 3,000 acres within sections 16, 15, 10, 9 and small portons of the upstream area, as well as part of the 285 acres of former Martines land. In a 100-year storm, this area will pass at least 75 to 80 acre feet in the first 24 hours (3,000 ac x 0.15 runoff x 2.5") at a probable peak rate (2 hour concentration time) of 3,000 ac x 0.15 x 0.5 feet per hour = 225 cfs. This natural or pre-project flow is considerably greater than the post-project flow rate, after detention in the Miravale III ponds with their probable 48 cfs discharge rate.

Considering the 100-year effect, we find that natural flow will be about double the above stated flow, or up to 400 cfs. In the proposed post project situation, which includes both ponds, a total of more than 148 AF of runoff will be impounded. Of this, the northerly pond will contain up to 18 AF (releasing a throttled 93 cfs to the lower pond) whereas the southerly pond will impound four elements:

1. The lower (elevation 162 to 176 feet) portion – 23 AF
2. A portion of driving range (elevation 176 to 182) approximately 29 AF (begin Braga discharge)
3. The mid driving range (elevation 182 to 186) containing approximately 25 AF, at the beginning of the discharge to City of Solead via San Vicente storm drain.
4. To the spillway at elevation 188.7, containing 30 AF, with continued rise at the rate of 1.0 AF for each 0.1 feet of rise above spillway weir.

Totaling 130 acre feet at spillway elevation, less discharge via pipes to Braga at approximately 48 cfs (= 3.97 AF/hr) and pipe discharge to city system at 0-to 15 cfs (up to 1.23 AF/hr), less percolation at variable rate from 0.36 AF/hr to 3.3 AF/hr (1.0 AF/hr = 12 cfs)

Of the total 148 AF impounded, approximately 0.5 x 700 x 3.45" = 102 AF, or 69% is from the development while 31%, or 46 AF, is natural runoff from the off-site area. Therefore, there will be less flooding on downstream lands, and any effect will be drastically reduced, both in total volume and in rate of discharge.

Re: Miravale III - Drainage Response to RM Associates Comments

Dear Cliff:

I have received the Robert James (RM Associates) memorandum to you dated 10/27/06, and have the following comments:

1. In response to his page 2 (unnumbered pages) request for design criteria, I suggest the following:

    a. Recurrence: We normally use 100 year, and base our figures on DWR depth-duration frequency for Soledad, #D20 – 8338 dated 2/14/05, which states RP 100 is 3.45 inches for day 1, 4.64 inches (an increase of 1.19) for day 2, and 5.25 inches (an increase of 0.61 inches) for day 3.
    b. 24 hour intensity: We have normally used the City of Soledad Fee Study dated May 2000, Table 3-2 (IDF curve) which shows 100 year, 1 hour at 0.88 inches, and 2 hours at 0.59 inches. We interpret to 90 minutes i = 0.74 inches.
    c. Coefficients of Runoff: We used the 2000 Fee Study Table 3-4, which shows agricultural land as 0.13 – 0.25, but modified to 0.15 at 10-year and 0.30 at 100-year. It shows 0.5 to 0.6 for low density, (i.e. 4 DU acre). We then used a density-weighted average, considering the presence of golf fairways and open space, at 0.49 for Miravale III (appropriate data was in our July report "Preliminary Drainage Analysis, Miravale III").
    d. Infiltration Rates for Drainage Basins: Our July report stated none available, but we later received the soil engineers data (used also by Mr. Jones) showing 60 minutes per inch for near surface sandy clay, and 3 minutes per inch for deeper sand/gravel We intend to use cased downdrains within the south pond, and will compromise at 15 inches per hour for that 2.2 acres (= 2.75 AF/hr).
    e. Maximum Discharge to City System: As noted by our July report, there will be zero discharge to the city until the pond level rises above 185 3, after which discharge is limited to 14 cfs by 24" RCP at 0.3%. We assume this will only occur if the pipes at elevation 182 to Braga are throttled (or closed). Assuming that the city discharge does occur, it will be only for a few hours, at maximum 50,000 cu ft/ hour (or 1.18 AF/hour).
    f. Maximum Discharge to Braga: As we stated, it will be several valved pipes at elevation 182, after approximately 60 to 80 acre feet has been retained in the two ponds, and is the replacement for the current situation of 16 acre feet retention, followed by impending overflow and washout at the earthen Braga field road. The pipes can be closed, raising spillway discharge elevation to 188.7, after which it is "Wrath of God".

Now, on with other points in Mr. James' report. His marking of the county map (his Exhibit B1) is incorrect. The map is a reduction, apparently at 1"=7 miles (not 5.5 miles), placing centroid of watershed too far north. I measured it at 0.32 inches/hour, not 0.4. Then, using the county formula of 2.22 factor for 100 year, and 90 minutes for TC, we find i = 1.24 inches/hour (James used 0.89 inches/hour). But I also find I_{100} = 3.45, not 4.34 (for 24 hours).

In his calculation of one-day runoff, I also differ. My total average of upstream off-site is 2,050 acres (not 1,930). My project area is 840 acres (not 927), and my one day rainfall is 3.45 inches (not 4.34) where:

inflow volume = 2,055(.3) (3.45/12) + 840(0.5) x (3.45/12) = 177.2 + 120.7 = 297.9 AF/day (not 369.3).

Then outflow computes using both ponds to be:

Percolation upper = 146 x 610 at 1"/hr = 0.16 acres
Percolation lower = 7.2 acres at 1"/hr + 2.2 at 15"/hr = 3.35 AF/hr
Pipe to city = 15 cfs x 3,600 = 1.24 AF/hr (x2)
Pipe to Braga = 4 x 7 cfs x 3,600/43,560 = 2.3 AF/hr (x15)
Outflow in one day = (0.16 + 3.35) 22 + 1.24(2) + 2.3(15) = 77.22 + 2.48 + 34.5 = 114.2 AF
Volume in storage (both ponds) 18.06 + 130 = 148 AF
Versus 279.9 – 114 = 166 inflow – controlled discharge, leaving 18 AF 24 hour weir discharge to Braga. Which is actually 17.5 AF/hr inflow – 7.05 AF/hr outflow = 1.7 hours at 10.5 AF/hr (+ the 2.3 AF/hr pipe flow).

This is in comparison to the pre project outflow of Volume $_{24}$ = 3.45" x 0.3 x (2055 + 840) (12) = 245 AF – 16 (existing pond) – San Vicente gutter flow which I earlier estimated at 27 cfs x 24 x 3,600 \ 4,3560 = 53.55 AF/day (gutter flow), leaving 175 AF which reaches Braga in a 100 year storm. There might be a little percolation loss; but nowhere near the stored volume of 148-acre feet.

So I believe the 148-acre feet of ponding is plenty and I will strenuously defend it. Remember, we started out to create a 9-acre golf driving range, and it evolved into a detention pond. I think it could realistically be reduced by perhaps 18 acre feet by lowering the berm two feet to 188 (now 190) which would also eliminate the 2 or 3 acre feet flow back to San Vicente, and increase the Braga flow to about 85 acre feet instead of the previously estimated 2.3(15 hr) + 30 = 64.5 acre feet. That is still less than half the pre-project 175-acre feet – or we could even drop the berm to 185 and allow more to flow to Braga. After all, it would save nearly 22 acres x 5 feet = 176,000 cubic yards of earthwork x 700-foot average haul. I don't particularly like that idea, since it would leave the hotel site and adjacent 16 acres at as much as 15 to 17 feet below San Vicente Road (now 10 feet below), and it does make the Braga land more vulnerable to flooding. Not as vulnerable as the present, pre-project situation, but more vulnerable.

Then, in the second day of a 100-year storm (0.14"/hr if we use City Table 3, or 1.19"/a day by DWR, which averages out to 0.05"/hr), inflow will average 2,895 acres x 0.05" x 50% / 12 = 6.0 AF/hr. Of this, 2.43 AF/hr will be lost to percolation, and the remaining, 3.57 AF/hr will go partially to the city and partially to Braga, depending on how valves are operated.

At any rate, we certainly don't need the extra 82-acre feet of ponding suggested by Mr. Jones.

Sincerely,

Re: Miravale III Drainage

Dear Cliff:

In my earlier Preliminary Drainage Analysis for Miravale III, I had based everything on published DWR intensities (copy enclosed), which show 24-hour rainfall to be 2 year – 1.35 in./day, 10 year – 2.32 in./day and 100 year – 3.45 in./day. I then based time of concentration intensities on Hanna-Brunetti's May 2000 "Storm Drain Impact Study – Final Report", Table 3-2, (pages 3-4), which shows 60 minute intensity to be 60 min., 2 year – 0.36 iph; 60 min., 10 year – 0.59 iph; and 60 min., 100 year – 0.88 iph (with mathematical deviations for various longer or shorter times of concentration).

Then, using area planimetered on a 1"=1000' enlargement of a USGS quad, I found the contributory area for the Section 15 creek to be 1248 acres. Then assumed an average overall runoff coefficient for that mountainous, brushy watershed to be 30% for 100 year, 15% for 10 year and 8% for smaller storms.

From that, I obtained the highly conservative concentration time of 102 minutes for the approximate 3.8-mile long stream at the southeast corner of Section 16 (The Project) (elevation 2102 to 333, average slope 465 feet per mile). This yields i100 = 0.63 inch per hour and Q 100 = 1248 ac. x 0.63 iph x 0.30 = 236 cfs.

Now, in retrospect, I feel there must be some error. I have reviewed the Schaaf & Wheeler study for Monterey County Water Resources Agency, by memo of 7/29/03 to David Foote, in which their specialist, Christy Chung, arrived at a 100 year flow in Bryant Canyon of 328 cfs. This is for the next easterly creek from Section 15, with almost identical terrain and vegetative cover, but with 3098 acres of watershed (versus our 1248, or 2.48 times the area). Ms. Chung used 90 minutes TC, and a composite curve number of 56, to arrive at her HEC-1 result of 328 cfs. This is equivalent to a runoff of 328/3008 = 0.106 cfs/ac. If applied to the Section 16 1248 acres, that yields 132.1 cfs. Stated differently, 323/2.48 = 132 cfs.

Effectively, this would indicate that I should have used a runoff coefficient of 236/132 = 16.7% - **not** my assumed 30%. The net effect would be to reduce the southeast corner inflow to 132 cubic feet per second and to reduce total external (the 1248 acres at the southeast corner plus the 747 acres at the north boundary) to 1995 acres x 3.45 inches x 0.167/12 = 98 acre feet of 100 year, 24 hour impoundment. **Not** the 1995 x 3.45/12 x 0.30 = 172 acre-feet that we had expected from upstream flows.

The on-site 920 acres (including future development of the Williamson Act left blank in our Vesting Tentative Map), as stated in our earlier analysis, would remain at 920 x 3.45/12 x 0.49 = 129.6 acre feet per day.

Using the numbers shown in my letter 11/10/06 for the various types of discharge, our peak day (100 year – 24 hour = 3.45 inches) would become:

Inflow: 98 AF off-site (from above discussion)

129.6 AF on-site from 920 ac. x 3.45 inches/12 x 49% coefficient (includes ultimate development of the Williamson Act ± 110 ac.)

Total Inflow at 24 hr = 227.6 AF

Outflow: Upper pond (north) percolation = 1.6 ac x 3 in/hr x 23 hr/12" = 9.7 AF/day
Lower pond (south) – deep portion = 1.05 ac x 20"/hr/12 x 22hr = 38.6 AF/day
Lower pond (mid section to 182) = 4.46 ac x 3"/hr/12 x 20 hr = 22.3 AF/day
Pipe to Braga: 48 cfs x 18 hr ÷ 43560 = 71.4 AF/day
Pipe to San Vicente: 15 cfs x 2 hr = 2.4 AF/day
Pond, 182 to 188 = 5.0 ac x 3"/hr/12 x 2 hr = 2.5 AF/day
Total to spillway: 146.9 AF discharged

Storage: Upper pond: 21 AF capacity
Lower pond: 108 AF capacity
Total storage required without spillway operation:
227.6 AF inflow – 146.9 AF outflow = 80.7 AF required

In actuality, if our rates of percolation actually are 3"/hr and 20"/hr, we have a surplus storage capacity of 49 acre feet or 60%. That means we could eliminate the San Vicente discharge of 2.4 AF/day and could throttle the Braga pipes to about 10%, or even to close all four valves. We would prefer to have them available, however, to reduce the probability of actually using the spillway.

Remember, 1995 was a 200-year storm (2 days) and we may someday see a 500-year storm of 4.26"/day (or 24% greater than a 100-year storm). Also, final actual percolation rate may not be as great as expected.

As for now, we could reduce the size of the ponds. This would most logically be done at the lower (south) pond, and could simply be done by reducing the berm height. That also enlarges the pond by about nine feet of width for each foot of height. For example, lowering berm (and spillway) by two feet makes the pond 18' wider, hence about 0.4 acres larger, adding to both overall surface and percolation rates. This also allows nearly 20 acres of commercial and hotel area to be lowered, saving about 60,000 cubic yards of fill.

I will await your comments before I make any definitive changes.

Sincerely,

Re: Miravale III - Storm Water Ponding

Dear Mr. Price:

On 12/7/06, I wrote you concerning the reduction in storm water ponding for Miravale III (copy attached) using comparable runoff figures from the Schaaf & Wheeler analysis of July 2003. The off-site inflow from a 100-year storm will be used at 132 cfs from the 1,248 acres of section 15 creek. A total of 410 + 72 + 29 acres (or 511 acres), resulting in 0.88 iph x17% x 511 acres = 76 acre feet enters from the north boundary of section 16. I will continue to use 126 acres to the north pond (old San Vicente Road) with its 83 cfs runoff, and find that necessary runoff (ignoring pond percolation) we find that the north pond discharge onto the west portion of Miravale will be a maximum of 85 cfs, or 35 cfs less than shown on our prior Vesting Tentative Map.

Then, we find that the 100-year runoff from the east side total of 565 acres reaches a peak flow at 507 cubic feet per second. This ignores the flow time of probably 25 to 30 minutes on-site (6,000 feet at on average of six to seven minutes – during which rainfall intensity will theoretically decrease from 1.3 iph to 0.88 iph).

We had earlier used over 600 cfs in the lowest pipe at the entrance to the retention/percolation pond, so this is at least a 1 or 2 pipe size reduction, affecting both major lines, or about 16,000 feet of pipe (or at least $300,000 to $400,000).

More importantly, however, we suggest lowering the pond berm. As earlier discussed, we can drop the southwest berm by at least five feet. This will affect about 2,000 feet of berm – making it much narrower, adding to pond capacity – but more importantly, reducing fill height in approximately 25 acres. It also allows Miravale Road to drop to match natural grades at its west end.

My suggestion is to drop berm to 185 (was 190). Decreasing pipe size, while still retaining the pond bottom at elevation 162 allows the driving range to drop from 176 to 170. Berm will be a maximum of four feet of fill (was as much as nine feet) Lowering the driving range will generate enough fill to create a close balance, with haul limited to about 600 feet maximum, whereas we previously had to consider up to 3,000 feet of haul distance. Also, while keeping the tee area (and street) unchanged, the narrower berm (still 12-foot maintenance road at the top) allows the range to be increased to 300 yards.

The south pond will now have 123.7-acre feet. The north pond still retains 18 AF of peak storage for a grand total of 141.7-acre feet. Total 24 hour, 100-year runoff is:

Off-site: 511 + 1,248 = 1,759 acres at 0.167 x 3.45/12 feet = 84.45 AF.

On-site (including future growth on Williamson Act Land): 920 acres at 0.50 x 3.45/12 feet = 132.25 AF.
Total = 216.7 acre-feet of runoff.

Percolation:

Upper Pond	1.6 ac x 3"/hr x 23hr	= 7.36 AF/day
Lower Pond, deep	1.148 ac x 15"/hr x 24hr	= 34.44 AF
Driving Range	6.2 ac x 6"/hr x 12hr	= 6.2 AF/day
Total:		= 48.0 AF/day

Storage available: 123.7 AF + 18AF = 141.7 AF available

Discharge: 216.7 AF run-off – 48 AF percolation – 141.7 AF storage = discharge 27 AF, or 27/84.43 = 32% of offsite run-off.

However, incoming pipes will stand full of water up to the spillway discharge level (184.0) about 1,000 ft of 72", 400 ft of 60" and 700 ft of 45". This is about 1.0 AF. The remaining 26 AF will be discharged at the rate of (1,759 x 0.14 x 0.17) + (920 x 0.14 x 0.5) = 360 cfs, over about a one or two hour period – after which percolation rate of about 0.5 AF/hour will about match the inflow rate. This is much lower than the 85 AF off-site + 45 AF of natural on-site that would pass or 130 AF through the same point in a pre-project 100-year storm, at 130 AF under present conditions

The new plan is in drafting and should be ready tomorrow.

Sincerely,
BESTOR ENGINEERS, INC.

Carl L. Hooper

Re: Miravale III

Dear Cliff:

Following our meeting with Black & Veatch on Friday (6/8/07) I have reconsidered some items as shown on the latest version of sheet 3 of 11, Miravale III Vesting Tentative Map. After your review and comments, we will furnish revised sheets to the EIR consultants for inclusion in their studies. The principal changes are:

1. Detention Pond/Driving Range is lowered to 184 (was 189) with berm at 185 (was 190). Sides were moved to enlarge storage (berm is still 3:1 with 12 foot road). The center (120 yards) now flat at elevation 170 (was 3% slope). The main pond clearance access was reduced to a 5% gradient. Table of storage volumes added were: 162 to 170 = 12.4 AF; 170 to 180 = 76.2 AF; 180 to 184 = 41.9 AF; Total = 130.5 (plus the northern 18 AF).
2. The sewer was relocated to San Vicente Road widening for 3,000 gpm peak (18-inch at 0.345%), which does NOT require pumping with delivery elevation at 188.0 (assuming headwork at that elevation and using mounded pipeline from San Vicente.
3. The sewer lift station then reduces to approximately 250 gpm (serving 47 single family, 120-room, hotel and approximately 18 acres of commercial) (was 3,300 gpm by about 10-foot lift)
4. The west sewer line above dwelling unit 47 crosses the fairway on sheet 4 about 800 lf across fairway 11.
5. The main storm drain from roundabout location is rerouted to eliminate three right angle bends by using a single 300-foot radius on 72-inch cast-in place pipe (CIP).

Incidentally, our new plan for the driving range/pond requires 146,900 cubic yards of cut, all of which will be used for fill in the hotel, southwest commercial area and reclaimed water plant site, an average of only 600 feet haul distance. I haven't calculated the golf course treated water ponds yet, but they should total bout 50,000 cubic yards, possibly 60,000, which will all be used in golf regrading.

Sincerely,
BESTOR ENGINEERS, INC.

Re: Miravale III – Revised Vesting Tentative Map sheet 3 of 11

Dear Denise:

Attached are four copies of the revised sheet 3 of 11 dated 6/12/07, and four copies of my letter to Cliff Price of City of Soledad. The revision changes the southwest stormwater detention pond and the approaching storm drains. It also revises the location and size of sanitary lift station at the recycled water plant adjacent to that stormwater detention pond. Since a large number of revisions were made to sheets 3, we elect to totally replace that sheet, and did not follow our customary practice of "clouded" revised portions. Mr. Price has reviewed these changes and has approved in principle.

Storm Water Changes – The pond is lowered by five feet to provide a better earthwork balance within the roughly 32 acres south of Miravale Road and west of San Vicente Road. This also reduces maximum fill berm height to less than four feet. The potential overflow to existing City of Soledad stormwater system and storage ponds has been eliminated. The previous three right angle bends in the main stormwater entry pipes were also eliminated.

Sanitary Sewer Changes – By rerouting the westerly (Street A) sanitary sewer across the golf course at fairway 11 and adding approximately 900 lineal feet of sewer main, the perpetual lift station size can be reduced from 3,300 gpm to approximately 250 gpm, immeasurably reducing long term operational costs.

Please inform your subcontractor of these changes so that any effect from them can be incorporated in your EIR.

Sincerely,
BESTOR ENGINEERS, INC.

Re: Miravale III, Traffic Conference

Dear Cliff:

Concerning our conference call today regarding the Miravale III traffic study by Hexagon:

Persons present were: Cliff Price, Peter Le, Don Fleming, Susan Hilinski, Robert del Rio (Hexagon) and Walter Grant. On the conference call were: Denise Duffy, Debbie (RRM) and Carl Hooper (Bestor Engineers).

Items discussed were:

1. Gabilan extension to be funded by redevelopment, and shared by impact fees, Soledad Plaza (commercial) and Miravale III. It should enter the Miravale III EIR as available prior to completion of phase 2 (304 dwelling units plus inclusionary and first nine of golf exempt).
2. Miranda extension to Gabilan, concurrent with Gabilan, fronted by Soledad Plaza.
3. San Vicente four-lane road north of Gabilan. Is it part of Gabilan extension or Miravale III?
4. Miravale Road, extension to Camphora Gloria/101 interchange – ultimate, impact fee funded – consider in 2030 EIR.
5. Orchard Lane extension to Metz – consider as existing for Miravale III (part of Orchard Villas and Miravale II). (This provides a Third Street route to downtown and Metz access to winery, rock quarry, etc. to the south via Metz Road).
6. Traffic Distribution – internal for Miravale III to be more thoroughly considered since it provides residential access to commercial in two areas, school, parks, golf and practice facilities, potential theaters, etc. Also more consideration than 5% in downtown, more than 5% in commercial/industrial in south Soledad, also less dependent on 101 northbound for employment. My suggestion is:

Area	%	Use %
Internal Miravale III	20 - 25	23
Downtown	10 - 15	12
Los Coches/Nestle	5 - 10	7
Metz South	2 - 3	2
101 South (Greenfield, King City, etc.)	15 - 20	18
101 North	30 - 40	38
Certainly not 101 N	(was 70)	

7. We are looking at long term 100% growth in Soledad, not merely a bedroom neighborhood.

The main thing is to keep this moving. I feel it is unfortunate that these weren't covered before, but let's all move along now.

Very truly yours,
BESTOR ENGINEERS, INC.

Re: Miravale III - Omni-Means 2007 Report

Dear Cliff:

I understand there will be a "stakeholders" meeting to discuss the Omni-Means Traffic Impact Fee Report received at the 6/20/07 council meeting. I have several points that should be discussed. I am still reading the reports but here are a few specific items:

1. Potential development table is wrong! Some items seem to be at 2006 fees, some are six times the 2006 rate
2. Shows Bryant Canyon Road going west when it already goes east and north up the canyon (needs new name for westward road).
3. List of improvements (table 4) doesn't match the map for road segment numbers.
4. Shows some streets that are already improved.
5. Budget estimates are haywire, for instance:

BC	$24 million/mile
West	$16 million/mile
Orchard 2 lane	$7.7 million/mile (and goes west instead of north)
Camphora/Gloria	$11 million/mile

6. Interchanges $42.6 million each? (including studies – only $35 million for construction)
7. Includes R/W cost although the developer dedicates.
   Example:

Crest	$758,000
S Street	$590,000
Orchard Lane	$8,397,000
Gabilan	$322,000

8. Table ES-1 says current fees (SFD) are $2,810. The council adopted $1,700 last week. Commercial says $2,867/KSL whereas council adopted $5,024/KSF and $3,737 for offices.

I'm sure I will dream up a few more, but you might start with these.

Sincerely,
BESTOR ENGINEERS, INC.

Re: Miravale III – 2007 Traffic Impact Fee Study

Dear Cliff:

As a follow up to the 7/6/07 meeting I offer these comments:

1. General Plan and Study Differences: Enclosed are copies of the General Plan figure V-2 and Study figure 5.

   a. West Street terminates at the section 16 south boundary in G.P., continues 2.27 miles to Camphora Gloria Road in study sheet 5 (Miravale III continues it about 1.1 miles, terminating at the San Vicente relocation). Four-lane in GP and ST, two-lane with left turn lane Miravale III.

   b. In the General Plan, Orchard Lane continues to the north and west to an unnamed street 0.15 miles short of Camphora Gloria Road. The study continues it to Camphora Gloria Road and places it 0.6 miles south of its GP location (Miravale III continues it north into section 9) (two-lane collector all three plans).

   c. Bryant Canyon Misnamed is two-lane in GP, four-lane in the study west of West Street. Miravale Road in Miravale III is actually intended to the ultimately connect to the interchange at Camphora Gloria Road as arterial. Incidentally, it passes awfully close to Dole on the GP whereas it makes more sense aimed at the interchange.

   d. Two east-west streets through section 16 are arterial in GP, collectors in study and actually Hilltop and Crest in Miravale III. They appear as two-lane (20 and 21) in study.

   e. Camphora Gloria is shown in the study as #13, a 1.3 mile, four-lane road. It merely appears as an existing county road in GP. It shows up as $14 million in Table B-2. It's listed as R12 in B-2, as #13 on sheet 5 and estimate, merely as an existing roadway in GP. Incidentally, it includes 12.45 acres of widening (which means 80 feet of widening). I assume it to be a 60-foot current right-of-way, so how could it need to be made 140 feet wide and take $706,000 worth of drainage facilities? That is $552,000 per mile in drainage structures. Is the Traffic Impact Fee intended to absorb this? Sorry, I got a little carried away by this apparent discrepancy.

2. Individual Estimate Questions:

a. Intersections (Table 4): There are more than ten intersection improvements at a total of $24,819,000, or nearly $2.5 million per intersection. Of these, four are on the questionable "Bryant Canyon" westerly extension, three are on the West Street extension that doesn't appear in the General Plan. I question the major portion of these. These appear on page 14 and again on page A8. Is there any possibility of duplicate count?

b. Miscellaneous Items Requiring Correction:

- Figure 7 – City limits do NOT include 41.7 acres of Miravale II or the northwestern Hambey 43 acres. Also, irregular lines such as section 16 and section 9 should reflect actual lines, or be removed. This also includes the Windmill parcel to be corrected.
- Table 6 to be corrected: 8,115 dwelling units? 915 MF? Retail and office? Possible amounts are questionable.
- Page 17 – current fees are wrong. Shown as $2,810, whereas they were increased in June to $1,700 (were $1,580 when the study was prepared and when the Miravale III application was made).

3. Questions about Estimates:

1. Gabilan, Orchard to Bryant, $2.5 million – This already exists as 64 feet within 84 foot right-of-way.
2. Gabilan, Bryant to Metz, $10 million – Where is it?
3. Front Street, Gabilan to Orchard $17.3 million – Apparently 7,000 feet long, apparently Road #10?
4. Orchard, Gabilan to Metz, $4.6 million – Part of Miravale II, includes $301,000 in storm drains.
5. Bryant Canyon, Metz to Orchard, $9.8 million – County road, not allowed as a city street in Miravale II.
6. Camphora/Gloria Road, Orchard to Hwy 101, $14.8 million, includes $5.4 million in right-of-way widening?
7. New collector #14, Bryant Canyon to Orchard, $7.5 milllion, includes $538,000 in drainage by development (not fee) and $2.85 million in right-of-way.
8. San Vicente extention, Bryant to north Orchard, $7.5 million, includes $530,000 in drainage (not fee) and $3.8 million in right-of-way.
9. Bryant Canyon, Camphora to West Street, $25.7 million, includes $9.2 million in right-of-way and $1.2 million in drainage.
10. Bryant Canyon, West Street to Orchard Lane, $3.2 million, includes $232,000 in drainage.
11. West Street, Bryant Canyon to Camphora $28.1 million includes $1,369,000 in drainage and $10.3 million in right-of-way.
12. Orchard Lane extension, Bryant Canyon to Camphora $21.3 million includes $8.4 million in right-of-way and $1.6 million in drainage.
13. Crest, Orchard to West Street, $1.9 million, includes $144,000 in drainage and $768,000 in right-of-way (all within two-lane street in Miravale III).
14. S Street, Orchard to West Street, $1.5 million, this is 700 feet at two-lane street in Miravale III, includes $590,000 in right-of-way and $112,000 in drainage.

BESTOR ENGINEERS, INC. 9701 BLUE LARKSPUR LANE MONTEREY, CALIFORNIA 93940

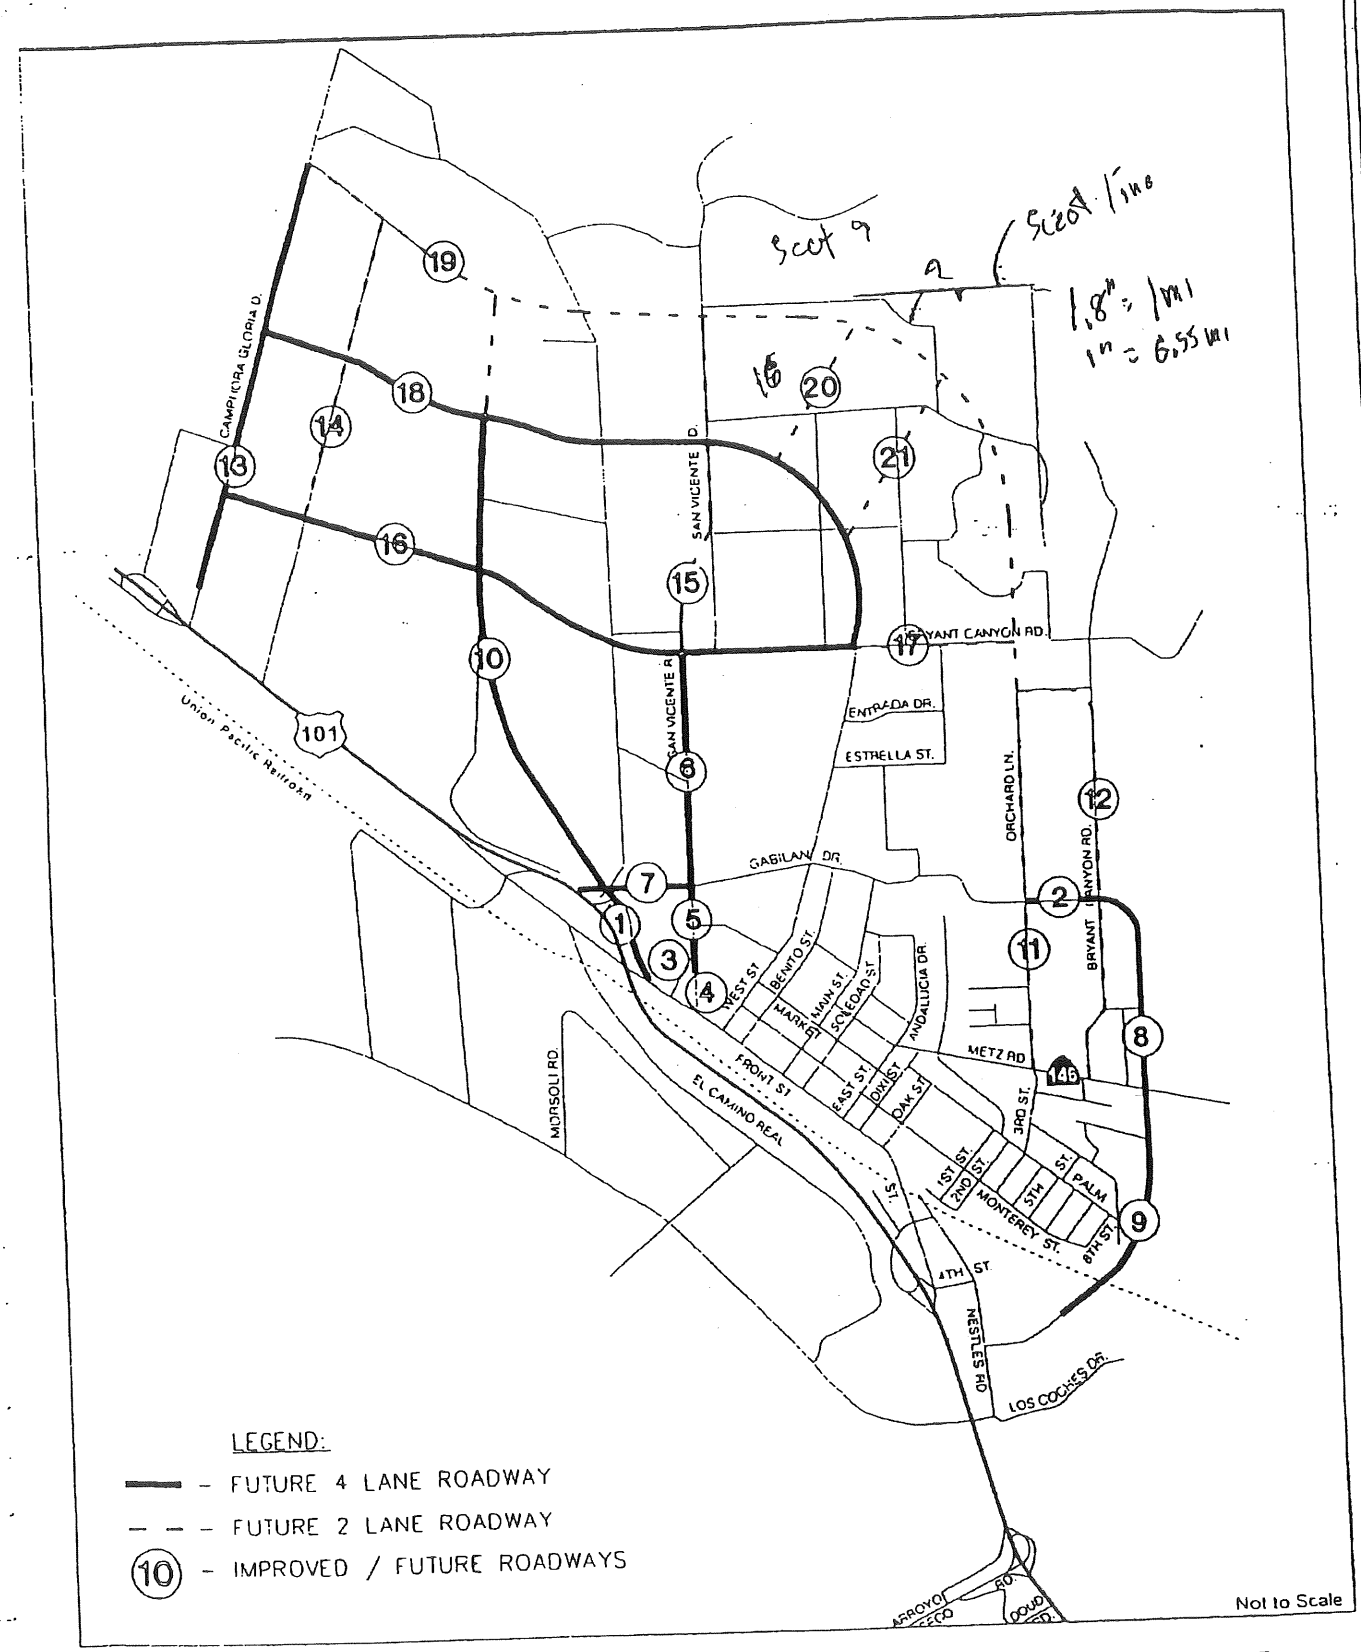
The rest are all "intersections" but include several million in right-of-way? Isn't that already included in the street cost? For instance, signals cost $200,000 each but take up 60 to 80 kst each at $800,000 to $1 million? And then, of course, is the $120 million in freeway interchanges! Aren't these included in TAMC fees?

Finally, I don't understand Table 6, the Traffic Fee Allocation. If we look at Table 1 (Development Potential) we find "holding capacity" in expansion areas to provide 5,521 SFD and 3,080 MFD, but Table 6 spreads costs over 8,115 SFD and 915 MFD (or a total of 9,030 dwelling units). Of those, about 1,100 are in Miravale II and already covered by the 2006 fee structure and 4,200 are in Miravale III which are also under the current fee structure. So that leaves about 3,730 dwellings to absorb the probable $82 million (after correcting all the apparent errors that I have listed above) or about 60% of the Omni-Means totaling $136 million (less the probable $25 million to be absorbed by FUTURE commercial and industrial uses) leaving $57 million ÷ 3,730 = $15,000 average per dwelling unit (I'll let you and Omni-Means do the math).

I sincerely doubt that the magnitude of fees will result in new development, since they practically eliminate "affordability".

Now, on to another question: Figures 3 and 4 purport to be "typical cross sections" for two or four lane streets of 75 and 104 feet width, but Appendix C of the General Plan shows 60 feet and 100 feet of right-of-way (plus ten feet if bike lanes are provided). Somehow, this discrepancy must be addressed. The numbers in the TIF Study assume right-of-way costs at $10/sq ft, or $436,000 per acre. I doubt that any court would ever require such a high award in an eminent domain suit – and certainly no developer can ever afford such inflated costs.

Remember, the fees must be reasonable and they will no doubt be anticipated as candidates for periodic increases, not unlike the recently adopted Section 14.06, a 7.6% increase from 2006 fees.



Sincerely,
BESTOR ENGINEERS, INC.

Re: Miravale III – Revised Vesting Tentative Map sheet 3 of 11

Dear Denise:

Attached are four copies of the revised sheet 3 of 11 dated 6/12/07, and four copies of my letter to Cliff Price of City of Soledad. The revision changes the southwest stormwater detention pond and the approaching storm drains. It also revises the location and size of sanitary lift station at the recycled water plant adjacent to that stormwater detention pond. Since a large number of revisions were made to sheets 3, we elect to totally replace that sheet, and did not follow our customary practice of "clouded" revised portions. Mr. Price has reviewed these changes and has approved in principle.

Storm Water Changes – The pond is lowered by five feet to provide a better earthwork balance within the roughly 32 acres south of Miravale Road and west of San Vicente Road. This also reduces maximum fill berm height to less than four feet. The potential overflow to existing City of Soledad stormwater system and storage ponds has been eliminated. The previous three right angle bends in the main stormwater entry pipes were also eliminated.

Sanitary Sewer Changes – By rerouting the westerly (Street A) sanitary sewer across the golf course at fairway 11 and adding approximately 900 lineal feet of sewer main, the perpetual lift station size can be reduced from 3,300 gpm to approximately 250 gpm, immeasurably reducing long term operational costs.

Please inform your subcontractor of these changes so that any effect from them can be incorporated in your EIR.

Re: Miravale III

Dear Cliff:

Following our meeting with Black & Veatch on Friday (6/8/07) I have reconsidered some items as shown on the latest version of sheet 3 of 11, Miravale III Vesting Tentative Map. After your review and comments, we will furnish revised sheets to the EIR consultants for inclusion in their studies. The principal changes are:

1. Detention Pond/Driving Range is lowered to 184 (was 189) with berm at 185 (was 190). Sides were moved to enlarge storage (berm is still 3:1 with 12 foot road). The center (120 yards) now flat at elevation 170 (was 3% slope). The main pond clearance access was reduced to a 5% gradient. Table of storage volumes added were: 162 to 170 = 12.4 AF; 170 to 180 = 76.2 AF; 180 to 184 = 41.9 AF; Total = 130.5 (plus the northern 18 AF).
2. The sewer was relocated to San Vicente Road widening for 3,000 gpm peak (18-inch at 0.345%), which does NOT require pumping with delivery elevation at 188.0 (assuming headwork at that elevation and using mounded pipeline from San Vicente.
3. The sewer lift station then reduces to approximately 250 gpm (serving 47 single family, 120-room, hotel and approximately 18 acres of commercial) (was 3,300 gpm by about 10-foot lift)
4. The west sewer line above dwelling unit 47 crosses the fairway on sheet 4 about 800 lf across fairway 11.
5. The main storm drain from roundabout location is rerouted to eliminate three right angle bends by using a single 300-foot radius on 72-inch cast-in place pipe (CIP).

Incidentally, our new plan for the driving range/pond requires 146,900 cubic yards of cut, all of which will be used for fill in the hotel, southwest commercial area and reclaimed water plant site, an average of only 600 feet haul distance. I haven't calculated the golf course treated water ponds yet, but they should total bout 50,000 cubic yards, possibly 60,000, which will all be used in golf regrading.

Sincerely,
BESTOR ENGINEERS, INC.

Carl L. Hooper

Re: Miravale III Water System Peak Factors

Dear Cliff:

In the water system design for Miravale III we have shown on the Vesting Tentative Map various pipelines, pumps and storage tanks that do not precisely match the size used by Schaaf and Wheeler in their Soledad Water Master Plan. That plan does not take into consideration the use of reclaimed water for irrigation purposes, whereas, at your instruction, we have shown a separate reclaimed water system. That system includes an on-site "scalping plant" which will result in sufficient reclaimed wastewater to irrigate:

a.	The Miravale III golf course –	approximately 125 acres.
b.	Streetscape for all streets -	approximately 14 acres.
c.	Public Parks –	approximately 30 acres.
d.	Public School Athletic Fields –	approximately 15 acres.
e.	Private lot front yards add MF landscape –	approximately 39 acres
	Total	**222 acres**

In aggregate, this is 222/815, or 27% of the total project. Only private rear yards and minor portions of multi-family and/or commercial areas, probably totaling less than 15% of the 815 acre project will be subject to potable water irrigation – certainly not enough to result in doubling fresh water demand.

A second factor to consider is the fact that the fire sprinkler systems will be required in public buildings and most probably in commercial and multi-family buildings, so the excessively large volumes for fire protection in Schaaf and Wheeler's analysis can be substantially reduced. We do not question large volumes in zones A or B, where many buildings lack such provisions. But zone C and the two very small zones above C can certainly avoid such large volume tanks with the inherent loss of quality that accompanies such a lack of turnover in storage.

As the result of our design, the pumps and tanks shown on the Vesting Tentative Map, coupled with the proposed use of a 12-inch double loop main system in zone B and only 8 inch pipelines in zones C, D and E should be adequate. Naturally, computations of individual segment pressure loss and fire flow conditions will be provided in the final design.

Regarding water consumption, we offer the following analysis:

Miravale III Water Consumption, Indoor, GPD

	Number	GPD/Unit	GPD	Peak Hour gpm	
Single Family	1,470	382	562,277	780.9	Avg 4.5/du
Multi-Family	3,730	323	881,790	1,224.70	Avg 3.8
Commercial	275	80/1,000	22,000	100.0	
Schools	2,200 std	20.4 gpd avg.	44,900	187.0	
Hotels	120 rm	167 rm	20,100	93.0	
Other	-	-	46,200	165.0	
Total			**1.577 mgd**	**2,400**	**Total Persons: 17,270**

(Sewer flow = 1.577 mgd + 14% = 1.8 mgd = 2,375 gpm peak hour)

Fresh water irrigation will total approximately 40 acres at 1.8 AF/acre or about 72 acre feet/year. Peak day use will be approximately 5%, or about 3.5 to 4.0 AF, or 1.0 mgd to 1.3 mgd. But this will be spread over probably 5 to 6 hours, requiring about 3,400 gpm make-up pumpage.

Of this, the majority of use will be in zone B. Zone A will be limited to 48 homes, the hotel and westerly commercial (34 acres). Zone C will include 569 total dwelling units (343 single family and 230 multi-family). Zone D (reduced pressure from Tank E) serves 21 single family dwellings. Zone E serves 30 single family dwellings.

Zone	Highest	Lowest	STP	MFD	Commercial/ Other (acres)	School
A	215	185	48	0	18	0
B	215	340	1,028	2,994	17	3
C	340	456	343	236	0	0
D	456	570	21	0	0	0
E	570	705 *	30	0	0	0
Totals			**1,470**	**3,230**	**35**	**3**

* includes two individual booster pumps

Our rationale for storage tanks and pumps is then:

Zone E – 51 customers on tank, but fire protection needs only 2 hours x 500 gallons per minute = 60,000 gallons. Domestic use is 30 customers x 1,500 gallons peak day = 45,000 gallons for a total of 105,000 gallons. Pumpage requirement – 45,000 gallons/1,000 min = 45 gpm. Proposed pumps are 2 at 25 gpm, plus one standby. Could be 2 at 45 gpm.

Zone D – 21 customers, served by 50 gpm reduced pressure zone, using single 8-inch pressure regulator. Storage is included in Zone E tank (only 30 Zone E customers).

Zone C – 343 single family dwelling customers plus 236 multi-family (assuming the split for undesigned PUD). All multi-family dwellings are required to have fire sprinklers, so fire flow is 60,000 gallons; domestic flow for the 579 dwelling units (1,544 occupants) is 115,800 gpd (160 gpm peak flow), plus the 45 gpm usage in zones D and E requires by most standards 205 gpm pump capacity. It requires 1.5 days plus fire flow = 233,700 gallons. We had suggested 320,000 or a 86,300 surplus.

Zone B – the 1,028 SFD plus 2,994 MFD will utilize the existing 2.0 mg tanks (plus a future tank at the same elevation if and when the "windmill" site is ever developed). The existing tanks supply 840,000 gallons of fire storage (3,500 gpm x 4 hours) plus 1,160,000 gallons domestic, or 288 gallons per dwelling unit for the 4,022 dwelling units in this zone. When ultimately built, along with perhaps 600 to 800 dwellings, that northerly 1.0 mg tank would improve storage to 2,160,000 gallons, or at least 430 gallons per dwelling, and would bracket the ends of the two-mile long service area. Pumpage needed is a total of 1,160,000 gpd, or 483 minutes for the current 2,400 gpm available. If discounted to 1,600 gpm (by keeping one existing pump in reserve), it would require 725 minutes of running time. Adding the 205 gpm for zone C requires the zone B pumps to operate 813 minutes. Since most systems are normally used 1,000 minutes per day (or 69% of the time), there is no justification for additional zone B pumpage.

Zone A – the 48 dwelling units plus commercial will cause demand for 47,000 gallons per day or approximately 32 minutes of pumping time for one well at 1,500 gpm. No additional storage is involved, since the existing tanks provide for fire storage.

Respectfully submitted,
BESTOR ENGINEERS, INC.

MIRAVALE III
RECLAIMED WATER SYSTEM
14 July 2007

(See also 7/17/06 report entitled "Reclaimed Water and Preliminary Report dated September 2006)

All Miravale III treated waste water is intended for use for irrigation on the golf course, parks, playgrounds, streetscapes and private front yards within Miravale III. This has been previously estimated at 85% of 1.7 mgd, or 1.4 mgd or 4.4 AF per day. The total available irrigation area has been estimated at approximately 125 acres of golf, 59 acres of public facilities and 39 acres of private front yards.

The probable distribution system will consist of approximately 4,200 lf of 12-inch, 8,200 lf of 8-inch and 3,000 lf of 6-inch on the main distribution system, about 11 miles of 4-inch and 2 ½-inch distribution lines in the individual streets. All will be purple pipe, to distinguish it from the potable water pipe. Principal storage facilities will include the 10 to 15 water hazards of the golf course and storage tanks at the 540 and 720 elevations. Individual irrigation pumps, distribution systems and spray heads will be the responsibility of the users (approximately 56% golf course, 26% city and 17% private owners).

The basic system will most probably contain the following pumps:

1. At the treatment plant – Three at 50 Hp (600gpm at 222 feet)
2. At westerly uppermost pond (temporarily at elevation 257, with ultimate extension within the Williamson Act land to the pond at 247) Zone B distribution pumps, probably three at 25 HP (300 gpm at 200 feet head) for distribution to the approximate by 60% of the development within that zone.
3. At pond 310 – two at 60 Hp (500 gpm at 285 feet)
4. At 540 tank site – two at 20 Hp – 100 gpm at 180foot head.

Total eight pumps – 20 at 60 Hp – 100 to 600 gpm at 180 to 285 foot head.

As stated above, these will be required in several phases, as the project proceeds. Until the final design of the golf course, the individual sizes of ponds cannot be determined. They should total the Zone C tank which will serve approximately 10 to 12% of the total development, providing up to about 0.5 acre feet daily, hence approximately 200,000 gallons. The golf course will be expected to use 125 acres.

This amount of irrigatable land can absorb an average of 0.10 to 0.15 inches per day, or about 1.2 to 1.5 AF/day (or about 700 to 1,000 gpm in an average eight hour irrigation period). During periods of extremely high-reclaimed water generation, it may be necessary to slightly extend irrigation hours.

LETTER N: BESTOR ENGINEERS, INC.

N1: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

N2: Comment acknowledged. This comment does not raise an environmental issue that warrants a response under CEQA. No response is necessary.

N3: Comment acknowledged. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N4: Comment acknowledged. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N5: Comment acknowledged. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N6: This comment is unclear. It appears that the comment is suggesting that Mitigation Measure 4.2-4 is unnecessary since agricultural access can be maintained through the Braga property. The purpose of this mitigation measure is to ensure that potential impacts to on-going agricultural operations are minimized to the extent feasible. The mitigation measure was identified as necessary in the Agricultural Resources Report prepared by Buchanan Associates. This measure would ensure that existing access from the ramp to Highway 101 North would not be adversely impacted by the proposed project.

N7: This comment is also unclear. It appears that this comment is trying to compare the environmental effects of existing agricultural operations and the proposed project. Although agricultural activities may result in emissions of fugitive dust and particulate matter, the analysis in the Draft EIR is specific to the environmental effects associated with the proposed project. The Draft EIR clearly identifies baseline activities and then evaluates the proposed project against specific thresholds of significance developed by the MBUAPCD. This comment incorrectly assumes that all grading is limited to only 2.5 acres per day. Mitigation Measure 4.3-1 was determined to be necessary in order to minimize construction-related impacts to the extent possible. The limitation of earth disturbing activities is considered standard practice to minimize the emission of dust and particulate matter. Contrary to the suggestions of the commenter, Mitigation Measure 4.3-1 clearly contains provisions to allow increased grading as more detailed construction information is available. Since this comment generally reflects the applicant's opposition to this mitigation measure, this comment is referred to decision-makers for further consideration as part of the deliberative process.

N8: This comment requests that the requirements of Mitigation Measure 4.3-1 be clarified. Mitigation Measure 4.3-1 has been revised to reflect comments received on the Draft EIR from MBUAPCD. Please see **Section 4.0 Revisions to the Draft EIR** for more information.

N9: This comment requests that the requirements of Mitigation Measure 4.3-2 be clarified. Mitigation Measure 4.3-2 has been revised to reflect comments received on the Draft EIR from MBUAPCD. Please see **Section 4.0 Revisions to the Draft EIR** for more information.

N10: This comment contends that the proposed project cannot comply with certain provisions of Mitigation Measure 4.9-1 related to stormwater and the City's adopted Stormwater Management Plan. This comment suggests that the Stormwater Management Plan and Stormwater Master Plan do not adequately or appropriately address the Miravale III project site and offsite drainage. The requirements identified in Mitigation Measure 4.9-1 were specifically identified by the City of Soledad as necessary to address the proposed project and also ensure consistency with applicable City-wide planning efforts. To date the applicant's representatives have failed to provide sufficient information to the City to demonstrate that these requirements inadequately address the Miravale III site. This comment is noted and is referred to City decision-makers for further consideration.

N11: This comment raises specific concerns related to Mitigation Measure 4.10-4 pertaining to mitigation of project noise-related impacts. Please refer to the analysis contained in the Draft EIR and supporting technical appendix. The Draft EIR and supporting Noise Assessment clearly identify the roadway segments that will require special treatment to address potential noise-related impacts. Moreover, the comment incorrectly suggests that other area developments may contribute to this impact and therefore the project should only pay its fair share. As described in the Draft EIR and Noise Assessment, this is a project impact and this mitigation is specific to this project. Please see **Section 4.10 Noise** of the Draft EIR for more information; please also see Technical Appendix T-7 in Volume II of the Draft EIR.

N12: This comment expresses specific concerns related to Mitigation Measure 4.12-1, which requires that the proposed fire and police facilities located in Phase 2 are operational prior to the issuance of any building permit for new residential and commercial development in that phase. These facilities must be operational prior to any building of new residential or commercial structures associated with Phase 2, otherwise inadequate public facilities would be available to meet anticipated demand. This could result in inadequate response times and staffing shortages which could result in the exposure of construction personnel and future site occupants to additional hazards. This would represent a significant impact in the absence of this mitigation measure. Mitigation Measure 4.12-1 was developed in consultation with the City of Soledad Police and Fire Departments and is necessary to ensure that adequate facilities will be provided to address the needs of Phase 2 of the project. For more information please refer to **Section 4.12 Public Services and Recreation** of the Draft EIR.

N13: This comment inaccurately asserts that the School district is requiring new school facilities to serve new development in a different project area. It implies that Mitigation Measure 4.12-4 is unnecessary based on earlier correspondence from the Soledad Unified School District (SUSD) on the Notice of Preparation (NOP) for the proposed project. Although this comment correctly identifies that the SUSD had previously identified that adequate schools sites could be provide elsewhere in the community, SUSD has subsequently revised their estimates. Based on subsequent correspondence, SUSD has determined that the proposed project would need to provide two (2) additional elementary schools and a 40-acre high school. Mitigation Measure 4.12-4 is reflective of SUSD's current comments. This mitigation correctly identifies that that high school shall be operational prior to the issuance of any certificate of occupancy for Phase II. This mitigation measure does allow for additional facilities to be provided elsewhere in the community provided that those facilities are available to serve the development at the time additional capacity is necessary. For more information please refer to **Section 4.12 Public Services and Recreation** of the Draft EIR.

N14: Comment acknowledged regarding typographical error in Mitigation Measures 4.13-3 and, similarly, 4.13-4; text is revised in **Section 4.0 Revisions to the Draft EIR.**

N15: This comment contends that Mitigation Measure 4.13-2 through 4.13-9 should be revised to identify that the transportation improvements should be constructed at the time they are required, not prior to occupancy. This comment incorrectly assumes that these mitigation measures represent a general prohibition on the issuance of occupancy permits. These mitigation measures clearly state that occupancy permits shall not be issued for any new residential or commercial development that require the implementation of the improvements identified in the mitigation measures. The City will determine the timing of required road and intersection improvements for each phase of development through an adopted Development Agreement with the Project Proponent and related subdivision improvement agreements. Please see **Section 4.0 Revisions to the Draft EIR** to the extent that revisions address this comment.

N16: This comment notes that TAMC's Regional Impact Fee would address the project's regional impacts. As identified elsewhere, at the time the Draft EIR was prepared the City of Soledad had not committed to collecting the TAMC fees. Since that time, however, the City has adopted the TAMC fee. Mitigation Measures 4.13-1 through 4.13-3 have been revised. Please refer to **Section 4.0 Revisions to the Draft EIR**.

N17: This comment states that fees to cover the existing sewer plant improvements should be waived if the developer pays to construct the treatment plant within the project site. As the City will be responsible for constructing the project's wastewater treatment facility, the project's impact fees will be applied toward the project's pro-rata share of the facility cost, and fees, therefore, will not be waived. Please refer also to **Section 4.14 Utilities and Service Systems** of the Draft EIR. As identified on pages 4.14-16 through 4.14-17 of the Draft EIR, Mitigation Measure 4.14-8 is necessary in order to ensure that adequate on-site treatment capacity will be available to serve future phases of development.

N18: This comment registers applicant's opposition to Mitigation Measure 4.14-11. This measure is meant to ensure the project does not jeopardize the City's ability to adequately provide wastewater services and meet the needs of prior commitments for service. The measure is not intended to require the project to address existing City commitments; Mitigation Measure 4.14-11 has been revised for clarity. Please refer to **Section 4.0 Revisions to the Draft EIR**.

N19: Comment acknowledged regarding additional information to Section 3.1. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N20: Comment acknowledged concerning correction to the range of lot sizes identified in Section 3.3 of the Draft EIR. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N21: This comment states that the total acreage of Williamson Act properties is 108 acres, not 104.8 acres, as noted in Table 3.0-1. The Notice of Non-Renewal contained in Appendix D states that the total amount of Williamson Act land affected by this Notice is 108 acres. Table 3.0-1 has been corrected in **Section 4.0 Revisions to the Draft EIR.**

N22: Comment acknowledged regarding the project's onsite wastewater treatment facility. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N23: Comment acknowledged concerning the possible need for more than one Sphere of Influence amendment. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N24: This comment asserts s that the Draft EIR should be revised to include all of the plans sheets included as part of the vesting tentative map in order to allow for more meaningful review. The Draft EIR contains sufficient detail to allow for meaningful review. The proposed project includes a Specific Plan and Vesting Tentative Map and the Draft EIR contains detailed exhibits that show the location of the proposed project, proposed land uses and circulation system, project vicinity, tentative map, and other characteristics to allow for substantive review.

N25: This comment is unclear. The Draft EIR clearly identifies that there is an existing residential subdivision to the south of the project area.

N26: This citation and source is on page 13 of the Buchanan Associates Agricultural Report for the project. The full report is included as Appendix T-1 of the Draft EIR.

N27: Comment acknowledged. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N28: This comment relates to biological mitigation that requires that medians be prohibited in the development. This comment is addressed to the City as to whether they would consider eliminating this requirement. Refer to **Response M-12.**

N29: This comment states that site elevation ranges are between 178 to 742 feet and that gradient percentage should be 2.0% to 3.5%. The information contained in the Draft EIR is based upon

topographical data and technical reports that were submitted by the project applicant and reviewed by the EIR consultant and City of Soledad. The correct lower elevation is approximately 180 feet above sea level; this is revised in **Section 4.0 Revisions to the Draft EIR.**

N30: This comment contends that development above the 400 foot elevation contour is consistent with General Plan policies because the lots would provide more aesthetic quality and that Figure II-7 of the General Plan indicates residential use above the 400 foot contour line. As described in the Draft EIR, the proposed project would result in significant aesthetic-related impacts as a result of hillside grading and development of roads and structures. Contrary to the comment, this would not provide and/or otherwise enhance the existing aesthetic quality of the area. Moreover, the General Plan clearly states that Figure II-7 (page II-18 of the General Plan) is illustrative only, while the Land Use Diagram, which constitutes established City policy, designates the area above the 400 foot contour for open space and grazing uses.

N31: This comment contends that the landfill footprint is incorrect and that the City has a specific limit of 19 acres. The Draft EIR identified the general footprint of the former Soledad Sanitary Landfill based on records obtained from the Monterey County Environmental Health Division. Although the former landfill is located within the City boundaries, a buffer zone was established consistent with Monterey County standards. The buffer was used for primarily illustrative purposes to demonstrate that future site occupants within that portion of the site could be exposed to fugitive emissions and/or other potential hazards associated with the former landfill.

N32: Comment acknowledged. Please refer to **Response N29** for more information.

N33: This comment requests clarification regarding the responsibility of fees collected for the purposes of maintenance costs for the on-site Best Management Practices (BMPs) identified on Draft EIR page 4.8-9. See also additional information provided in Response N34.

N34: This comment requests additional clarification regarding Mitigation Measure 4.8-2. Specifically, this comment is concerned whether the maintenance will be part of an assessment to maintain facilities. As described in the Specific Plan, the project will require the formation of an assessment district that will be responsible for maintaining project infrastructure including storm drain maintenance and maintenance of other drainage facilities. This mitigation measure was identified as necessary by the City of Soledad to ensure that all facilities were properly maintained in perpetuity.

N35: This comment questions the affordability requirements of the Soledad Inclusionary Housing Ordinance, Chapter 17.41 of the Soledad Municipal Code, In order to meet the requirements of the City's Inclusionary Housing Ordinance, inclusionary housing must meet specific criteria and terms stipulated by the ordinance. Higher density housing that is intended to be affordable by design, including the "workforce housing," proposed by the Miravale III Specific Plan, would not comply with the provisions of the Inclusionary Housing Ordinance unless the affordability of such housing is ensured through enforceable restrictions governing both the price/rents of such units and the eligibility of buyers and tenants. Inclusionary housing provided pursuant to Chapter 17.41 is restricted in terms of pricing, rents and eligible income levels of buyers and renters for a 45-year term to ensure continued affordability of such housing in the community.

N36: As noted in Response N35, the proposed project will be required to adhere to the requirements of the City's Inclusionary Housing Ordinance. The determination of what constitutes "in the immediate vicinity of another inclusionary housing development" will be made by the City during the project review process. The intent of this ordinance requirement is to prevent an over-concentration of affordable housing. This comment does not raise an environmental issue under CEQA and is referred to decision-makers for further consideration as part of the deliberative process.

N37: Comment acknowledged. This portion of the Draft EIR is a synopsis of the applicant's proposed Specific Plan. This comment is addressing the merits of the design of the Specific Plan and does not raise an issue that warrants a response under CEQA. This comment is referred to decision-makers for further consideration as part of the deliberative process.

N38: This comment questions whether a 15-20 year buildout is considered reasonable. At the time the Draft EIR was prepared it was considered reasonable to assume that buildout would occur over a 15-20 year timeframe. This estimate was derived directly from the Specific Plan.

N39: This comment contends that the proposed project would result in an average density of 4.56units/acre not 10.8 as identified in the Draft EIR. Average density was calculated by dividing the total number of residential units (4,200) by the total acreage of residential land uses (approximately 387.76 acres). This equals an average residential density of approximately 10.8 units/acre of residential land use.

N40: This is a specific comment regarding General Plan Policy S-32. This does not relate to an environmental issue that requires a response under CEQA. This comment is referred to decision-makers for further consideration as part of the deliberative process.

N41: This comment states that the Draft EIR should be revised to identify that the project applicant may pay a fee for impacts related to police and fire protection services. Mitigation Measure 4.12-2 clearly identifies that the project applicant will be required to submit payment of all applicable public facility impact fees in accordance with City requirements.

N42: This comment contends that the proposed golf course facility should be considered parkland and that Mitigation 4.12-6 of the Draft EIR should be revised accordingly. This comment reflects the applicant's opinion that the golf course should be credited as parkland. Mitigation Measure 4.12-6 has been revised to indicate that the proposed project will be required to provide improved parkland at a ratio of five acres/ 1,000 residents consistent with the park dedication standard of Appendix B of the General Plan. Please refer to **Section 4.0 Revisions to the Draft EIR** for more information. This comment is referred to decision-makers for further consideration as part of the deliberative process.

N43: Comment is unclear. The reference to Section 66483 (a) of the Subdivision Map Act pertaining to the payment of storm drainage and wastewater treatment impact fees does not appear to be entirely relevant to the referenced Mitigation Measure 4.14-8, and does not raise an environmental issue under CEQA. This comment is referred to decision-makers for further consideration as part of the deliberative process.

N44: Comment acknowledged concerning the "No Golf Course" Alternative. This comment is referred to decision-makers for further consideration as part of the deliberative process. It should be noted that a "No Golf Course" alternative is not mutually exclusive of other alternatives identified by the Draft EIR and has, in fact, been combined in this FEIR with the "Buildout Consistent General Plan" as a sub-alternative. Please refer to **Section 4.0 Revisions to the Draft EIR, Section 6.0 Alternatives.**
N45: Comment unclear.

N46: Comment acknowledged concerning Williamson Act acreage. Please refer to **Section 4.0 Revisions to the Draft EIR.**

N47: This comment reflects specific concerns related to the assumptions used in the analysis prepared by RM Associates in regard to the drainage analysis prepared by Bestor Engineers, Inc. The analysis prepared by RM Associates was prepared in consultation with the City of Soledad. The SDMP has since been adopted by the City of Soledad and the proposed project will be required to comply with its requirements; otherwise, additional technical information, including but not limited to, site specific geotechnical analyses and project-level detail, will need to be submitted by the project applicant to

demonstrate that the proposed system is sufficient. The City has indicated that compliance with the 2007 SDMP would ensure that the proposed project has adequate storm drain facilities in accordance with City specifications. This comment is referred to the City for further consideration as part of the deliberative process.

N48: Figure 8 of the traffic study presents the projected trip distribution for both the residential and retail components of the proposed project. The indication of "0%" distribution in regards to the residential portion of the project indicates an area consisting primarily of existing residential land uses. Therefore, it is assumed that trips from the proposed residential units would not originate or be bound for other existing residential units within Soledad. Similarly, the retail distribution indicates "0%" for areas that consist primarily of other existing retail/commercial land uses.

N49 This comment is addressing the merits of the Specific Plan itself and does not raise an environmental issue under CEQA that warrants a response. No further response is necessary.

N50: This comment also addresses the Specific Plan itself and, as such, does not raise an environmental issue under CEQA that warrants a response. No further response is necessary.

N51: This is a comment on the merits of the Specific Plan itself and does not raise an environmental issue under CEQA that warrants a response. No further response is necessary.

N52: This comment references a number of attachments that are included as part of this comment letter. They consist of previous correspondence submitted to the City of Soledad and are part of the administrative record. These comments were previously considered by the City during the preparation of the Draft EIR and supporting technical analyses. They do not introduce any new issues that have not already been articulated by the project applicant and/or his representatives and considered by the City. For this reason, a detailed response to these attachments is not included as part of this Final EIR.

The following section provides revisions to the text of the Draft EIR, in amendment form. The revisions are listed by page number. All additions to the text are presented in underline, and all deletions are shown in ~~strikeout~~.

Table 2-1, Summary of Significant Environmental Impacts and Mitigation, pages is revised as follows:

Under Introduction, Section 1.0, Page 1-1, the third paragraph is revised as follows:

This EIR addresses implementation of Miravale III Specific Plan and Vesting Tentative Map on 920-acres located within unincorporated lands of Monterey County on the northern edge of the City of Soledad. Full implementation of the Miravale III Specific Plan allows for mixed-use development consisting of approximately 1,470 single-family residential units, 2,730 duplex and multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. The project also proposes three school sites (two elementary schools and one middle school), a fire and police substation, a recycled water plant,[2] and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system. The project proposes sphere of influence amendments and annexation by the City of Soledad from the County of Monterey and future subdivision of the site. The project site is located generally between San Vicente Road and Orchard Lane, and is surrounded by agricultural land to the north and ~~east~~ west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the ~~west~~ east.

Under Project Description, Section 3.1, Page 3.0-2, is revised as follows:

"3.1 PROJECT LOCATION

The project is located within unincorporated lands of Monterey County on the northern edge of the City of Soledad, approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of the San Francisco Bay Area (refer to Figure 3-2). The 920-acre project site is generally between San Vicente Road and Orchard Lane and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east. (Refer to Figure 3-3). The Assessor's Parcel Numbers are: 417-151-082, 417-151-083, 417-151-084, 417-151-085, 257-081-005, 257-081-026, 257-081-027, and 257-081-032.

The project site consists primarily of undeveloped land. The site's topography is comprised of a natural slope from the southwest corner of the site to the northeast with steeper slopes located at the eastern boundary. The majority of the site ranges in elevation between approximately 180 and 600 feet above mean sea level. The site generally drains to the southwest toward Miravale Road and a large detention basin is proposed at the golf practice range just south. Several small drainages occur in the eastern and western portions of the site. Site vegetation can be characterized primarily with areas of open annual grassland and minimal trees. Existing trees are located near two single family homes, and a row of eucalyptus trees line one side of San Vicente Road. In addition, there is an existing high voltage transmission line that is located adjacent to San Vicente Road."

[2] The proposed recycled water plant is also referred to as a "scalping plant" in other City documents, but for the purposes of this EIR it is referred to as a "recycled water plant."

Under Project Description, Section 3.3, Page 3.0-3, is revised as follows:

"Single Family Residential (M3 – R-1)

Single Family Residential zones occur on approximately 241 acres of the Plan area. These low density areas are located throughout the project site. A total of 1,470 units are proposed within this designation, at a density of approximately one to six dwelling units per acre. The single-family residential development will include a mix of architectural styles, lot sizes, and structure heights. Lot sizes range from ~~6,000~~ 5,000 square feet to ~~30,000~~ 55,000 square feet (for hillside homes)."

Under Project Description, Section 3.3, Page 3.0-6, is revised as follows:

"Sanitary Sewer System

The City of Soledad is responsible for treatment and disposal of wastewater for the project area. The sanitary sewer collection system is also operated and maintained by the City. Buildout of the project would generate approximately 1,579,500 gallons per day of wastewater. The existing treatment plant will need to be enlarged and improved to accommodate projected growth. These upgrades are scheduled to be completed by the end of 2010. Sanitary sewer lines will be located within the proposed street right-of-ways and connect to the existing sanitary sewer lines that serve the City. As proposed, project generated wastewater demands will be accommodated through an on-site reclamation plant, which will supplement the City's existing wastewater treatment system. The sanitary sewer system is evaluated in **Section 4.14 Utilities and Service Systems**."

Under Project Description, Section 3.3, Table 3.0-1, Page 3.0-4, is revised as follows:

First Column – Land Use
"Urban Reserve – ~~84.8~~ 88 acres"

Third Column – Acres
"Williamson Act Properties: ~~104.8~~ 108"

Under Project Description, Section 3.3, Page 3.0-7, final bullet under "Project Implementation" sub-section, is revised as follows:

- **"**Application for ~~a~~ one or more Sphere of Influence amendments and subsequent Annexations approvals from LAFCO of Monterey County."

Under Project Description, Section 3.0, Page 3.0-9, tenth bullet, is revised as follows:

- "Monterey County Local Agency Formation Commission (LAFCO) for the approval of sphere of influence amendment and annexation required for development within the incorporated limits of the City. This required LAFCO approval would include detachment of Miravale III from the Mission Soledad Rural Fire Protection District and the Resource Conservation District of Monterey County."

Under Project Description, Section 3.0, Page 3.0-9, the following bullet is added after bullet 11, is revised as follows:

- "Tax transfer agreement with the County of Monterey pursuant to the requirements of Revenue and Taxation Code Section 99."

Under Aesthetics, Section 4.1, Page 4.1-2, is revised as follows:

"Regulatory Environment

City of Soledad General Plan

The Land Use and Conservation/Open Space Elements of the General Plan guide the City's future physical and spatial form, and appearance. Numerous goals and policies of the General Plan are intended to protect the visual character of the City and surrounding scenic resources. The following aesthetic and visual resource policies apply to development within the project area.

Policy L-45 The City shall require all new development to be planned and designed in a manner which employs design, construction and maintenance techniques that:

a. Avoids locating structures along ridgelines and steep slopes.
b. Incorporates design and screening measures to minimize the visibility of structures and graded areas.
c. Maintains the character and visual quality of the area.

Policy C/OS-7 The City shall require new public and private development to protect scenic resources by:

a. Prohibiting structures along ridgelines, steep slopes (above the 400 foot elevation contour), or in other highly visible locations unless no practical alternative is available, or such a location is necessary to protect public health and safety;
b. Utilizing natural landforms and vegetation for screening structures, access roads, building foundations, and cut and fill slopes;
c. Requiring landscaping which provides a landscape transition between development areas and adjacent open space or undeveloped areas; and is compatible with the scenic resources being protected;
d. Incorporating sound Soil Conservation Service practices and minimizing land alterations. Land alterations shall be minimized by: keeping cuts and fills to a minimum; limiting grading to the smallest practical area of land; limiting land exposure to the shortest practical amount of time; replanting graded areas to ensure establishment of plant cover before the next rainy season; and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur;
e. Designing roads, parking, and utilities to minimize visual impacts. If possible, utilities shall be underground. Roadways and parking shall fit the natural terrain; and
f. Designing projects to fit the sites scale and character. Structures shall be designed and located so: they do no silhouette against ridgeline, or hilltops; roof lines and veridical architectural features blend with and do not detract from the natural background or ridge outline; residential density and massing is decreased with increased elevation where it would mar the scenic quality of the scenic resources; they fit the natural terrain, and they utilize building materials, colors, and textures that blend with the natural landscape and avoid the creation of high-contracts situations."

Under Aesthetics, Section 4.1, Page 4.1-8 through 4.1-9, are revised as follows:

"Scenic Vista

The project site currently consists of relatively undeveloped agricultural and grazing lands. The highly visible foothills of the Gabilan Mountain Range are located on the eastern edge of the project site and serve as a dramatic backdrop to the flat valley land below. The City's General Plan recognizes the scenic value of these foothills and contains numerous policies to protect this scenic resource by limiting new

development below the 400 foot elevation contour. Moreover, according to the General Plan EIR, policies prohibiting development above the 400 foot elevation contour were identified as mitigation measures to ensure that adverse impacts to scenic resources, including the Gabilan Mountain Range, were minimized to the extent feasible. These measures were incorporated as part of the City's General Plan in order to ensure the preservation of the City's unique scenic resources. Due to the relative importance of the Gabilan Mountain Range, development above the 400 foot contour would constitute a potentially significant impact. Therefore, for the purposes of this analysis, these foothills are considered a scenic vista and development above the 400 foot elevation contour would constitute ridgeline development and thereby a significant impact. Development above the 400 foot elevation contour would conflict with several General Plan policies, including but not limited to L-45, C/OS-7, C/OS-8, and C/OS-9. For a detailed evaluation of the proposed project's consistency with applicable General Plan policies please refer to Table 4.9-2."

Under Aesthetics, Section 4.1, Page 4.1-14, Mitigation Measure 4.1-11, is revised as follows:

"4.1-11 Final design plans for proposed residential development shall include form, scale, and character elements which emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks. Prior to the issuance of any building permit for residential development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad. All residential development within the Specific Plan area shall be subject to a conditional use or design-review process as administered by the City of Soledad."

Under Aesthetics, Section 4.1, Page 4.1-15, Mitigation Measure 4.1-14, is revised as follows:

"4.1-15 Ornamental lighting use for streets, parks, public open spaces, trails, bike paths, parking lots, and walkways shall utilize fixtures consisting of metal halide with full cut-off luminaries or other form of similar fixtures in order to control light and glare. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-~~12~~ 14, demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department."

Under Agricultural Resources, Section 4.2, Page 4.2-6, under "Cortese-Knox Capability Classification", add the following text:

"Cortese-Knox Capability Classification. Three of the four criteria above apply to classifying prime lands within the project site. Approximately 500 acres meet criterion #1 exclusively, approximately 430 acres meet criterion #3, and the total potentially irrigated land area of 760 acres (actively cropped plus recently fallowed) could meet criterion #4. Therefore, the vast majority of the project site can meet one of the criteria under the definition for classification under Cortese-Knox. It should be noted that the City General Plan EIR also provides an assessment of land in and around Soledad and acknowledges that almost all of the soils surrounding the urban area of the City meets at least one of these qualifications and, therefore, can be considered prime agricultural land with the exceptions of GhC (Gloria sandy loam 2 to 9 percent slopes) and Xb (Xerorthents, sandy)."

Under Agricultural Resources, Section 4.2, Page 4.2-14 through 4.2-15, Mitigation Measures 4.2-1, 4.2-2, and 4.2-3, are revised as follows:

"4.2-1 Adequate buffer areas between urban and agricultural uses, including a minimum 50 foot buffer along the northern and eastern boundary of the project site and a –200 foot buffer along the western boundary, shall be incorporated into the proposed project. These buffers shall also be

supplemented with physical barriers in areas where residential and commercial structures are to be located, as recommended by the Agricultural Resources Report contained in Appendix T-1. The 200 foot buffer along the project's western boundary may be reduced upon demonstration to the satisfaction of the City that other measures, including those recommended in Mitigation Measure 4.2-2, will adequately protect human health and safety and minimize potential conflicts, and provided that any such reduction shall not result in a buffer width of less than 100 feet. The County of Monterey Agricultural Commissioner shall be consulted regarding the adequacy of the proposed buffers and physical barriers and evidence of said consultation and recommendation shall be submitted to the City prior to approval of the tentative map. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report, subject to the review and approval of the City of Soledad. All agricultural buffers, excluding public right-of-ways, shall be maintained by the Project Proponent and/or his/her successor(s) in interest through easements dedicated to the City or other entity until such time that the adjoining agricultural operation and use no longer exists.

4.2-2 In order to ensure the adequacy of the ~~proposed 60'~~ agricultural buffer located along the western boundary of the project site, as required by Mitigation Measure 4.2-1, the project applicant shall submit a detailed landscape plan that includes vegetative screening in addition to physical barriers, such as fences, walls or similar structures, to protect human health and safety. One or more of the following options may also be used in combination with landscaping requirements to create an ~~60-foot~~ adequate buffer between the agricultural parcel property line and habitable structures within the Plan area:

a. Public or private road right-of-ways;
b. Landscaped islands and planting areas;
c. Recreational trail corridors; and/or
d. Placing dwellings in the rear portion of lots.

Prior to the recordation of any final map along the western project boundary, the ~~an~~ agricultural buffer ~~setback~~ and any related easement shall be delineated on the final map, subject to the review and approval of the City of Soledad.

4.2-3 Prior to the issuance of any certificate of occupancy for residences adjacent or in close proximity to the agricultural buffer ~~to on-going agricultural uses~~ on along the western project boundary, the project applicant shall provide documentation demonstrating that adequate screening, landscaping, and structural improvements have been installed and/or constructed within the ~~60' agricultural~~ buffer, subject to the review and approval of the City of Soledad."

Under Air Quality, Section 4.3, Page 4.3-2, the fourth paragraph is revised as follows:

"The project site is located east of Highway 101 ~~on the eastern border~~ to the north and west of the City of Soledad, about 35 miles southeast of Monterey Bay, and about 25 miles south of Salinas. Winds from the northwest are most common in Soledad and the rest of the Salinas Valley. In general, wind flow is aligned along the valley orientation. In the winter, winds tend to flow down the Salinas Valley from the southeast toward Monterey Bay, averaging about 2.6 miles per hour (mph). In the spring, winds tend to blow from the west (on-shore) averaging about 6.5 mph. In the fall, winds flow from the southeast during the night, and switch to the west and northwest by about 10 a.m., and average about 2.4 mph.[3] Rainfall in the area averages about 13.4 inches per year, with almost all substantial precipitation occurring between November and April. The presence or absence of winter storms and rainfall affect dust generation on

[3] *California Surface Wind Climatology,* California Air Resources Board, Modeling and Meteorology Branch, June 1989.

plowed fields, wildfires, and other factors influencing local air quality. Temperatures are generally mild, with little winter frost, and summer maxima rarely exceeding 100 F."

Under Air Quality, Section 4.3, Page 4.3-16, Mitigation Measures 4.3-1, is revised as follows:

"4.3-1 Prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall, at a minimum, include the following measures:

- Limit grading activity to a maximum of 2.5 acres daily. As more detailed construction information becomes available, emissions from grading activities could be reassessed to determine if the area of grading could be increased. Such an assessment would have to be conducted using appropriate assumptions and mitigation measures.
- Water all active construction areas at least twice daily and more often during windy periods. Active areas adjacent to existing businesses should be kept damp at all times. If necessary, during windy periods, watering is to occur on all days of the week regardless of onsite activities.
- Cover all trucks hauling <u>dirt, sand, or loose materials.</u> ~~trucks or maintain at least two feet of freeboard.~~
- <u>Haul trucks shall maintain at least 2'0" of freeboard.</u>
- <u>Plant tree windbreaks on the windward perimeter of construction project if adjacent to open land.</u>
- <u>Install wheel washers at the entrance to construction sites for all exiting trucks.</u>
- <u>Pave all roads at construction sites.</u>
- Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.
- Sweep daily all paved access roads, parking areas and staging areas at construction sites.
- Sweep streets daily if visible soil material is deposited onto the adjacent roads.
- Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more).
- Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles.
- Limit traffic speeds on unpaved roads to 15 mph.
- Replant vegetation in disturbed areas as quickly as possible.
- Suspend excavation and grading activity when hourly-average winds exceed 15 mph and visible dust clouds cannot be contained within the site."

Under Air Quality, Section 4.3, Page 4.3-17 through 4.3-18, Mitigation Measures 4.3-2, is revised as follows:

"4.3- 2 Projects developed under the specific plan ~~should~~ <u>shall</u> be evaluated for individual construction period air quality impacts. Project-specific mitigation measures ~~would~~ <u>shall</u> be identified at that time <u>to reduce impacts to a less-than-significant level, if feasible</u>. However, the following ~~mitigation measures~~ ~~should~~ <u>shall</u> be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment:

- <u>The following equipment may be used without control devices or additional mitigation measures without causing acute adverse health effects:</u>
  - <u>No engineers greater than 750HP are used; and</u>
  - <u>Engines between 501 HP and 750 HP are model years 2002 and newer; and</u>

- Engines between 251 HP and 500 HP are model years 1996 or newer; and
- Engines between 175 HP and 250 HP are model years 1985 or newer.

- The following equipment may be used without causing acute adverse health effects, if retrofitted with a catalyzed diesel particulate filter (CDPF):
  - Engines greater than 750 HP; if model year 2006 and newer; and
  - All engines less than 749HP, regardless of model year.
- If construction equipment uses B99 biodiesel, no acute adverse health effect would be expected in the following:
  - Engines between 501 HP and 750 HP, if model years 2002 or newer; and
  - Engines between 250 HP and 500 HP, if model years 1996 and newer; and
  - Any engine less than 250 HP.
- ~~All off-road construction vehicles/equipment greater than 100 horsepower that will be used on site for more than one week shall: 1) be manufactured during or after 1996, and 2) shall meet the NOx emissions standard of 6.9 grams per brake horsepower hour. Alternatively, the project shall implement a combination of the following emission reduction measures on some or all of the above described vehicles equipment, subject to approval by the MBUAPCD:~~
  - ~~Use alternative fuels (such as biodiesel blends),~~
  - ~~Require diesel particulate matter filters on equipment,~~
  - ~~Require diesel oxidation catalyst on equipment.~~
- ~~The contractor shall install temporary electrical service whenever possible to avoid the need for independently powered equipment (e.g. compressors).~~
- ~~Diesel equipment standing idle for more than five minutes shall be turned off. This would include trucks waiting to deliver or receive soil, aggregate or other bulk materials. Rotating drum concrete trucks could keep their engines running continuously as long as they were onsite and staged away from residential areas.~~
- ~~Properly tune and maintain equipment for low emissions.~~
- ~~Stage large diesel powered equipment at least 200 feet from any active land uses (e.g., residences).~~
- ~~Limit the pieces of equipment used at any one time.~~
- ~~Minimize the use of diesel powered equipment (i.e., wheeled tractor, wheeled loader, roller) by using gasoline-powered equipment.~~
- ~~Limit the daily hours of operation for heavy-duty equipment."~~

Under Air Quality, Section 4.3, Page 4.3-18, is revised as follows:

"Regional Pollutants

The Specific Plan proposes development of 1,470 single-family residences and 2,730 multi-family residences, in addition 120-room hotel, 275,000 square feet of retail, an 18-hole golf course as well as schools and parks. The project's traffic analysis forecasts that the Miravale III specific plan would generate about 35,504 daily vehicle trips. Emissions from these trips would affect regional air quality in terms of contributing to possible exceedances of ambient air quality standards for ozone. Direct and indirect emissions from each phase of the proposed specific plan were calculated using the latest available version of the URBEMIS model (i.e., URBEMIS 2007 ver. 9.2.2) distributed by Rimpo Associates through www.urbemis.com and the updated model template provided through the MBUAPCD website. Specific Plan related emissions were calculated by phase in accordance with the proposed phasing schedule, because the entire project site is too large for URBEMIS to accurately estimate emissions."

Under Air Quality, Section 4.3, Page 4.3-20, Mitigation Measure 4.3-3, is revised and new Mitigation Measures 4.3-4, 4.3-5 and 4.3-6 are added as follows:

~~4.3-3 The project shall apply the following measure to the extent appropriate for the specific land uses proposed:~~

- ~~Develop a Transportation Demand Management Program with the intent of reducing vehicle trips and vehicle miles traveled associated with build out of the specific plan. Components of this plan may include:~~
  - ~~Develop parking strategies for commercial and retail uses that reduce single occupant vehicle trips.~~
  - ~~Provide bicycle storage/parking facilities.~~
  - ~~Provide shower/locker facilities in light industries and office uses.~~
  - ~~Provide onsite or near site child care centers for large employment centers.~~
  - ~~Develop park-and-ride lots.~~
  - ~~Provide opportunities to include or increase transit service to plan area.~~
- ~~Include plans to incorporate safe and efficient modes of bicycle and pedestrian transportation. Bicycle routes and pedestrian paths should include amenities such as signs and traffic signal activation (e.g., loop activators).~~
- ~~Identify energy efficiency goals for new developments that would conserve energy beyond requirements of the State Title 24 building code.~~
- ~~Provide exterior electrical outlets on new buildings that encourage use of electrical landscape equipment.~~
- ~~Prohibit open wood burning stoves or fireplaces in new residences unless they are EPA certified wood heaters that meet EPA's particulates matter emission standard of 7.5 grams per hour.~~

4.3-3. In order to reduce greenhouse gas (GHG) and regional air pollutants and precursors (criteria air pollutants or CAPs) emissions to the extent feasible, the applicant/project proponent shall prepare and submit a GHG and CAP Reduction Plan (GCRP) concurrent with submittal of any revised Tentative Map under the Specific Plan or any Site Plan that differs from the Specific Plan as described in this EIR. The GCRP shall include a description of the measures that are proposed to be implemented by that phase of the project, including one or more of the measures contained in Appendix __ of this Final EIR. The plan shall be approved by the City prior to construction of structures and site improvements, including but not limited to, determination of substantial conformance, building permits, and grading permits. For each of the measures not included, the applicant shall describe why the measure was not included. The GCRP shall present estimated reductions in GHGs and CAPs based on available information source.

No certificate of occupancy for any phase, or portion thereof, of the project shall be granted until all of the feasible, applicable measures have been implemented by the applicant/project proponent. The proponent shall demonstrate that measures that must be implemented throughout the life of the project are included in all applicable CC&Rs, property deeds, commercial center rules and regulations, and draft tenant lease agreements.

4.3-4 Fireplaces and stoves shall be gas-fired and meet U.S. Environmental Protection Agency certification requirements. The installation or operation of a wood-burning fireplace or a wood-burning stove shall be prohibited in perpetuity on all residential properties in the Miravale III Specific Plan Development. This restrictive covenant shall be recorded on the title of all parcels in the Miravale III Specific Plan area and shall run with the land.

4.3-5 Projects developed under the Specific Plan shall facilitate transit service to the plan area by providing the necessary bus shelters and turn-outs to serve each development phase as recommended by the Monterey-Salinas Transit District, subject to approval by the City. Any tentative map or development plan and related improvement plans submitted pursuant to the adopted Specific Plan shall clearly denote the locations and design specifications for such facilities.

4.3-6 Projects developed under the Specific Plan shall adhere to the most current standards of the California Building Code concerning energy efficient construction and buildings, as may be updated and amended periodically, pertaining to reduction of air quality impacts and greenhouse gas emissions. In those instances where the City may have adopted standards that are more exacting than those of the State, the City's standards shall apply."

The measures described above and in **Appendix F-1** of this Final EIR (Appendix F-1 - Greenhouse Gas and Criteria Air Pollutant Reduction Plan Requirements) would reduce emissions of greenhouse gases and ozone precursors; however, the effectiveness and adequacy of these measures for this proposed project are unknown, precluding definitive quantification of emission reductions. Therefore, the significance of the impact related to ozone precursors and GHG emissions with implementation of the above mitigation is considered to be significant and unavoidable.

Under Biological Resources, Section 4.4, Page 4.4-1, after "Introduction," the following sections are added:

"**Methods**

Special-status Species

The project site was surveyed for special-status plant and wildlife species, and appropriate habitat for these species. Special-status species are those plants and animals that have been formally Listed or Proposed as Endangered or Threatened, or are Candidates for such listing under the federal Endangered Species Act (ESA) or the California Endangered Species Act (CESA). Listed and Proposed species are afforded protection under these acts. Plants on the California Native Plant Society (CNPS) lists 1A, 1B, and 2 are also treated as special-status species, as well as CDFG species of special concern. Species of special concern are those that face extirpation in California if current trends continue. Although they have no special legal status, these species (and federal species of concern) are given management consideration whenever possible. Impacts to these species may be considered significant according to the California Environmental Quality Act (CEQA).

In order to determine which special-status species are known or have the potential to occur in the proposed Miravale III project area, California Natural Diversity Data Base (CNDDB) occurrence records for the Soledad quad and all surrounding quads (9 quads total) were reviewed. In addition, the United States Fish and Wildlife Service (USFWS) list of federally protected species known to occur in the County was reviewed. DD&A also contacts other knowledgeable biologists familiar with the region for any additional occurrence information that may not appear in the CNDDB. From these sources, combined with personal knowledge and experience, a list of special-status plant and wildlife species known, or with the potential to occur, in the vicinity of the project site was compiled. Appendix F lists these species along with their legal status, habitat requirements, and a brief statement of the likelihood to occur.

Sensitive Habitats

The project site was surveyed for sensitive habitats. Sensitive habitats include riparian corridors, wetlands, habitats for legally protected species and California Department of Fish and Game (CDFG)

species of special concern, areas of high biological diversity, areas providing important wildlife habitat, and unusual or regionally restricted habitat types. Habitat types considered sensitive include those protected on the CNDDB's working list of "high priority" habitats (i.e. those habitats that are rare or endangered within the borders of California) (Holland 1986; CDFG 1997) and those that are Critical Habitat in accordance with the Endangered Species Act.

Botany

Also reviewed were habitat and distribution information in local and state floras (Howitt and Howell 1964, 1973; Munz and Keck 1973; Hickman 1993; Matthews 1997). Current status information for plant species protected as Threatened or Endangered under the federal ESA and for federal Proposed and Candidate species was obtained from USFWS (2007). The CNPS Inventory (Tibor 2002) was reviewed to identify species on CNPS Lists 1 and 2.

The plants present within the project site were surveyed on July 28, 2006. The entire project site was surveyed for botanical resources following the applicable guidelines outlined in *Guidelines for Conducting and Reporting Botanical Inventories for Federally listed, Proposed and Candidate Plants* prepared by the USFWS (January 2000), *Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened, and Endangered Plants and Natural Communities prepared by CDFG* (revised May 8, 2000), and *CNPS Botanical Survey Guidelines* prepared by the California Native Plant Society (revised June 2, 2001). All plant species were identified to the intraspecific taxon necessary to exclude them as being special-status using keys and descriptions in Hickman (1993) and Matthews (1997). Scientific nomenclature for plants in this report follows Hickman (1993); common names follow Matthews (1997). A list of plants observed within the project area is included in Appendix G of the Biological Assessment (Appendix T-3 of the Draft EIR).

Habitats within the project site were characterized during field surveying. Data was recorded on physiognomy of the vegetation and on dominant and characteristic species, as well as basic ecological factors, including topography, slope, aspect, soil type, hydrologic regime, and evident disturbance. The generalized vegetation classification schemes for California of Holland (1986) and Sawyer and Keeler-Wolf (1995) were consulted in classifying the vegetation of the project site. The final classification and characterization of the vegetation of the project site is based on field observations.

Wildlife

A focused review of literature and data sources was conducted in order to determine which special-status wildlife species have potential to occur at the proposed project site, and field surveys were conducted on several occasions. Current agency status information was obtained from USFWS (2007) for species protected as Threatened or Endangered, as well as Proposed and Candidate species for listing, under the federal ESA. Agency status information was obtained from CDFG (2007) for species protected as threatened or endangered by the state of California under the CESA, or protected as "species of special concern" by CDFG. In addition, the following literature and data sources are standard reference used in document preparation: CDFG reports on special-status wildlife (Remsen 1978; Williams 1986; Jennings and Hayes 1994; Thelander 1994); California Wildlife Habitat Relationships (CWHR) species-habitat models (Zeiner et. al. 1988, 1990a, 1990b); as well as general wildlife references (Stebbins 1985 and 2003, Peterson, 1990, Sibley 2002, etc.). A list of all special-status species reported to occur in the vicinity of the project site was compiled by review of the CNDDB (within the Soledad quad or any surrounding quad) and USFWS species-list, is presented in Appendix F. A list of all wildlife species observed within project boundaries is included as Appendix H of Appendix T-3.

Surveying Personnel

DD&A was contracted to assess the potential presence of special-status plants, animals, and/or habitats within the proposed Miravale III residential development in the City of Soledad, CA. Prior to conducting the site assessment, DD&A reviewed all available site plans and created a GIS figure presenting all California Natural Diversity Database (CNDDB) reported occurrences of special-status species within 10 kilometers of the project site.

David Keegan, DD&A Senior Wildlife Biologist, conducted an initial site visit on July, 19, 2006, with the project engineer (Jim Wurtz, Bestor Engineers), and was onsite between approximately 1000-1300 hours (note: other DD&A staff present included Brett Becker, Tyler Potter, and Elizabeth Guzman). David Keegan and Josh Harwayne, DD&A Senior Environmental Scientists, conducted a site review on July 28, 2006, and were onsite between approximately 1000-1500 hours; a preliminary wetland assessment was completed. As the proposed development site is relatively large (920-acres), the site was reviewed via meandering transects. All data were recorded on site plans and/or aerials and in "Rite-in-the-rain" notebooks. Site photographs were recorded using a digital camera.

DD&A contracted Don Roberson (noted Monterey Bay Ornithologist) to assess the "reservoir" portion of the Miravale III site for the potential presence of nesting bank swallows *(Riparia riparia)*. David Keegan and Don Roberson visited the site on August 10, 2006, for approximately 2.5 hours.

DD&A contracted Mark Allaback (Wildlife Biologist) and David Laabs (Wildlife Biologist) of Biosearch to prepare studies on a number of species, including: presence/absence of the Salinas pocket mouse *(Perognathus inornatus psammolphilus*) via a small mammal trapping study (Appendix B of Appendix T-3); preparation of a San Joaquin Kit Fox *(Vulpes macrotis mutica*) Early Evaluation Report for USFWS review (Appendix C of Appendix T-3); California tiger salamander Habitat Assessment Report (Appendix D of Appendix T-3); and, Protocol-level Western burrowing owl *(Athene cunicularia*) surveys at the site (Appendix F of Appendix T-3). Small mammal trapping and San Joaquin Kit fox habitat evaluation occurred August 28-September 1, 2006. David Keegan, Mark Allaback, and David Laabs were onsite together on August 28, 2006 from 1800-2100 hours to design and initiate the study. David Keegan baited the traps on August 29 and 30th, 2006, requiring approximately 3 hours just before sunset each evening (1700-2000 hours per visit). David Keegan and David Laabs checked and closed the traps during 0700-1000 hours on August 30th and 31th, 2006. David Laabs and Mark Allaback checked and closed the traps during 0700-1000 hours on September 1, 2006, then discontinued the study and removed all associated materials. See Appendix B for additional information. The site visits conducted in the course of the small mammal trapping were sufficient to prepare the SJKF Early Evaluation Report for USFWS (see Appendix C of Appendix T-3).

David Laabs conducted an additional site visit on October 17, 2006, to assess all onsite aquatic basins for the potential presence of California tiger salamander (*Ambystoma californiense*, CTS), and was onsite approximately 3 hours (Appendix C of Appendix T-3). Based on the USFWS review of the habitat assessment, protocol-level surveys for this species were initiated by David Keegan on May 8, 2007 (initial round of aquatic sampling at each basin); DD&A biologists were onsite for approximately 5 hours. A second round of aquatic sampling occurred on May 24, 2007; DD&A biologists were onsite for approximately 5 hours. The third round occurred on June 12, 2007; DD&A biologists were onsite for approximately 5 hours. DD&A biologists completed a fourth sampling event at the onsite reservoir on June 26, 2007 to capture CTS larvae and/or paedomorphs and to collect tissue from each individual for genetic analysis at the Shaffer Lab (U.C. Davis). Mark Allaback was also present on June 12, 2007.

The first non-breeding season burrowing owl survey was conducted on January 18, 2007; DD&A and Biosearch biologists were onsite for approximately 4 hours. The second survey was conducted January 31, 2007; DD&A and Biosearch biologists were onsite for approximately 4 hours. The first breeding season survey (third survey total) was conducted on June 26, 2007; biologists were onsite for approximately 4 hours. The second and final breeding season survey was completed on July 11, 2007; biologists were onsite for approximately 4 hours. DD&A and Biosearch biologists were onsite for

approximately 4 hours for the final survey, with an additional 7 hours dedicated to mapping ground squirrel burrow clusters present sporadically throughout the site. The results of these surveys are presented in Appendix F of Appendix T-3."

Biological Resources, Section 4.4, Page 4.4-2, under "State Laws and Regulations," under California Endangered Species Act, the following text is added:

"Sections 2081(b) and (c) of the California Endangered Species Act allow the Department to issue an incidental take permit for a State listed threatened and endangered species only if specific criteria are met. These criteria are reiterated in Title 14 CCR, Sections 783.4(a) and (b), and are as follows:

1. The authorized take is incidental to an otherwise lawful activity;
2. The impacts of the authorized take are minimized and fully mitigated;
3. The measures required to minimize and fully mitigate the impacts of the authorized take: a. are roughly proportional in extent to the impact of the taking on the species, b. maintain the applicant's objectives to the greatest extent possible, and c. are capable of successful implementation;
4. Adequate funding is provided to implement the required minimization and mitigation measures and to monitor compliance with and the effectiveness of the measures; and
5. Issuance of the permit will not jeopardize the continued existence of a State-listed species.

The terms and conditions of the permit will be determined by the CDFG and must ensure that the issuance criteria in items 1 through 5 above are met. Measures to minimize the take of species covered by the permit and to mitigate the impacts caused by the take are outlined in a mitigation plan and submitted as part of the permit.

California Environmental Quality Act (CEQA) and CESA Authority: The CDFG has commented that the Department is a Trustee Agency with the responsibility under CEQA for commenting on projects that could impact fish and wildlife resources, including plants. Pursuant to Fish and Game Code Section 1802, the Department has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. As a Trustee Agency for fish and wildlife resources, the Department is responsible for providing, as available, biological expertise to review and comment on environmental documents and impacts arising from project activities, as those terms are used under CEQA. The Department is a Responsible Agency when a subsequent permit or other type of discretionary approval is required from the Department, such as an Incidental Take Permit, pursuant to CESA, or a Lake or Streambed Alteration Agreement, issued under Fish and Game Code Section 1600 et seq."

The CDFG's issuance of an Incidental Take Permit is also considered a "project" subject to CEQA (CEQA Guidelines Section 15378). The CDFG typically relies on the Lead Agency's CEQA compliance to make findings, pursuant to CEQA Guidelines Section 15091. A Statement of Overriding Considerations for significant State-listed species impacts will not legally support State Incidental Take Permit issuance."

Biological Resources, Section 4.4, Page 4.4-3, under "California Fish and Game Code," the following text is revised:

"CDFG has jurisdiction over the bed and bank of natural drainages according to provisions of Section 1601 and 1603 of the California Fish and Game Code. Activities that would disturb these drainages are regulated by CDFG via a Lake or Streambed Alteration Agreement (LSAA). Such an agreement typically stipulates certain measures that will protect the habitat values of the hydrologic feature being impacted.

The Fish and Game Code (Section 1602) requires an entity to notify the CDFG of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state or local government agency, or public utility that proposes an activity that will:

- substantially divert or obstruct the natural flow of any river, stream or lake;
- substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake; or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

The notification requirement applies to any work undertaken in or near a river, stream, or lake that flows at least intermittently through a bed or channel. This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water. After the CDFG receives a complete notification package, it will determine whether you will need a LSAA for your activity. An Agreement will be required if the activity could substantially adversely affect an existing fish and wildlife resource. The Agreement includes reasonable conditions necessary to protect those resources and must comply with the California Environmental Quality Act (CEQA). The entity may proceed with the activity in accordance with the final Agreement.

The CDFG's issuance of a LSAA is also considered a "project" subject to CEQA (CEQA Guidelines Section 15378). The CDFG typically relies on the Lead Agency's CEQA compliance to make findings, pursuant to CEQA Guidelines Section 15091. A Statement of Overriding Considerations for significant State-listed species impacts will not legally support the issuance of a LSAA."

Under Biological Resources, Section 4.4, Page 4.4-6 under "Sensitive Habitats," the second paragraph is revised as follows:

"No wetland delineations were undertaken at the Miravale III project site, but a wetland assessment was completed that documented the presence of fringe wetlands. A small vegetated fringe wetland exists adjacent to the onsite reservoir. In addition, fringe wetlands are associated with the agricultural basins to the east of San Vicente Road. A total of approximately 0.17 acres of fringe wetlands of marginal habitat value were documented on site. Please note that these types of fringe wetlands are not typically USACOE jurisdictional given current regulations regarding Section 404 of the Clean Water Act. Moreover, existing on-site wetlands are not hydrologically or geographically linked with other bodies of water or jurisdictional wetlands and are therefore not considered jurisdictional for the purposes of this analysis. Although only the USACOE can determine whether on-site wetlands are considered jurisdictional, the onsite fringe wetlands are not considered to be jurisdictional for the purposes of this analysis for the reason provided above. Additionally, this project may require a LSAA for the filling of the on-site reservoir. Impacts to these areas would also be regulated by ESA and CESA if any federal or state listed or special-status wildlife species utilize these areas as breeding habitat."

Under Biological Resources, Section 4.4, Page 4.4-10 under "Special-Status Plant Species," the text is revised as follows:

"Special-status Plant Species

The CNDDB reports an occurrence of robust spineflower (*Chorizanthe robusta* var. *robusta*) approximately 2 km south of the project site. In addition, the CNDDB reports occurrences of Congdon's tarplant (*Centromadia parryi* ssp. *congdonii*), Indian valley bush mallow (*Malacothamnus aboriginum*), and Gabilan Mountains manzanita (*Arctostaphylos gabilanensis*) within 5 miles of the project site. The CNDDB also reports that Monterey spineflower (*Chorizanthe pungens* var. *pungens*) critical habitat is present within 2 km of the project site. Jolon's clarkia (*Clarkia jolonensis*) has been reported to occur within 1.25 miles of the project site. However, appropriate habitat does not exist on site to support any of these species (please refer to Appendix F, Table of Special-status Species Potentially Present in the

Project Vicinity). Lemmon's jewelflower (*Caulanthus coulteri* var. l*emmonii*) is known to occur approximately 10 miles from the project site, and marginally appropriate habitat occurs in the mixed grassland and rocky outcrop habitats. ~~Jolon's clarkia (*Clarkia jolonensis*) has been reported to occur within 1.25 miles of the project site.~~ The CNDDB does not report the presence of any special-status plant species within or immediately adjacent to the proposed project boundaries and none were identified by DD&A biologists during the botanical survey on July 28, 2006 ~~any of the site visits~~. Therefore, ~~T~~the only plant species with the potential to occur within the project boundaries, Lemmon's jewelflower, is discussed below. Please note that no other special-status plant species are anticipated within project boundaries for the species-specific reasons provided in Appendix F of this EIR."

Under Biological Resources, Section 4.4, Page 4.4-11, Paragraph 3, fifth line, under heading "San Joaquin kit fox," is revised as follows to correct the reporting error in the Preliminary Biological Assessment:

"The CNDDB reports several occurrences of San Joaquin kit fox approximately 10 km east of the project site (Figure 3). In addition, the CNDDB reports the presence of SJKF critical habitat within 10 km of the Miravale III site. DD&A and BioSearch biologists mapped the presence of California ground squirrel burrow "clusters" throughout the mixed grassland potions of the site and in portions of the fallow and active agricultural portions of the site; many of the burrows observed were of appropriate size to support this species. ~~In addition, one active "natal den" was mapped and recorded by the Biosearch biologists.~~

No natal dens were found or recorded by the Biosearch biologists as was originally identified in the Draft EIR. This Final EIR corrects and clarifies that the biologists revised their report, included in Appendix T-3, Under Appendix C, to take out this error and it was inaccurately transferred to the Draft EIR."

Under Biological Resources, Section 4.4, Page 4.4-13, is revised as follows:

"California tiger salamander

California tiger salamander is a federally Threatened and is also a state Threatened species recently list under the CESA on March 3, 2010. ~~designated California state Species of Special Concern~~. Critical Habitat for CTS (70 FR 49379-49458) went into effect on September 22, 2005. CTS is a large, stocky salamander that inhabits grasslands and oak savanna habitats in the valleys and low hills of central and coastal California. Adults spend most of their lives underground, typically in burrows of small mammals. During winter rains between November and February, adults emerge from underground retreats to breed. Adults have been found more than 2 km (1.24 miles) from breeding sites. Eggs are laid singly or in clumps on both submerged and emergent vegetation and on submerged debris in shallow water.

The CNDDB reports several occurrences of this species approximately 4.5 km north of the project site. In addition, the CNDDB reports the presence of CTS critical habitat within 4.5 km of the project site. Upland grassland habitats surrounding the pond represent appropriate estivation habitat for CTS. Tiger salamander larvae and paedomorphs were routinely detected at the onsite reservoir in the course of protocol-level surveys (aquatic sampling only) for this species (see below).

Brad Shaffer of U.C. Davis reports that multiple introductions ~~on~~ of non-native tiger salamanders occurred in the nearby city of Gonzales, and that this portion of the Salinas Valley is a known "epicenter" of non-native genes in Monterey County (David Keegan, pers. comm.). The Shaffer Lab conducted genetic testing on 23 larval CTS tissue samples collected at the reservoir and reports that these animals range between highly hybridized to completely non-native (note: only 22 samples were successfully analyzed). The "nativeness" of these animals is summarized by the Shaffer Lab Report (Appendix E of the June 2008 Preliminary BA) via a Hybrid Index Score (HIS). HIS can range from 0.00 (pure native) to 1.00 (pure non-native). For the samples collected from the onsite reservoir, HIS values ranged from

0.8889-1.00 (i.e., 89-100% non-native). No genotyped individual can be described as "pure native." As such, coordination with USFWS regarding ESA jurisdiction over onsite hybrid/non-native tiger salamanders was initiated by DD&A on November 6, 2007. USFWS Ventura subsequently determined that tiger salamanders present at Miravale Pond 1 (onsite reservoir) are not subject to regulation under ESA and are therefore not within the regulatory jurisdiction of USFWS regulation (USFWS concurrence letter issued February 26, 2008 and presented in Appendix I of the June 2008 Preliminary BA).

While the USFWS declines Federal Endangered Species Act jurisdiction over the non-native tiger salamander population present at the Miravale site, the CDFG has not yet determined the jurisdiction of the California Endangered Species Act over hybridized and non-native tiger salamanders. CDFG may determine that authorization under the CESA is required for "take" of onsite tiger salamanders if CDFG decides to exert jurisdiction over the tiger salamanders. The CDFG has concurred with the USFWS determination that a threat to California tiger salamander is hybridization with non-native salamanders as described in a DFG report, *A Status Review of the California Tiger Salamander* (January 11, 2010), which recommends the listing of the species under the CESA. The CDFG report recommends as a management measure that the DFG "in cooperation with the USFWS, determine what level of CTS x NNTS [California tiger salamander and non-native tiger salamander] hybridization warrants management actions such as eradication or control." Also, as discussed in the CDFG report, Fitzpatrick and Shaffer (2007) recommend that slightly introgressed populations should not lose their protected status. However, as summarized in the genetic study conducted for this project by the Shaffer Lab, the tiger salamander population on-site is highly introgressed, and the USFWS determined that this population is not afforded protection under the federal ESA. Coordination with the CDFG will occur to determine whether the CDFG will take jurisdiction over the on-site tiger salamander population."

Under Biological Resources, Section 4.4, Page 4.4-17, the first paragraph following "Wetlands/Sensitive Habitats" is revised as follows:

"Wetlands/Sensitive Habitats

According to the Preliminary BA prepared by DD&A, development of the proposed project has the potential to directly impact sensitive habitat types, including 0.17 acres of wetlands. According to the US Army Corps of Engineer's Wetland Delineation Manual (1987), wetlands are defined as "[t]hose areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." As detailed in the Preliminary BA and discussed above, a wetlands assessment was conducted to determine whether on-site aquatic features (i.e. agricultural ponds) contained characteristics consistent with wetlands. The wetlands identified on-site exist as a thin band of emergent vegetation on the fringe of four small man made reservoirs/ponds used in conjunction with routine agricultural operations. It is assumed that this resource satisfies the soils, vegetation and hydrologic criteria set forth by the U.S. Amy Corps of Engineers (USACOE) for wetlands. However, the USACOE does not regulate wetlands that are hydrologically isolated and geographically distinct from other jurisdictional resources in the vicinity. The individual aquatic features are not contiguous with other jurisdictional wetlands and/or waters of the U.S. and do not have any hydrologic connectivity or abut any permanent water body. As a result, the fringe wetlands identified on site ~~are~~ have been determined as not falling under the Jurisdiction of the USACOE. Further, impacts to these wetlands would not be in conflict with federal regulation. The USACOE should be contacted and a request for jurisdictional determination should be made to verify this conclusion. Per comments received by the CDFG, this project will likely require a LSAA. The project is required to comply with LSAA regulations and will notify the CDFG prior to filling the reservoir to determine whether a LSAA is required. If a LSAA is required, the project will be subject to the conditions of the permit."

Under Biological Resources, Section 4.4, Page 4.4-20, Mitigation Measures 4.4-1 through 4.4-6 are revised as follows:

"4.4-1 A Forest Management Plan shall be prepared for the project due to proposed tree removals. The Forest Management Plan shall include a map that indicates all of the trees within the project site and denotes which trees are to be removed. The map shall also include notes which clearly state protection procedures for trees that are to be preserved. In addition, the Forest Management Plan shall include, but is not limited to, a description of each tree by species and its condition. The City approved Forest Management Plan (and associated replanting plan) shall be incorporated as a condition of project approval to satisfy General Plan Conditions C/OS 17-19. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a Forest Management Plan, subject to the review and approval of the City of Soledad.

4.4-2 Prior to the onset of construction, ~~T~~trees and vegetation not planned for removal shall be protected during construction to the maximum extent feasible. This shall include the use of exclusionary fencing of herbaceous and shrubby vegetation, such as hay bales and protective wood barriers for trees. Only certified weed-free straw shall be used to avoid the introduction of non-native, invasive species. A qualified biological monitor shall verify that adequate protective measures are in place prior to construction and remain intact throughout the construction phase.

4.4-3 Following construction, the disturbed areas that are proposed as parks and ~~native~~ landscaping areas shall be restored to pre-project contours ~~to the maximum extent feasible~~ and revegetated using locally-occurring native species and native erosion control seed mix to the maximum extent feasible. Landscape plans for all such areas adjoining natural open space, including landscaped strips within right-of-ways, shall be reviewed by a qualified biologist to ensure that only native and non-invasive species are included in the planting palette and shall include a supplemental note and/or report by said biologist documenting compliance with this requirement. Landscape plans for other disturbed areas or for designated parks shall utilize native species to the extent feasible and avoid the use of all invasive species; such plans shall include a note from the licensed professional who prepared the plan(s) or from a qualified biologist documenting compliance with this requirement. Prior to the issuance of any grading and/or building permit, the project applicant shall submit landscape plans prepared by a licensed landscape architect for review and approval by the City of Soledad.

4.4-4 Prior to the onset of construction, ~~P~~protective fencing shall be placed so as to keep construction vehicles and personnel from impacting vegetation adjacent to the project site outside of work limits. A qualified biological monitor shall verify protection is in place prior to construction and remains intact throughout the construction phase.

4.4-5 Grading, excavating, and other activities that involve substantial soil disturbance shall be planned and carried out in consultation with a qualified hydrologist, engineer, or erosion control specialist, and shall utilize standard erosion control techniques to minimize erosion and sedimentation to native vegetation. Only natural-fiber, biodegradable meshes shall be used in erosion control mats, blankets, and straw or fiber wattles. "Photodegradable" and other plastic mesh products will not be used as these materials are known to persist in the environment, ensnaring and killing a variety of terrestrial wildlife species. A qualified biological monitor shall verify that erosion control measures are implemented and materials used are consistent with this measure and remain intact throughout the construction phase.

4.4-6 No construction equipment shall be serviced or fueled outside of designated staging areas. A qualified biological monitor shall verify that this measure is being implemented throughout the construction phase."

Under Biological Resources, Section 4.4, Page 4.4-19, Mitigation Measure 4.4-7 is revised as follows:

"4.4-7 A qualified botanist shall be retained to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species. If no Lemmon's jewelflower is present, no additional mitigation is required. If Lemmon's jewelflower is present, a qualified biologist shall prepare a mitigation plan to be approved by CDFG prior to initiation of construction. The mitigation plan shall include a description of the special-status plant population(s), map depicting the location(s), and size of the population(s). If feasible, disturbance of the population(s) of Lemmon's jewelflower shall be avoided and its habitat protected utilizing methods developed in coordination with the CNPS and CDFG. Avoidance shall be confirmed by the City prior to the time of tentative map approval for this phase of the project. If impacts to the Lemmon's jewelflower population(s) cannot be avoided, mitigation shall include preservation on- or off-site at a minimum 1:1 ratio (one plant preserved for each plant impacted), or restoration on- or off-site at a minimum 3:1 ratio (three plants planted for each plant impacted). The CNPS and CDFG shall be consulted to evaluate the suitability for transplanting the impacted species to suitable habitat within the identified and established preserve/restoration area. These details shall be described and included in the mitigation plan. Restoration and preservation strategies shall be developed in coordination with the CNPS and CDFG. The City of Soledad Planning Department shall be provided verification of CDFG concurrence and satisfaction prior to issuance of grading permits."

Under Biological Resources, Section 4.4, Page 4.4-20, is revised as follows:

"**Impact** Suitable foraging/dispersal habitat for San Joaquin kit fox is present throughout project boundaries, with potential denning habitat present in the annual grassland, rocky outcrop, and fallow agricultural portions of the site. The vast majority of the habitats present within project boundaries would be directly impacted by the proposed project. The project may result in direct and indirect "take" of individual kit fox (i.e., entombment, increased traffic, mortality/predation due to exposure, loss of habitat, reduced habitat connectivity, attraction of predators, placement of structures and roads, etc.) ~~(grubbing and grading, construction phase impacts, permanent placement of structures and impermeable surfaces, etc.).~~ Impacts proposed in the grassland portions of the site will likely result in kit fox abandonment of the property due to ongoing disturbance, if present at the site. Based on USFWS Ventura Office review of the early evaluation report prepared by Biosearch, protocol-level SJKF northern-range protocol-level surveys were recommended (pers. comm. Roger Root, USFWS). The USFWS and CDFG have stated that a determination of SJKF absence from the proposed project site and a finding of "no take" of the species could only be supported by completing the protocol for this species and having a negative finding. Since protocol-level surveys for this species have not yet been conducted, the Draft EIR assumes kit fox presence within the project site. ~~For this reason,~~ Therefore, the project is assumed to have a significant and unavoidable adverse affect on San Joaquin kit fox (i.e. direct mortality, loss of habitat, loss of dens, etc.). *This impact may be reduced by implementation of the following mitigation measures; however, the impact will not be reduced to a less-than-significant level without completion of the required protocol surveys in coordination with the USFWS and CDFG ~~consultation~~ (Federal Endangered Species Act and California Endangered Species Act, respectively) and implementation of appropriate avoidance measures or redesign, per the CDFG letter of comment on the Draft EIR.*

Please note that the following measures are consistent with direction from USFWS on other projects, ~~but greater or lesser~~ however, additional measures ~~may~~ will likely be required by USFWS and CDFG ~~the regulatory agencies~~ (~~possibly~~ including completion of protocol-level surveys to determine utilization of the site and/or project redesign to avoid development on upper grassland habitat that could cause potential take)."

Under Biological Resources, Section 4.4, Page 4.4-19, Revise Mitigation Measures 4.4-9 and 4.4-10 and add additional mitigation as follows:

"**Mitigation**

4.4-9 The applicants shall enter into consultation with USFWS and CDFG and shall provide evidence of their compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act to the City prior to the issuance of building permits.

4.4-10 Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. The preconstruction surveys shall be conducted per Standardized Recommendations for the Protection of the San Joaquin Kt Fox Prior to or During Ground Disturbance (USFWS 1999b), as updated. Potential dens (including man-made structures) and known dens shall be protected by minimum buffers of 50 feet and 100 feet, respectively. If an occupied or unoccupied natal den is detected, no construction shall occur for the Phase until the USFWS and CDFG have been contacted and authorization to proceed has been obtained by the applicant. Pre-construction surveys shall be conducted by a qualified biologist no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites.

In addition to pre-construction surveys, a qualified biologist, meeting the required qualifications described in the *U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance*, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox. In the event that an active kit fox den is found, then the standard mitigation actions outlined in the USFWS Recommendations for SJKF, are recommended to avoid possible take of kit fox during future construction activities. These actions are general in nature; therefore, site specific strategies for the project site shall be based upon consultation with USFWS and CDFG, as stated above in Mitigation Measure #4.4-**9**. To reduce the risk of impacts during construction, the applicant shall, at a minimum, implement the following measures, unless directed otherwise through consultation with the USFWS and CDFG:

a) Restrict project-related vehicle speed to 20 mph on project roads.
b) Cover all excavated, steep-walled holes or construction trenches more than 2 feet deep at the close of each working day by plywood or similar materials or provide such holes or trenches with one or more escape ramps constructed of earth fill or wooden planks, inspect such holes or trenches for trapped San Joaquin kit fox prior to filling.
c) Inspect all construction pipes, culverts, or similar structures with a diameter of 4 inches or greater that are stored at a construction site for one or more overnight periods for kit foxes before the pipe is subsequently buried, capped, or otherwise used or moved in any way.
d) Contain all food-related trash items in closed containers and remove food related trash at least once a week from the project site.
e) No firearms shall be allowed on the project site.
f) No pets shall be permitted on the project site.
g) Use of rodenticides and herbicides on the project site shall be restricted to the use of zinc phosphide, in cases where it is necessary to protect public health and safety.
h) A representative shall be appointed by the project proponent who will be the contact source for any employee or contractor who might inadvertently kill or injure a kit fox or who finds a dead, injured or entrapped individual. The representative will be identified during the employee education program. The representative's name and telephone number shall be provided to the Service.

i) An employee education program shall be conducted and shall consist of a brief presentation by persons knowledgeable in kit fox biology and legislative protection to explain endangered species concerns to contractors, their employees, and agency personnel involved in the project. The program shall include the following: a description of the San Joaquin kit fox and its habitat needs; a report of the occurrence of kit fox in the project area; an explanation of the status of the species and its protection under the Endangered Species Act; and a list of measures being taken to reduce impacts to the species during project construction and implementation. A fact sheet conveying this information shall be prepared for distribution to the above-mentioned people and anyone else who may enter the project site.

j) In the case of trapped animals, escape ramps or structures shall be installed immediately to allow the animal(s) to escape, or the Service shall be contacted for advice.

k) To the extent feasible, nighttime construction shall be avoided.

l) Include kit fox mitigation measures on project plans

If active kit fox den sites are found and/or kit fox individuals are observed during the survey, the applicant will be required to comply with all mitigation actions required by USFWS and CDFG and the City shall monitor implementation of those actions. Examples of mitigation actions that may be required by the regulatory agencies may include, but are not limited to:

- To the extent feasible, lot placement shall be situated to create wildlife corridors in protected open space to allow for kit fox and other wildlife movement through the site.

- Fencing shall surround the site to restrict kit fox movement into the development area; types of fencing (e.g. exclusionary or kit fox friendly) shall depend on the density of the development area.

- Speed bumps, rolls, or reduced speed limits shall be employed along project roads in or near open space areas to reduced likelihood of kit fox mortality by vehicle strikes.

- Street lighting shall be situated as to not spill into adjacent open space areas. The height and intensity of street lighting shall be designed to minimize indirect impacts to open space. Outdoor lighting for residential uses adjacent to open space and large lots shall also be restricted to CC&Rs to be low wattage (150 watts or less) and directed toward the residences to reduce effects on kit fox nocturnal activities."

Under Biological Resources, Section 4.4, Page 4.4-21, Mitigation Measures 4.4-11 through 4.4-13 are revised as follows:

"4.4-11 The applicant shall retain a qualified biologist to conduct focused preconstruction surveys for potential American badger dens. These surveys shall be conducted no sooner than 2 weeks prior to the start of construction. Surveys for badger dens may be conducted at the same time as burrowing owl surveys. The results of the survey shall be submitted to the City prior to issuance of grading permit or initiation of grading for that phase of development on the site. ~~Please refer to the mitigation measures in the Preliminary BA (June 2008) for measures that may be implemented B~~based on the results of these surveys, one or more of the following additional measures shall be implemented:

- If the qualified biologist determines that potential dens are inactive, the biologist shall excavate these dens by hand with a shovel to prevent badgers from re-using them during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities.

- If the qualified biologist determines the presence of active dens, the location of these dens shall be documented and reported to CDFG. Avoidance of active dens, particularly natal dens, is the preferred approach; Impacts to active badger dens shall be avoided by establishing a 100-meter exclusion zones around all active badger dens, within which construction related activities shall be prohibited until denning is complete and/or the den is abandoned. A qualified biologist shall monitor each den once per week in order to track the status and inform the project sponsor of when a den area has been abandoned.

- If avoidance of an active badger den is not feasible, the biologist shall coordinate with CDFG on the appropriate way to evict/exclude badgers from their dens. Please note that special consideration of natal dens is required given the low likelihood that excluded young would survive; a CDFG depredation permit would be required to disrupt a natal den. For non-natal dens, CDFG has permitted badgers to be gradually excluded from their dens by placement of soil, sticks, and debris at den entrances, incrementally increasing the degree of blockage over a period of three to five days (please note that blockage cannot trap/entomb badgers). After the monitoring biologist determines that badgers have stopped using active dens within the project boundary, the dens shall be hand-excavated with a shovel to prevent re-use during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities. Please note that eviction of onsite badgers will reduce construction phase impacts to this species, but given the large home ranges and territoriality of this species, emigration to alternative habitats may not be feasible without inter/intra specific competition (energetic stress possibly resulting in mortality). CDFG may require that appropriate onsite or adjacent habitat be conserved to allow relocation of excluded animals within their home range.

4.4-12 A qualified bat specialist shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist). The results of the survey shall be submitted to the City prior to issuance of grading permit or initiation of grading for that phase of development on the site. ~~Please refer to the mitigation measures in the Preliminary BA (June 2008) for measures that may be implemented based on the results of these surveys.~~ Based on the results of these surveys, one or more of the following additional measures shall be implemented:

- If it is determined that bats are not present at the site, no additional mitigation is required.

- If it is determined that bats are utilizing the site and would likely be impacted by the proposed project, preconstruction surveys shall be conducted no more than 30 days prior to modification, demolition, or removal of onsite buildings and/or any other occupied habitat. If no bat or bat sign are observed in the course of preconstruction surveys, then demolition/removal of buildings and/or construction initiation may proceed. If bat and/or bat sign are observed during the preconstruction surveys, the biologists shall determine if disturbance will jeopardize a maternity roost, or another type of roost (foraging, day, night).

- If a single bat and/or only adult bats are roosting, demolition or removal of the structure can proceed after the bats have been safely excluded from the roost. Exclusion techniques shall be determined by the biologist and depend on the type utilization; the biologist shall prepare a mitigation plan for provision of alternative habitat to be approved by CDFG and the City.

- If an active maternity roost is detected, work in the vicinity of the roost (and/or demolition of the structure) shall be postponed until the qualified biologist monitoring the roost(s)

determines that the young have fledged and are no longer dependent on the roost. The monitor shall ensure that all bats have left the building and or area of disturbance prior to initiation of construction and/or demolition activities. *If disruption of a maternity roost cannot be avoided, a depredation permit would be required.*

4.4-13 The applicant shall contract a qualified biologist to coordinate with CDFG and prepare a mitigation and monitoring plan for the Salinas pocket mouse. The mitigation and monitoring plan shall include a description of the population and locations of known and potential habitat within the project site, mitigation to avoid and reduce impacts to the species, monitoring actions, success criteria, and adaptive management measures if success criteria are not met. Verification of CDFG concurrence/approval shall be submitted to the City of Soledad prior to issuance of a grading permit for that phase of development of the site ~~initial grubbing and grading of the site~~."

Under Biological Resources, Section 4.4, Page 4.4-24, the text is revised as follows:

"**Impact** **Although extensive aquatic surveys have been conducted, ~~T~~the presence of California red-legged frog and/or Western spadefoot has not been determined at this time. The project as currently designed would fill the onsite reservoir to establish home-sites, removing a potential breeding resource for these species. Pond 3 would likewise be permanently filled as a result of the proposed project. If CRLF or spadefoot are present, proposed impacts to onsite agricultural basins (particularly the reservoir) would result in direct impacts to these species including "take~~.~~" of CRLF under ESA (i.e. loss of individuals and habitat, loss of a breeding resource, direct mortality, etc.). In addition, grading and other earthmoving activities proposed would represent an adverse affect on upland estivation habitat for these species, if present.** ***Therefore, the proposed project would represent a significant and unavoidable impact to a federally Threatened Species and State Species of Special Concern ~~and state regulated wildlife species~~ (if present,) as currently designed. However, implementation of the mitigation measures identified below will reduce these impacts as much as feasible but not to a less-than-significant level without completion of the protocol-level surveys in coordination with the USFWS and CDFG to comply with ESA and Fish and Game Code, and implementation of appropriate avoidance measures or redesign.***

Mitigation

4.4-17 Protocol-level CRLF surveys (USFWS, August 2005) shall be completed at each aquatic resource present within project boundaries. Protocol-level CRLF surveys would likely detect Western spadefoot, if present (Western spadefoot toad surveys are also conducted at night during winter months, preferably January through March, and therefore, overlap CRLF survey protocol requirements). The results of the survey shall be submitted for the review and approval of the City, USFWS, and CDFG. If it is determined that CRLF are present, the applicant shall coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA (e.g., applying for an Incidental Take Permit [Section ~~7 and/or~~ 10 ~~depending on lead agency~~]) and implementing the permit requirements prior to issuance of a grading permit. Any mitigation and avoidance measures required by USFWS for potential impacts to CRLF (if applicable) would likewise reduce impacts to Western spadefoot given their overlapping habitat characteristics. If CRLF is not found on-site and USFWS concurs with a negative finding, no further mitigation is required.

If it is determined that spadefoot are present, but CRLF are not, coordination with CDFG regarding appropriate mitigation to reduce impacts to this species shall be required prior to

issuance of a grading permit. If the Western spadefoot toad is not found on-site, no further mitigation is required.

Under Geology, Soils, Mineral Resources, Section 4.6, Page 4.6-2, the lower elevation range for the project site as noted in the first paragraph is corrected as follows:

"The elevation ranges from approximately 180 ~~200~~ to 600 feet above sea level."

Under Geology, Soils, Mineral Resources, Section 4.6, Page 4.6-19, Mitigation Measure 4.6-6, is revised as follows:

"4.6-6 All drainage from improved surfaces shall be captured by closed pipe or lined ditches and carried to neighborhood storm sewers or natural drainages. At no time shall any concentrated discharge be allowed to spill directly onto the ground adjacent to structures or to fall directly onto steep slopes. The control of runoff is essential for erosion control and prevention of water ponding against foundations and other improvements. The project shall implement Low Impact Development (LID) strategies, as determined appropriate by the City of Soledad consistent with the requirements of Mitigation Measure 4.8-4. LID strategies shall be implemented in connection with the proposed project to the satisfaction of the City of Soledad. Prior to the issuance of any grading and/or building permit for each new structure, the project applicant shall submit an erosion control plan and storm water pollution prevention plan consistent with this measure, subject to the review and approval of the City of Soledad Public Works Director."

Under Hydrology and Water Quality, Section 4.8, Page 4.8-3, is revised as follows:

"Flooding

The General Plan FEIR describes generalized flood hazards within the City of Soledad area. The Salinas River is located approximately 1.25 miles south of the project site and is the primary surface drainage feature that affects the surrounding area. As identified in the General Plan FEIR, the boundaries of the 100-year floodplain generally correspond to the areas surrounding the Salinas River. There are no areas within the project site that are identified within a 100-year flood hazard area on the Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map. The 100-year floodplain defines the boundary of flooding statistically anticipated to occur once every 100 years. Although the City is not located within the 100-year floodplain, flooding has occurred in the downtown portion of the City and a portion of the project site. More specifically, flooding occurred during a 1995 storm event that resulted in the Bryant Canyon Channel overflowing. The ~~City of Soledad~~ Monterey County Water Resources Agency (MCWRA) ~~has~~ recently completed improvements along the Bryant Canyon Channel at or near Metz Road to prevent future flooding. According to the City, these improvements are thought to have mitigated potential flooding hazards within the surrounding area (personal communication, S. Hilinski, May 2008). In addition, the MCWRA completed a number of drainage improvements upstream of Metz Road in 2002 to address potential flood-related hazards. MCWRA has indicated that these improvements were sized for a 100-year storm event from the Bryant Canyon watershed, but additional flows from adjacent watersheds impact the channel. As a result, MCWRA has stated that additional drainage improvements are necessary to provide adequate flood protection for the surrounding area."

Under Hydrology and Water Quality, Section 4.8, Page 4.8-10 through 4.8-12, are revised as follows:

"Surface Drainage /Flooding

Development of the proposed project would result in substantial physical changes to the existing drainage conditions within the project area as a result of grading activities, the introduction of impervious surface areas, changes in site topography, and other site disturbing activities. The alteration of existing drainage

patterns combined with the introduction of impervious surface areas has the potential to result in substantial soil erosion, in addition to flooding. Project-induced impacts related to increased soil erosion and sedimentation are addressed in **Section 4.6 Geology, Soils, and Mineral Resources.** Moreover, mitigation measures were incorporated in order to reduce the extent of potential project-related impacts related to increased soil erosion (see mitigation measures 4.6-4 – 4.6-6). Therefore, the following analysis focuses only on potential project-related impacts associated with drainage and associated flooding. For more information regarding project-related impacts associated with increased erosion and sedimentation, please refer to **Section 4.6 Geology, Soils, and Mineral Resources.**

As identified above, implementation of the Miravale III Specific Plan would significantly increase impervious surfaces and stormwater runoff thereby resulting in potential impacts related to surface runoff and on- and off-site flooding. In order to ensure that project-induced impacts would not result in significant on- or off-site flooding, the proposed project would be required to provide adequate drainage facilities in order to accommodate a 100-year storm event. As currently proposed, however, the drainage facilities are inadequately sized to accommodate projected stormwater flows associated with a 100-year storm event. This is considered a potentially significant impact.

Based on design information submitted by Bestor Engineers, Inc. the proposed project would enhance two existing on-site agricultural ponds to provide downstream flood protection and provide additional groundwater recharge benefits. According to preliminary design information provided by Bestor Engineers, Inc. these facilities would be sized to accommodate 148 acre feet and would reduce runoff to pre-project levels. These assumptions are based on calculations submitted by Bestor Engineers, Inc. that indicate that these facilities would be adequate to accommodate on-site and off-site runoff. This documentation is available for review at the City of Soledad. The information submitted by Bestor Engineers, Inc. in support of the Miravale III Specific Plan and associated Vesting Tentative Map was subsequently reviewed by RM Associates as part of the 2007 Storm Drain Master Plan (SDMP) to ensure that the proposed facilities adequately accounted for project demand consistent with the requirements of the SDMP.

The SDMP represents a comprehensive approach to planning storm drain facilities throughout the City and proposed expansion areas to ensure that the City has adequate facilities to accommodate projected development, in addition to existing needs within the City. The SDMP divided the City into a series of on-site and off-site drainage basins. The off-site drainage basins include the Miravale III Sub-basin, which is described as the 920-acre project site which is within a designated expansion area identified in the City's 2005 General Plan. Off-site drainages were included in the SDMP to ensure that the drainage needs of future expansion areas are adequately addressed within the context of the 2007 SDMP. Specific planning, hydrologic, and hydraulic criteria were identified in the SDMP for the purposes of determining whether additional improvements would be necessary to meet existing system requirements and anticipated growth.

The 2007 SDMP contained a detailed analysis of the Miravale III project and associated drainage improvements. Based on that analysis, the SDMP determined that the hydrologic condition of soils within the Miravale III sub-basin was classified as "good." The SDMP determined that the upstream watershed of the Miravale III sub-basin consists of a total of 2,225 acres, of which only 325 acres are considered on-site. The Miravale III sub-basin watershed was identified as consisting of designated Watershed I, III and IV. For a detailed description of these watersheds, please refer to the SDMP available for review on the City of Soledad's website. For modeling purposes, peak flow estimates were developed for a 2-year, 10-year, and 100-year storm event were developed (See SDMP Table 4-1). This information was subsequently used in order to develop a specific analysis of the proposed Miravale III storm drainage system using HYDRA software. Based on the analysis contained in the SDMP, it was determined that the proposed project facilities were inadequate. In order to accommodate projected stormwater flows, the project would need to provide retention facilities with an estimated storage volume of approximately 230 acre feet (RM Associates, Memorandum to City Public Works Director, dated October 27, 2006). As

currently proposed, the project would provide storage facilities with an estimated volume of approximately 148 acre feet, which is considered inadequate to accommodate peak stormwater flows. Inadequately sized facilities could result in off-site flooding and associated impacts, such as property damage, disruption of public services, and similarly related impacts.

As part of the SDMP conducted by RM Associates, several storm water models were developed to evaluate on-site conditions, in addition to off-site conditions on an individual project level, and cumulative level. The results of RM Associates' analysis indicated that the preliminary design proposed as part of the Miravale III Specific Plan does not meet the design requirements delineated in the October 2007 SDMP in regards to flood protection from a 100-year storm event. In addition to providing inadequately sized detention facilities, proposed piping in the major branches were not considered adequately sized to convey stormwater associated with a 100-year storm event. Accordingly, the proposed facilities are considered to be inconsistent with the requirements of the City's adopted SDMP. The applicant's engineer, however, has indicated that RM Associates' analysis does not account for the percolation and disposal of stormwater via native soils. According to the review conducted by RM Associates, the project engineer's design assumptions are not supported by technical evidence and additional geotechnical testing would be necessary to support the project engineer's assumptions. As a result, it was determined that the proposed system would be inadequate to meet the project needs in the absence of additional technical analysis. The City has concluded that compliance with the adopted SDMP would ensure that adequate facilities are provided on-site to meet project generated demand and ensure the post-project runoff is at pre-project conditions. The final location, size, and design of the proposed drainage facilities and associated drainage infrastructure would also be required to be built in conformance with a design-level geotechnical evaluation consistent with the City's standards as evidence of suitable percolation rates at the proposed drainage facilities (refer to Section 3.4 of the Storm Drain Master Plan for design requirements of detention basins).

While the proposed project site is not located within a flood hazard area as delineated by FEMA, localized flooding has been known to occur within the project area and surrounding vicinity. Development of the proposed, which would result in substantial grading, changes in topography, and similarly related activities, has the potential to result in on- and off-site flooding due to changes in existing drainage patterns. In order to ensure that these impacts would be minimized to a less-than-significant level, drainage infrastructure would need to be designed and built in accordance with the City's standards as identified in the SDMP. As currently proposed, the preliminary design is considered inadequate and has the potential to result in additional impacts related to flooding. As a result, project-specific mitigation is warranted in order to ensure that final-design level plans are consistent with adopted City standards. The City of Soledad has determined that compliance with the 2007 SDMP, as applicable to the Miravale III project site, would ensure that adequate storm drainage facilities would be available to meet the demand associated with the proposed project. Moreover, the City of Soledad has also determined that the implementation of Low Impact Development (LID) strategies would ensure that impacts related to drainage and flooding are further minimized to a less-than-significant level.

LID is an integrative stormwater management approach with the goal of maintaining or replicating the natural (pre-development) hydrologic regime of a site through the use of design techniques strategically employed throughout the project area. LID strategy employs a variety of natural and built features to substantially reduce the rate of surface water runoff, filter pollutants out of runoff, and facilitate infiltration of water into the ground. Potential LID measures may include the use of pervious building materials, avoiding the use of coal-tar-based pavement sealers, dispersal of runoff onto onsite pervious surfaces, and similar preventative measures. Mitigation Measure 4.8-4 has been added to ensure that future buildout of the Specific Plan will implement LID strategies to the extent feasible. Implementation of these ~~following~~ mitigation measures ~~is~~ are necessary in order to ensure that impacts would be reduced to a less-than-significant level. Implementation of the following mitigation measure would not result in any new impact beyond those identified elsewhere in this EIR.

Impact **Construction and operation of the project could potentially result in flooding impacts to off-site properties if adequately sized drainage facilities are not provided within the proposed development. Project development could also impact existing drainage as a result of increased impervious surface coverage and modifications to the existing drainage pattern.** ***This is a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.8-3 In order to ensure that project-induced impacts related to changes in the existing drainage patterns on the project site are minimized, the project applicant shall submit design-level improvement plans for the project's storm drainage collection and retention system. Final design-level plans shall be supported with appropriate soils and hydrologic data in accordance with City standards. All conveyance system and retention basins shall be sized and designed in accordance with applicable City design standards and shall be appropriately sized to accommodate stormwater runoff from a 100-year storm event. Prior to the recordation of any final map, the project applicant shall submit all design-level plans and supporting details to the City of Soledad Director of Public Works for review and approval. The VTM and Specific Plan shall be revised as necessary to reflect final locations of drainage facilities, subject to the review and approval of the City of Soledad.

4.8-4 In order to reduce the extent of impervious surface coverage and potential drainage/flooding impacts, Low Impact Development (LID) strategies shall be implemented, to the maximum extent feasible, in connection with all new development within the Specific Plan area. Prior to the approval of any final map or approval of any permit for all new residential and commercial developments, the project applicant shall submit design-level site and improvement plans to the City of Soledad for review and approval that incorporate the latest approved LID strategies and best practices as applicable, and the City shall ensure that all such measures are included in the final design plans, Examples of various LID strategies and best practices are identified as follows:

.

- Where possible, landscaped or grassy areas shall be substituted for impervious surfaces such as building entrances, traffic medians, etc.
- Permeable pavements such as crushed aggregate, turf lock or unit pavers shall be used in place of sidewalks, walkways or overflow parking areas wherever design allows.
- Bioretention cells, planter boxes, vegetated swales, and greenbelt buffer zones shall be implemented in landscaped areas, along streets and sidewalks wherever feasible.
- Final roadway design and street layout shall convey surface water runoff and storm flows into bioretention cells and swales.
- All commercial development shall integrate bioretention into parking lot islands or filter strips distributed throughout the parking area(s) to infiltrate, store and/or convey stormwater flows. In addition, permeable paving materials shall be used in spillover parking that is used only for peak demand periods.

Alternative types of LID strategies and measures may also be approved provided evidence is submitted to the City of Soledad by a qualified engineer demonstrating that said strategies will achieve the intended result of this mitigation measure.

Under Land Use and Planning, Section 4.9, Page 4.9-11, is revised to add a new paragraph following Table 4.9-1 as follow:

"The Draft EIR for the Miravale III Specific Plan was published prior to completion of the City of Soledad's update of its Housing Element. The updated Housing Element was adopted and certified in 2009, Although many of the relevant provisions of the 2009 document or essentially the same or similar to those of the 2003 Housing Element, the 2009 Housing Element includes the following additional requirements applicable to the proposed Specific Plan project:

- Program 2.1.1: Housing affordable to very low-and low-income persons or families shall achieve a minimum density of 20 units per acre;
- Program 2.1.2: A minimum of 30 percent of all units in each new neighborhood must be designed to accommodate rental households in accordance with Housing Element guidelines identified by this program."

Under Land Use and Planning, Section 4.9, Page 4.9-11, is revised as follows:

"Additionally, ~~project development also includes several amendments to the General Plan; they are~~ in order for the Specific Plan and related Vesting Tentative Map to be approved as proposed, a number of amendments to the General Plan, including the adopted 2009 Housing Element, would be necessary as ~~summarized~~ identified below. If the City elects to deny any or all of these proposed amendments for environmental, public service and/or fiscal reasons, the draft Specific Plan and related Tentative Map must then be revised to conform with the applicable General Plan provision.

~~Proposed~~ General Plan Amendments Necessary to Accommodate the Project as Proposed:

- Revision of General Plan land use diagrams to reflect Specific Plan's proposed planning area boundary and land use designations—i.e., Figures II-4 (Northwest Expansion Area), II-6 (San Vicente West Specific Plan Area), II-7 (Mirassou Specific Plan area) and Figure II-9-Land Use Diagram and Figure VI-1-Parks and Trails.

- Revision of Figure V-2 , Circulation Diagram, to reflect the circulation system proposed by the VTM/Specific Plan contingent upon demonstration that the proposed circulation achieves the same objectives—connectivity/service levels, etc.—as that shown by the Fig. V-2.

- Revision of the land use descriptions and development potential tables for the affected Expansion Areas—Northwest Expansion Area (pp. II-11 –II-12), San Vicente West (p.II-16), and Mirassou Specific Plan area (p. II-18) to reflect the alternative land use concept of the proposed Specific Plan. Revisions may include deletion of the L-shaped block from the Mirassou Specific Plan Expansion area.

- Modification of Table II-1, General Plan Development Potential, to allow an additional 1,050 - ~~1,550~~ 1.500 units—over and above the maximum development currently allowed (number of additional units varies depending upon the extent to which development is reduced in the NW Expansion area)

- Modification of Land Use Policy L-45 to allow exceptions to the restriction on ridgeline development per the proposed Specific Plan/VTM.

- Modification of Land Use Policy L-5 and Policy S-1 and S-23 to allow exceptions to the requirements that adequate public services, including schools, be provided concurrent with new development (or demonstration that the existing middle school and high school—with or without improvements—can accommodate the majority of students generated by the project.)

- ~~Modification of PR-33 to allow exception to the requirement that new development provide its fair share of public park and recreation opportunities (the minimum standard of 3.0 acres~~

~~per 1000 residents is being met but this includes approximately 8 acres of trails and park connections; further, the General Plan goal is 5 acres of parkland for each 1,000 persons).~~

- Amendment of the 2009 Housing Element Policy 2.1 and implementing Program ~~4-2~~ 2.1.2 to allow exceptions to requirements that new ~~"development must be organized into functioning~~ neighborhoods ~~that~~ must contain a mix of housing types affordable to very low, low and moderate-income housing that is fully integrated with market-rate single-family housing.,~~"~~ with at least 20 percent of all units in new neighborhoods consisting of duplexes, tri-plexes and smaller multi-family housing. Being "next to" as noted in Section 2.5 of the draft Specific Plan doesn't meet the intent of the Housing Element to achieve "fully integrated" mixed income housing types and affordability."

Under Land Use and Planning, Section 4.9, Pages 4.9-15, is revised as follows:

"Consistency with City of Soledad Jobs/Housing Balance Goals

Evaluation of the existing and future jobs/housing balance considers employment potential (existing and projected), housing demand, new housing production, and available transportation systems. New residential development will be phased so that the number of new units constructed annually is consistent with the jobs-housing balance provision of the City's General Plan.

As currently proposed, the Specific Plan does not provide a balance of jobs and housing due to its substantially larger residential component compared to the employment generating commercial portion. ~~that is consistent with the Housing Element.~~ The Specific Plan includes an industrial, office, and commercial component, which is expected to generate approximately 550 jobs. The housing component of the Specific Plan includes the development of 4,200 dwelling units. This equates to a jobs to housing ratio of approximately 0.13 new jobs for each new home within the Plan area. As a result, the proposed project would result in a substantial increase of housing within the City over a 10-20+ year period while failing to provide a significant source of additional employment opportunities for area residents. In the absence of additional employment generating uses during this same timeframe, the project would exacerbate the imbalance of jobs and housing within the City. While the proposed project itself does not contain a balance of land uses, the ultimate development of the City as envisioned under the General Plan, including development of the proposed project, would provide for a favorable jobs/housing balance in the long-term. More specifically, the City of Soledad anticipates as many as 22,000 jobs and about 14,000 total dwelling units at buildout of the General Plan, which includes the Miravale III site. Should this development potential be realized, the City's ratio of jobs to dwelling units would be about 1.57, or considerably more jobs than dwelling units. ~~The proposed project has substantially larger residential portion compared to employment generating commercial portion.. The ultimate development of the City as envisioned under the General Plan, including development of the proposed project, would provide for a favorable jobs/housing balance.~~"

Under Land Use and Planning, Section 4.9, Pages 4.9-17 through 4.9-37, Table 4.9-2, is revised as follows:

"Based on further review of the proposed Miravale III Specific Plan by the City of Soledad Community Development Department, revisions to Table 4.9-2 were identified as necessary. Specifically, the City has determined that the proposed Specific Plan does not meet the requirements of Appendix B of the General Plan or relevant provisions of the Housing Element, in addition to a number of other planning considerations. Adherence to the Specific Plan standards of Appendix B is mandated by General Plan Policy L-3. These comments/concerns are reflected in the revised Table 4.9-2 identified below. It is important to distinguish that CEQA specifically requires that an EIR evaluate potential conflicts with any land use plan, policy, or regulation that was adopted for the purpose of avoiding or mitigating an environmental impact. These changes would not change and/or substantially alter the analysis in this EIR.

These revisions have been incorporated to provide additional clarification regarding the project's consistency with the General Plan."

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
GENERAL PLAN			
Land Use			
L-2	Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council.		The General Plan anticipated future growth in the Miravale III plan area (Mirassou plan area, Northwest and San Vicente West Plan Expansion Areas). The Plan is providing the City with market-rate and affordable housing, a golf course, parks, schools, police and fire sites, and trails. The fiscal impact on the City will be reviewed as part of the City Council consideration of the project. With the preparation of an independent and comprehensive fiscal analysis that accounts for the long-term operational and maintenance costs of the golf course, the City will be able to make a determination concerning the fiscal impacts of this project. In the absence of a complete fiscal impact report, a determination of policy consistency cannot be made. Moreover, a determination of project consistency would be inappropriate in this EIRas this policy is not considered an environmental policy that warrants consideration under CEQA. The Planning Commission (PC) shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council to determine consistency with the requirements of this policy. ~~Mitigation measures under the Cumulative and Population and Housing Sections of this EIR also incorporate this policy.~~ **~~With PC determination on above, the project is consistent with this provision.~~**
L-3	A specific plan shall be required for all annexations and development of properties designated Expansion Area. Specific plans shall be prepared in accordance with the standards provided in Appendix B.		The City will review the Miravale III Specific Plan to ensure compliance with policy and that the Specific Plan has been prepared in accordance with the standards provided in Appendix B of the Soledad General Plan. The Specific Plan, as currently proposed, does not meet the requirements of Appendix B of the Specific Plan. Specifically, the proposed project is inconsistent with Appendix B standards #4, #10, #11, #14, #16, and #24. Accordingly, the City has determined that the Specific Plan will need to be substantially revised to achieve consistency with this policy and Appendix B of the General Plan. A number of mitigation measures identified in

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
			this EIR would ensure that the Appendix B requirements related to environmental issues (i.e. parkland) would be addressed. Nevertheless, the project is inconsistent with relevant General Plan requirements concerning integration of multi-family and other affordable housing, street design, jobs-housing balance, and adequate public facilities (i.e., schools, police and fire facilities – unless mitigated pursuant to MM 4.12-1 through 4.12-7)). **As proposed, the project is not consistent with this provision.**
L-4	The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services.		Public services will be provided as described in Section 5 of the Specific Plan and in the Public Services and Utilities section of this EIR. **The project, as mitigated, is consistent with this provision.**
L-5	New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development.		~~**Project consistent.**~~ Development of the proposed project would be required to provide adequate public services in order to accommodate project development. As identified in **Section 4.12 Public Services,** the proposed project, as mitigated (see Mitigation Measures 4.12-1 through 4.12-7), would provide sufficient services to meet project demands. **Therefore, the project, as mitigated, is considered consistent with this policy**
L-6	New development shall pay its fair share of providing additional public services needed to accommodate such development.		~~**Project consistent**~~. **The proposed project, as mitigated in this EIR, is considered consistent with this policy.** As identified in **Section 4.12 Public Services** and **Section 4.14 Utilities,** development of the proposed project would be required to submit payment of its fair share of the cost of providing public services needed to accommodate project development. Moreover, completion of a Development Agreement and Plan for Services required for the project will address the timing and costs of needed public services and facilities.
L-7	Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City.		Section 5.0 of the Specific Plan provides conceptual public utility plans. Section 4.0 provides a conceptual circulation plan. Final plans will be submitted upon completion of the vesting tentative map. **The project is consistent with this provision.**

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
L-8	The City shall permit only low-intensity land uses in areas where natural conditions such as floodplains and steep hillsides are likely to pose a threat to public safety or produce excessive maintenance costs.		The Specific Plan proposes Low Density Residential in hillside locations, subject to the Hillside Development Standards found in Appendix A of the Specific Plan. However, because these standards are proposed to apply only to those hillside lots with average slopes of 30 percent or more and because many of the "standards" are in fact non-mandatory guidelines, the City of Soledad Community Development Department, has determined that the proposed project would be inconsistent with this policy. **The project is ~~consistent~~ inconsistent with this provision.**
Land Use - Jobs/Housing Balance			
L-10	The City shall monitor development and adjust land use designations and new residential project approvals as needed to promote a reasonable balance between employment-generating land uses and housing.		The proposed project will provide 4,200 residential units and 550 jobs as part of project development. This equates to a jobs housing ratio of 0.13 new jobs for each new home within the plan area, which, in the absence of additional jobs created outside the project area, would contribute to an imbalance of jobs and housing within the City (a jobs-housing ratio of 1.0 is considered balanced). Based on further review by the City of Soledad, it was concluded that the project, would not be consistent with this policy as a result of the significant amount of residential development proposed in excess of the General Plan's development threshold for the project area (as identified by General Plan Table II-1). ~~considered a reasonable balance for the proposed project considering development potential associated with General Plan buildout.~~ **The project,** as proposed**, is ~~consistent~~ inconsistent with this provision.**
L-11	The City shall encourage large residential development projects to be phased or timed with development that will provide primary wage-earner jobs.		Miravale III proposes commercial and office job opportunities in Phases 1 and 2, as well as new schools, police and fire facilities in Phases 1-4 to provide sources of employment within the project area. Based upon further review by the City of Soledad, it was determined that the proposed Specific Plan is inconsistent with this policy since it lacks provisions for ensuring that the commercial uses will be constructed prior to or concurrent with the first or second phases of project development. **The project is ~~consistent~~ inconsistent with this provision.**

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
Land Use - Residential Development			
L-13	The City shall require that residential projects be designed to reflect and consider the relationship of the project to surrounding uses. Residential densities and lot patterns will be determined by these and other factors. As a result, the maximum density specified by the General Plan land use designations or zoning for a given parcel of land may not be realized.		The project Specific Plan proposes a maximum 4,200 units within the Plan Area including a number of PUD areas that have not been fully designed. Residential siting and design of the residential portion of the project will be required to adhere to the residential guidelines contained in the Specific Plan, as modified by the mitigation measures identified in this EIR. Specifically, mitigation measures have been identified in this EIR to: 1) avoid potential land use compatibility issues associated with on-going agricultural operations, 2) ensure that residential development is compatible and complementary to the existing residential neighborhoods located adjacent to the project site, and 3) ensure that potential visual impacts are minimized to the extent feasible. Moreover, future buildout of the project site will be required to adhere to adopted General Plan policies. ~~reflect awareness of surrounding land uses as residential and non residential uses abut similar uses in the surrounding project vicinity.~~ **The project, as mitigated, is consistent with this provision.**
L-14	The maximum allowable residential density for new residential subdivisions or development projects shall be computed based on the gross area of the lot before dedications for highway setbacks, parks, streets, or other requirements.		The maximum residential density for the proposed project is 30 units per acre. Dedications for parks, streets, etc. have been considered and are part of the proposed project. Moreover, additional project-specific mitigation measures have been identified to ensure that adequate facilities are provided as part of project development. **The project, as mitigated, is consistent with this provision.**
L-15	The City shall require new subdivided lots to be adequate in size and shape for the range of primary and accessory uses designated for the area.		The proposed project provides lots of varying size and shape for the range of primary and accessory uses per new zoning designations as provided in the Specific Plan and Zoning Code. **The project is consistent with this provision.**
L-16	The pace of new residential development should be such that new residents can be absorbed into the fabric of the town and existing residents are not overwhelmed by newcomers. This can be accomplished in part by requiring phasing of larger residential projects and by ensuring that adequate infrastructure and public improvements are in place concurrently, or in advance of new		The project will be constructed in 4 phases and includes a Plan for Services. As identified elsewhere in this EIR, mitigation measures have been adopted to ensure project development provides adequate public services in accordance with City requirements. In addition, General Plan policies, as well as, policies identified in the Specific Plan, ensure that adequate

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	development.		facilities will be in place concurrently with project development. **The project, as mitigated, is consistent with this provision.**
L-17	Major new residential development is appropriate in the areas on the east and north sides of the developed portions of the City.		The Miravale III Specific Plan area lies north of the developed portions of the City in an area planned for expansion. **The project is consistent with this provision.**
L-19	In general, higher densities of residential development shall be located in areas served by the widest range of urban services, and shall be preferred along collector and arterial streets, within walking distance of schools, city parks and transit stops.		The Plan provides six (6) Village Residential neighborhoods. Villages 1, 2, 4, and 5 are within a ¼ mile walking distance to schools, commercial uses, parks, and transit. Village 3 is adjacent to commercial, transit, and parks. The sixth village (Village 6) is within walking distance to open space, parks, and transit. All villages are located adjacent to collector roads. Mitigation has been incorporated into this EIR to ensure that appropriately sized parks will be provided in connection with the development of the six Village Residential neighborhoods. Moreover, as future development is proposed in connection with the Village Residential neighborhoods, the merits of those developments will be reviewed on. an individual basis to ensure consistency with applicable requirements of the City's General Plan and the Specific Plan at that time. **The project, as mitigated, is consistent with this provision.**
L-20	The approval of new residential subdivisions shall incorporate provisions to ensure that an appropriate amount of new multi-family development is constructed concurrently, or in advance of, new single family residences.		Multi-family development is planned in Phases 1-4. The development agreement will provide policies that require the multi-family development be constructed concurrently, or in advance of, new single family residences. **The project, as mitigated, is consistent with this provision.**
Land Use - Commercial Development			
L-21	New commercial development shall be encouraged in Soledad near the freeway interchanges with Highway 101. Limited new neighborhood commercial development will be allowed within areas designated *Expansion Area*, and/or at specified nodes to provide for the everyday needs of the surrounding residential neighborhoods.		The two commercial centers are sited in the southwest corner of the project site, nearest San Vicente road and the highway 101 freeway interchange. In addition, limited neighborhood serving commercial designations are also included as part of the Specific Plan, which is located within a designated expansion area. **The project is consistent with this provision.**
L-23	In general, new retail commercial development should provide a		Two commercial centers; the Gateway Commercial Center,

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	wider range of shopping opportunities for the community.		and the Village Commercial Center are planned to contain a variety of shopping opportunities for the community. **The project is consistent with this provision.**
L-24	New commercial development shall be designed to encourage safe and efficient pedestrian circulation within and between commercial sites and nearby residential neighborhoods.		The ~~two commercial sites within the Plan Area~~ proposed Specific Plan contains policies and guidelines that provide for pedestrian designated walkways through parking lots, wider sidewalks around the building and parcel perimeters, and pedestrian connections to adjacent residential neighborhoods. At the time that design-level proposals are submitted for development within the designated commercial areas, those proposals will be evaluated for consistency with existing General Plan policies and the policies contained in the Specific Plan. The proposed Specific Plan, at a programmatic level, is considered to be generally consistent with this policy. **The project is consistent with this provision.**
L-25	New commercial development shall be designed to minimize the visibility of parking areas from public roadways.	Section 2.16 – Guideline 1	Design level drawings are not available at this stage. Parking lots visible from public streets should be adequately screened from vehicle view through one or more of the following: rolling earth berms, low screen walls, landscaping, changes in elevation, or combinations of above. Moreover, building orientation to the street with parking behind the buildings, main street format, and other guidelines contained in the Specific Plan would ensure consistency with this policy. In addition, mitigation measures have been incorporated into this EIR to ensure that aesthetic/visual impacts are reduced to the maximum extent feasible. **The future project design must comply with this provision.**
L-26	The visitor-serving sector of the local economy shall be maintained and expanded. New motels/hotels shall especially be encouraged in areas within walking distance of the downtown. Visitors to the nearby Pinnacles National Monument offers another potential market for visitor-serving land uses.		The project includes an opportunity site for future hotel adjacent to the golf course to expand the visitor-serving sector of the City's economy. Based on further review by the City of Soledad, the City has determined that consistency with this policy cannot be determined in the absence of a hotel market feasibility study to verify that the hotel site and use is feasible with and without the proposed golf course. Accordingly, a determination of policy consistency cannot be made in the absence of this additional information.. ~~**The project is**~~

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
			~~**consistent with this provision.**~~
Land Use - Public-Quasi-Public/Office Development			
L-32	The City shall designate adequate, appropriately located land for the development of City and County facilities and offices, schools, medical facilities, water facilities, and public safety facilities.		**Project consistent.** The proposed project, as mitigated, will provide adequate public facilities, including parks, open space, schools, and a police and fire station.
L-34	When considering plans for large-scale development, the City shall designate adequate, appropriately-located land for the development of quasi-public land uses, such as, hospitals, churches, private schools, cemeteries, and utility uses.		The Plan Area provides a church opportunity site as well as areas for infrastructure/utilities on site. **The project is consistent with this provision.**
L-35	The City shall promote the clustering of public and quasi-public uses such as schools and parks, libraries, child care facilities, and community activity centers. Joint use of public facilities shall be promoted, and agreements for sharing costs and operational responsibilities among public service providers shall be encouraged.		Joint use of the three public schools and adjacent parks is intended to be implemented in the development agreement. Policies have been incorporated into the Specific Plan to promote the joint use of public facilities. **The project is consistent with this provision.**
L-36	The City shall encourage efforts to locate adequate emergency services and other types of health care facilities in Soledad to meet the present and future needs of its residents.		The plan provides a potential site for a joint police/fire station. **The project is consistent with this provision.**
Land Use- Expansion Areas/Specific Plan Areas			
L-42	The City shall use Community Design Guidelines as a decision-making tool to ensure that new development incorporates the qualities and character desired by Soledad residents.		Design Guidelines have been provided for each urban land use within the Miravale III Specific Plan. Based on further review by the City of Soledad Community Development Department, the City has determined that the proposed Specific Plan is inconsistent with the requirements of Appendix B of the General Plan, which identifies specific standards for Specific Plans. Development in accordance with the guidelines contained in the proposed Specific Plan, as supplemented by existing General Plan requirements (see GP Policy L-3) will ensure that the proposed project, as mitigated, will be consistent with this policy. **The project, as mitigated, is consistent with this provision.**
L-43	Specific plans prepared for major expansion areas shall incorporate the standards described in Appendix B – Standards		a. Similar residential product types along the southern portion of the Plan Area and the extension of West Street and San

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	for Specific Plans. In general: a. New residential projects should be designed to integrate with existing neighborhoods to ensure that they do not destroy the established character. Subdivisions in City expansion areas should be designed so that individual, separately developed projects work together to create true neighborhoods with a sense of identity, instead of disjointed or isolated enclaves. b. Subdivision design should emphasize pedestrian connectivity within each project, and to adjacent neighborhoods, and nearby schools and parks. All streets and walkways should be designed to provide safe and pleasant conditions for pedestrians. Streets within neighborhoods should be no wider than needed to accommodate parking and two low-speed travel lanes. Sidewalks should be separated from curbs by parkway strips of at least four feet in width; and the parkways should be planted with canopy street trees. c. Specific plans should provide a range of residential housing types affordable to the widest range of income groups, consistent with the goals, policies and programs of the Housing Element of the General Plan. d. Subdivisions should be designed to provide usable public open spaces in the form of parks, linear bicycle and pedestrian trails, squares, and greens, as appropriate.		Vicente Road creates neighborhoods that are integrated and linked with existing residential development b. Pedestrian connectivity has been emphasized with the provision of 65 pedestrian park connections and neighborhood connections (refer to section 4.2.7 of the Specific Plan). Local streets cross-sections have been designed per City direction but many substantially exceed the maximum length of 520 feet per Appendix B standards. Sidewalks are separated from curbs by landscaped parkway strips in all instances except for Hillside Roads which do not require a parkway strip. c. Although a variety of housing types are planned, including single family detached, attached duplex, townhouses, and for rent apartments, the proposed Specific Plan does not provide the total amount of affordable housing required or adequately integrate such housing at the neighborhood level. **The provision of affordable housing is therefore inconsistent with the Housing Element of the City's General Plan.** d. Development of the proposed project entails the provision of public open space, parklands, and a semi-private golf course. In addition, mitigation measures have been identified in order to ensure the proposed project provides adequate public facilities to meet project generated demands. As the Specific Plan is inconsistent with additional standards in Appendix B of the General Plan, the City has determined the proposed project to be inconsistent with this policy. Appendix B identifies specific development standards with which Specific Plans must comply and implement. The City has generally identified that the proposed Specific Plan is inconsistent with the requirements of items #3, 5, 7, 8, 10, 11, 14, 15, 16, 19, 25, and 26. Consistency will require revision of the Specific Plan, prior to project approval, consistent with the requirements contained in Appendix B. **The project~~, as mitigated,~~ is ~~consistent~~ inconsistent with this provision.**
L-44	The City shall require that all new development be designed to complement the scale and character of existing development.		**Project inconsistent.** Development of the proposed project, while physically transforming a previously undeveloped

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	Views of the surrounding hills and mountains shall be preserved through such means as design review, sign control, undergrounding of utilities, grading and tree removal standards.		project site into a new development, would complement the existing residential character of Soledad. As identified in **Section 4.1 Aesthetics,** development of the proposed project would result in a significant unavoidable impact to a scenic vista. Although measures are incorporated to insure that these impacts would be minimized to the extent feasible, project development would substantially alter the existing visual character of the Hillside portion of the project site. Existing views of the project site as perceived from adjacent uses would ~~consistent~~ consist predominately of new urban features, such as roads, structures, and other factors. The proposed project, which includes several General Plan amendments pertaining to development within the hillside area, would still degrade the existing character of the surrounding hills and mountains. Although these amendments would revise a number of policies prohibiting development above the 400' elevation contour, project impacts would still substantially alter the existing character of these resources.
L-45	The City shall require all new development to be planned and designed in a manner which employs design, construction and maintenance techniques that: a. Avoids locating structures along ridgelines and steep slopes. b. Incorporates design and screening measures to minimize the visibility of structures and graded areas. c. Maintains the character and visual quality of the area.		**Project inconsistent.** As previously identified in **Section 4.1 Aesthetics,** project development would substantially alter the existing visual character of the project site such that project impacts would be significant and unavoidable. Moreover, project development, including development above the 400' elevation contour, would also result in a significant unavoidable impact to a scenic vista. Although the proposed project includes several amendments to the General Plan to address potential inconsistencies with development within the Hillside portion of the site, project development would nevertheless conflict with the provisions of this policy as these impacts were identified as significant and unavoidable.
L-46	New development on hillsides shall employ design, construction and maintenance techniques that: a. Ensure that development near or on portions of hillsides do not cause or worsen natural hazards such as erosion, sedimentation, or fire hazards. b. Minimize risk to life and property from slope failure,	4.1.2.12	**Project inconsistent.** Although the proposed Specific Plan contains numerous policies and guidelines to minimize erosion and potential geological hazards within the Hillside portion of the project site, development within the project area would result in a significant and unavoidable impact to the existing visual quality. As a result, the proposed project is considered

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	landslides and flooding. c. Include erosion and sediment control measures including temporary vegetation sufficient to stabilize disturbed areas. d. Maintain the character and visual quality of the hillside.		inconsistent with this policy.
L-47	The City may, where appropriate, require new development to provide pedestrian amenities along public sidewalks, such as seating and 'pocket parks'.		Public amenities such as benches will be provided around commercial centers and parks. Pocket parks may be included in the ultimate design of the Village Residential areas. **The project is consistent with this provision.**
L-49	The form, scale and character of new residential development shall emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks.		Figure 2-6 of the Specific Plan summarizes the number of floors for each product type. Local residential streets are required to provide street trees separated by a 5' wide planting strip. Single family units are also required to provide adequate offstreet parking and landscaped front yards. Mitigation has been incorporated into this EIR to ensure that the proposed Specific Plan will comply with the requirements of this policy; please see Mitigation Measure 4.1-11. Please also see the consistency determination for General Plan Policy L-43 above as it relates to the adequacy of the proposed Specific Plan in relationship to existing City requirements. **The project, as mitigated, is consistent with this provision.**
L-50	Multi-family development shall include usable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood.		**Project consistent.** Multi-family development is proposed within six areas designated as Village Residential. Currently, no formal plans have been submitted for development within these areas. Mitigation measures have been incorporated to ensure that adequate open space and improved parkland are provided within the Village Residential areas consistent with the intent of this policy. Moreover, individual applications for multi-family development within the Miravale III Specific Plan area would be required to adhere to the requirements of this policy.
L-51	All exterior lighting in new development shall be located and designed so as to avoid shining directly onto nearby residential properties, and shall minimize offsite glare. Proponents of commercial or industrial projects on property adjacent to residential areas shall submit a lighting plan to the City for review and approval; said plan shall incorporate features such as		City shall review lighting plan prior to approval of commercial projects. Design guidelines and mitigations have also addressed light glare issues. **The project, as mitigated, is consistent with this provision.**

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	low level, downward-directed exterior lights to achieve the intent of this policy.		
L-52	Historically or architecturally significant buildings shall not be demolished or substantially changed in outward appearance in a way that diminishes the historical character, unless doing so is necessary to remove a threat to health and safety and other means to avoid the threat are infeasible.		**Project consistent with mitigation.** As identified in **Section 4.5 Cultural Resources,** the project applicant will be required to relocate the historically significant Lorentzen house in order to ensure project impacts are less-than-significant. Moreover, the relocation of this building would not diminish the historical character of the house.
Housing			
H-1	The City of Soledad shall promote the expansion of its LAFCO Sphere of Influence and annexation of additional land consistent with its General Plan Land Use Element to accommodate long-term demand for residential development.		The project site includes portions of the San Vicente West, Mirrasou, and Northwest Expansion Areas. These expansion areas combine for residential capacity of 9,012 units on 1,488 acres. Development of the proposed project, as described in this EIR, would exceed the development projections contained in the City's General Plan. Mitigation measures identified in this EIR, if adopted, would ensure that future buildout within the General Plan expansion areas would not exceed those development projections. Please refer to the analysis contained in **Section 4.11 Population and Housing** for further discussion. Specifically, please refer to Mitigation Measures 4.11-1 and 4.11-2, as modified in the Final EIR, for more information. **The project, as mitigated, is consistent with this provision.**
H-3	The City of Soledad shall require new residential areas to contain a mix of housing types targeted to very low, low, moderate, and above moderate households in approximately the proportion that each of these income categories represent in the AMBAG Fair Share Housing Allocation.		Approximately 340 very low, 318 low, 569 moderate, and 1,047 workforce housing units are proposed within the Plan Area. Although the proposed project does not provide the required amount of affordable housing units, as described in the EIR, the project proponent will be required to enter a Development Agreement with the City, as stipulated by the City's General Plan. The Development Agreement or other legal instrument will prescribe the parameters of the development of affordable housing units consistent with the City's Housing Element, Inclusionary Housing Ordinance, and the final revised Specific Plan. The City Council (CC) shall

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
			review the merits of a development agreement (DA) which will demonstrate project's consistency with the city's affordable housing requirements per the housing element and inclusionary housing ordinance~~.~~ As identified in this EIR, the project, as currently proposed, is inconsistent with the Housing Element. As a result, the EIR identified that Mitigation Measure 4.11-3 was necessary. Mitigation measures under the Population and Housing Sections of this EIR also incorporate this policy. **With mitigation and City ~~PC~~ determination on above, the project ~~is~~ will be consistent with this provision.**
Housing – Removal of Development Constraints			
H-9	The City of Soledad shall ensure that city site improvement standards, development review procedures, and development fees do not unreasonably constrain the development, conservation, and rehabilitation of housing.		Housing development shall comply with the Specific Plan and all applicable housing policies and will not unreasonably constrain the development, conservation, and rehabilitation of housing. **The project is consistent with this provision.**
H-10	The City of Soledad shall ensure the availability of adequate public facilities for the expected housing need of the city.		The ~~developer~~ City will prepare a Development Agreement and the applicant will complete a Plan for Services that conforms with the City's adopted Master Plans concurrent with project approval. As identified elsewhere in this EIR, the proposed project, as mitigated, would be adequately served by public facilities. **The project, as mitigated, is consistent with this provision.**
Housing – Energy Conservation			
H-11	The City of Soledad shall support and initiate, where feasible, public and private energy conservation programs which will reduce the energy needs of housing in Soledad and so increase housing affordability.	5.1.4.10	The Specific Plan contains goals to maximize energy conservation. In addition, mitigation measures have been incorporated into this EIR to promote the use of solar energy devise and encourage solar orientation of residential and buildings building to reduce the use of fossil fuels. **The project, as mitigated, is consistent with this provision.**
Circulation – Traffic Management			
C-1	Level of Service "D" or better shall generally be maintained on all streets and intersections. Lower levels of service may be accepted during peak times or as a temporary condition, if improvements to address the problem are programmed to be developed. To identify potential impacts of new development on		According to Hexagon's 2006 Traffic Impact Analysis Report, a Level of Service "D" or better shall be maintained upon project build-out. Mitigation measures have been identified in this EIR to ensure that all project-related transportation impacts would be reduced to the greatest extent feasible. **The project,**

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	traffic service levels, the City shall require the preparation of traffic impact analyses generally at the sole expense of the developer for developments determined to be large enough to have potentially significant traffic impacts.		**as mitigated, is consistent with this provision.**
C-2	Streets shall be dedicated, widened, extended and constructed in accordance with City standards. Dedication and improvements of full rights-of-way shall not be required in existing developed areas where the City determines such improvements are infeasible or undesirable. New development shall be responsible for improving a minimum one-half street along the outer-boundaries of each subdivision along subdivision property where street extensions are identified. Other deviations from these standards shall be permitted upon a determination by the City Engineer that safe and adequate public access and circulation are preserved by such deviations.		This policy will be implemented by the pending Vesting Tentative Map and the Developer Agreement. **The project is consistent with this provision.**
C-5	The street system in residential neighborhoods shall provide safe and logical connections to the existing street pattern, and connectivity to the range of complementary land uses within neighborhoods (housing, schools, parks, neighborhood shopping, etc.). The use of multiple collector streets shall be favored over the use of arterials in new residential subdivisions.		Connections to the existing street pattern have been provided via the proposed extension of West Street and San Vicente Road. New circulation alignments within the Plan Area have been designed to effectively connect residential neighborhoods to commercial and recreational areas. Sidewalks adjacent to commercial centers and schools will be wider to accommodate higher levels of pedestrian traffic. **The project is consistent with this provision.**
C-8	The City shall manage the street network so that the standards presented in policies C-1 and C-12. are not exceeded. The City will require new development to mitigate the traffic impacts it causes, or the City will limit development along streets where congestion levels are unacceptable		The project, as proposed, provides mitigation for traffic impacts including payment of traffic impact fees to maintain Level of Service "D" or better upon project build-out. **The project, as mitigated, is consistent with this provision.**
C-9	New local streets shall be developed consistent with the goals, policies and programs of the Land Use Element of the General Plan.		Local streets within the Miravale III Plan Area have been designed per City standards as established by the General Plan with respect to cross-sections; however, project street design is does not comply with General Plan standards regarding maximum street length and the use of cul-de-sacs. Many of the project streets are designed as cul-de-sacs, and many exceed the standard of 520 feet for maximum street length—a number of proposed streets are 1,000 feet or more in length.. **The**

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
			project is, <u>therefore, inconsistent</u> with this provision.
C-10	Facilities that promote the use of alternate modes of transportation, including bicycle lanes, pedestrian and hiking trails, park-and-ride lots and facilities for public transit shall be incorporated into new development, and shall be encouraged in existing development.		Over 27 miles of trails, sidewalks, and bicycle lanes will be provided to promote alternative modes of transportation. Three transit stops are also planned. **The project is consistent with this provision.**
C-13	The City shall ensure through a combination of traffic impact fees and other funding mechanisms that new development pays its fair share of the costs of circulation improvements required by such development.		Site improvements will be constructed by the developer. Off-site improvements will be addressed through the EIR mitigation requirements. **The project, as mitigated, is consistent with this provision.**
C-14	The City shall prohibit the development of private streets in new residential projects, unless approved on a project specific basis where circumstances support such a use and the streets are privately maintained.		No private streets are proposed. **The project is consistent with this provision.**
C-15	New development shall continue the existing street pattern, where logical.		This has been accomplished with the planned extension of West Street and San Vicente Road. **The project is consistent with this provision.**
C-16	Roundabouts will be considered as an alternative to traditional intersection controls.		One roundabout is proposed at project entry. **The project is consistent with this provision.**
Circulation – Parking			
C-17	The City shall require the provision of adequate off-street parking in conjunction with all new development. Parking shall be located convenient to new development and shall be easily accessible from the street. The adequacy and appropriateness of parking requirements in the Zoning Ordinance shall be periodically evaluated.		Parking requirements are consistent with 17.36.020 of the City of Soledad's Municipal Code. All future applications for development within the Specific Plan area will be required to adhere to the parking requirements identified in Section 17.36.020 per the Specific Plan. **The project is consistent with this provision.**
Circulation – Bicycle Circulation			
C-21	Bicycle routes shall emphasize paths separate from vehicle traffic to the maximum extent feasible, but shall also include bicycle lanes within public streets.		Bike lanes are proposed on collector streets. **The project is consistent with this provision.**
C-22	Bike lanes and paths shall be designed and maintained to improve bicycling safety, and convenience, and encourage people to use bicycles to commute to work or school.		Over 4 miles of Class II bike lanes are planned. Bicycles will also be permitted on the Hillside Trail and Linear Park Trail. **The project is consistent with this provision.**
C-25	New development shall provide bike lanes and paths, secure bicycle storage and parking facilities.	Section 2.11 policy j	**Project consistent.** As proposed, the project includes over 4 miles of Class II bike lanes within the project area. Future

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
			development within the commercial and village residential areas will be required to provide additional bike facilities, including storage racks, consistent with this requirement
Circulation – Pedestrian Circulation			
C-27	The City shall complete a continuous network of sidewalks and separated pedestrian paths connecting housing areas with major activity centers and with trails leading into City and county open space areas.		Over 15 miles of separated sidewalks are planned. These sidewalks will connect housing areas to major activity centers such as parks, open space, commercial, and civic uses. **The project is consistent with this provision.**
C-28	New commercial development and development in Specific Plan areas shall provide sidewalks and pedestrian paths consistent with applicable State, federal and local plans, programs and standards.		Figure 2-7 of the Miravale III Specific Plan illustrates the location of pedestrian amenities such as sidewalks and pedestrian paths. The Gateway Commercial Center is intended to provide the same. **The project is consistent with this provision.**
Parks & Recreation – Parks			
PR-1	The City will acquire future park and recreation land and facilities by: a. Requiring park dedications from future residential subdivisions at the rate of one acre per 1,000 population anticipated in the project; b. Requiring payment of a park impact fee, or requiring the dedication of land and improvements in-lieu of fees, from all new development; c. Cooperating with Monterey County to acquire land for a new regional park in the Soledad planning area; d. Acquiring parkland near existing or potential public park or recreation sites, or near quasi- public or private sites that have a good opportunity for a joint use agreement. Acquired parkland should be contiguous to proposed or existing park and recreation facilities or provide a logical connection. e. Pursuing joint use agreements with public and private schools, other public government agencies, private park and recreation providers, and institutions with potential parkland to make existing or proposed park and recreation facilities available to the community on an extended basis.	4.1.2 policy 3	**The project, as mitigated, is consistent with this policy.** The proposed project, consistent with the requirements of this policy, provides park and recreational areas within the project area. a. As currently proposed, the project includes approximately 45.60 acres of parkland, including 24.27 acres of parkland to be provided in conjunction with the development of the multi-family Village Residential areas. In addition, the proposed project also includes an approximately 159 acre golf course and approximately 62 acres of open space. Mitigation 4.12-6, as revised herein, requires the dedication of improved parkland at the ratio of 5 acres/1,000 new residents. b. The proposed project will be required to provide improvements or pay park impact fees, in addition to the dedication of land. c. Not applicable. d. Parks and recreational facilities are located throughout the proposed development and several facilities are planned adjacent to educational facilities. e. A joint use agreement may be established between the

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
			City and the School District for shared use of school recreational facilities.
Parks & Recreation – Trails			
PR-10	The City should provide a pedestrian network within the City Limits. The system should: a. Accommodate pedestrians and bicycles. b. Connect residential neighborhoods with: 1) Soledad's downtown, 2) schools, 3) City park and recreation facilities, and 4) regional trails.		The Specific Plan provides both bike lanes and pedestrian sidewalks. All parks within the Plan Area have pedestrian accesses logically located in key areas. Signage may be provided throughout the Plan area to guide bicyclist toward trails, parks and other points of interest. **The project is consistent with this provision.**
Parks & Recreation – Acquisition & Development			
PR-16	Parks shall be designed to be compatible with the neighborhoods in which they are located, and shall provide security and privacy to adjoining properties. Where necessary, buffers shall be provided between park and recreation lands and adjacent development to provide privacy and a physical separation between uses.[4]		Village 1 Park and Z Street Park are planned to be joint use facilities with the adjacent elementary schools. These parks will be lit to ensure security. I Loop Park and Crest St. Park are surrounded by residences which will provide "eyes on the park." Lighting will be provided at parks. **The project is consistent with this provision.**
Parks & Recreation – Management			
PR-24	New development shall be required to add to proposed or existing park and recreation projects where legally feasible. Public or private development shall provide, as appropriate and legally feasible: 1) a buffer between proposed development and existing park, recreation and/or open space parcels to minimize conflicts between development and existing facilities; and 2) gates, fences, or other deterrents when such facilities are deemed necessary to discourage prohibited or non-compatible uses from entering park, recreation or open space lands.	4.1.2 policy 12	The plan area is not adjacent to existing park and recreation facilities. Where new parks are proposed fencing will be provided as a component of the residential development. A 100' foot buffer will be provided between structures and the hillside open space area. **The project is consistent with this provision.**
PR-25	New development shall not adversely impact adjacent park, recreation or open space lands.	4.1.2 policy 12	There are no park or recreation lands adjacent to the Plan Area. A 100' foot buffer will be provided between structures and the hillside open space area. **The project is consistent with this provision.**

[4] Buffers may include setbacks, landscaping, fencing, and/or dramatic breaks or changes in topography.

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
Parks & Recreation – Funding			
PR-33	New development shall be required where legally feasible to provide its fair share of public park and recreation opportunities. New development within the City shall be required to provide park and recreation lands or facilities consistent with this Element. Conditions placed on new development shall be reasonable and consistent with the nature and extent of such development plans. The City shall require the dedication and improvement of park land even in circumstances where the total cost to improve such parkland exceeds the value of the corresponding development impact fee.	4.1.2 policy 2	**Project consistent with mitigation.** As identified in **Section 4.12 Public Services,** the proposed project, as mitigated, will provide approximately 78 ~~45.60~~ acres of improved parkland consistent with existing General Plan policies; see Mitigation 4.12-6, as revised in this FEIR. ~~as well as related provisions contained in the Miravale III Specific Plan~~. In addition, the proposed project also includes approximately 62 acres of open space and a 159 acre golf course.
Public Services & Facilities – Services & Facilities			
S-1	The City shall ensure through the development review process that adequate public facilities and services are available to serve new development. New development shall not be allowed until adequate public services and facilities to serve such development are provided. Where existing facilities are inadequate, new development may only be approved when the following conditions are met: a. The developer and/or City can demonstrate that all necessary public facilities will be adequately financed and installed in time (through fees or other means); and b. The facilities improvements are consistent with applicable facility plans approved by the City or other agencies in which the City is a participant.		Improvements for the project infrastructure must be in compliance with the adopted City wide Urban Water Management Plan, Water Master Plan, project Water Supply Assessment and Written Verification of Supply, Long-Term Wastewater Management Plan, and other facility related planning documents. As proposed and with mitigation, adequate public services are available to serve the proposed project. Final design of project infrastructure will be required prior to the recordation of the final map and the City of Soledad will be responsible for insuring that project infrastructure is consistent with applicable City Standards. **The project is consistent with this provision.**
S-2	The City shall plan for the expansion of needed water and sewer infrastructure including, but not limited to, the expansion of water production, storage and distribution facilities, the expansion of wastewater collection and treatment capacity, and storm drainage facility expansion.		Adequate public services are available to meet project generated demands assuming project mitigation. Final infrastructure plans will be reviewed by the City of Soledad prior to the recordation of the final map to insure that infrastructure sizing adheres to City requirements. For more information regarding project specifics, please refer to **Section 4.14 Utilities and Service Systems.**
S-3	Public facilities, such as wells, pumps, tanks, and yards shall be located and designed so that noise, light, odors, and appearances		**Project consistent.** Future development of project infrastructure, including wells, pumps, tanks, and similar

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	do not adversely affect nearby land uses.		public facilities would be required to be built in conformance with this policy.
Public Services & Facilities – Funding			
S-4	Where new development requires the construction of new public facilities, the new development shall pay its fair share of the construction. Where necessary, the City shall require the dedication of land within newly developing areas for public facilities.		**Project consistent <u>with mitigation</u>.** The proposed project, as mitigated, would provide adequate public facilities in order to accommodate project demand. More specifically, a site for fire and police facilities has been integrated into the plan area <u>although it may need to be enlarged to meet facility needs</u>. School sites have also been integrated and coordinated with the School District; <u>however, additional sites are required to serve the projected student population.</u> Park sites, open space trails, roads, and the golf course will be developed as a part of this plan.
S-5	The City shall require that new development pay its fair share of the cost of all existing facilities it uses based on the demand for these facilities attributable to the new development; exceptions may be made when new development provides alternative sources of funding or equipment to offset any shortfall in revenues.		**Project consistent.** Development of the proposed project would be required to submit payment of all impact fees consistent with current adopted City provision. Fore more information, please refer to **Section 4.12 Public Services** and **Section 4.14 Utilities and Service Systems.**
Public Services & Facilities – Water			
S-8	The City shall promote the efficient use of water and reduced water demand by: a. Requiring water-conserving design and equipment in new construction; b. Encouraging water-conserving landscaping and other conservation measures; c. Encouraging the retrofitting of existing fixtures with water-conserving fixtures.		**Project consistent.** All project wastewater would be treated at a wastewater treatment plant located on the southwest corner of the project area. Recycled wastewater would subsequently be used for irrigation purposes, including open spaces area, front yards, and golf course areas. Final infrastructure plans will be reviewed by the City of Soledad prior to the recordation of the final map to insure that infrastructure sizing adheres to City requirements. For more information regarding project specifics, please refer to **Section 4.14 Utilities and Service Systems.**
S-10	The City will manage the increase in water demand from new development to help insure groundwater resources are not overdrafted. The City will work with Monterey County and public and private water entities to plan for the efficient, long term management of groundwater resources.		**Project consistent.** As identified in the City Water Master Plan and the Urban Water Management Plan adequate water is available to serve the proposed development. Moreover, the WSA further identifies that adequate water exists to serve the proposed development

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
S-11	Gravity flow for sewer and water service shall be employed wherever feasible.		**Project consistent.** Gravity flow for sewer and water services will be employed where feasible. Final design of project infrastructure will be required prior to the recordation of the final map and will be subject to the review and approval of the City.
Public Services & Facilities – Drainage			
S-14	The City shall strive to improve the quality of urban stormwater runoff and quality of groundwater recharge through the use of appropriate mitigation measures including, but not limited to, infiltration/sedimentation basins, oil/grit separators, and other management practices, including storm water retention.		~~**Project consistent.**~~ **The project, as mitigated, is consistent with this policy.** As identified in **Section 4. Hydrology and Water Quality** mitigation measures have been incorporated to ensure that project-impacts would be reduced to a less-than-significant level. These measures have been incorporated to ensure that project development is consistent with the City's adopted Storm Drain Master Plan.
S-15	The City shall require new development to adequately mitigate increases in stormwater peak flows and/or volume. Mitigation measures shall take into consideration impacts on adjoining properties and impacts on groundwater recharge related to existing and proposed water wells.		~~**Project consistent.**~~ **The project, as mitigated, is consistent with this policy.** As identified in **Section 4. Hydrology and Water Quality** mitigation measures have been incorporated to ensure that project-impacts would be reduced to a less-than-significant level. These measures have been incorporated to ensure that project development is consistent with the City's adopted Storm Drain Master Plan.
S-16	The City shall encourage project designs that minimize drainage concentrations and impervious coverage and maintain, to the extent feasible, natural site drainage conditions. Drainage onto adjacent properties shall be restricted to pre-project levels minus any runoff from the area to be developed.		~~**Project consistent.**~~ **The project, as mitigated, is consistent with this requirement.** As identified in **Section 4.8 Hydrology and Water Quality** project-specific mitigation measures have been incorporated to ensure that project development is consistent with the City's adopted Storm Drain Master Plan and other relevant facility planning documents.
S-17	The City shall require projects to allocate land as necessary for the purpose of retaining flows and/or for the incorporation of mitigation measures for water quality and supply impacts related to urban runoff.		~~**Project consistent.**~~ **The project, as mitigated, is consistent with this requirement.** Mitigation measures have been incorporated to address water quality and urban runoff concerns. For more information please refer to **Section 4.8 Hydrology and Water Quality.**
S-19	Engineered drainage plans shall be required for all development projects. Engineered drainage plans shall incorporate a collection and treatment system for stormwater runoff consistent with applicable federal and State laws.		**Project consistent.** As a standard condition of approval the project applicant will be required to submit an engineered drainage plan consistent with the City's adopted Stormwater Drainage Master Plan.

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
Public Services & Facilities – Schools			
S-20	The City will work cooperatively with the Soledad Unified School District to monitor housing, population and school enrollment trends and in planning for future school facility needs. The City shall assist the District in locating new school sites.		**Project consistent.** The City of Soledad is currently working with the School District to identify a future high school site within the City of Soledad. Per the School District's comment letter, a second high school will be needed to serve the project's projected student population. For more information, please see **Section 4.12 Public Services**.
S-21	The siting of new schools shall be coordinated with the City's Circulation Element to ensure that traffic conflicts are avoided, the safety of students is addressed and roadway function is not reduced, including provisions for off street student drop-off/pick up.		The two elementary schools have been located along collector and local streets in order to provide safe student drop-off/pick up locations. All new school facilities provided in conjunction with the proposed project would be required to adhere to this policy. **The project is consistent with this provision.**
S-22	The City will work closely with the school district to secure adequate funding for new school facilities, and where legally feasible, shall provide a mechanism which requires development projects to mitigate the cost of providing school facilities needed to serve such development, consistent with relevant provisions of State law.		**Project consistent.** As identified in **Section 4.12 Public Services** the project applicant/developer will be required to submit payment of a school impact fee for each type of development within the project area.
S-23	The City, to the extent feasible, shall ensure that new school facilities are constructed and operating prior to the occupation of residences which the schools are intended to serve.		**The project, as mitigated, is consistent with this policy.** The City is currently in the process of coordinating with the School District regarding the timing of new school facilities. In addition, all new facilities provided as part of the proposed project would be required to adhere to this policy.
Public Services & Facilities – Solid Waste			
S-27	The City shall require that all new development complies with applicable provisions of the Monterey County Integrated Waste Management Plan.		**Project consistent with mitigation.** As requested by the Salinas Valley Solid Waste Authority, project-specific mitigation measures have been identified in order to insure that construction generated waste is recycled to the greatest extent possible. For more information, please see **Section 4.14 Utilities and Service Systems.**
Public Services & Facilities – Police Protection			
S-29	The City shall strive to achieve and maintain a ratio of a minimum of 1 police officer per 1,000 residents.		**Project consistent with mitigation.** In order to maintain the desired ratio of police officers, development of the proposed project will be required to fund a fully operational police sub-station within the project site through the payment of

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
			development impact fees. <u>This sub-station, as required pursuant to Mitigation Measure 4.12-1, must be operational prior to the construction of Phase 2.</u> Please see **Section 4.12 Public Services** for further information.
S-30	The City shall strive to achieve and maintain emergency response time to a maximum of 5 minutes for police emergencies.		**Project consistent.** As identified above, the proposed project includes a site for the future location of a police substation, which the applicant/developer will be responsible for funding. The construction of a substation in this location will insure that response times will be within this timeframe.
S-32	The City shall require new development to pay its fair share of providing or funding facilities that, at a minimum, achieve and maintain the above police protection standards.		**Project consistent.** As identified in **Section 4.12 Public Services** the project applicant/developer will be required to submit payment of all applicable fees in order to maintain the police protection standards enumerated above.
Public Services & Facilities – Fire Protection			
S-36	The City shall strive to achieve and maintain an emergency response time of 5 minutes or less for fire emergencies over 90% of the City.		**Project consistent <u>as mitigated.</u>** The proposed project, as mitigated, contains measures to in order that adequate public facilities are provided to ensure that emergency response time are within the established target range. More specifically, project development would result in the construction of both a police and fire substation within the project area.
S-37	The City shall require new development to pay its fair share of providing or funding facilities that, at a minimum, achieve and maintain the fire protection standards identified in Policies S-35 and S-36.		**Project consistent.** The project applicant/developer will be required to submit payment of fees in order to insure that facilities are adequately funded. For more information, please refer to **Section 4.12 Public Services.**
S-38	The City shall ensure that all proposed developments are reviewed for compliance with fire safety standards per the Uniform Fire Code and other City standards and ordinances.		**Project consistent.** All new development will be reviewed by the City for consistency with fire safety standards contained in the Uniform Building Code, as well as, other City standards and ordinances.
S-39	New non-residential development and non-residential additions of over 100 square feet of habitable space shall provide fire sprinklers in accordance with City standards, and as determined by the Fire Marshal. New residential development shall be provided with fire sprinklers unless the developer provides studies that prove the standard identified in Policy S-35 is not negatively affected.		**Project consistent.** Future buildout of the project site will be required to adhere to these standards.

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
Conservation / Open Space – Agricultural Resources			
C/OS-1	The City shall discourage "leapfrog" development and development in peninsulas extending into agricultural lands to avoid adverse effects on agricultural operations.		The project site is located directly north of existing city limits and the proposed project will not adversely affect surrounding agricultural operations. Project site includes Williamson Act property which will remain in open space/ag use per the contract until cancellation date (approximately ~~18 years~~ 2026), unless an earlier contract termination date is approved by the County and State.. **The project is consistent with this provision.**
C/OS-2	The City shall retain the agricultural land use designation on lands within its planning area until the land is needed for urban development.		**Project consistent.** The project site is currently located within the County of Monterey and is zoned for agricultural use. The subject site, however, is designated within the City of Soledad General Plan as a future expansion area to accommodate projected growth as envisioned under the 2005 General Plan. Upon annexation, the subject site would be appropriately zoned for commercial and residential uses consistent with the Miravale III Specific Plan except for the Williamson Act parcel which would be zoned Urban Reserve..
C/OS-3	The City shall ensure that new development and public infrastructure projects do not encourage expansion of urban uses outside the general plan area into areas designated *Agriculture* by the Monterey County General Plan.		The project site is located within expansion areas as designated in the Land Use Diagram of the General Plan. Williamson Act property will remain in open space/ag use per the contract until cancellation date. **The project is consistent with this provision.**
C/OS-4	The City shall support the agricultural economy by encouraging the location of agricultural support industries in the City, establishing and promoting marketing of local farm products, and providing its regional fair share of adequate housing to meet the needs of agricultural labor.		According to the Specific Plan, the proposed project will provide ~~2,276~~ 1,229 units of affordable ~~and workforce~~ housing. ~~which will exceed City's regional fair share of adequate housing units (799 units) to meet the needs of agricultural labor.~~ Based on the analysis contained in this EIR, the proposed project would not provide the required amount of affordable housing units as stipulated in the City's Housing Element. Mitigation, however, has been identified in the EIR to ensure that the proposed project would provide the required number of affordable units; please see Mitigation Measures 4.11-3 and 4.11-4. **The project, as mitigated, is consistent with this provision.**

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
C/OS-5	The City shall require a right-to-farm condition to all future subdivision maps adjacent to farmlands.		**Project consistent <u>as mitigated</u>.** The proposed project, as mitigated, contains right-to-farm measures. Please see **Section 4.2 Agricultural Resources** for further discussion.
C/OS-6	The City shall require development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses.		<u>The\proposed project, with mitigation as provided in this FEIR, will provide a minimum</u> 100' wide ~~linear parkway~~ <u>agricultural buffer, with physical barriers,</u> on the western border of the Plan Area <u>and 50 foot buffers on the project's northerly and easterly boundaries</u> **The project, <u>as mitigated</u>, is consistent with this provision.**
Conservation / Open Space – Scenic Resources			
C/OS-7	The City shall require new public and private development to protect scenic resources by: a. Prohibiting structures along ridgelines, steep slopes (above the 400 foot elevation contour), or in other highly visible locations unless no practical alternative is available, or such a location is necessary to protect public health and safety; b. Utilizing natural landforms and vegetation for screening structures, access roads, building foundations, and cut and fill slopes; c. Requiring landscaping which provides a landscape transition between developed areas and adjacent open space or undeveloped areas; and is compatible with the scenic resource being protected; d. Incorporating sound Soil Conservation Service practices and minimizing land alterations. Land alterations shall be minimized by: keeping cuts and fills to a minimum; limiting grading to the smallest practical area of land; limiting land exposure to the shortest practical amount of time; replanting graded areas to insure establishment of plant cover before the next rainy season; and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur; e. Designing roads, parking, and utilities to minimize visual impacts. If possible, utilities shall be underground. Roadways and parking shall fit the natural terrain; and	4.1.2 policy 12	**Project inconsistent.** Although the proposed project includes several General Plan amendments to facilitate project development, the project, as currently proposed, would result in significant and unavoidable visual impacts due to development above the 400' elevation contour. Therefore, the proposed project is considered to be inconsistent with the provisions of this policy. It is important to note, however, that despite the inconsistencies, the Miravale III Specific Plan identifies specific measures and guidelines for development within areas of visual sensitivity.

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	f. Designing projects to fit the site's scale and character. Structures shall be designed and located so: they do not silhouette against ridgelines, or hilltops; roof lines and vertical architectural features blend with and do not detract from the natural background or ridge outline; residential density and massing is decreased with increased elevation where it would mar the scenic quality of the scenic resource; they fit the natural terrain, and they utilize building materials, colors, and textures that blend with the natural landscape and avoid the creation of high-contrast situations.		
Conservation / Open Space – Hillside Protection			
C/OS-8	The City shall require public or private development to: a. The City shall designate hillside areas above the 400 foot elevation contour as *Open Space/Grazing, Public Facility* (parkland) or *Agricultur*e. b. Locate primary structures, accessory structures, paving, and grading at the base of a hill (generally that are below the 400 foot contour or 15 percent slope) unless: (1) no practicable alternative is available, (2) the location on a greater slope or at a greater elevation provides more aesthetic quality, or (3) the location is necessary to protect public health and safety. c. Utilize design, construction, and maintenance techniques that: (1) preserve and enhance the hillsides; (2) ensure that development near or on portions of a hill do not cause, or make worse natural hazards (such as erosion, sedimentation, fire, or water quality concerns); (3) include erosion and sediment control practices including temporary vegetation sufficient to stabilize disturbed areas; (4) minimize risk to life and property from slope failure, landslides, and flooding; (5) maintain the character and visual quality of the adjacent hillside. d. Incorporate recreation and public access on or near hillsides consistent with this Element.		**Project inconsistent.** As identified above, the project, as proposed, consists of several General Plan amendments pertaining to the development above the 400' elevation contour. Despite the incorporation of General Plan amendments to facilitate development within the project area, the proposed project would nevertheless conflict with this policy as significant and unavoidable visual impacts would occur due to project development. Moreover, as discussed previously, this policy was adopted in order to mitigate potential adverse impacts associated with buildout of the General Plan.
C/OS-9	The City shall support the preservation and enhancement of		~~**Project Consistent.**~~ The Hillside Development Standards

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	natural land forms, natural vegetation, and natural resources to the maximum extent feasible.		Section II in Appendix A of the Miravale III Specific Plan states that the project development will: • Maintain the existing open rural character, • Be in harmony with the natural setting, • Conserve land forms and other features of the natural landscape, • Preserve wildlife habitat and movement corridors, • Protect and preserve viewsheds of the mountains, and • Promote the establishment of native trees and shrubs. the project, as proposed, is inconsistent with this policy: grading for roads on steeper slopes and ridgeline development in the project area would not conserve landforms, nor protect the viewshed, and would significantly impact wildlife habitat; Although mitigation measures identified in this EIR would reduce a number of related impacts, the proposed Specific Plan would nevertheless conflict with this policy as significant and unavoidable visual and biological impacts would occur as a result of hillside and ridgeline development. **The proposed project is therefore inconsistent with this provision.**
Conservation / Open Space – Plant, Animal & Related Habitat Protection			
C/OS-10	The City shall support State and federal laws and policies to preserve populations of rare, threatened, and endangered species by ensuring development does not adversely affect such species in a significant way or by fully mitigating adverse effects.		**Project consistent.** As identified in **Section 4.14 Biological Resources** the project will provide mitigation to limit adverse impacts to rare, threatened, and endangered species. In addition, project development will be required to adhere to all applicable State and Federal requirements pertaining to biological resources within the project area. Compliance with existing laws, in addition to the incorporation of project specific mitigation insures that the proposed project is consistent with this provision.
C/OS-11	The City shall require that significant natural, open space, and cultural resources be identified in advance of development and incorporated into site-specific development project design to the		**The project, as mitigated, is consistent with this policy.** In addition to providing ~~45.60 acres of~~ improved parkland at the rate of 5 acres per 1,000 residents per Mitigation Measure

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	extent feasible.		4.12-6 as revised by this FEIR, the proposed project also ~~entails~~ includes 62 acres of natural open space. The project, as mitigated, also includes provisions to insure that impacts to historically significant structures within the project area are minimized to the extent feasible. For more information, please refer to **Section 45 Cultural Resources** and **Section 4.12 Public Services.**
C/OS-12	The City shall require developers to use native and compatible non-native species, especially drought-tolerant species, to the extent possible in fulfilling landscaping requirements imposed as conditions of project approvals or project mitigations.		The proposed project will be required to comply with this policy. The analysis contained in this EIR is a programmatic level review of the proposed Specific Plan. Future applications for physical construction within the Specific Plan will be required to comply with this requirement. In addition, mitigation identified in this EIR requires that landscaping utilize native plant materials wherever possible. All future landscaping and replanting plans will be required to comply with the requirements of this measure. Plant palettes will be developed in conjunction with the vesting tentative map and subsequent development applications. **The project as mitigated is consistent with this provision.**
Conservation / Open Space – Air Quality			
C/OS-13	The City will encourage the improvement of air quality in Soledad and in the region by implementing the measures described in the Monterey County Air Quality Management Plan. Such measures include, but are not limited to, measures to reduce dependence on the automobile and encourage the use of alternate modes of transportation such as buses, bicycles and walking.		The Specific Plan Area contributes to improving air quality by providing non motorized amenities such as pedestrian and bicycle trails, bicycle lanes, and transit stops. **The project is consistent with this provision.**
C/OS-14	The City shall, to the extent feasible, separate sensitive land uses from significant sources of air pollution.		No significant sources of air pollution are proposed as part of this project or in the project vicinity. **The project is consistent with this provision.**
C/OS-16	The City shall promote and encourage the use of alternate modes of transportation by incorporating public transit, bicycle, and pedestrian modes in City transportation planning and by requiring new development to provide adequate pedestrian and bikeway facilities.		The Miravale III Specific Plan provides 3 transit stops, 4 + miles of bicycle lanes, and over 20 miles of pedestrian amenities such as separated sidewalks and trails. **The project is consistent with this provision.**
Conservation / Open Space – Tree Preservation/Landscaping			

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
C/OS-17	When considering the approval of activities that result in the removal of mature trees, the following factors shall be considered: a. The size, age, health and species of tree(s) to be removed. b. Whether or not the removal of the tree(s) is necessary for the reasonable development and use of the site. c. Whether the tree(s) to be removed is (are) a native or introduced species.		**The project, as mitigated, is consistent with this policy.** As identified in **Section 4.4 Biological Resources** development of the proposed project would result in the removal of existing mature trees in order to accommodate project development. Mitigation has been incorporated in order to ensure consistency with this policy, in addition to minimizing potential impacts associated with tree removal.
C/OS-18	The City shall institute and promote a vigorous program of tree planting in new development areas and in older portions of the City to increase the number and density of tree cover.	See Section 2.13 Landscaping.	**Project consistent.** Final landscaping plans will be required for development within the specific plan area. As identified in the Specific Plan, numerous policies have been identified regarding the use of street trees and accent trees.
C/OS-19	When mature trees are removed to accommodate new development, they shall be replaced at a ratio of at least two new trees for every one tree removed, or such additional number and size of trees as considered appropriate by the reviewing body at the time of approval of such development.	See Section 2.13 Landscaping.	**The project, as mitigated, is consistent with this policy.** Development of the proposed project would result in the removal of several mature trees. As identified in **Section 4.4 Biological Resources,** the project applicant/developer will be responsible for preparing a Forest Management Plan that identifies replanting ratios consistent with the requires identified in this policy.
C/OS-21	Landscaping plans for new development incorporate water conservation methods and shall employ native varieties of plants that are drought tolerant.	See Section 2.13 Landscaping.	**Project consistent.** To the extent feasible all front yards and landscaped areas will be irrigated using recycled water.
Conservation / Open Space – Archaeological & Cultural Resources			
C/OS-23	If development of a site uncovers cultural resources, the recommendations of Appendix K of the Guidelines for Implementation of the California Environmental Quality Act (Public Resources Code Section 15000 et seq.) shall be followed for identification, documentation, and preservation of the resource.		This policy is included as mitigation during project construction. **The project, as mitigated, is consistent with this provision.**
C/OS-24	The City shall document and record data or information relevant to prehistoric and historic cultural resources which may be impacted by proposed development. The accumulation of such data shall act as a tool to assist decision-makers in determinations of the potential development effects to prehistoric		A single historic structure is located on the site and mitigation measures are identified in the EIR. The historic structure will be relocated from its current location. **The project, as mitigated, is consistent with this provision.**

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	and historical resources located within the City.		
Conservation / Open Space – Mineral Resources			
C/OS-26	The City and County shall discourage urban uses adjacent to State-designated regional resource deposits if such uses would be incompatible with mining operations, or would restrict future extraction of significant mineral resources.		The project site is not located adjacent to State-designated regional resource deposits. **The project is consistent with this provision.**
Safety – Flood Hazards			
HZ-2	The City shall prohibit the construction of facilities essential for emergencies and large public assembly in the 100-year floodplain, unless the structure and access to the structure are free from flood inundation.		**Project consistent.** No emergency facilities are located within the 100-year floodplain.
HZ-4	The City shall manage flood prone areas consistent with the requirements of the Federal Emergency Management Agency (FEMA) and the Monterey County Water Resources Agency.		**Project consistent.** The proposed project is not located with an area that is prone to flooding as defined by the Federal Emergency Management Agency of the Monterey County Water Resources Agency.
Safety – Seismic Safety			
HZ-5	All new development shall satisfy the applicable requirements of the Uniform Building Code.		**Project consistent.** All new development within the Specific Plan will be required to adhere to all applicable requirements contained in the Uniform Building Code.
HZ-6	The City shall require the preparation of a soils engineering and geologic-seismic analysis prior to permitting development in areas prone to geologic or seismic hazards (ie, groundshaking, landslides, liquefaction, expansive soils).		**The project, as mitigated, is consistent with this policy.** A soils engineering and geological/seismic analysis was prepared for the project. Specific geological and geotechnical constraints were identified in these reports and incorporated as part of this EIR. In addition, mitigation has been incorporated requiring that final-design level plans be developed in accordance with individual project-specific geotechnical evaluations.
HZ-7	The City shall limit development in areas of steep or unstable slopes to minimize hazards by landslides or liquefaction.		**Project consistent.** The proposed project includes development above the 400 foot elevation contour. Due to the underlying geological unit, these areas have been identified as not being prone to liquefaction and/or landslide potential. Nevertheless, the proposed project includes specific Hillside Development Standards to insure that development within these areas would not be prone to geological hazards.
HZ-8	In landslide hazard areas, the City shall prohibit alteration of land in a manner that could increase the hazard, including		**Project consistent.** See response above.

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	concentration of water through drainage or irrigation systems; removal of vegetative cover; and steepening of slopes and undercutting the bases of slopes.		
Safety – Emergency Preparedness			
HZ-9	New development shall provide fire flow, emergency access and hydrants consistent with Fire Department requirements	Policy 5.2 - 7	All new development shall provide fire flow, emergency access and hydrants consistent with Fire Department Requirements. . **The project is consistent with this provision.**
HZ-12	The City will encourage site planning which helps reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department.	Policy 5.2 - 8	All new development shall help to reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department. . **The project is consistent with this provision.**
Noise			
N-1	The City shall not allow development of new noise-sensitive land uses where existing or ambient noise levels exceed those shown on Figure X-1, as measured immediately within the property line of the new development, unless effective noise mitigation measures have been incorporated into the development design to achieve the standards set by Figure X-1.		As identified is **Section 4.10 Noise**, effective noise mitigation measures have been incorporated to achieve standards in Table 4.10-1 of the City's Noise Element.
N-2	Where non-residential land uses are likely to generate noise levels exceeding those shown on Figure X-1 on adjacent or nearby existing or planned noise-sensitive uses, the City shall require preparation of an acoustical analysis as part of the environmental review process so that noise mitigation may be included in the project design.		**The project, as mitigated, is consistent with this policy.** An acoustical analysis has been prepared by Illingworth & Rodkin, Inc. and the mitigation measures identified in their report have been incorporated into this EIR. See **Section 4.10 Noise** for more information.
N-3	New residential development shall comply with State Noise Insulation Standards.		**Project consistent.** Development of the proposed project will be required to comply with all applicable State Noise Insulation Standards.
N-4	New commercial and industrial development shall incorporate design elements to minimize the noise impact when residential neighborhoods are nearby.		A conceptual site plan has been prepared for Village 4. Noise reduction techniques include providing parking lots interior to the center and the provision of a landscaped sound wall where adjacent to residential uses. The City should consider limiting delivery times to mid-day and restrict truck idling times.
N-5	Where noise mitigation measures are required to achieve the standards described in Figure X-2, the emphasis of such		**Project consistent with mitigation.** As identified in **Section 4.10 Noise** mitigation measures have been identified in order to

Table 4.9-2 Project Consistency with Relevant City of Soledad General Plan Land Use Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Consistency**
	measures shall be placed on site planning and project design. The use of noise barriers shall be considered as a means of achieving the noise standards only after all other practical design-related mitigation measures have been integrated into the project.		insure project-related noise impacts are reduced to the extent feasible. While some noise sensitive land uses would be expose to noise in excess of applicable standards, mitigation measures emphasize site planning and project design principles, including the use of building materials to minimize noise related impacts.

***Under Population and Housing, Section 4.11, Pages 4.11-9 through 4.11-10, Mitigation Measure 4.11-2, is revised as follows*:**

"4-11.2 Implement General Plan policies L-2 to L-7 and other applicable policies for phased development and population growth in the project and expansion areas. General Plan policies L-2 to L-7, (below) identify expansion area requirements and applicable policies for annexation of these areas:

L-2 Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council.

L-3 A specific plan shall be required for all annexations and development of properties designated *Expansion Area*. Specific plans shall be prepared in accordance with the standards provided in Appendix B of the General Plan.

L-4 The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services.

L-5 New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development.

L-6 New development shall pay its fair share of providing additional public services needed to accommodate such development.

L-7 Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City.

The required fiscal analysis shall be completed by a qualified, independent consultant, utilizing realistic and verifiable assumptions concerning investment earnings, interest rates, property taxes, transient occupancy tax, projected home/property sale prices and sales rates, etc."

***Under Public Services and Recreation, Section 4.12, Page 4.12-12, Mitigation Measure 4.12-1, is revised as follows*:**

"4.12-1 Prior to the initiation of construction for Phase 2 of the proposed development, the proposed fire and police facilities located on West Street shall be constructed and operational. The project applicant shall also be responsible for providing the necessary funding to the City of Soledad or establishing the appropriate funding mechanism to ensure the provision of adequate police and fire staffing to meet the demands of the proposed project, as determined by the City of Soledad. Prior to the issuance of any building permit for new residential and commercial development in Phase 2, the project applicant shall obtain written documentation from the Soledad Fire and Police Departments indicating that the fire and police substations are operational and adequately staffed to meet the needs of the proposed project, subject to the review and approval of the City of Soledad. This mitigation measure shall not be construed as prohibiting

the implementation of infrastructure necessary to serve the proposed facility or the needs of Phase 2 of the proposed project."

Under Public Services and Recreation, Section 4.12, Page 4.14, Mitigation Measure 4.12-4, is revised as follows:

4.12-4 "Prior to project approval, the project applicant shall submit evidence, including a revised Specific Plan and tentative map, demonstrating that an additional two elementary school sites of sufficient size and a 40-acre high school site will be designated within the project boundaries to meet project demands, subject to the review and approval of the City of Soledad and the Soledad Unified School District. The 40-acre high school site shall be operational prior to the issuance of any certificate of occupancy for Phase II of the proposed project, unless otherwise approved by the City of Soledad and the Soledad Unified School District[5] In lieu of providing said high school facilities on-site, the project shall submit payment of its proportionate share of funding towards site acquisition and construction of new school facilities, prior to the recordation of any final map. Pro-rata payment of the cost of providing a second high school shall not be construed as waiver of the previous requirement that adequate high school capacity be available to meet project demands prior to occupancy of any housing constructed in Phase II of the project. Pro-rata payment of the cost of providing a second high school shall not be construed as waiver of the previous requirement that adequate high school capacity be available to meet project demands prior to occupancy of any housing constructed in Phase II of the project."

Under Public Services and Recreation, Section 4.12, Page 4.12-14 through 4.12-15, are revised as follows:

"Parks and Recreation

The project proposes to provide public park lands to serve the recreational needs of the proposed development and surrounding community. As identified in the Miravale III Specific Plan, an array of active and passive recreational opportunities would be provided in conjunction with project development, including an approximately 159-acre golf course, four pocket parks totaling 11.52 acres, 61.90 acres of open space, and approximately 4.22 miles of class II Bike Lanes within the Specific Plan area. Moreover, project development includes 1.90 acres of park connections, 5.96 acres of trails, and a 1.95-acre linear park located along the western boundary of the project site. The proposed linear park also serves as an agricultural buffer.

According to General Plan Policy PR-1, new residential subdivisions are required to provide parkland at a ratio of three (3) acres per 1,000 residents anticipated as part of new subdivision development. Appendix B of the City's General Plan, however, provides a higher park dedication standard for Expansion Areas subject to Specific Plans. As identified in Appendix B, the minimum parkland ratio for a Specific Plan is five (5) acres per 1,000 residents. Buildout of the proposed Specific Plan is anticipated to provide housing for approximately 15,201 new persons within the City of Soledad. As such, project development would be required to provide a minimum of ~~45~~ 76 acres of improved parkland. As proposed, the project consists of 11.52 acres of improved parks, 1.90 acres of park connections, 5.96 acres of trails, and a 1.95 linear park/agricultural buffer totaling 21.33 acres of improved parkland. For the purpose of this analysis, the golf course is not included as parkland because access would be restricted to persons with scheduled

[5] Alternatively, if additional school sites will not be provided in conjunction with project development, the project applicant shall obtain written documentation from the Soledad Unified School District demonstrating that adequate school facilities, including a 40-acre high school and two appropriately sized elementary ~~middle~~ schools, will be available within the City of Soledad to accommodate anticipated project demands. If, however, adequate capacity does not exist, development shall be restricted until such time that additional capacity is available to accommodate subsequent phases of development.

tee times and, therefore, would not be immediately available to area residents. Figure 4.12-2 provides a graphical representation of open space and parkland to be provided as part of project development.

According to the projected population figure identified in **4.11 Population and Housing**, which includes estimates for the buildout of the six Village areas, project development does not meet the minimum required parkland contribution. More specifically, the Specific Plan identifies that future park sites would be provided in conjunction with the development of the six Village areas. As no formal plans have been submitted for these areas, no formal park sites have been officially delineated within these areas of the project site. Therefore, additional park sites would be required as part of development of the Village areas consistent with the requirements of the Specific Plan. As these additional sites have not been officially designated at this time, the project does not meet the minimum required parkland contribution pursuant to the General Plan. This is considered a significant impact. ~~As identified in Table 4.12-3 above, it is estimated that~~ A minimum ~~24.27~~ 54.67 acres of parkland would be necessary in order to achieve the minimum required parkland contribution pursuant to General Plan requirements for future development within its Specific Plan areas. Implementation of project-specific mitigation identified below would ensure that future residents have adequate access to parkland consistent with City standards. Because all of the parks and recreation facilities necessitated by the project would be provided on the project site, the environmental impacts of constructing the parks and recreation facilities (e.g., dust and noise emitted during grading) are addressed in the relevant chapters of this EIR. Implementation of the following mitigation measure would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **As proposed, the project does not meet the minimum required parkland ratio of ~~three~~ five acres per 1,000 residents.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measure.***

Mitigation

4.12-6 In order to ensure adequate improved parkland is provided as part of project development, the applicant shall submit detailed plans, including a revised Specific Plan and Tentative Map, demonstrating that adequate parkland ~~(3~~ 5 acres/1,000 residents) is designated within the project boundaries consistent with the requirements of Appendix B of the General Plan ~~and Miravale III Specific Plan dated June 2007~~, prior to project approval, subject to the review and approval of the City of Soledad. Prior to the recordation of each final map, the project applicant shall submit a comprehensive Park Master Plan to the City of Soledad for review and approval. This plan shall address park design and development consistent with the City's adopted Parks and Recreation Master Plan, along with maintenance, operation and financing components for each dedicated recreation parcel in that phase of development This plan shall also identify the appropriate types of improvements within each park parcel to meet the recreational needs of all age groups within that phase of the project."

Under Traffic and Circulation, Section 4.13, Page 4.13-11, "Freeway Ramp Analysis" is revised as follows by adding the following new paragraph:

" A more recent freeway ramp analysis was completed by OmniMeans for the City of Soledad in October of 2008 in connection with a Project Study Report for planned interchange improvements to the North Front Street ramps. The Omni Means analysis indicates that all freeway ramps analyzed currently operate at LOS C or better."

Under Traffic and Circulation, Section 4.13, Page 4.13-12 , Table 4.13-6, is revised as follows:

Note correction: Existing ramp operations for northbound Highway 101 from Moranda Road are operating at a Level of Service (LOS) "C" during a.m. peak hour, revised from LOS B as stated in the Draft EIR

Under Traffic and Circulation, Section 4.13, Page 4.13-14, is revised as follows:

"Traffic Impact Fees. The City's traffic impact fee (TIF) program was adopted in October 2007 by the City Council. The City TIF identifies fees per single-family unit and multi-family unit to be collected from proposed development and used towards identified improvements to the roadway system within and serving the City of Soledad.

Regional improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway widening, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The TAMC fee is levied against new developments within local member jurisdictions of TAMC, including the City of Soledad. ~~At this time, however, the City of Soledad has not committed to collecting the TAMC fee. In order to address regional improvement, the City of Soledad has incorporated local TAMC improvements projects into their adopted TIF program. Therefore, the collection of impact fees as part of the City's TIF program will include regional improvements and will be in lieu of payment of an independent TAMC fees.~~ The City of Soledad adopted the TAMC Regional Development Impact Fee Program on June 4, 2008, thereby subjecting all new development in the City of Soledad to the regional impact fee. As a result, the proposed project will be subject to the TAMC Regional Development Impact Fee in order to mitigate project impacts to regional facilities such as Highway 101."

Under Traffic and Circulation, Section 4.13, beginning on Page 4.13-30, Mitigation Measure 4.13-1, Mitigation Measure 4.13-3 and Mitigation Measure 4.13-4 are revised as follows:

"4.13-1 Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings shall not be permitted along streets classified as collectors or arterials unless at a traffic light. Prior to the issuance of any building and/or grading permit for development associated with the golf course facility, the project applicant shall submit detailed design-level plans demonstrating compliance with this measure, subject to the review and approval of the Director of Public Works. Improvements shall be constructed in accordance with this measure prior to the issuance of any certificate of occupancy or final permit for development associated with the golf course."

4.13-3 *San Vicente Road and Front Street:* Widen NB Front Street to two lanes, NB San Vicente Road to three lanes, add two EB left-turn lanes ~~lands~~ and a SB free-right-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-4 *San Vicente and Gabilan Drive:* Signalize this intersection and add a second westbound left-turn lane ~~land~~, exclusive northbound right-turn lane, and southbound left-turn lane ~~land~~. SB San Vicente Road will need to be widened to accommodate the dual left-turn lanes from Gabilan. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. If this alternative is selected the project applicant shall submit payment of the projects fair share towards the construction of this improvement in accordance with the traffic impact fee in effect at the time of building permit issuance for each phase of the project. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Under Traffic and Circulation, Section 4.13, Pages 4.13-35 through 4.13-36, are revised as follows:

"The identified freeway segment and interchange ramp improvements described below cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway widening, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The payment of fees is considered mitigation for impacts to freeway facilities by TAMC and the California Department of Transportation. ~~At this time, however, the City of Soledad has not committed to collecting the TAMC fee. In order to address regional improvement, the City of Soledad has incorporated local regional improvement projects into their adopted TIF program. Therefore, the collection of impact fees as part of the City's TIF program will include regional improvements and will be in lieu of payment of an independent TAMC fees.~~ The City of Soledad adopted the TAMC Regional Development Impact Fee Program on June 4, 2008, thereby subjecting all new development in the City of Soledad to the regional impact fee. As a result, the proposed project will be subject to the TAMC Regional Development Impact Fee in order to mitigate project impacts to regional facilities. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not included as part of the fee program, the impact would be considered significant and unavoidable.

Regional Impacts

Impact **Based on the significance impact criteria, the project will have a significant impact on two freeway ramps and four freeway segments. Therefore, the project will have a significant impact on regional roadways.** ***With implementation of the mitigation identified below these significant impacts will be reduced to a less-than-significant level. However, should the proposed improvements be deemed infeasible or not part of the TAMC fee program, the impacts will be considered significant and unavoidable.***

4.13-10 Moranda Road and US 101 NB Ramps: Signalize the intersection and widen the NB US 101 on ramp to add a second NB left-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fees in effect at the time of building permit issuance, including the TAMC Regional Development Impact Fees pursuant to Chapter 3.56 of the Soledad Municipal Code, in order to

mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. ~~Alternatively, the project can contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. 101. If this alternative is chosen,~~ If the aforementioned interchange improvements are not implemented by the time required, the project could instead contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. 101. Under this approach to mitigation, local roadways shall be monitored to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. In addition, the US 101 interchange at Moranda Road/Front Street will require reconfiguration/reconstruction to provide more efficient access to the project site and north Soledad in general. ~~As this is a regional improvement, funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee, which includes regional improvements, would mitigate the project's regional impact at this location.~~ However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-11 *North Front Street and US 101 SB Ramps:* Signalize this intersection, widen southbound Front Street to two lanes and add a second lane on the off-ramp. In addition, the volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. As this is a regional improvement, ~~funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee would mitigate the project's impact at this location~~ the project applicant shall contribute funding towards its implementation by submitting payment of the TAMC Regional Development Impact Fees, pursuant to Chapter 3.56 of the Soledad Municipal Code. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the TAMC fee program, the impact should be considered significant and unavoidable. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the ~~City of Soledad~~ traffic impact fees in effect at the time of building permit issuance, including the Regional Development Transportation Impact Fees, in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-12 The project applicant shall be required to pay towards the City's TIF program, which includes regional improvements, and shall also pay the City's adopted Regional Development Impact Fees established in Chapter 3.56 of the Municipal Code. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the Regional Development Impact Fee and City of Soledad traffic impact fees in effect at the time of building permit issuance in order to mitigate the impacts at identified ~~this~~ locations. The payment of fees is considered mitigation for project impacts to ~~freeway~~ highway and regional facilities. All fees shall be ~~paid prior to the issuance of any building permit for each phase of development and shall be~~ subject to the approval of the Director of Public Works. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable."

Under Utilities and Service Systems, Section 4.14, Page 4.14-17, Mitigation Measures 4.14-5 and 4.14-7 are revised as follows:

"4.14-5 In order to ensure that the proposed wastewater treatment system is consistent with the applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and Chapter 13.11 Recycled Water Service, the project applicant shall submit detailed design-level plans in accordance with ~~these~~ City requirements, prior to approval of the first Final Map ~~the issuance of any building and/or grading permit~~, subject to the review and approval of the City of Soledad Public Works Director.

4.14-7 In order to ensure that adequate wastewater treatment is available to accommodate each phase of project development, the treatment capacity for the onsite recycled water facility shall be increased to accommodate each phase of the project prior to the final approval of the first building permit or occupancy permit for each of the respective project phases as appropriate. Subject to the review and approval of the Director of Public Works, excess treatment capacity and related infrastructure shall be added to the plant and disposal facilities, as needed, for each phase of the project, to accommodate future increases in wastewater flow rates, based on estimates of future development. In addition, flows shall be metered and records of the flows shall be provided to the City ~~RWQCB~~ for review and approval. No building permits shall be issued ~~issuance~~ unless sufficient capacity exists to accommodate additional phases of development"

Under Utilities and Service Systems, Section 4.14, Page 4.14-18, Mitigation Measure 4.14-11 is revised as follows:

"4.14-11 The project would be required to construct new infrastructure that is of adequate capacity to serve the project's projected demand ~~in addition to the wastewater provider's existing commitments~~. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level documentation, in addition to written documentation from the City of Soledad, documenting that design-level plans are in accordance with City standards and requirements, as well as documenting that the City has sufficient capacity to accommodate project demands in addition to existing commitments, subject to the approval of the Director of Public Works."

Edit Section 5.2G Air Quality under the heading "Greenhouse Gas and Global Climate Change" that begins on page 5.0-19 as follows:

Add the following new subsection on Page 5.0-22 at the end of the section titled: "Regulatory Framework" and prior to the section titled "Greenhouse Gas Emissions/Global Climate Change Thresholds"

"*City GHG Regulatory Framework*

In addition to the state requirements that are under development and continually evolving, Table 5.2-6 below contains the City of Soledad's relevant programs, policies, codes, and ordinances that would reduce greenhouse gas emissions associated with the proposed project. In the case of the codes and ordinances, the reductions could be applied as a background condition that would occur for all development at the site. Also, if future development on the site is found to be consistent with the programs and policies below, then additional GHG reductions would be considered achieved.

Table 5.2-6

CITY OF SOLEDAD's LOCAL REGULATORY MECHANISMS FOR ACHIEVING REDUCTIONS IN GHG EMISSIONS

Existing Policy or Ordinance	**Requirement**
2009 Housing Element Program 2.1.2	Minimum average density of 7 units per acre for new neighborhoods
2009 Housing Element Policy 6.1 and Program 6.1.1 (Energy Conservation)	Requires City support & initiation of energy & water conservation programs to reduce energy needs of new housing.
General Plan Circulation Policies C-10, C-20, C-25, C-27, C-31 Specific Plan Standards	Policies relating to the provision of alternative modes of transportation, including bicycle, public transit and pedestrian circulation.
General Plan Standards for Specific Plans	Includes requirements to encourage connectivity, walkability and pedestrian use: i.e., shorter streets – no greater than 520 feet long; residential streets "no wider than needed to accommodate parking and two-low speed travel lanes;" minimizing the use of cul-de-sacs; requiring planter strips with canopy trees. Other requirements include designing circulation system to accommodate public transit, concentrating higher intensity uses within one-quarter mile of transit stops and/or commercial centers, and using roundabouts rather than conventional controls at intersections to enhance traffic flows
Zoning Ordinance – Section 17.38.110 (Energy Conservation)	Provides broad authority & discretion to require incorporate passive or natural heating or cooling opportunities and other measures that conserve nonrenewable energy resources in subdivision design, thereby reducing GHG emissions
Chapter 13.05 of the SMC- Deconstruction, Demolition and Construction Material Recovery and Diversion from Landfills	Requires 100 percent diversion (i.e., reuse/ recycling)of inert solids (e.g., concrete, asphalt, brick) and a minimum diversion of 50% (by weight of non-inert materials). Applies to all new residential and commercial construction over a certain dollar value
Chapter 13.09 of the SMC – Mandatory Water Conservation Regulations	For new construction, 13.09 requires ultra low-flow toilets, low-flow shower fixtures, water recirculating systems and

	xeriscape landscaping.
Chapter 13.52 of the SMC – Stormwater Quality	Provides the authority for the City to require storm water permits and related Storm Water Quality Plan.

"

On Page 5.0-22, edit the first sentence under "Greenhouse Gas Emissions/Global Climate Change Thresholds" as follows:

"At the time of the Draft EIR preparation, n~~N~~o air districts had~~ve~~ established significance thresholds for greenhouse gas (GHG) emissions or a methodology for analyzing air quality impacts related to greenhouse gas emissions. Since then, the Bay Area Air Quality Management District's (BAAQMD) has adopted thresholds for GHG emissions, including a plan-level efficiency threshold of 6.6 metric ton (MT) CO2e per service population per year (BAAQMD, CEQA Guidelines, June 2010). Because this project is within the MBUAPCD, this threshold would not necessarily apply to this project or even future projects within the MBUAPCD; however, the substantial evidence generated by the BAAQMD in developing and approving the threshold could be used to support a project-specific, City-wide, or regional threshold given the global nature of the issue. ~~With the adoption of AB 32, the state has set a goal of reducing GHG emissions to 1990 levels by 2020. It has been acknowledged by previous EIRs addressing this issue that it may be considered speculative to determine if a project would be consistent with the AB 32 goals.~~ CO_2 emissions do not directly create environmental effects; rather it is the cumulative increased concentration of CO_2 in the atmosphere that results in global climate change and associated consequences. While it is possible to estimate the project's CO_2 emissions, it is typically not possible to determine whether those emissions (however small) would manifest into significant environmental impacts. The complexity of global and regional-scale physical, chemical, atmospheric, terrestrial, and aquatic systems preclude a meaningful determination of whether the CO_2 emitted by a single project (or in this case adoption of a Specific Plan) would result in a measurable or even, non-negligible change in climate. A quantitative standard of significance is not used in this EIR because of the global nature of the analysis required, instead a project's contribution to the cumulative significant impact of global climate change would be considered significant if, due to the size or nature of the project, it would generate a substantial increase in GHG emissions relative to existing conditions. In addition, the discussion considers whether or not the project would result in greenhouse gas emissions that would hinder or delay the State's ability to meet the reduction targets contained in AB 32. If a quantitative threshold (such as the recently adopted BAAQMD plan efficiency threshold of 6.6 MT CO_2e /service population/year) had been applied to this project, the conclusions would not change for the purposes of this EIR . However, in the case of future projects developed consistent with the Specific Plan it is possible to conduct analysis demonstrating that project-level impacts related to GHG emissions could be reduced to a less-than-significant level based upon the size and design of the project, including details on GHG reduction measures proposed, such that one could quantitatively demonstrate that emissions would be reduced below an applicable threshold."

On Page 5.0-25, edit the impact statement paragraph at the top of the page as follows:

Impact **Implementation of the Miravale III Project may increase global greenhouse gas (GHG) emissions resulting in a potentially cumulatively considerable incremental contribution to significant cumulative global climate change impacts and the project may hinder or delay the State's ability to meet GHG reduction targets in AB 32.** ***This is considered a significant and unavoidable cumulative impact that can be reduced by implementation of Mitigation Measures # 4.3-3(as revised in this Final EIR), new Mitigation Measures 4.3.4, 4.3-5, 4.3-6, and 4.13-1, however, not to a less-than-significant level.***

Add to Section 6.0 Alternatives, Alternatives Selected, Page 6-1:

"Alternatives Selected, The following section discusses the alternatives evaluated in this EIR and the comparative environmental effects of each. The alternatives considered in this analysis are as follows:

- *No Project Alternative – No Development*
- *Buildout Consistent with General Plan Alternative*
- *Reduced Project Alternative*
- *No Golf Course Alternative*
- *Alternative Design: Increased Senior Housing Alternative*

For the FEIR, a sub-alternative (Buildout Consistent with General Plan and No Golf Course) is also considered. This alternative would reduce the golf course and keep the former golf course area as open space, provide the allowed level of development per the Alternative Consistent with the General Plan and also avoid development above the 400 foot contour.

The alternatives chosen for this analysis, beyond those mandated by CEQA, were developed specifically to avoid or substantially reduce the significant impacts of the project. A comparison of the impacts for each alternative is presented in Table 6-1. A substantive discussion is provided for each issue area where a proposed alternative would lessen the significance of an impact. For an alternative that would result in approximately the same level of impact (i.e. less-than-significant, less-than-significant with mitigation) as the proposed project, a discussion of that issue area is not necessarily provided. It is important to note, however, that certain aspects of a given alternative may minimize the extent of impact, but may not necessarily affect the level of significance relative to the proposed project.

Table 6-1 Comparison of Impacts – Project Alternatives					
Impact	**6.3 No Project - No Build**	**6.4 Buildout Consistent w/ General Plan***	**6.5 Reduced Project**	**6.6 No Golf Course**	**Alternative Design: Increased Senior Housing**

> Impact Greater than Project
= Impact Comparable to Project
< Impact Less than Project

***Alternative 6.4-A For the FEIR, a sub-alternative (Buildout Consistent with General Plan and No Golf Course) is also considered. This alternative would reduce the golf course and keep the former golf course area as open space, provide the allowed level of development per the Alternative Consistent with the General Plan and also avoid development above the 400 foot contour. This Alternative results in essentially the same impact category above" < Impact Less than Project" as the General Plan Consistent alternative with the exception that impacts to Biological Resources and Soils would be further reduced due to the greater amount of land retained in its natural state and the associated reduction in grading and land disturbance."**

Revise Section 6.4 Alternatives, Buildout Consistent with General Plan, Page 6-4, as follows:

"6.4 BUILDOUT CONSISTENT WITH GENERAL PLAN

Description

Development under this scenario would assume buildout of the project site consistent with existing policies contained within the General Plan. Under this scenario, a Specific Plan would be prepared, as required by the General Plan. Single family residential uses would be prohibited above the 400 foot elevation contour and the project would consist of the construction of approximately 2,680 units. Additional units identified in other expansion areas would not be applied to this alternative and no General Plan amendments would be required. This alternative would consist of an array of residential uses, including low, medium, and high density land uses, as well as commercial, and public uses.

Development under this alternative is assumed to result in approximately the same impacts in regard to cultural resources, ~~geology and soils,~~ and hazards and hazardous materials as the proposed project and less than significant impacts in comparison to the proposed project in the impact areas of aesthetics,

agricultural resources, aesthetics, biological resources, noise, traffic, air quality, agricultural resources, public utilities, public services, land use, population and housing and hydrology/water quality. ~~Although development of the proposed alternative would substantially lessen the extent of project-related impacts, the proposed alternative would not reduce the overall level of significance (i.e. less than significant, less than significant with mitigation) for each of these respective issues.~~ The following discussion addresses ~~only~~ those issues areas where significant project-related impacts would be minimized and/or avoided.

Impacts

Aesthetics. This alternative would result in less intensive urban development of the project site. More specifically, significant unavoidable impacts associated with development above the 400 foot elevation contour would be eliminated and the proposed alternative would not result in significant impacts to the existing Gabilan Range, which is considered a scenic vista. The area above the 400 foot contour would remain as open space, consistent with the requirements of the General Plan and views of the project site as perceived from adjacent public vantage points would be significantly lessened. Moreover, significant grading and changes in topography would not be necessary within the hillside portion of the project site as development would be eliminated within the visually sensitive areas on the Gabilan Range. Development of this alternative would still substantially alter the visual character of the project site by introducing urban development onto a previously undeveloped site. The effects from new light/glare sources would be reduced in comparison ~~comparable~~ to the proposed project due to the reduction of development proposed.

Agricultural Resources. Development of this alternative, while not changing the level of significance determination (i.e. significant unavoidable), would require less development of the project site and, therefore, potentially less prime farmland would be converted to a non-agricultural use. Despite the reduction in units and the corresponding reduction in developable space, the project site would still be converted to a non-agricultural land use. ~~Furthermore,~~ The majority of the project area is identified in the General Plan as an area of future urban development. The effects of loss of agricultural resources would likely be reduced in comparison to the proposed project due to the reduction of development proposed, provided that a portion of the agricultural land area is conserved for agricultural purposes in the long-term.

Air Quality. Development of this alternative would reduce the level of emissions associated with buildout of the project site. More specifically, due to the reduction in units, project-generated traffic is anticipated to decline significantly in comparison to the proposed project. This reduction in traffic trips would reduce project emissions associated with the project. In addition, less area would be developed under this scenario, therefore, requiring less grading and project construction. While the duration of construction impacts are anticipated to be approximately the same as the proposed project, the amount of construction would be significantly less. The effects the project on air quality would be reduced in comparison to the proposed project due to the reduction of overall development and comparable reduction in grading, infrastructure, roads, housing and traffic proposed.

Biological Resources. Development of the proposed alternative would substantially lessen potential impacts to biological resources located within the project area. More specifically, as identified in the General Plan portions of the Gabilan Range are identified as Open Space. As development would not occur above the 400 foot elevation contour, these areas would remain as natural Open Space. As identified in the biological resources section of this EIR, impacts associated with the loss of Open Space was identified as a potentially significant impact that would affect a number of federally listed species. Although development of this scenario would still result in the introduction of urban features within the project site, the extent to which the site would be disturbed would be substantially less. Specifically, this alternative would substantially lessen potential impacts to biological resources located within the project area by eliminating development within the foothill portions of the project site. In particular, as this

alternative is consistent with the General Plan, it reduces and limits development to below the 400-foot elevation contour. The General Plan Consistent Alternative will thus reduce impacts to the San Joaquin kit fox to a less-than-significant level by avoidance of the upland habitat area and reduction of potential fragmentation of the wildlife corridor identified in the General Plan. As identified in the biological resources section of this EIR, impacts associated with the loss of Open Space was identified as a potentially significant impact that would affect a number of federally listed species. The proposed alternative would eliminate potential impacts to badgers, borrowing owl, Salinas pocket mouse, kit fox, and other species identified as special status. The grassland habitat located in the foothill portion of the Gabilan Range is considered a biologically sensitive area of the project site. Development of this alternative would avoid this upland area and, therefore, substantially lessen project impacts. While specific mitigation would still be warranted, as identified in this Final EIR, impacts would be reduced to a less-than-significant level. The effects of the project on biological resources would be significantly reduced in comparison to the proposed project due to the reduction of overall development and comparable reduction in grading, infrastructure, roads and housing proposed.

Hydrology/Water Quality. Development of this alternative would substantially reduce impervious surfaces due to the overall reduction of development. Although this alternative would reduce impervious surface areas, as well as off-site related impacts, this alternative would not reduce the overall level of significant (i.e. less-than-significant with mitigation) as compared to the proposed project. Moreover, development of this alternative would also be required to adhere to the requirements of the City of Soledad Storm Drainage Master Plan. The environmental effects of the project in this category would be reduced in comparison to the proposed project due to the reduction of overall development and comparable reduction in grading, infrastructure, roads and housing proposed and overall reduction in impervious surfaces.

Land Use. As identified in this EIR, development of the proposed project would conflict with adopted General Plan policies that are intended to either avoid and/or mitigated a potential environmental impact. Development of this alternative would, however, be required to comply with existing General Plan policies, including the preservation of areas above the 400 foot elevation contour. The prohibition of development above this contour was identified as a mitigating factor for a number of issue areas. By complying with existing adopted General Plan policies this alternative would not result in any conflicts with policies intended to avoid and/or mitigate a potential adverse environmental impact. As such, this alternative would lessen the impact determination to a level considered less-than-significant and reduce associated impacts in comparison to the proposed project as described herein.

Noise. Due to the overall reduction of units, the proposed project is anticipated to result in less project generated noise. Moreover, due to the reduction of units and the corresponding reduction in vehicular traffic associated with project development, the proposed alternative would also result in substantially less construction noise. Development would also be less intensive and therefore impacts to adjacent sensitive land uses could potentially be minimized and/or avoided through site planning and project design. Due to the above rationale, this alternative would reduce impacts in comparison to the proposed project.

Population and Housing. This alternative would result in substantial growth-inducing impacts. As compared to the proposed project, however, this alternative would generate less housing and population within the project area and would not require revisions to the General Plan in order to accommodate increased housing and density beyond what has been identified for this area by the adopted Plan. The alternative would also be required to comply with the City's adopted Inclusionary Housing Ordinance and would provide a variety of residential land use types. As the project would result in less units, this alternative would also allow the City to maintain a jobs/housing ratio that is more balanced in nature and reduce impacts in comparison to the proposed project.

.

Public Services. Although all project impacts can be reduced to a less-than-significant level through the incorporation of mitigation for public services, the proposed alternative would substantially lessen the

demand for public services (i.e. fire, police, schools, parks, etc.). Moreover, preliminary estimates indicate that this alternative would generate approximately 550 high school aged children. The existing high school would have sufficient capacity to accommodate the additional demands generated by this alternative. Future buildout of the General Plan, however, would still require that the City and School District identify a future high school site within the City. Additionally, as development would predominantly be located outside of the hillside areas, the proposed alternative would not be subject to potential wildland fires. This alternative would still require additional public services, including police and fire substations, but the demand for these services would be less due to the reduction in units and developable area. Development consistent with the General Plan would also provide additional parkland and open space as the hillside areas would be designated as Open Space areas. This alternative would reduce public service impacts in comparison to the proposed project.

Utilities and Service Systems. While the City of Soledad has adequate capacity to provide utilities to the project site, the proposed alternative would substantially lessen the demand for water and energy. Additionally, due to the reduction of units, the proposed alternative would generate less wastewater, solid waste, and water demand. As such, the overall demand for utilities would be reduced. While all project impacts would be mitigated to a less-than-significant level, the overall reduction of population associated with the proposed alternative would substantially lessen impacts to City services and infrastructure and reduce impacts in comparison to the proposed project.

.

Traffic. Development of the proposed alternative is anticipated to significantly reduce the amount of project-generated traffic due to the overall reduction in the number of proposed units. While the level of significance (i.e. less-than-significant with mitigation) is not anticipated to change, this alternative would likely require less mitigation. This alternative would reduce impacts in comparison to the proposed project.

Summary

Buildout consistent with the City of Soledad's General Plan would substantially lessen potential impacts in terms of aesthetics, agricultural resources, air quality, biological resources, land use and planning, noise, population and housing, public services, utilities, and traffic. As identified in Table 6-1, development of this alternative would result in substantially the same impacts in regard to cultural resources, ~~geology and soils~~, and hazards and hazardous materials and a reduction of impacts to all other impact areas in comparison to the proposed project. ~~While this alternative would not change the level of significance determination for many of the impact areas,~~ This alternative would still require the implementation of the mitigation measures identified in this EIR. The proposed alternative, due to the reduction in project site, would lessen the extent to which the project would impact ~~these~~ identified resources and effects would be reduced in comparison to the proposed project on aesthetics, biological resources, noise, traffic, air quality, agricultural resources, public utilities, public services, land use, population and housing and hydrology, water quality."

Revise Section 6.4 Alternatives, Buildout Consistent with General Plan, to add the description of Sub-Alternative 6.4-A to follow the "Summary," Page 6-6, as follows:

"SubAlternative 6.4-A Buildout Consistent with General Plan/No Golf Course

This alternative would reduce the golf course and keep the former golf course area as open space, provide the allowed level of development per the Alternative Consistent with the General Plan and also avoid development above the 400 foot contour. This Alternative results in the same reduction of impacts as the General Plan consistency alternative although it further reduces impacts to Biological Resources and Soils due to the reduction in grading and land disturbance and retention of greater area as natural open space."

Revise Section 6.5 Alternatives, Reduced Project, Page 6-6, as follows:

"6.5 REDUCED PROJECT

Description

This alternative consists of reducing development on the project site to avoid significant impacts. More specifically, development of this alternative would result in the reduction of residential uses on the project site by 50 percent. As a result, this alternative would result in the construction of 2,100 residential units. The Reduced Project alternative would also result in a 50% reduction of commercial uses on the project site as well. More specifically, this alternative would allow approximately 125,000 square feet of commercial space. All development under this scenario would occur within the predominantly level portions of the project site and no development would occur within the foothill areas. Development would primarily be concentrated adjacent to existing residential areas within the City of Soledad and avoid the area above the 400 foot contour, similar to Alternative 6.4". As with the preceding Alternative 6.4, the Reduced Project alternative could be implemented with or without a golf course.

Development under this alternative is assumed to result in approximately the same impacts in regard to cultural resources, ~~geology and soils,~~ and hazards and hazardous materials as the proposed project and less than significant impacts in comparison to the proposed project in the impact areas of geology/soils, aesthetics, agricultural resources, aesthetics, biological resources, noise, traffic, air quality, agricultural resources, public utilities, public services, land use, population and housing and hydrology/water quality. ~~Although development of the proposed alternative would substantially lessen the extent of project-related impacts, the proposed alternative would not reduce the overall level of significance (i.e. less-than-significant, less-than-significant with mitigation) for each of these respective issues.~~ The following discussion addresses ~~only~~ those issues areas where significant project-related impacts would be minimized and/or avoided.

Impacts

Aesthetic. This alternative would result in less intensive urban development of the project site. Consistent with the General Plan Consistency Alternative, development of this alternative would eliminate potential impacts to the Gabilan Range, which is considered a scenic vista. Grading would no longer be necessary within the foothill areas and changes to topography would be minimal. Additionally, due to the overall reduction of units, this alternative would also reduce the extent of visual impacts associated with development of this alternative. More specifically, the development of 2,100 residential units would be less visible from adjacent public vantage points due to the reduction in developable area. Additionally, less commercial area would be developed and potential aesthetic impacts associated with the development of commercial uses adjacent to residential areas would also be minimized. To the extent that the project

would reduce the amount of units, the proposed alternative would still result in the conversion of a previously undeveloped site into urban uses and would therefore transform the visual character of the site permanently. The effects from new light/glare sources would be reduced in comparison comparable to the proposed project due to the reduction of development proposed.

Agricultural Resources. Development of this alternative, while not changing the level of significance determination (i.e. significant unavoidable), would require less development of the project site and, therefore, potentially less prime farmland would be converted to a non-agricultural use. Regardless, this alternative would require the conversion of significant prime farmland into an urban use. The effects of loss of agricultural resources would likely be reduced in comparison to the proposed project due to the reduction of development proposed, provided that a portion of the agricultural land area is retained for agricultural uses.

Air Quality. Air quality impacts associated with this alternative would be substantially less than the proposed project due to the reduction in commercial and residential land uses. Similar short-term construction activities would occur under this alternative. However, long-term emissions associated with vehicle trips and stationary sources (i.e., non-residential uses) would be incrementally decreased under this alternative. In the long-term, at project buildout, the Miravale III Project would exceed criteria pollutant emission thresholds (e.g., PM10, CO, NOx) resulting in a significant and unavoidable impact to air quality. A decrease in development intensity by 50 percent under the Reduced Project Alternative would reduce air quality impacts. Despite the reduction in units, the Reduced Project Alternative would not reduce project impacts to a level considered less-than-significant. However, since the Reduced Project Alternative would generate less air quality emissions, this alternative is considered to have less effect on air quality in relation to the proposed project. The effects of the Reduced Project Alternative on air quality would be reduced in comparison to the proposed project due to the reduction of overall development and comparable reduction in grading, infrastructure, roads and housing proposed.

Biological Resources. Development of the proposed alternative would substantially lessen potential impacts to biological resources located within the project area. By eliminating development within the foothill portions of the project site, the proposed project would not result in the loss of an area of significant biological value. Specifically, this alternative would substantially lessen potential impacts to biological resources located within the project area by eliminating development within the foothill portions of the project site. In particular, this alternative is consistent with the General Plan, reduces development to below the 400-foot elevation contour and will reduce impacts to San Joaquin kit fox to a less-than-significant level by avoidance of the upland habitat area and reduction of potential fragmentation of the wildlife corridor identified in the General Plan. This area would remain as Open Space consistent with the City's General Plan and would retain its natural features. As identified in the biological resources section of this EIR, impacts associated with the loss of Open Space was identified as a potentially significant impact that would affect a number of federally listed species. The proposed alternative would eliminate potential impacts to badgers, borrowing owl, Salinas pocket mouse, kit fox, and other species identified as special status. The grassland habitat located in the foothill portion of the Gabilan Range is considered a biologically sensitive area of the project site. Development of this alternative would substantially lessen project impacts. While specific mitigation would still be warranted, ~~impacts could potentially be reduced to a less-than-significant level~~ as identified in this Final EIR, impacts would be reduced to a less-than-significant level. The effects the project on biological resources would be reduced in comparison to the proposed project due to the reduction of overall development and comparable reduction in grading, infrastructure, roads and housing proposed and avoidance of habitat areas.

Hydrology/Water Quality. Development of this alternative would substantially reduce impervious surfaces due to the reduction of development. Although this alternative would reduce impervious surface areas, as well as off-site related impacts, this alternative would not reduce the overall level of significant (i.e. less-than-significant with mitigation) as compared to the proposed project. Moreover, development of this alternative would also be required to adhere to the requirements of the City of Soledad Storm Drainage Master Plan. The effects the project in this category would be reduced in comparison to the proposed project due to the reduction of overall development and comparable reduction in grading, infrastructure, roads and housing proposed and overall reduction in impervious surfaces.

Land Use. As identified in this EIR, development of the proposed project would conflict with adopted General Plan policies that are intended to either avoid and/or mitigated a potential environmental impact. This alternative would not conflict with any plans or policies intended to minimize and/or avoid an adverse environmental impact. This alternative would not require any General Plan amendments to insure consistency with adopted plans and policies pertaining to development within the project area. This alternative would reduce impacts in comparison to the proposed project.

Noise. In comparison to the proposed project, construction-related noise is anticipated to be similar due to the extent and duration of development. Consistent with the proposed project, mitigation measures would be applicable to reduce potential noise-related impacts. Project-related long-term noise impacts associated with vehicle trips and stationary sources (i.e. mechanical equipment), however, would be significantly less. Due to the reduction in vehicle trips and the decrease in commercial square footage, the Reduced Project Alternative would result in less noise impacts. The final configuration of land uses may warrant mitigation to assure that impacts do not exceed established thresholds. Development would also be less intensive and therefore impacts to adjacent sensitive land uses could potentially be minimized and/or avoided through site planning and project design. This alternative would reduce impacts in comparison to the proposed project.

Population and Housing. This alternative would result in substantial growth-inducing impacts. As compared to the proposed project, however, this alternative would generate less population within the project area and would not require revisions to the General Plan in order to accommodate increased density. The alternative would be required to comply with the City's adopted Inclusionary Housing Ordinance and would provide a variety of residential land use types. As the project would result in less units, this alternative would also allow the City to maintain a jobs/housing ratio that is more balanced in nature. This alternative would reduce impacts in comparison to the proposed project.

Public Services. Although all project impacts can be reduced to a less-than-significant level through the incorporation of mitigation for public services, the proposed alternative would substantially lessen the demand for public services (i.e. fire, police, schools, parks, etc.). This alternative would still require additional public services, including police and fire substations, but the demand for these services would be substantial less due to the reduction in units and developable area. This alternative would reduce public services impacts in comparison to the proposed project.

Utilities and Service Systems. The Reduced Project alternative would require upgrades and/or extensions of utilities such as water and wastewater facilities. As compared to the proposed project, this alternative would result in an incremental decrease in the demand for services. However, as identified in Section 4.14 Utilities and Service Systems, impacts would be mitigated to a level considered less-than-significant. Since the project would not generate as much demand for utilities, this alternative is considered to have fewer impacts on utilities as compared to the proposed project. This alternative would reduce impacts in comparison to the proposed project.

Traffic. Development of the proposed alternative is anticipated to significantly reduce the amount of project-generated traffic due to the overall reduction in the number of proposed units. While the level of significance (i.e. less-than-significant with mitigation) is not anticipated to change, this alternative would

likely require less mitigation. This alternative would reduce traffic impacts in comparison to the proposed project.

Summary

This alternative would result in approximately the same impacts as the proposed project in the areas of cultural resources, geology, and hazardous materials. By decreasing the extent of development, however, the Reduced Project alternative would reduce the overall site disturbance and construction-related impacts, including grading, construction noise, and short-term air quality impacts. Furthermore, this alternative would substantially reduce the impact of the project on sensitive biological resources and would reduce aesthetic, agricultural, air quality, biological, land use, noise, population and housing, public services, utilities, and traffic impacts. This alternative would reduce impacts in comparison to the proposed project."

Revise Section 6.8, Environmentally Superior Alternative, as follows:

"6.8 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

A comparison of the impacts of each alternative relative to the proposed project is presented in Table 6-1. CEQA requires that an environmentally superior alternative to the proposed project be specified. In general, the environmentally superior alternative is that which minimizes the adverse impacts of the project to the greatest extent, while achieving the basic objectives of the project.

The No Project – No Development alternative could be considered the environmentally superior alternative because all adverse impacts associated with project construction and operation would be avoided. However, the No Project – No Development alternative does not satisfy the primary project objective to provide a range of housing types for future Soledad residents. In addition, CEQA Guidelines section 15126.6(e)(2) states: "If the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

Among the remaining alternatives, the Reduced Project alternative would represent the environmentally superior alternative, since it avoids or reduces many of the project's impacts associated with more intense development on the site. While this alternative would result in ~~less~~ fewer units than the "Buildout Consistent with the General Plan" Alternative (i.e., 2,100 units), the General Plan alternative assumes buildout according to the maximum allowable density on the site (i.e., 2,680 units). The Reduced Project alternative would allow the City to meet its objectives, while insuring that adverse environmental impacts are reduced to the extent feasible. This alternative would reduce impacts in other impact areas in accordance with the decrease in development. The next environmentally superior alternative is the General Plan Consistency Alternative, with Sub-Alternative of No Golf Course. This alternative reduces development area consistent with General Plan policies, including no development on the area above the 400' contour, and reduces development due to the elimination of the golf course on the site and retention of a substantial portion of this area for open space uses.

CHANGES/ERRATA TO DRAFT EIR TECHNICAL APPENDICES,

Appendix L- CESA Information and Background is added to the Appendices and is attached, located after the Revised Summary Section.

CHANGES/ERRATA TO DRAFT EIR TECHNICAL APPENDICES, VOLUME 2

Revise the Text of **Appendix T-3 Biological Assessment, Page 23,**, *as follows to correct reporting error in Biological Assessment Report*:

"Species potential presence within project boundaries:
The CNDDB reports several occurrences of San Joaquin kit fox approximately 10 km east of the project site (Figure 3). In addition, the CNDDB reports the presence of SJKF critical habitat within 10 km of the Miravale III site. DD&A and BioSearch biologists mapped the presence of California ground squirrel burrow "clusters" throughout the mixed grassland potions of the site and in portions of the fallow and active agricultural portions of the site; many of the burrows observed were of appropriate size to support this species. ~~In addition, one active "natal den" was mapped and recorded by the Biosearch biologists."~~

REVISED SUMMARY TABLE 2-1 FINAL EIR

The following pages provide the Revised Summary Table which replaces Table 2-1 in the Draft EIR.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
4.1 Aesthetics			
The project would permanently alter a scenic vista, consisting of a portion of the Gabilan Mountain Range foothills, by causing changes to topography, removing vegetation, and adding roads, buildings, pavement, and lighting.	4.1-1	Building heights of all new structures shall adhere to the limits set forth in the Miravale III Specific Plan dated June 2007. Additionally, all new structures shall adhere to the applicable Development Standards as established in Section 2.0 of the Specific Plan. Prior to the issuance of any building permit for development within the Specific Plan area, the project applicant shall submit detailed plans, including elevations, site plans, and/or other documentation detailing compliance with applicable development standards, subject to the review and approval of the City of Soledad.	Significant and unavoidable.
	4.1-2	In order to minimize potential adverse visual impacts associated with development within the hillside portions of the project site, the project applicant shall submit and have approved, prior to the recordation of the final map for Phases three and four, building envelopes for each new residential lot proposed above the 400 foot elevation contour. The proposed building envelopes shall be located in the least visually sensitive area of each lot. No new structures shall be constructed outside of the approved building envelopes, unless otherwise approved by the City of Soledad.	
	4.1-3	In order to minimize aesthetic-related impacts due to development within the hillside portion of the site, the project applicant, prior to project approval, shall submit a revised Specific Plan that includes the following policy in Section 2.6 Low Density Residential (LDR & LDR-H/M3-R-1): All new residential units proposed within areas of the project site above the 400 foot elevation contour shall be subject to a Design Review approval process or similar. As part of the design review process, vertical building envelopes shall be identified and staking and flagging shall be required to demonstrate the extent of proposed development. All new structures shall be designed to minimize visual impacts to the greatest extent feasible.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	4.1-4 Final design plans for proposed development shall utilize natural landforms and vegetation for screening structures, access roads, building foundations, cut and fill slopes, and exterior lighting. Roads, parking, and utilities shall be designed to minimize visual impacts. Prior to the issuance of any grading and/or building permit, the project applicant shall submit design-level drawings demonstrating compliance with this measure, subject to the review and approval of the City of Soledad. If an alternative design would minimize impacts, the applicant shall submit evidence demonstrating that the alternative design is infeasible. 4.1-5 The applicant shall provide landscape screening appropriate to the surrounding area in order to integrate the development with the existing natural landscape. Landscaping plans shall be submitted to the City of Soledad for review and approval prior to the issuance of any building or grading permit. 4.1-6 All buildings shall be designed with colors and materials that effectively blend the structures with the surrounding landscape. Building applications for new structures shall include color and material sample photo sheets and shall be approved by the City of Soledad, prior to the issuance of any building permit. 4.1-7 A site-specific geotechnical report shall be prepared for new development on hillsides in order to ensure that the development will not cause or worsen natural hazards, such as erosion and sedimentation, and will minimize risk to life and property from slope failure, landslides, and flooding. The report shall include erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas. Prior to the issuance of any grading and/or building permit for new development within the hillside portions of the project site, the project applicant shall submit a geotechnical report prepared by a qualified professional to the City of Soledad Department of Public Works for review and approval. The site-specific geotechnical report shall identify feasible recommendations and	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	avoidance measures to minimize potential impacts. 4.1-8 Land alterations within areas above the 400 foot elevation shall be minimized by keeping cuts and fills to a minimum, limiting grading to the smallest practical area of land, limiting land exposure to the shortest practical amount of time, replanting graded areas to insure establishment of plant cover before the next rainy season, and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur. Prior to the issuance of any grading permit, the project applicant shall submitted detailed grading plans consistent with the intent of this mitigation, subject to the review and approval of the City of Soledad.	
Development of the proposed project may impact scenic resources within view of a State Scenic Highway.	No Mitigation Measures identified.	Less-than-significant
The project would permanently alter the existing visual character of the site by causing changes to topography, removing vegetation, and adding roads, buildings, pavement, parking areas, and lighting.	4.1-9 In order to minimize tree removal and associated visual impacts, final design-level improvements plans shall retain existing mature eucalyptus and other tree species to the greatest extent possible. Final design-level plans shall be prepared in consultation with a registered arborist/forester to minimize tree removal and ensure the health of remaining trees. Prior to the issuance of any grading and/or building permits, final plans shall be subject to the review and approval of the City of Soledad Director of Public Works. If the removal of existing mature eucalyptus is required the applicant shall submit evidence demonstrating that there are no feasible design alternatives to avoid tree removal. In the event that tree removal is required, the project proponent shall prepare a tree removal and replacement plan for each phase of construction, subject to the review and approval of the City of Soledad Community Development Director. The tree removal and replacement plan shall identify specific grading limits that minimize tree removal, as well as appropriate tree replacement ratios and replanting locations. 4.1-10 Final design plans for the proposed gateways shall include elements, such as signage, landscaping and landscaped center medians, and	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		appropriate architectural detailing consistent with the Miravale III Specific Plan. Prior to issuance of any permit for the construction of any of the four gateways, the project applicant shall submit detailed plans that include the above referenced elements, subject to the review and approval of the City of Soledad.	
	4.1-11	Final design plans for proposed residential development shall include form, scale, and character elements which emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks. Prior to the issuance of any building permit for residential development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad. <u>All residential development within the Specific Plan area shall be subject to a conditional use or design review process as administered by the City of Soledad.</u>	
	4.1-12	Final design plans for proposed multi-family development shall include useable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood. Prior to the issuance of any building permit for multi-family development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad.	
	4.1-13	Final design plans for proposed development shall include a tree planting plan in order to increase the number and density of tree cover within new development areas. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed tree planting plan, subject to the review and approval of the City of Soledad.	
The project would create a new source of light or glare that would adversely affect day or nighttime views in the area.	4.1-14	All buildings shall be designed so that exterior lighting is down-lit and illuminates the intended area only. Building applications for new structures shall include an exterior lighting plan subject to approval of	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	the Soledad Planning Department that includes the following requirements: 1) exterior lighting shall be directional; 2) glare from exterior lighting shall be adequately minimized; 3) the source of directional lighting shall not be directly visible; and 4) vegetative screening shall be considered, where appropriate, as a means of reducing development-related light and glare. The project applicant shall submit an exterior lighting plan to the City of Soledad Planning Department prior to the issuance of any building permit. 4.1-15 Ornamental lighting use for streets, parks, public open spaces, trails, bike paths, parking lots, and walkways shall utilize fixtures consisting of metal halide with <u>full</u> cut-off luminaries <u>other form of similar fixtures</u> in order to control light and glare. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department. 4.1-16 Light reduction and screening measures shall be required in order to reduce nighttime ambient light increases in the area. Lighting levels in commercial areas shall be kept as low as feasible and controlled to minimize operating time. Light sources shall be installed, so there is no light radiation above the horizontal plane (i.e., dark sky). Lighting shall be focused downward to prevent the splay of ambient light to other areas. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department	
4.2 Agricultural Resources		
The proposed project would include the conversion of prime agricultural land.	No feasible mitigation.	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
Development of land designated for urban development as part of Phase 4 of the Specific Plan will require the cancellation of Land Conservation Act Contract 73-25 within the project site.	No feasible mitigation.		Significant and unavoidable.
The proposed project will be sited adjacent to existing agricultural uses located on the boundary of the project footprint. This has the potential to cause an increase in land use compatibility problems and nuisance complaints due to urban uses being sited adjacent to agricultural uses. In order to minimize these potential land use conflicts, the project has been designed with a minimum 60' buffer zone between the residential and agricultural uses along the western boundary of the project site. Additional buffers, however, are warranted along the northern and eastern project boundaries. Moreover, as currently proposed, the 60' buffer does not meet the minimum buffer distance recommended by the Monterey County Agricultural Commissioner. To ensure that residential uses are adequately buffered from agricultural uses, additional measures are necessary to protect human health and the environment resulting from potential conflicts between agricultural and urban uses.	4.2-1	Adequate buffer areas between urban and agricultural uses, including a minimum 50 foot buffer along the northern and eastern boundary of the project site and a 200 foot buffer along the western boundary, shall be incorporated into the proposed project. These buffers shall also be supplemented with physical barriers in areas where residential and commercial structures are to be located, as recommended by the Agricultural Resources Report contained in Appendix T-1. The 200 foot buffer along the project's western boundary may be reduced upon demonstration to the satisfaction of the City that other measures, including those recommended in Mitigation Measure 4.2-2, will adequately protect human health and safety and minimize potential conflicts, and provided that any such reduction shall not result in a buffer width of less than 100 feet. The County of Monterey Agricultural Commissioner shall be consulted regarding the adequacy of the proposed buffers and physical barriers and evidence of said consultation and recommendation shall be submitted to the City prior to approval of the tentative map. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report, subject to the review and approval of the City of Soledad. All agricultural buffers, excluding public right-of-ways, shall be maintained by the Project Proponent and/or his/her successor(s) in interest through easements dedicated to the City or other entity until such time that the adjoining agricultural operation and use no longer exists.	Less-than-significant
	4.2-2	In order to ensure the adequacy of the proposed ~~60'~~ agricultural buffer located along the western boundary of the project site, as required by Mitigation 4.2-1, the project applicant shall submit a detailed landscape plan that includes vegetative screening in addition to	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	physical barriers, such as fences, walls, or similar structures to protect human health and safety. One or more of the following options may also be used in combination with landscaping requirements to create an adequate ~~average 60 foot~~ buffer between the agricultural parcel property line and habitable structures within the Plan area: a. Public or private road right-of-ways; b. Landscaped islands and planting areas; c. Recreational trail corridors; and/or d. Placing dwellings in the rear portion of lots. Prior to the recordation of any final map along the western project boundary, the ~~an~~ agricultural buffer ~~setback~~ and any related easement shall be delineated on the final map, subject to the review and approval of the City of Soledad. 4.2-3 Prior to the issuance of any certificate of occupancy for residences adjacent or in close proximity to the agricultural buffer along ~~to on-going agricultural uses on~~ the western project boundary, the project applicant shall provide documentation demonstrating that adequate screening, landscaping and structural ~~and landscaped~~ improvements have been installed and/or constructed within the ~~60' agricultural~~ buffer, subject to the review and approval of the City of Soledad.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
The proposed project has the potential to impact routine and on-going agricultural activities on the areas adjacent to the northern, eastern, and western boundaries of the project site.	4.2-4	Access for agricultural equipment and vehicles to the adjoining row crop land on the western boundary shall continue to be provided from the ramp to Highway 101 North (see Figure 2 in Technical Appendix T-1, Agricultural Report). The current access road to the Braga property should remain at the current width to allow for passing and ensure adequate turnaround space for field equipment. Implementation of this measure would reduce impacts to routine and on-going agricultural operations on lands west of the proposed project site.	Significant and unavoidable.
	4.2-5	Prior to the issuance of any permit, the project applicant shall have recorded a right-to-farm notice on parcels adjacent to existing and on-going agricultural uses consistent with the requirements of the City of Soledad General Plan, subject to the review and approval of the City of Soledad.	
4.3 Air Quality			
Construction activities, such as clearing, excavation and grading operations, construction vehicles traffic on unpaved ground, and wind blowing over exposed earth would generate dust and particulate matter.	4.3-1	Prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall, at a minimum, include the following measures: • Limit grading activity to a maximum of 2.5 acres daily. As more detailed construction information becomes available, emissions from grading activities could be reassessed to determine if the area of grading could be increased. Such an assessment would have to be conducted using appropriate assumptions and mitigation measures. • Water all active construction areas at least twice daily and more often during windy periods. Active areas adjacent to existing businesses should be kept damp at all times. If necessary, during windy periods, watering is to occur on all days of the week regardless of onsite activities.	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		• Cover all trucks hauling dirt, sand, or loose materials. ~~trucks or maintain at least two feet of freeboard.~~ • Haul trucks shall maintain at least 2'0" of freeboard. • Plant tree windbreaks on the windward perimeter of construction project if adjacent to open land. • Install wheel washers at the entrance to construction sites for all exiting trucks. • Pave all roads at construction sites. • Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites. • Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites. • Sweep streets daily (with water sweepers) if visible soil material is deposited onto the adjacent roads. • Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more). • Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles. • Limit traffic speeds on unpaved roads to 15 mph. • Replant vegetation in disturbed areas as quickly as possible. • Suspend excavation and grading activity when hourly-average winds exceed 15 mph and visible dust clouds cannot be contained within the site.	
Construction activities would involve use of the heavy-duty off-road equipment and large trucks that use diesel fuel resulting in emissions of diesel particulate matter and NOx.	4.3- 2	Projects developed under the specific plan shall ~~should~~ be evaluated for individual construction period air quality impacts. Project-specific mitigation measures shall ~~would~~ be identified at that time to reduce impacts to a less-than-significant level, if feasible. However, the following ~~mitigation~~ measures shall ~~should~~ be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment: • The following equipment may be used without control devices or additional mitigation measures without causing acute adverse health	Less-than-significant

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	effects: o No engineers greater than 750HP are used; and o Engines between 501 HP and 750 HP are model years 2002 and newer; and o Engines between 251 HP and 500 HP are model years 1996 or newer; and o Engines between 175 HP and 250 HP are model years 1985 or newer. • The following equipment may be used without causing acute adverse health effects, if retrofitted with a catalyzed diesel particulate filter (CDPF): o Engines greater than 750 HP; if model year 2006 and newer; and o All engines less than 749HP, regardless of model year. • If construction equipment uses B99 biodiesel, no acute adverse health effect would be expected in the following: o Engines between 501 HP and 750 HP, if model years 2002 or newer; and o Engines between 250 HP and 500 HP, if model years 1996 and newer; and o Any engine less than 250 HP. ~~• Use off-road construction equipment, manufactured during or after 1996 that meets the NOx emissions standard of 6.9 grams per brake-horsepower-hour or use of alternative fuels (such as biodiesel) that result in lower particulate emissions.~~ ~~• The contractor shall install temporary electrical service whenever possible to avoid the need for independently powered equipment (e.g. compressors).~~ ~~• Diesel equipment standing idle for more than two minutes shall be turned off. This would include trucks waiting to deliver or receive soil, aggregate, or other bulk materials. Rotating drum concrete trucks could keep their engines running continuously as long as they were onsite and staged away from residential areas.~~ ~~• Properly tune and maintain equipment for low emissions.~~ ~~• Stage large diesel powered equipment (i.e. wheeled tractor, wheeled loader, roller by using gasoline-powered equipment to reduce NOx emissions.~~ ~~• Limit the hours of operation for heavy-duty equipment.~~	
Implementation of the proposed specific plan would result in increases in long-term operational	4.3-3. In order to reduce greenhouse gas (GHG) and regional air pollutants and precursors (criteria air pollutants or CAPs)	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
emissions of ozone precursor pollutants. These emissions would exceed significance thresholds established by the MBUAPCD.	emissions to the extent feasible, the applicant/project proponent shall prepare and submit a GHG and CAP Reduction Plan (GCRP) concurrent with submittal of any revised Tentative Map under the Specific Plan or any Site Plan that differs from the Specific Plan as described in this EIR. The GCRP shall include a description of the measures that are proposed to be implemented by that phase of the project, including one or more of the measures contained in Appendix __ of this Final EIR. The plan shall be approved by the City prior to construction of structures and site improvements, including but not limited to, determination of substantial conformance, building permits, and grading permits. For each of the measures not included, the applicant shall describe why the measure was not included. The GCRP shall present estimated reductions in GHGs and CAPs based on available information source. No certificate of occupancy for any phase, or portion thereof, of the project shall be granted until all of the feasible, applicable measures have been implemented by the applicant/project proponent. The proponent shall demonstrate that measures that must be implemented throughout the life of the project are included in all applicable CC&Rs, property deeds, commercial center rules and regulations, and draft tenant lease agreements. 4.3-4 Fireplaces and stoves shall be gas-fired and meet U.S. Environmental Protection Agency certification requirements. The installation or operation of a wood-burning fireplace or a wood-burning stove shall be prohibited in perpetuity on all residential properties in the Miravale III Specific Plan Development. This restrictive covenant shall be recorded on the title of all parcels in the Miravale III Specific Plan area and shall run with the land.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	4.3-5 Projects developed under the Specific Plan shall facilitate transit service to the plan area by providing the necessary bus shelters and turn-outs to serve each development phase as recommended by the Monterey-Salinas Transit District, subject to approval by the City. Any tentative map or development plan and related improvement plans submitted pursuant to the adopted Specific Plan shall clearly denote the locations and design specifications for such facilities. ~~The project shall apply the following measure to the extent appropriate for the specific land uses proposed:~~ ~~• Develop a Transportation Demand Management Program with the intent of reducing vehicle trips and vehicle miles traveled associated with build out of the specific plan. Components of this plan may include:~~ ~~o Develop parking strategies for commercial and retail uses that reduce single occupant vehicle trips.~~ ~~o Provide bicycle storage/parking facilities.~~ ~~o Provide shower/locker facilities in light industries and office uses.~~ ~~o Provide onsite or near site child care centers for large employment centers.~~ ~~o Develop park-and-ride lots.~~ ~~o Provide opportunities to include or increase transit service to plan area.~~ ~~• Include plans to incorporate safe and efficient modes of bicycle and pedestrian transportation. Bicycle routes and pedestrian paths should include amenities such as signs and traffic signal activation (e.g., loop activators).~~ ~~• Identify energy efficiency goals for new developments that would conserve energy beyond requirements of the State Title 24 building code.~~ ~~• Provide exterior electrical outlets on new buildings that encourage use of electrical landscape equipment.~~	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	• ~~Prohibit open wood burning fireplaces in new residences unless they are natural gas fired or EPA certified wood heaters that meet EPA's particulates emission standard of 7.5 grams per hour.~~	
Development of residential uses adjacent to agricultural uses has the potential to result in nuisances and odors due to ongoing agricultural operations.	Please refer to Mitigation Measures 4.2-1 through 4.2-3.	Less-than-significant.
4.4 Biological Resources		
The proposed project would represent temporary and permanent impacts to all habitats and the vast majority of vegetation within project boundaries, and will result in the removal of 3 or more oak trees plus all Eucalyptus and/or Tamarisk trees lining San Vicente Road. Temporary impacts to vegetation included grubbing and grading associated with development of the site; permanent impacts include the conversion of open vegetated areas to urban housing through placement of structures, homes, roads, driveways, etc.	4.4-1 A Forest Management Plan shall be prepared for the project due to proposed tree removals. <u>The Forest Management Plan shall include a map that indicates all of the trees within the project site and denotes which trees are to be removed. The map shall also include notes which clearly state protection procedures for trees that are to be preserved. In addition, the Forest Management Plan shall include, but is not limited to, a description of each tree by species and its condition.</u> The City approved Forest Management Plan (and associated replanting plan) shall be incorporated as a condition of project approval to satisfy General Plan Conditions C/OS 17-19. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a Forest Management Plan, subject to the review and approval of the City of Soledad. 4.4-2 <u>Prior to the onset of construction,</u> ~~T~~trees and vegetation not planned for removal shall be protected during construction to the maximum extent feasible. This shall include the use of exclusionary fencing of herbaceous and shrubby vegetation, such as hay bales and protective wood barriers for trees. Only certified weed-free straw shall be used to avoid the introduction of non-native, invasive species. <u>A qualified biological monitor shall verify that adequate protective measures are in place prior to construction and remain intact throughout the construction phase.</u>	Less-than-significant

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	4.4-3 Following construction, the disturbed areas that are proposed as parks and landscaping areas shall be restored to pre-project contours and revegetated using locally-occurring native species and native erosion control seed mix to the maximum extent feasible. Landscape plans for all such areas adjoining natural open space, including landscaped strips within right-of-ways, shall be reviewed by a qualified biologist to ensure that only native and non-invasive species are included in the planting palette and shall include a supplemental note and/or report by said biologist documenting compliance with this requirement. Landscape plans for other disturbed areas or for designated parks shall utilize native species to the extent feasible and avoid the use of all invasive species; such plans shall include a note from the licensed professional who prepared the plan(s) or from a qualified biologist documenting compliance with this requirement. Prior to the issuance of any grading and/or building permit, the project applicant shall submit landscape plans prepared by a licensed landscape architect for review and approval by the City of Soledad. 4.4-4 Prior to the onset of construction, ~~P~~protective fencing shall be placed so as to keep construction vehicles and personnel from impacting vegetation adjacent to the project site outside of work limits. A qualified biological monitor shall verify protection is in place prior to construction and remains intact throughout the construction phase. 4.4-5 Grading, excavating, and other activities that involve substantial soil disturbance shall be planned and carried out in consultation with a qualified hydrologist, engineer, or erosion control specialist, and shall utilize standard erosion control techniques to minimize erosion and sedimentation to native vegetation. 4.4-6 No construction equipment shall be serviced or fueled outside of designated staging areas. A qualified biological monitor shall verify that this measure is being implemented throughout the construction phase.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
The presence/absence of jewelflower has not been determined at this time, but appropriate habitat is present within project boundaries. This species could be permanently impacted by proposed grading, excavation, and other activities that may result in the permanent loss or disturbance of individual jewelflowers and/or jewelflower habitat.	4.4-7	A qualified botanist shall be retained to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species. If no Lemmon's jewelflower is present, no additional mitigation is required. If Lemmon's jewelflower is present, a qualified biologist shall prepare a mitigation plan to be approved by CDFG prior to initiation of construction.. The mitigation plan shall include a description of the special-status plant population(s), map depicting the location(s), and size of the population(s). If feasible, disturbance of the population(s) of Lemmon's jewelflower shall be avoided and its habitat protected utilizing methods developed in coordination with the CNPS and CDFG. Avoidance shall be confirmed by the City prior to the time of tentative map approval for this phase of the project. If impacts to the Lemmon's jewelflower population(s) cannot be avoided, mitigation shall include preservation on- or off-site at a minimum 1:1 ratio (one plant preserved for each plant impacted), or restoration on- or off-site at a minimum 3:1 ratio (three plants planted for each plant impacted). The CNPS and CDFG shall be consulted to evaluate the suitability for transplanting the impacted species to suitable habitat within the identified and established preserve/restoration area. These details shall be described and included in the mitigation plan. Restoration and preservation strategies shall be developed in coordination with the CNPS and CDFG. The City of Soledad Planning Department shall be provided verification of CDFG concurrence and satisfaction prior to issuance of grading permits.	Less-than-significant.
Project development would fragment (i.e., divide and disrupt) the vast majority of the existing wildlife habitat on the site, and would represent an urban encroachment into the foothills of the Gabilan Range (an important wildlife corridor). The ongoing presence of homes, roads, cars, people, firearms, pets, etc. would adversely impact any wildlife currently utilizing the site, particularly in the grassland portions of the site (i.e. deer, coyote,	4.4-8	Prior to approval of each final map, the applicant shall prepare and submit draft Covenant, Conditions, and Restrictions (CC&Rs) applicable to that phase that shall include the following: a) restrict installation fencing to the immediate vicinity of residences, and where fencing is placed adjacent to open space areas and areas of natural, undisturbed habitat, fences shall be installed such that a six inch space is left between the bottom of the fence and the surface of the ground; b) prohibit off-road vehicle use;	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
fox, jackrabbits, squirrels, and raptors). Comparable development is present immediately south of the proposed project, but does not extend into the grassland/foothill portions of the site.		c) prohibit illegal discharge of firearms; d) prohibit the installation of road medians throughout the development. These CC&Rs shall be reviewed and approved by the City of Soledad prior to approval of each final map.	
Suitable foraging/dispersal habitat for San Joaquin kit fox is present throughout project boundaries, with potential denning habitat present in the annual grassland, rocky outcrop, and fallow agricultural portions of the site (see Early Evaluation Report in Appendix C). The vast majority of the habitats present within project boundaries would be directly impacted by the proposed project <u>. The project may result in direct and indirect "take" of individual kit fox (i.e., entombment, increased traffic, mortality/predation due to exposure, loss of habitat, reduced habitat connectivity, attraction of predators, placement of structures and roads, etc.)</u> ~~(grubbing and grading, construction phase impacts, permanent placement of structures and impermeable surfaces, etc.).~~ Impacts proposed in the grassland portions of the site will likely result in kit fox abandonment of the property due to ongoing disturbance, if present at the site<u>. Based on USFWS Ventura Office review of the early evaluation report prepared by Biosearch, protocol-level SJKF northern-range protocol-level surveys were recommended (pers. comm. Roger Root, USFWS). The USFWS and CDFG have stated that a determination of SJKF absence from the proposed project site and a finding of "no take" of the species could only be supported by completing the protocol for this species and having a negative finding. Since protocol-level surveys for this species have</u>	4.4-9 4.4-10	The applicants shall enter into consultation with USFWS and CDFG and shall provide evidence of their compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act <u>to the City</u> prior to the issuance of building permits. Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. Pre-construction surveys shall be conducted by a qualified biologist no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites. <u>The preconstruction surveys shall be conducted per Standardized Recommendations for the Protection of the San Joaquin Kt Fox Prior to or During Ground Disturbance (USFWS 1999b), as updated. Potential dens (including man-made structures) and known dens shall be protected by minimum buffers of 50 feet and 100 feet, respectively. If an occupied or unoccupied natal den is detected, no construction shall occur for the Phase until the USFWS and CDFG have been contacted and authorization to proceed has been obtained by the applicant.</u> Pre-construction surveys shall be conducted by a qualified biologist no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites. In addition to pre-construction surveys, a qualified biologist, meeting the required qualifications described in the *U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance*, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox. In the event that an active kit fox den is found, then the standard mitigation actions outlined in the	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
not yet been conducted, the Draft EIR assumes kit fox presence within the project site. ~~For this reason,~~ Therefore, the project is assumed to have a significant and unavoidable adverse affect on San Joaquin kit fox (i.e. direct mortality, loss of habitat, loss of dens, etc.). *This impact may be reduced by implementation of the following mitigation measures; however, the impact will not be reduced to a less-than-significant level without completion of the required protocol surveys in coordination with the USFWS and CDFG ~~consultation~~ (Federal Endangered Species Act and California Endangered Species Act, respectively) and implementation of appropriate avoidance measures or redesign, per the CDFG letter of comment on the Draft EIR.*	USFWS Recommendations for SJKF, are recommended to avoid possible take of kit fox during future construction activities. These actions are general in nature; therefore, site specific strategies for the project site shall be based upon consultation with USFWS and CDFG, as stated above in Mitigation Measure #4.4-9. To reduce the risk of impacts during construction, the applicant shall, at a minimum, implement the following measures, unless directed otherwise through consultation with the USFWS and CDFG: a) Restrict project-related vehicle speed to 20 mph on project roads. b) Cover all excavated, steep-walled holes or construction trenches more than 2 feet deep at the close of each working day by plywood or similar materials or provide such holes or trenches with one or more escape ramps constructed of earth fill or wooden planks, inspect such holes or trenches for trapped San Joaquin kit fox prior to filling. c) Inspect all construction pipes, culverts, or similar structures with a diameter of 4 inches or greater that are stored at a construction site for one or more overnight periods for kit foxes before the pipe is subsequently buried, capped, or otherwise used or moved in any way. d) Contain all food-related trash items in closed containers and remove food related trash at least once a week from the project site. e) No firearms shall be allowed on the project site. f) No pets shall be permitted on the project site. g) Use of rodenticides and herbicides on the project site shall be restricted to the use of zinc phosphide, in cases where it is necessary to protect public health and safety. h) A representative shall be appointed by the project proponent who will be the contact source for any employee or contractor who might inadvertently kill or injure a kit fox or who finds a dead, injured or entrapped individual. The representative will be identified during the employee education program. The representative's name and telephone number shall be provided to the Service.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	i) An employee education program shall be conducted and shall consist of a brief presentation by persons knowledgeable in kit fox biology and legislative protection to explain endangered species concerns to contractors, their employees, and agency personnel involved in the project. The program shall include the following: a description of the San Joaquin kit fox and its habitat needs; a report of the occurrence of kit fox in the project area; an explanation of the status of the species and its protection under the Endangered Species Act; and a list of measures being taken to reduce impacts to the species during project construction and implementation. A fact sheet conveying this information shall be prepared for distribution to the above-mentioned people and anyone else who may enter the project site. j) In the case of trapped animals, escape ramps or structures shall be installed immediately to allow the animal(s) to escape, or the Service shall be contacted for advice. k) To the extent feasible, nighttime construction shall be avoided. l) Include kit fox mitigation measures on project plans If active kit fox den sites are found and/or kit fox individuals are observed during the survey, the applicant will be required to comply with all mitigation actions required by USFWS and CDFG and the City shall monitor implementation of those actions. Examples of mitigation actions that may be required by the regulatory agencies may include, but are not limited to: • To the extent feasible, lot placement shall be situated to create wildlife corridors in protected open space to allow for kit fox and other wildlife movement through the site. • Fencing shall surround the site to restrict kit fox movement into the development area; types of fencing (e.g. exclusionary or kit fox friendly) shall depend on the density of the development area. • Speed bumps, rolls, or reduced speed limits shall be employed	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		along project roads in or near open space areas to reduced likelihood of kit fox mortality by vehicle strikes. • Street lighting shall be situated as to not spill into adjacent open space areas. The height and intensity of street lighting shall be designed to minimize indirect impacts to open space. Outdoor lighting for residential uses adjacent to open space and large lots shall also be restricted to CC&Rs to be low wattage (150 watts or less) and directed toward the residences to reduce effects on kit fox nocturnal activities.	
Multiple badger dens and badger diggings were observed in the vicinity of the onsite reservoir and within other portions of the annual grassland habitat. An adult badger was observed emerging from an onsite den by Biosearch biologists. Badger diggings were also observed in fallow agricultural portions of the site, demonstrating badger utilization of these areas as foraging habitat. Therefore, construction activities in grassland portions of the site have the potential to impact badger dens, and construction within fallow agricultural portion of the site will impact badger foraging habitat. Project-related construction activities (i.e. grading, excavation, development, etc.) may result in a permanent loss or disturbance of American badgers and their habitat.	4.4-11	The applicant shall retain a qualified biologist to conduct focused preconstruction surveys for potential American badger dens. These surveys shall be conducted no sooner than 2 weeks prior to the start of construction. Surveys for badger dens may be conducted at the same time as burrowing owl surveys. The results of the survey shall be submitted to the City prior to issuance of grading permit or initiation of grading for that phase of development on the site. Based on the results of these surveys, one or more of the following additional measures shall be implemented: ▪ If the qualified biologist determines that potential dens are inactive, the biologist shall excavate these dens by hand with a shovel to prevent badgers from re-using them during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities. ▪ If the qualified biologist determines the presence of active dens, the location of these dens shall be documented and reported to CDFG. Avoidance of active dens, particularly natal dens, is the preferred approach; Impacts to active badger dens shall be avoided by establishing a 100-meter exclusion zones around all active badger dens, within which construction related activities shall be prohibited until denning is complete and/or the den is	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		abandoned. A qualified biologist shall monitor each den once per week in order to track the status and inform the project sponsor of when a den area has been abandoned. ▪ If avoidance of an active badger den is not feasible, the biologist shall coordinate with CDFG on the appropriate way to evict/exclude badgers from their dens. Please note that special consideration of natal dens is required given the low likelihood that excluded young would survive; a CDFG depredation permit would be required to disrupt a natal den. For non-natal dens, CDFG has permitted badgers to be gradually excluded from their dens by placement of soil, sticks, and debris at den entrances, incrementally increasing the degree of blockage over a period of three to five days (please note that blockage cannot trap/entomb badgers). After the monitoring biologist determines that badgers have stopped using active dens within the project boundary, the dens shall be hand-excavated with a shovel to prevent re-use during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities. Please note that eviction of onsite badgers will reduce construction phase impacts to this species, but given the large home ranges and territoriality of this species, emigration to alternative habitats may not be feasible without inter/intra specific competition (energetic stress possibly resulting in mortality). CDFG may require that appropriate onsite or adjacent habitat be conserved to allow relocation of excluded animals within their home range.	
Two special-status bat species may be present onsite (pallid bat and Townsend's big-eared bat); several other bat species may also be present. Removal of onsite trees, removal of onsite buildings, and development of the site (including encroachment/disruption of rocky outcrops) may	4.4-12	A qualified bat specialist shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist). ~~Please refer to the mitigation measures in the Preliminary BA (June 2008) for measures that may be implemented based on the results of these surveys~~. The results of the survey shall be submitted to the City prior	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
result in direct impacts to bats and/or bat roosts (day, night, foraging, and maternity) and would remove the vast majority of onsite foraging habitat for these species.	to issuance of grading permit or initiation of grading for that phase of development on the site. Based on the results of these surveys, one or more of the following additional measures shall be implemented: ▪ If it is determined that bats are not present at the site, no additional mitigation is required. ▪ If it is determined that bats are utilizing the site and would likely be impacted by the proposed project, preconstruction surveys shall be conducted no more than 30 days prior to modification, demolition, or removal of onsite buildings and/or any other occupied habitat. If no bat or bat sign are observed in the course of preconstruction surveys, then demolition/removal of buildings and/or construction initiation may proceed. If bat and/or bat sign are observed during the preconstruction surveys, the biologists shall determine if disturbance will jeopardize a maternity roost, or another type of roost (foraging, day, night). ▪ If a single bat and/or only adult bats are roosting, demolition or removal of the structure can proceed after the bats have been safely excluded from the roost. Exclusion techniques shall be determined by the biologist and depend on the type utilization; the biologist shall prepare a mitigation plan for provision of alternative habitat to be approved by CDFG and the City. ▪ If an active maternity roost is detected, work in the vicinity of the roost (and/or demolition of the structure) shall be postponed until the qualified biologist monitoring the roost(s) determines that the young have fledged and are no longer dependent on the roost. The monitor shall ensure that all bats have left the building and or area of disturbance prior to initiation of construction and/or demolition activities. *If disruption of a maternity roost cannot be avoided, a depredation permit would be required.*	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
Salinas pocket mouse is known to occur onsite; presence was confirmed in September 2006. As the vast majority of the onsite grassland habitat will be converted to residential usage and the remaining portions will be fragmented from surrounding habitat and subject to ongoing disturbance (cars, lights, noise, sound, vibration, etc.), significant impacts to this species are anticipated (direct and indirect mortality).	4.4-13	The applicant shall contract a qualified biologist to coordinate with CDFG and prepare a mitigation and monitoring plan for Salinas pocket mouse. The mitigation and monitoring plan shall include a description of the population and locations of known and potential habitat within the project site, mitigation to avoid and reduce impacts to the species, monitoring actions, success criteria, and adaptive management measures if success criteria are not met. Verification of CDFG concurrence/approval shall be submitted to the City of Soledad prior to issuance of a grading permit for that phase of development of the site. ~~initial grubbing and grading of the site~~.	Significant and unavoidable.
Tree removal (i.e., Eucalyptus and Tamarisk trees lining San Vicente Road and oaks present in the northeast corner of the site) and disturbance associated with construction of the proposed project would likely impact any nesting birds and/or raptors present within project boundaries (harassment, stress, brood-less, nest abandonment, injury, mortality). Per the CDFG Guidelines, impacts to burrowing owls are defined as disturbance or harassment within 160 feet of occupied burrows, destruction of burrows and burrow entrances, and degradation of foraging habitat adjacent to occupied burrows. In addition, the project would require grading, grubbing, tree removal, excavation, and other activities that may result in a permanent loss or disturbance of raptors and migratory birds and their habitat.	4.4-14	Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the Miravale site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The survey shall conform to the CDFG 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied). Please refer to the mitigation measures regarding burrowing owl in the Preliminary BA (June, 2008) for avoidance and mitigation measures that may be implemented based on the results of these surveys.	Less-than-significant.
	4.4-15	If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area. If active nests are found, a suitable construction buffer shall be established by a qualified biologist, and no work shall	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	occur within that buffer until August 1 when young are assumed fledged. Alternatively, a qualified biologist can conduct weekly nest checks to gauge nestling/fledgling status, and construction may proceed once fledglings have dispersed from the nest provided written concurrence from CDFG. No active nest shall be impacted or removed without a depredation permit from CDFG, and a depredation permit will not be issued for impacts to Fully Protected Species such as the white-tailed kite. For activities that occur outside of the nesting season (generally September 1 through February 14), preconstruction surveys are not required. If construction is initiated outside of the nesting season and continues into the nesting season, preconstruction surveys are required if construction will occur in areas not previously accessed and/or disturbed (>300 feet from previous construction activities). 4.4-16 A preconstruction survey shall be conducted no more than 14 days prior to modification, demolition, or removal of onsite buildings. If no owls or other nesting birds are observed, then demolition or removal may proceed. If barn owls (or any other nesting birds) are observed during the preconstruction survey, a determination shall be made on whether birds are roosting or nesting. If a single owl is roosting, demolition or removal of the structure can proceed after the owl has been persuaded to move from the roost area. Non-invasive techniques include light shining into the roost space for one or two nights and days. If barn owls (or other nesting avian species) are found to be actively nesting in the barn, work on or demolition of the structure shall be postponed until one of the following conditions have been met: 1) a qualified biologist monitoring the nest determines that the owls have abandoned the nest without any outside interference or 2) a qualified biologist monitoring the nest has determined that the young have fledged and are capable of relocating and using another roost site. Once the young have fledged, non-invasive techniques may be used to encourage the owls to leave the barn. Under either scenario, the monitor shall ensure that all owls have left the building prior to construction or demolition activities. The barn owl nesting period is typically between February 15 and July 15.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
Although extensive aquatic surveys have been conducted, ~~T~~the presence of California red-legged frog and/or Western spadefoot has not been determined at this time. The project as currently designed would fill the onsite reservoir to establish home-sites, removing a potential breeding resource for these species. Pond 3 would likewise be permanently filled as a result of the proposed project. If CRLF or spadefoot are present, proposed impacts to onsite agricultural basins (particularly the reservoir) would result in direct impacts to these species including "take~~.~~" of CRLF under ESA (i.e. loss of individuals and habitat, loss of a breeding resource, direct mortality, etc.). In addition, grading and other earthmoving activities proposed would represent an adverse affect on upland estivation habitat for these species, if present. *Therefore, the proposed project would represent a significant and unavoidable impact to a federally Threatened Species and State Species of Special Concern ~~and state regulated wildlife species~~ (if present,) as currently designed. However, implementation of the mitigation measures identified below will reduce these impacts as much as feasible but not to a less-than-significant level without completion of the protocol-level surveys in coordination with the USFWS and CDFG to comply with ESA and Fish and Game Code, and implementation of appropriate avoidance measures or redesign.*	4.4-17	Protocol-level CRLF surveys (USFWS, August 2005) shall be completed at each aquatic resource present within project boundaries. Protocol-level CRLF surveys would likely detect Western spadefoot, if present (Western spadefoot toad surveys are also conducted at night during winter months, preferably January through March, and therefore, overlap CRLF survey protocol requirements). The results of the survey shall be submitted for the review and approval of the City, USFWS, and CDFG. If it is determined that CRLF are present, the applicant shall coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA (e.g., applying for an Incidental Take Permit [Section ~~7 and/or~~ 10 ~~depending on lead agency~~]) and implementing the permit requirements prior to issuance of a grading permit. Any mitigation and avoidance measures required by USFWS for potential impacts to CRLF (if applicable) would likewise reduce impacts to Western spadefoot given their overlapping habitat characteristics. If CRLF is not found on-site and USFWS concurs with a negative finding, no further mitigation is required. If it is determined that spadefoot are present, but CRLF are not, coordination with CDFG regarding appropriate mitigation to reduce impacts to this species shall be required prior to issuance of a grading permit. If the Western spadefoot toad is not found on-site, no further mitigation is required.	Significant and unavoidable.
Proposed development of the majority of the onsite grassland habitat and fragmentation of remaining grassland habitat represents a significant impact to coast horned lizards and black-legless lizards (and	4.4-18	The applicant shall retain a qualified biologist to conduct a construction monitoring program for black legless lizards, coast horned lizards, and San Joaquin coachwip which shall include procedures for capture and release. The biologist shall remain on-site	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
other wildlife species).	during initial grading activities to salvage and relocate these species that may be uncovered during earthmoving activities. Recovered individuals shall be placed in appropriate habitat outside of the project site in accordance with the MOU with CDFG. The biologist shall walk alongside the grading equipment in each new area of disturbance and shall have the authority to halt construction temporarily if necessary to capture and relocate an individual. Any individual captured in the grading zone shall be relocated as soon as possible to adjacent suitable habitat outside of the area of impact, pursuant to the MOU. 4.4-19 The applicant shall conduct an employee education program for construction crew and City staff prior to construction activities. A biological monitor shall meet with the construction crew at the onset of construction to educate the construction crew on the following: 1) the appropriate access route in and out of the construction area; 2) how biological monitor will examine the area and agree upon a method which will ensure the safety of the monitor during such activities, 3) the special-status species that may be present; 4) the specific mitigation measures that will be incorporated into the construction effort; and 5) the proper procedures if a special-status animal or any other animal is encountered within the project site. 4.4-20 A representative shall be appointed by the City who will be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. The representative shall be legally responsible to notify USFWS and CDFG immediately in the event that "take" of any special-status wildlife species occurs. The representative shall be identified during the Employee Education Program and his/her contact information shall be provided to USFWS and CDFG. It is imperative that this individual will be present onsite every day and will be accessible to regulatory agency personnel. 4.4-21 All food-related and other trash shall be disposed of in closed containers and removed from the project area at least once a week	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		during the construction period or more often if trash is attracting avian or mammalian predators. Construction personnel shall not feed or otherwise attract wildlife to the area. These instructions to the construction crew shall be reiterated during the employee education program and during update meetings with construction crews. The instructions shall also be posted conspicuously on the site.	
Implementation of the proposed project would result in impacts to wildlife movement and nursery sites.	See above.		Significant and unavoidable.
4.5 Cultural Resources			
Development of the project and the resulting move of the historical resource to another location would cause a substantial, adverse change to a historical structure eligible for listing in the California Register on the site.	4.5-1	Relocation of House. The project proponent shall ensure that the design and implementation of the relocation project is consistent with the *Secretary of the Interior's Standards for* Rehabilitation *and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992),* the California Historical Building Code, and the Mitigation Monitoring and Reporting Plan (MMRP) for the project. Prior to recordation of the final map, the project applicant shall submit a relocation plan prepared by a qualified professional in accordance with the general recommendations of *Moving Historic Buildings*, a publication of the National Park Service, to the City of Soledad for review and approval. The relocation plan shall discusses planning, research, and recording prior to the move. In addition, the relocation plan shall identify siting, foundation construction, building reassembly, and restoration work after a successful move. See John Obed Curtis, *Moving Historic Buildings*, Heritage Conservation and Recreation Service, Publication No. 9, US Department of Interior (1979) for further details. Prior to the relocation, the applicant shall provide verification of compliance with related mitigations to the City of Soledad Community Development Department Director for review and approval. In addition, the structure shall be relocated prior to the issuance of any building and/or grading permit for development within the Specific Plan area.	Less-than-significant.
	4.5-2	Protective Measures. The project proponent shall develop and implement measures to protect the character-defining features of the Lorentzen House building from damage by the relocation project. The	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	features include, but are not limited to scale, massing, and layout of the house, as well as siding and wood frame fenestration. Protective measures shall be prepared by a qualified professional in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, *Moving Historic Buildings*, and the MMRP for the project. Prior to the recordation of the final map, the project applicant shall submit a relocation plan, consistent with Mitigation Measure 4.5-1, which incorporates protective measures consistent with the intent of this measure. Prior to the relocation of the structure, the applicant shall submit evidence from a qualified professional demonstrating that protective measures have been implemented, subject to the review and approval of the City of Soledad. 4.5-3 Repair of Inadvertent Damage. The project proponent shall ensure that any inadvertent damage to the character-defining features of the Morris Lorentzen House resulting from the rehabilitation project is repaired in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992) and California Historical Building Code. A qualified professional shall be consulted prior to any repairs. The condition of the building shall be photographed as part of the proposed recordation document and/or video documentation, prior to the start of the relocation, and this will help to establish the baseline condition for assessing inadvertent damage. The project applicant shall submit detailed documentation prepared by a qualified professional demonstrating that all repairs have been completed in accordance with applicable standards prior to the issuance of any building and/or grading permit. 4.5-4 Professional Standards. All activities regarding historical architectural resources and historic preservation carried out as part of this project shall be carried out by or under the direct supervision of persons	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	meeting, at a minimum, the Secretary of the Interior's professional qualifications standards (48 FR 44738-9) in these disciplines. Prior to the relocation of the Lorentzen House, the applicant shall submit evidence to the City of Soledad demonstrating compliance with this measure. 4.5-5 Monitoring. The mitigation measures applying to the relocation of the Lorentzen House shall be set forth in a Mitigation Monitoring and Reporting Program (MMRP) for the project. The MMRP will guide project-specific mitigation, monitoring, and/or reporting programs for various aspects of mitigation monitoring, reporting, and enforcement in order to ensure full compliance with the conditions of project approval. 4.5-6 Coordination. The project proponent shall coordinate with and inform interested parties, including, but not limited to the Soledad Historical Society and the Monterey County Historical Society, regarding the status of its compliance with the mitigation measures set forth in the MMRP, as necessary. 4.5-7 Recordation to Historic American Building Survey standards. Prior to the start of any project work, the project proponent shall ensure that the Lorentzen House property is recorded and documented in accordance with the Level II recordation standards of the Historic American Building Survey/Historic American Engineering Record (HABS/HAER) program. This level of recordation would include: ▪ Archival reproduction of any existing historic images of the property and grounds; ▪ Archival reproduction of any existing maps, sketches, or drawings of the house; ▪ Production of measured architectural plans and drawings; ▪ Production of large-format photographs of exterior and interior views of the house, and exterior views of the house and current setting, including relationship to non-eligible outbuildings; and ▪ Narrative history and description of the property (based on	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		the narrative provided in the Seavey (2006) evaluation of the property, and the Monterey County survey(s) of similar properties. The original archival set of recordation documents and photograph prints will be submitted to the Soledad Historical Society (or its designee), and archival quality photocopies of the documentation set will be provided to the following interested parties and local repositories: the Monterey County Historical Society; the Monterey County Libraries (Soledad and Salinas branches), and the UC Santa Cruz Library Special Collections Department. The project proponent would ensure that this recordation documentation was prepared prior to carrying out any other treatment and would make the content of the document available for other mitigation measures, such as the preparation of interpretive material.	
Construction of the project may result in the discovery and disturbance of unknown archaeological resources and/or human remains.	4.5-8	In order to ensure that project-impacts to potentially unknown resources are avoided, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If archaeological resources or human remains are accidentally discovered during construction, work shall be halted within 150 feet (50 meters) of the find until a qualified professional archaeologist can evaluate it. Work shall not recommence until the project archaeologist has submitted documentation to the City indicating that discovered resources have been adequately salvaged and no further resources have been identified within the area of disturbance	Less-than-significant.
	4.5-9	In order to ensure that the proposed project does not impact buried human remains during project construction, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		If buried human remains are encountered during construction, work in that area must halt and the archaeologist and the coroner immediately notified. If the remains are determined to be Native American, then the NAHC must be notified within 24 hours as required by Public Resources Code 5097. The NAHC will notify designated Most Likely Descendants who will provide recommendations for the treatment of the remains within 24 hours. The NAHC will mediate any disputes regarding treatment of remains. Work shall not recommence until the project archaeologist, coroner, and NAHC, submit documentation to the City indicating that buried human remains have been adequately salvaged and no further remains have been identified within the area of disturbance.	
4.6 Geology, Soils and Mineral Resources			
The project would be exposed to potential adverse effects from strong seismic ground shaking that may result in damage to proposed structures.	4.6-1	To minimize the potential effects from strong seismic ground shaking on project components, a project-specific geotechnical analysis shall be performed by a registered professional engineer with geotechnical expertise, and all recommendations shall be incorporated into final design plans. Prior to the issuance of any building and/or grading permit, the project applicant shall submit a project-specific geotechnical analysis to the City of Soledad Public Works Director for review and approval. The project engineer shall develop project-level plans based upon and in response to the observations and recommendations made in the project specific geotechnical analysis.	Less-than-significant.
	4.6-2	In order to minimize potential seismic-related hazards, the project engineer shall incorporate the seismic shaking analysis contained within the Geologic Hazards Investigation Update prepared by Nolan Associates (September 2006) into project design. Prior to the issuance of any building and/or grading permits, the project applicant shall submit design level plans demonstrating that the recommendations of the Geologic Hazards Investigation Update are incorporated into project design, subject to the review and approval of the City of Soledad Public Works Director. In addition, all structures shall be designed to the most current standards of the California Building	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		Code, at a minimum.	
	4.6-3	In order to minimize seismic-related hazards to new public facilities, a site-specific probabilistic seismic hazards assessment shall be incorporated into the design of any schools, hospitals, fire or police stations, or any other critical facilities planned for the project site. An individual assessment shall be performed for each site by an engineering geologist. Prior to the issuance of any grading and/or building permit for new public facilities, including but not limited to new schools, hospitals, and fire or police stations, a probabilistic seismic hazards assessments shall be prepared and submitted to the City of Soledad Director of Public Works for review and approval.	
Construction of the project could result in substantial soil erosion or loss of topsoil.	4.6-4	In order to reduce wind and water erosion on the project site, an erosion control plan and Storm Water Pollution Prevention Plan (SWPPP) shall be prepared for the site preparation, construction, and post-construction periods. The erosion control plan shall incorporate best management practices consistent with the requirements of the National Pollution Discharge Elimination System (NPDES). The erosion component of the plan must at least meet the requirements of SWPPP required by the California State Water Resources Control Board. If earth disturbing activities are proposed between October 15 and April 15, these activities shall be restricted per the requirements of Soledad Municipal Code Chapter 15.08. Prior to the issuance of any permit, the project proponent shall submit detailed plans to the satisfaction of the City of Soledad Public Works Director. The components of the erosion control plan and SWPPP shall be monitored for effectiveness by City of Soledad Public Works. The following measures shall be implemented, where appropriate, to control erosion: 1) Keep construction machinery off of established vegetation as much as possible, especially the vegetation on the upwind side of the construction site; 2) Establish specific access routes at the planning phase of the project, and limits of grading prior to development, which should be strictly observed;	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	3) Utilize mechanical measures (i.e. walls from sand bags and/or wooden slat or fabric fences) to reduce sand movement; 4) Immediate revegetation (plus the use of temporary stabilizing sprays), to keep sand movement to a minimum; and 5) For larger-scale construction, fabric or wooden slat fences should be placed around the construction location to reduce sand movement. 4.6-5 Areas disturbed by grading shall be stabilized with adequate landscaping vegetative cover. A re-vegetation and landscaping plan shall be prepared by a landscape architect with experience in working with the type of soils that are characteristic of the site, subject to the review and approval of the City of Soledad. Prior to the issuance of any certificate of occupancy and concurrent with project construction, disturbed areas shall be re-vegetated consistent with the City approved landscaping plan. All project replanting shall be continually monitored by the landscape architect for a duration of three years. The landscape architect shall submit annual monitoring reports to the City of Soledad after each successive year detailing the success of landscaping. Success shall be based on an 80% survival rate. If it is determined that the replanting has not been successful, additional replanting shall be required by the City of Soledad. 4.6-6 All drainage from improved surfaces shall be captured by closed pipe or lined ditches and carried to neighborhood storm sewers or natural drainages. At no time shall any concentrated discharge be allowed to spill directly onto the ground adjacent to structures or to fall directly onto steep slopes. The control of runoff is essential for erosion control and prevention of water ponding against foundations and other improvements. <u>The project shall implement Low Impact Development (LID) strategies, as determined appropriate by the City of Soledad, consistent with the requirements of Mitigation Measure 4.8-4. LID strategies shall be implemented in connection with the proposed project to the satisfaction of the City of Soledad.</u> Prior to the issuance	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		of any grading and/or building permit for each new structure, the project applicant shall submit an erosion control plan and storm water pollution prevention plan consistent with this measure, subject to the review and approval of the City of Soledad Public Works Director	
The project could be exposed to localized liquefaction and collapse.	4.6-7	In order to reduce the risk of localized liquefaction and collapse, and allow for adequate foundation and structural fill support, grading plans shall be consistent with a project-specific geotechnical analysis. The project geotechnical engineer shall prepare a quantitative assessment of liquefaction and seismically-induced settlement potential for the project as part of a comprehensive site geotechnical evaluation, prior to the recordation of each final map. Measures to ensure adequate reduction of risk to standard acceptable levels in accordance with standard geotechnical practice shall be incorporated into project design and specifications, subject to the review and approval of the City of Soledad Public Works Director.	Less-than-significant.
The project could be exposed to potential adverse effects from on- or off-site landslides and lateral spreading that may result in damage to proposed structures.	4.6-8	Portions of the project located within debris flow hazard areas as described in the Geological Hazards Investigation Update prepared by Nolan Associates (September 2006, see pg. 14) shall incorporate design measures to mitigate this hazard to acceptable levels in accordance with standard engineering practices. Suitable measures include: 1) Restricting development to outside these areas; 2) Constructing artificial channels or diversion walls, designed to divert fluidized debris away from habitable structures; or 3) Constructing impact walls, designed to withstand anticipated debris flow volumes and velocities. An engineering geologist shall be retained to provide site-specific geologic design criteria for debris flow hazard areas once the final project plans are available. Diversion or retaining structures shall be designed based on recommendations by a geotechnical engineer, subject to review and approval of the City of Soledad Public Works Director. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate design measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad.	Less-than-significant.
The project could be exposed to localized soil	4.6-9	In order to minimize potential hazards associated with expansive soils,	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
expansion.		the expansion potential of site soils shall be evaluated as part of a site-specific geotechnical study to ensure hazards are reduced to an acceptable level of geotechnical and Uniform Building Code practices. The recommendations of a geotechnical engineer for mitigating soil shrink-swell hazards shall be incorporated into project design. These measures may include replacement of soil with engineered backfill or treatment of expansive soil with lime. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad Director of Public Works.	
4.7 Hazards and Hazardous Materials			
The project proposes a variety of uses in an area that may be contaminated with hazardous materials. Release of these contaminants could pose a health risk to construction workers and future users on the site.	4.7-1	Prior to the recordation of any final map, the applicant shall arrange for a Phase II Environmental Site Assessment to be prepared which assesses the localized environmental conditions described in the Phase I Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. (September 2006) and identifies any required remedial actions for the safe handling, removal and special needs for any identified materials. The Phase II Assessment shall include site-specific soil sampling in order to assess the presence of potential soil contamination and to identify special needs for soil handling during construction/grading activities and possible health risks to construction workers and future users consistent with the recommendations contained in the Phase 1 Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. If results indicate the presence of such materials in excess of screening levels for residential, educational, or commercial uses, a Remediation Plan shall be prepared and implemented to reduce contamination to acceptable levels, maintain the safety of construction workers and future site users, and assure proper management of contaminated materials in accordance with state and local regulatory requirements. This plan shall be subject to review and approval by the Monterey County Division of Environmental Health. Prior to the issuance of any building and/or grading permit, the project applicant shall submit	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	evidence to the City of Soledad for review and approval demonstrating compliance with this measure. 4.7-2 Prior to commencement of new development, the applicant shall obtain approval of a Soil Management Plan from the Monterey County Division of Environmental Health, which establishes management practices for handling potentially contaminated soil, if encountered, during construction/grading activities. 4.7-3 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to survey all buildings to be demolished for asbestos under the National Emissions Standards for Hazardous Air Pollutants (NESHAP) guidelines prior to demolition activities. If asbestos containing material is documented within existing on-site structures, all potentially friable asbestos shall be removed prior to building demolition in accordance with NESHAP guidelines. Prior to the issuance of a grading permit, the project proponent shall submit written evidence to the City of Soledad Director of Public Work from a qualified consultant demonstrating that all asbestos containing material, if present, has been properly removed and demolition activities may proceed without exposing construction personnel to asbestos related-hazards. 4.7-4 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to conduct a lead-based paint survey to evaluate the presence of lead-based paint residues in site soils adjacent to existing structures. If lead contamination is documented on-site, all peeling and flaking lead-based paint shall be removed and properly disposed of separately from building debris, in accordance with current Department of Toxic Substances Control policies. In addition, all existing structures within the Specific Plan area that were constructed prior to 1978 shall be surveyed for lead-based paint prior to any demolition activities. Prior to the issuance of any permit for each phase of development, the project proponent shall submit written evidence	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	from a qualified consultant documenting that all lead-based paint hazards have been appropriately removed and disposed of in accordance with industry standards, subject to the review and approval of the City of Soledad.	
Due to the proximity of the Soledad Sanitary Landfill to the proposed school sites, there is the potential for hazardous emissions and/or other environmental hazards to affect the health and safety of students attending new schools within the project area. More specifically, the existing landfill has the potential to expose several of the proposed school sites to environmental hazards. Although the landfill is listed as "closed" and no known hazardous incidents have been reported, releases of emissions may, nevertheless, adversely affect the health of students.	4.7-5 If, during the course of the Phase II Environmental Site Assessment, it is determined that the existing Soledad Sanitary Landfill would expose the proposed school sites to an environmental hazard that cannot be reduced to an acceptable level through remediation, the project applicant, in conjunction with the Soledad Unified School District and the City of Soledad, shall identify new school sites within the Miravale III project area that would not be exposed to known environmental hazards, prior to the recordation of any final map. If new school locations are necessary, the applicant shall amend the Specific Plan and submit a revised tentative map demonstrating the new school locations, subject to the review and approval of the City of Soledad, prior to the recordation of any final map. Any new school site shall be coordinated with the Soledad Unified School District.	Less-than-significant.
Future development could involve the use/storage of hazardous materials and/or be located in proximity to existing agricultural use/storage of hazardous materials. Accidental release of hazardous materials could result in significant impacts on public health and the environment.	The following mitigation measure is in addition to mitigation previously identified in **Section 4.2 Agricultural Resources** that are intended to reduce potential land use conflicts associated with agricultural operations. 4.7-6 The applicant shall prepare a Chemical Application Management Plan (CHAMP). This plan shall detail the procedures to construct, operate, and maintain the golf course. The CHAMP shall provide technical public disclosure regarding pesticides, fertilizers and other chemicals to be used on the golf course, as well as methods of application and handling. This plan shall be submitted to the Monterey County Environmental Health Division for review and approval. Prior to the issuance of any permit for golf course development, the project applicant shall submit documentation to the City of Soledad demonstrating that a CHAMP has been prepared and approved by the County of Monterey. The following provisions shall be included in the CHAMP: ▪ Drought, pest, and disease resistant grass species shall be selected.	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		▪ Pesticides shall be handled, applied, and disposed of by a licensed (State-certified) spray technician. ▪ Only approved and legal chemicals shall be used. All county, state, and federal guidelines must be strictly adhered to regarding storage, handling, and application of pesticides. ▪ Advanced technology/monitoring equipment shall be used to insure minimal application of pesticides, herbicides, and fertilizers. This equipment shall be maintained and in proper calibration. ▪ A controlled and designated area/facility shall be used for the proper mixing and loading of pesticides into application equipment. The facility shall consist of an impermeable pad with controlled and contained drainage, and should be at least 50 feet from open ditches, ponds, or other water bodies. Rinse water shall be properly stored and hauled for disposal at an approved facility. ▪ Selection of pesticides shall be based on the ability to achieve treatment goals and criteria to minimize off-site movement. Selection of less toxic, less mobile, and less persistent pesticides shall be a priority management criterion. ▪ Pesticide applications shall be carefully timed and combined with other pest management practices; pests shall be accurately identified and pesticide applications made only when necessary, using the least amount required for all seasons. ▪ Pesticides shall not be applied when soil moisture is high during the rainy season. Applications shall be restricted prior to any anticipated late or early season storm events to preclude potential impacts from runoff. ▪ Irrigation applications shall be consistent with turf grass evapotranspiration requirements. Over-watering shall be avoided.	
4.8 Hydrology and Water Quality			
Construction and operation of the project could impact water quality through substantial soil erosion	4.8-1	In order to ensure that impacts are minimized to the greatest extent feasible, the project shall be designed to meet the BMP standards for	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
during grading activities, loss of topsoil, and surface runoff from the proposed development.		operational phase storm water runoff and to maintain the onsite BMPs. The project shall implement BMPs to manage water quality by providing onsite runoff treatment in line with the onsite infiltration system. Prior to the issuance of any grading and/or building permit, the project applicant shall prepare a Construction Management Plan that identifies a designated construction supervisor responsible for the continued implementation of all construction BMPs throughout the duration of project construction. Moreover, the Construction Management Plan shall also identify BMPs to be implemented as part of the project and associated monitoring activities. The Construction Management Plan shall be reviewed by the City of Soledad Public Works Director prior to the issuance of any permit. 4.8-2 In order to prevent excess sediment buildup and ensure that all percolation basins are functioning in accordance with project-level plans, the project applicant and/or his/her successor in interest, shall be responsible for the long-term maintenance of all percolation basins and related private on-site drainage improvements and shall enter into a maintenance agreement with the City to provide for such. Bi-annually a basin maintenance report shall be submitted to the City of Soledad, subject to the review and approval of the Public Works Director, demonstrating that the basins have been properly maintained and cleaned in accordance with City standards. Prior to the issuance of any building and/or grading permit, the project applicant shall enter into a maintenance agreement with the City of Soledad.	
Construction and operation of the project could potentially result in flooding impacts to off-site properties if adequately sized drainage facilities are not provided within the proposed development. Project development could also impact existing drainage as a result of increased impervious surface coverage and modifications to the existing drainage pattern.	4.8-3	In order to ensure that project-induced impacts related to changes in the existing drainage patterns on the project site are minimized, the project applicant shall submit design-level improvement plans for the project's storm drainage collection and retention system. Final design-level plans shall be supported with appropriate soils and hydrologic data in accordance with City standards. All conveyance system and retention basins shall be sized and designed in accordance with applicable City design standards and shall be appropriately sized to accommodate stormwater runoff from a 100-year storm event. Prior to the recordation of any final map, the project applicant shall submit all	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	design-level plans and supporting details to the City of Soledad Director of Public Works for review and approval. The VTM and Specific Plan shall be revised as necessary to reflect final locations of drainage facilities, subject to the review and approval of the City of Soledad. 4.8-4 In order to reduce the extent of impervious surface coverage and potential drainage/flooding impacts, Low Impact Development (LID) strategies shall be implemented, to the maximum extent feasible, in connection with all new development within the Specific Plan area. Prior to the approval of any final map or approval of any permit for all new residential and commercial developments, the project applicant shall submit design-level site and improvement plans to the City of Soledad for review and approval that incorporate the latest approved LID strategies and best practices as applicable, and the City shall ensure that all such measures are included in the final design plans, Examples of various LID strategies and best practices are identified as follows: ▪ Where possible, landscaped or grassy areas shall be substituted for impervious surfaces such as building entrances, traffic medians, etc. ▪ Permeable pavements such as crushed aggregate, turf lock or unit pavers shall be used in place of sidewalks, walkways or overflow parking areas wherever design allows. ▪ Bioretention cells, planter boxes, vegetated swales, and greenbelt buffer zones shall be implemented in landscaped areas, along streets and sidewalks wherever feasible. ▪ Final roadway design and street layout shall convey surface water runoff and storm flows into bioretention cells and swales. ▪ All commercial development shall integrate bioretention into parking lot islands or filter strips distributed throughout the parking area(s) to infiltrate, store and/or convey stormwater flows. In addition, permeable paving materials shall be used in spillover parking that is used only for peak demand periods.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	Alternative types of LID strategies and measures may also be approved provided evidence is submitted to the City of Soledad by a qualified engineer demonstrating that said strategies will achieve the intended result of this mitigation measure.	
4.9 Land Use and Planning		
The proposed project would conflict with several policies intended to avoid and/or mitigate environmental impacts.	Mitigation measures have been identified in this EIR to reduce the extent of project-induced impacts, but these impacts cannot be minimized to a less-than-significant level. Measures have been identified in **Section 4.1 Aesthetics** and **4.4 Biological Resources.** No additional measures are feasible.	Significant and unavoidable.
As proposed, the Miravale III Specific Plan has the potential to conflict with adopted planning documents pertaining to public services.	4.9-1 In order to maintain project consistency with adopted City-wide facility planning documents, the project applicant/developer shall revise Section 5.0 of the Specific Plan to incorporate revisions identified by the City of Soledad Director of Public Works, prior to project approval. The following policy revisions have been identified as necessary. Revisions are underlined. Revise Wastewater Policy 2 to read as follows, "Design and construct the wastewater treatment system for Miravale III in accordance with applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and the Recycle Water Service Ordinance No. 645. Revise Water Policy 1 to read as follows, "Design and construct the water supply and distribution system for Miravale III that expands upon and is integrated with the City's water distribution system and which meets the needs of future project developments of the Specific Plan area consistent with the Urban Water Management Plan and the City's 2005 Water Master Plan." Revise Stormwater Policy 5 to read as follows, "Design and construct a stormwater collection and retention system that adequate retains peak storm flows onsite, avoids aggravating or causing offsite downstream from the project site, and ensures separation of stormwater drainage from Recycled water generated within the Plan area and that is	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		consistent with the 2007 Stormwater Management Plan, Stormwater Master Plan, and Ordinance No. 617" Add a new policy to the Section 5.2.2 Law Enforcement and Fire Protection/Medical Services. The new policy shall read as follows: "9. Police and fire services will be maintained with funding from a public safety benefit assessment district or similar district."	
4.10 Noise			
Future residential uses developed at the project site would be exposed to exterior noise levels greater than 65 dBA CNEL, which exceeds the noise and land use compatibility standards presented in the City of Soledad's General Plan. Interior noise levels would be expected to exceed 45 dBA CNEL without the incorporation of noise insulation features into the project's design.	4.10-1	Maintain a sufficient buffer distance between transportation noise sources and future sensitive land uses, or alternatively, construct noise barriers or create acoustically shielded outdoor use areas utilizing buildings to achieve noise exposures of 65 dBA CNEL or less. The specific determination of necessary mitigation measures will occur during project level environmental review and design. Results of the analysis shall be submitted to the City prior to issuance of a building permit.	Less-than-significant.
	4.10-2	Retain a qualified Acoustical Specialist to prepare for City review and approval a detailed acoustical analysis of interior noise reduction requirements and specifications for all projects proposed within the 60 dBA CNEL contours of area roadways, in accordance with State and City standards. Interior noise levels must be maintained at or below 45 dBA CNEL. Building sound insulation requirements will include forced air mechanical ventilation in noise environments exceeding 60 dBA CNEL. Special building construction techniques (e.g., sound-rated windows and building facade treatments) may be required where exterior noise levels exceed 65 dBA CNEL. These treatments include, but are not limited to, sound rated windows and doors, sound rated exterior wall assemblies, and acoustical caulking. The specific determination of required treatments will be made on a unit-by-unit basis during project design. Results of the analysis, including the description of the necessary noise control treatments, will be submitted to the City along with the building plans prior to issuance of a building permit. Feasible construction techniques such as these would	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		adequately reduce interior noise levels to 45 L_{dn} or lower.	
	4.10-3	Non-residential development will comply with the noise standards established in the Zoning Code at existing or planned residential properties in the vicinity. Further, efforts will be made to reduce noise impacts through the following planning and equipment requirements: ▪ Development site planning will be utilized in a fashion that reduces noise impacts for nearby sensitive receptors, such as by not locating loading docks near residences. ▪ Equipment screens, fan silencers, and engine mufflers will be used to mitigate noise from mechanical equipment. ▪ Noise barriers will be used to control noise from parking and vehicle circulation. ▪ For recreational uses, proposed development must consider impacts upon the adjacent residential development in terms of the location of active sports areas, their orientation on the site, whether or not lights are included, and speech amplification systems.	
Traffic volume increases from the project would increase traffic noise along the local roadway network. In some locations, there would be a substantial, permanent increase in noise levels at sensitive receptors.	4.10-4	The project shall incorporate noise reduction methods, subject to the review and approval of the City of Soledad. Methods to reduce noise on the project site may include the following measures: ▪ Pave and re-pave streets with "quieter" pavement types, such as Open-Grade Rubberized Asphaltic Concrete, that would reduce noise levels by 2 to 3 dBA depending on the existing pavement type, traffic speed, traffic volumes, and other factors. All new and improved streets within the project area shall use quieter pavement types. ▪ Implement new or larger noise barriers that may reduce noise levels by 5 dBA CNEL in areas that would not impair access requirements. Final design of such barriers, including an assessment of their feasibility and reasonableness, must be approved by the City during project-specific development applications. An increase in barrier height per foot equates to	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	approximately 1 dBA noise reduction. However, noise barriers must be considered as a last resort to alternative noise reduction methods per the City of Soledad General Plan. ▪ Install traffic calming measures to slow traffic and provide qualitative improvement by smoothing out the rise and fall in noise levels caused by speeding vehicles. For each 5 mph reduction in average speed, noise generation is reduced by approximately 1 dBA. ▪ Provide affected residences with building sound insulation, such as sound rated windows and doors on a case-by-case basis to reduce interior noise levels to below the 45 dBA CNEL noise standard.	
Existing and proposed noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one construction season.	4.10-5 Noise-generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturdays, unless otherwise approved by the City. No construction activities should occur on Sundays or holidays, including New Years and 4th of July. 4.10-6 Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment. 4.10-7 Locate stationary noise generating equipment (e.g., portable concrete crusher) as far as possible from sensitive receptors. Construct temporary noise barriers to screen stationary noise generating equipment when located near adjoining sensitive land uses. 4.10-8 Utilize "quiet" air compressors and other stationery noise sources where technology exists. 4.10-9 Route all construction traffic to and from the project site via designated truck routes where possible. Prohibit construction related	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	heavy truck traffic in residential areas where feasible. 4.10-10 Control noise from construction workers' radios to a point that they are not audible at existing residences bordering the project site. 4.10-11 Consider the use of multiple-pile drivers to expedite construction where pile driving is required. (Although noise levels generated by multiple pile drivers would be higher than the noise generated by a single pile driver, the total duration of pile driving activities would be reduced.) 4.10-12 Use temporary noise control blanket barriers to shroud pile drivers or erect in a manner to shield the adjacent land uses. Such noise control blanket barriers can be rented and quickly erected. 4.10-13 Pre-drill foundation pile holes to minimize the number of impacts required to seat the pile. Pre-drilling reduces the number of blows required to seat the pile and is a standard construction noise control technique. 4.10-14 The contractor shall prepare a detailed construction management plan identifying the schedule for major noise-generating construction activities. The construction management plan shall identify a procedure for coordination with the adjacent noise sensitive facilities so that construction activities can be scheduled to minimize noise disturbance. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed construction management plan to the City of Soledad for review and approval. 4.10-15 The project applicant shall designate a "disturbance coordinator" who shall be responsible for responding to any local complaints about construction noise. The disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall require that reasonable measures warranted to correct the problem are implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	notice sent to neighbors regarding the construction schedule. Prior to the issuance of any grading and/or building permit, the project proponent shall provide the City of Soledad with the contact information for the designated "disturbance coordinator."	
4.11 Population and Housing		
The project would represent an increase in overall residential holding capacity identified in the 2005 General Plan EIR for portions of the Mirassou, San Vincente and Northwest Expansion Areas within the project area and could be considered growth inducing if annexations and development in the remaining expansion areas exceed development potential addressed in the General Plan EIR.	4-11.1 Phase approval of development applications and annexations in the Mirassou, San Vincente and Northwest Expansion Areas to maintain holding capacity and population projections in Table 4.11-5 of the General Plan EIR. Monitor development approvals in these expansion areas to limit overall density and population growth to the holding capacity identified to ensure consistency with projections in approved City planning documents. 4-11.2 Implement General Plan policies L-2 to L-7 and other applicable policies for phased development and population growth in the project and expansion areas. General Plan policies L-2 to L-7, (below) identify expansion area requirements and applicable policies for annexation of these areas: L-2 Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council. L-3 A specific plan shall be required for all annexations and development of properties designated *Expansion Area*.	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	Specific plans shall be prepared in accordance with the standards provided in Appendix B of the General Plan. L-4 The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services. L-5 New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development. L-6 New development shall pay its fair share of providing additional public services needed to accommodate such development. L-7 Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City. <u>The required fiscal analysis shall be completed by a qualified, independent consultant, utilizing realistic and verifiable assumptions concerning investment earnings, interest rates, property taxes, transient occupancy tax, projected home/property sale prices and sales rates, etc.</u>	
Although the project site is located in an area that has been identified for future population growth in City's General Plan, the project would result in a significant growth-inducing impact through the introduction of new sources of employment and a significant portion of the City's projected population growth, which would result in additional demands on existing facilities.	No Mitigation Measures identified.	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
The Miravale III Specific Plan is inconsistent with the Housing Element, which requires affordable housing to be fully integrated with market rate housing.	4.11.3	The applicant shall enter into a Development Agreement per Program 4.3 of the City's Housing Element with the City that prescribes the parameters of the development of affordable housing consistent with the City's Housing Element, Inclusionary Housing Ordinance, and the revised Specific Plan. The Development Agreement shall be reviewed and approved by the City of Soledad prior to or concurrent with project approval.	Less-than-significant.
The Miravale III Specific Plan is inconsistent with affordable housing requirements of the City's Inclusionary Housing Ordinance.	4.11.4	Prior to project approval, the Specific Plan shall be revised to provide 20% of the units proposed in each Planned Development area and the Low Density Residential area to be affordable housing units. Alternatively, the project applicant shall dedicate real property for affordable housing or submit payment of in-lieu fees in order to ensure project consistency with the requirements of the City of Soledad's Inclusionary Housing Ordinance, subject to the approval of the City of Soledad. The project's consistency with the City's Inclusionary Housing Ordinance shall be evidenced in the Development Agreement (DA) prepared for the project, subject to the approval of the City of Soledad. The DA shall be reviewed concurrently with the project's General Plan amendments, Specific Plan and the Vesting Tentative Map.	Less-than-significant.
4.12 Public Services and Recreation			
The project would result in an increased demand for police and fire services.	4.12-1	Prior to the initiation of construction for Phase 2 of the proposed development, the proposed fire and police facilities located on West Street shall be constructed and operational. The project applicant shall also be responsible for providing the necessary funding to the City of Soledad or establishing the appropriate funding mechanism to ensure the provision of adequate police and fire staffing to meet the demands of the proposed project, as determined by the City of Soledad. Prior to the issuance of any building permit for new residential and commercial development in Phase 2, the project applicant shall obtain written documentation from the Soledad Fire and Police Departments indicating that the fire and police substations are operational and adequately staffed to meet the needs of the proposed project, subject to the review and approval of the City of Soledad. This mitigation measure shall not be construed as prohibiting the implementation of	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		infrastructure necessary to serve the proposed facility or the needs of Phase 2 of the proposed project."	
	4.12-2	Prior to the issuance of building permits, the applicant/developer shall pay a City Public Facilities Development Impact Fee for each type of new development in accordance with the adjusted impact fee in effect at the time of building permit issuance. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.	
	4.12-3	Prior to the recordation of each final map for development within areas currently designated as "State Responsibility Areas," the applicant shall submit evidence, subject to the review and approval of the City of Soledad Fire Department, demonstrating that a minimum 100-foot defensible space will be provided around any structure constructed within the foothill area. The defensible space shall be cleared of and maintained free of brush and combustible debris, and any landscaping placed within the defensible space shall be irrigated.	
The project would result in an increased demand for educational services.	4.12-4	Prior to project approval, the project applicant shall submit evidence, including a revised Specific Plan and tentative map, demonstrating that an additional two elementary school sites of sufficient size and a 40-acre high school site will be designated within the project boundaries to meet project demands, subject to the review and approval of the City of Soledad and the Soledad Unified School District. The 40-acre high school site shall be operational prior to the issuance of any certificate of occupancy for Phase II of the proposed project, unless otherwise approved by the City of Soledad and the Soledad Unified School District[1] In lieu of providing said high school facilities on-site, the project shall submit payment of its proportionate share of funding	Less-than-significant.

[1] Alternatively, if additional school sites will not be provided in conjunction with project development, the project applicant shall obtain written documentation from the Soledad Unified School District demonstrating that adequate school facilities, including a 40-acre high school and two appropriately sized elementary ~~middle~~ schools, will be available within the City of Soledad to accommodate anticipated project demands. If, however, adequate capacity does not exist, development shall be restricted until such time that additional capacity is available to accommodate subsequent phases of development.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		towards site acquisition and construction of new school facilities, prior to the recordation of any final map. Pro-rata payment of the cost of providing a second high school shall not be construed as waiver of the previous requirement that adequate high school capacity be available to meet project demands prior to occupancy of any housing constructed in Phase II of the project.	
	4.12-5	The applicant/developer shall pay a school impact fee for each type of development pursuant to the criteria set forth within California Government Code Section 65995. Prior to the issuance of building permits, the applicant shall pay required school mitigation fees. As indicated above, the fees set forth in Government Code Section 65996 constitute the exclusive means of both "considering" and "mitigating" school facilities impacts of projects [Government Code Section 65996(a)]. They are "deemed to provide full and complete school facilities mitigation" [Government Code Section 65996(b)].	
As proposed, the project does not meet the minimum required parkland ratio of five ~~three~~ acres per 1,000 residents.	4.12-6	In order to ensure adequate improved parkland is provided as part of project development, the applicant shall submit detailed plans, including a revised Specific Plan and Tentative Map, demonstrating that adequate parkland (~~3~~ 5 acres/1,000 residents) is designated within the project boundaries consistent with the requirements of Appendix B of the General Plan ~~and Miravale III Specific Plan dated June 2007~~, prior to project approval, subject to the review and approval of the City of Soledad. Prior to the recordation of each final map, the project applicant shall submit a comprehensive Park Master Plan to the City of Soledad for review and approval. This plan shall address park design and development consistent with the City's adopted Parks and Recreation Master Plan, along with maintenance, operation and financing components for each dedicated recreation parcel in that phase of development This plan shall also identify the appropriate types of improvements within each park parcel to meet the recreational needs of all age groups within that phase of the project.."	Less-than-significant.
Population growth anticipated under the Miravale III Specific Plan would create additional demands	4.12-7	Prior to the issuance of any building permit, the applicant/developer shall submit payment of a Park Facilities Impact Fee in accordance	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
on park and recreational facilities.		with the adjusted impact fee in effect at the time of building permit issuance, if determined to be applicable. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.	
4.13 Traffic and Circulation			
Based on the significance criteria, the project has the potential to increase hazards due to a design feature or incompatible uses.	4.13-1	Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings shall not be permitted along streets classified as collectors or arterials unless at a traffic light. Prior to the issuance of any building and/or grading permit for development associated with the golf course facility, the project applicant shall submit detailed design-level plans demonstrating compliance with this measure, subject to the review and approval of the Director of Public Works. Improvements shall be constructed in accordance with this measure prior to the issuance of any certificate of occupancy or final permit for development associated with the golf course.	Less-than-significant.
Based on the significance criteria, the project will have a significant impact on eleven study intersections, five roadway segments, and signal warrants would be met on nine intersections under project conditions.	4.13-2	*Moranda Road and Front Street:* Widen NB Front Street to two lanes, add a second NB through lane, EB free-right-turn lane and widen Front Street between Moranda road and San Vicente Road. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.	Less-than-significant.
	4.13-3	*San Vicente Road and Front Street:* Widen NB Front Street to two	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	lanes, NB San Vicente Road to three lanes, add two EB left-turn lanes ~~lands~~ and a SB free-right-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-4 *San Vicente and Gabilan Drive:* Signalize this intersection and add a second westbound left-turn lane ~~land~~, exclusive northbound right-turn lane, and southbound left-turn lane ~~land~~. SB San Vicente Road will need to be widened to accommodate the dual left-turn lanes from Gabilan. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. If this alternative is selected the project applicant shall submit payment of the projects fair share towards the	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	construction of this improvement in accordance with the traffic impact fee in effect at the time of building permit issuance for each phase of the project. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-5 *West Street and Gabilan Drive:* Signalize the intersection and add exclusive left-turn lanes with protected phasing on all approaches. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-6 *Main Street and Gabilan Dive:* Signalize the intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	4.13-7 *Andalucia Drive and Gabilan Drive:* Signalize this intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. 4.13-8 *Orchard Land and Metz Road:* Signalize this intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect that the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. 4.13-9 *Oak Street and Front Street:* Widen Front Street to four lanes between Nestles Road and Oak Street and add a second EB left-turn lane at the intersection of Nestles Road and Oak Street. Alternatively, the construction of the US 101/SR 146 bypass would alleviate impacts at this intersection. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance. All fees shall be paid prior to the issuance of any building permits for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.	
The project will have a significant impact on two freeway ramps and four freeway segments.	4.13-10	*Moranda Road and US 101 NB Ramps:* Signalize the intersection and widen the NB US 101 on ramp to add a second NB left-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fees in effect at the time of building permit issuance, including the TAMC Regional Development Impact Fees pursuant to Chapter 3.56 of the Soledad Municipal Code, in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. ~~Alternatively, the project can contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. 101. If this alternative is chosen,~~ If the aforementioned interchange improvements are not implemented by the time required, the project could instead contribute its fair share towards the construction of the extension of Gabilan Drive to U.S. 101. Under this approach to mitigation, local roadways shall be monitored to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. In addition, the US 101 interchange at Moranda Road/Front Street will require reconfiguration/reconstruction to provide more efficient access to the project site and north Soledad in general. ~~As this is a regional improvement, funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee, which includes regional improvements, would mitigate the project's regional impact at this location.~~ However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable. All fees shall be paid prior to the issuance of any building permit for each phase of development	Less-than-significant with mitigation. However, if these improvements are determined to be infeasible impacts would be significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	and shall be subject to the approval of the Director of Public Works. 4.13-11 *North Front Street and US 101 SB Ramps:* Signalize this intersection, widen southbound Front Street to two lanes and add a second lane on the off-ramp. In addition, the volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. As this is a regional improvement, funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee would mitigate the project's impact at this location the project applicant shall contribute funding towards its implementation by submitting payment of the TAMC Regional Development Impact Fees, pursuant to Chapter 3.56 of the Soledad Municipal Code. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the TAMC fee program, the impact should be considered significant and unavoidable. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fees in effect at the time of building permit issuance, including the Regional Development Transportation Impact Fees, in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-12 The project applicant shall be required to pay towards the City's TIF program, which includes regional improvements, and shall also pay the City's adopted Regional Development Impact Fees established in Chapter 3.56 of the Municipal Code. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the Regional Development Impact Fee and City of Soledad traffic impact fees in effect at the time of building permit issuance in order to mitigate the impacts at identified this	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		locations. The payment of fees is considered mitigation for project impacts to freeway highway and regional facilities. All fees shall be ~~paid prior to the issuance of any building permit for each phase of development and~~ shall be subject to the approval of the Director of Public Works. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable."	
The project together with the cumulative developments will have a significant impact on two intersections	4.13-13	*Moranda Road and Front Street:* Addition of an east leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.	Less-than-significant.
	4.13-14	*San Vicente Road and Gabilan Drive:* Addition of a west leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.	
4.14 Utilities and Service Systems			
Development of the proposed project would require or result in the construction of new water and recycled water facilities and the expansion of existing facilities. Project development would also require the construction of additional distribution and storage systems, transmission mains and improvements. Potential significant environmental effects could be realized through construction of the	4.14-1	Design and construct the water supply and distribution system for the project that is integrated with the City's water distribution system and consistent with the Urban Water Management Plan and the City's 2005 Water Master Plan. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
facilities if not planned and constructed consistent with Citywide infrastructure improvement plans.	4.14-2	All water and recycled water facilities and infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.	
	4.14-3	All water and recycled water pipelines shall be placed underground and in the utilities right-of-way and constructed to comply with all applicable state and local standards. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.	
	4.14-4	The project shall be required to construct new infrastructure that is of adequate capacity to serve the project's projected water and fire flow demand in addition to the provider's existing commitments. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.	
Development of the proposed project would potentially exceed existing and planned wastewater treatment capacity.	4.14-5	In order to ensure that the proposed wastewater treatment system is consistent with the applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and Chapter 13.11 Recycled Water Service, the project applicant shall submit detailed design-level plans in accordance with these requirements, prior to approval of the first Final Map ~~the issuance of any building and/or grading permit~~, subject to the review and approval of the City of Soledad Public Works Director.	Less-than-significant.
	4.14-6	Prior to the approval of the first final map within the Specific Plan area, all required permits for the on-site recycled water facility, including, but not limited to, a Waste Discharge Permit from the Regional Water Quality Control Board and approval of the system design, shall be obtained. The project applicant shall submit written	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		evidence to the City of Soledad documenting compliance with this measure.	
	4.14-7	In order to ensure that adequate wastewater treatment is available to accommodate each phase of project development, the treatment capacity for the on-site recycled water facility shall be increased to accommodate each phase of the project prior to the final approval of the first building permit or occupancy permit for each of the respective project phases as appropriate. Subject to the review and approval of the Director of Public Works, excess treatment capacity and related infrastructure shall be added to the plant and disposal facilities, as needed, for each phase of the project, to accommodate future increases in wastewater flow rates, based on estimates of future development. In addition, flows shall be metered and records of the flows shall be provided to the City ~~RWQCB~~ for review and approval. No building permits shall be issued ~~issuance~~ unless sufficient capacity exists to accommodate additional phases of development"	
	4.14-8	Prior to the issuance of any building permit, the applicant/developer shall submit payment of the current City Development Impact Fee for each type of development in accordance with the adjusted impact fee in effect at the time of building permit issuance. Additionally, the applicant/developer shall submit payment of all fees necessary to fund the construction of the expansion of the treatment plant located within the project site, as required by the City of Soledad. All fees shall be subject to the review and approval of the Director of Public Works.	
Development of the proposed project would require or result in the construction of new water or wastewater treatment facilities and expansion of existing facilities, including the construction of water and wastewater facilities, transmission mains and improvements which could cause significant environmental effects through construction of the facilities if not planned and constructed consistent with Citywide infrastructure improvement plans.	4.14-9	All water and wastewater infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building and/or grading plan, the project applicant shall submit detailed evidence, including but not limited to design-level infrastructure plans, consistent with the requirements of this mitigation, subject to the approval of the Director of Public Works.	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	4.14-10 All wastewater pipelines shall be placed underground and in the utilities right-of-way. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works. 4.14-11 The project would be required to construct new infrastructure that is of adequate capacity to serve the project's projected demand ~~in addition to the wastewater provider's existing commitments~~. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level documentation, in addition to written documentation from the City of Soledad, documenting that design-level plans are in accordance with City standards and requirements, as well as documenting that the City has sufficient capacity to accommodate project demands in addition to existing commitments, subject to the approval of the Director of Public Works.	
Project construction would result in significant construction-generated waste. The following mitigation has been identified by the Salinas Valley Solid Waste Authority to ensure that all construction-generated waste is recycled to the greatest extent feasible in order to minimize impacts to existing facilities within their jurisdiction.	4.14-12 Prior to the commencement of construction related activities, the applicant/developer shall prepare and submit a Construction and Demolition Diversion Plan consistent with the requirements of the City's adopted Diversion Plan Ordinance, subject to the review and approval of the Salinas Valley Solid Waste Authority and the City of Soledad. This plan shall identify on-going implementation measures for the diversion and separation of construction waste to ensure that all construction-generated solid waste is recycled to the greatest extent possible.	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
Development of the proposed project would increase demands for electricity and natural gas consumption.	The following mitigation measure is necessary to reduce project demands for electricity and natural gas and is in addition to other mitigation measures identified **Section 4.3 Air Quality.** 4.14-13 In order to prevent the wasteful use of energy, all new residential, commercial, and hospitality oriented structures shall incorporate the principles of passive solar design to the maximum extent feasible. Typical passive solar design principles may include the following; 1) large south-facing windows; 2) tile, brick, or other thermal mass material used in flooring or walls to absorb natural heat; 3) improved insulation; 4) building orientation that takes advantage of the sun, shade, and wind; and 5) energy efficient building materials. For new structures that are unable to incorporate these principles, the project applicant shall submit detailed evidence, such as site plans, landscape plans, and similar, to the City of Soledad Public Works Director demonstrating that there are no viable design alternatives to accommodate these principles. Prior to the issuance of each individual building permit for new structures, the project applicant shall submit evidence, including but not limited to, site plans, proposed building materials, and landscape plans, to the City of Soledad Public Works Director for review and approval.	Less-than-significant.
5.0 CEQA Considerations		
Development of the proposed project would contribute to a number of potentially significant cumulative impacts.	Implementation of mitigation measure identified above, in addition to adherence to applicable General Plan policies.	Cumulative impacts would be reduced to a less-than-significant level for geology and soils, utilities and service systems. Significant unavoidable cumulative impacts include aesthetics, agricultural resources, air quality, transportation and traffic, and biological resources.

APPENDICES

Appendix L to the Draft EIR for Miravale III

Appendix L- to the Final EIR for Miravale III

Discussion of the State Endangered Species Act (CESA)

In 1984, the State legislated the California Endangered Species Act (CESA) (Fish and Game Code §2050). The basic policy of CESA is to conserve and enhance endangered species and their habitats. State agencies will not approve private or public projects under their jurisdiction that would jeopardize threatened or endangered species if reasonable and prudent alternatives are available.

CESA requires that all State lead agencies (as defined under CEQA) conduct an endangered species consultation with CDFG if their actions could affect a State listed species. The State lead agency and/or project applicants must provide information to CDFG on the project and its likely impacts. CDFG must then prepare written findings on whether the proposed action would jeopardize a listed species would result in the direct take of a listed species. Because CESA does not have a provision for "harm" (see discussion of FESA, above), CDFG considerations pursuant to CESA are limited to those actions that would result in the direct take of a listed species.

If CDFG determines that a proposed project could impact a State listed threatened or endangered species, CDFG will provide recommendations for "reasonable and prudent" project alternatives. The CEQA lead agency can only approve a project if these alternatives are implemented, unless it finds that the project's benefits clearly outweigh the costs, reasonable mitigation measures are adopted, there has been no "irreversible or irretrievable" commitment of resources made in the interim, and the resulting project would not result in the extinction of the species. In addition, if there would be threatened or endangered species impacts, the lead agency typically requires project applicants to demonstrate that they have acquired "incidental take" permits from CDFG and/or USFWS (if it is a Federal listed species) prior to allowing/permitting impacts to such species.

If proposed projects would result in impacts to a State listed species, an "incidental take" permit pursuant to §2081 of the Fish and Game Code would be necessary (versus a Federal incidental take permit for Federal listed species). CDFG will issue an incidental take permit only if:

1) The authorized take is incidental to an otherwise lawful activity;
2) the impacts of the authorized take are minimized and fully mitigated;
3) the measures required to minimize and fully mitigate the impacts of the authorized take:

a) are roughly proportional in extent to the impact of the taking on the species;
b) maintain the project applicant’s objectives to the greatest extent possible; and,
c) capable of successful implementation; and,

4) adequate funding is provided to implement the required minimization and mitigation measures and to monitor compliance with, and the effectiveness of, the measures.

If an applicant is preparing a habitat conservation plan (HCP) as part of the Federal 10(a) permit process, the HCP might be incorporated into the §2081 permit if it meets the substantive criteria of §2081(b). To ensure that an HCP meets the mitigation and monitoring standards in Section 2081(b), an applicant should involve CDFG staff in development of the HCP. If a final Biological Opinion (Federal action) has been issued for the project pursuant to Section 7 of the Federal Endangered Species Act, it might also be incorporated into the §2081 permit if it meets the standards of §2081(b).

No §2081 permit may authorize the take of a species for which the Legislature has imposed strict prohibitions on all forms of “take.” These species are listed in several statutes that identify “fully protected” species and “specified birds.” *See* Fish and Game Code §§ 3505, 3511, 4700, 5050, 5515, and 5517. If a project is planned in an area where a “fully protected” species or a “specified bird”

occurs, an applicant must design the project to avoid all take.

In September 1997, Assembly Bill 21 (Fish and Game Code §2080.1) was passed. This bill allows an applicant who has obtained a “non-jeopardy” Federal Biological Opinion pursuant to Section 7, or who has received a Federal 10(a) permit (Federal incidental take permit), to submit the Federal opinion or permit to CDFG for a determination as to whether the Federal document is “consistent” with CESA. If after 30 days CDFG determines that the Federal incidental take permit is consistent with State law, no further permit or consultation is required under CESA for the project. However, if CDFG determines that the Federal opinion or permit is not consistent with CESA, the applicant must apply for a State permit under section 2081(b).

The process provided in Fish and Game Code §2080.1 (Assembly Bill 21) may be of use when the incidental take would occur to species that are listed under both the Federal and State endangered species acts. Assembly Bill 21 is of no use if an affected species is State-listed, but not Federally listed. Section 2080.1 will automatically be repealed if and when Congress amends Section 7 or Section 10 of the Federal act. Since FESA could be amended at any time, we are recommending that project applicants who are applying for authorization for "incidental take" of a Federal and State listed species, enter into a Section 2081 agreement with CDFG in addition to the Federal permit so that the project is covered under both FESA and CESA in case AB21 is repealed during the life of the project.

State and Federal incidental take permits are issued on a discretionary basis, and are typically only authorized if applicants are able to demonstrate that impacts to the listed species in question are unavoidable, and can be mitigated to an extent that the reviewing agency can conclude that the proposed impacts would not jeopardize the continued existence of the listed species under review. Typically, if there would be impacts to a listed species, mitigation that includes habitat avoidance, preservation, and creation of endangered species habitat is necessary to demonstrate that projects would not threaten the continued existence of a species. In addition, management endowment fees are usually collected as part of the agreement for the incidental take permit(s).

The endowment is used to manage any lands set-aside to protect listed species, and for biological mitigation monitoring of these lands over (typically) a five-year period.

Final EIR
Appendix F-1

Greenhouse Gas and Criteria Air Pollutant Reduction Plan Requirements

APPENDIX F-1 to the Final EIR
GREENHOUSE GAS AND CRITERIA AIR POLLUTANT REDUCTION PLAN REQUIREMENTS AND EXAMPLE MEASURES

In accordance with Mitigation Measure 4.3-3, in order to reduce greenhouse gas (GHG) and regional air pollutants and precursors (criteria air pollutants or CAPs) emissions, the applicant shall prepare and submit a GHG and CAP Reduction Plan (GCRP) prior to approval of the first tentative map that shall include a description of the measures that are proposed to be implemented by the entire Specific Plan project, including one or more of the following Example GHG and CAP Reduction Measures. The plan shall be approved by the City and implemented to the extent feasible prior to approval of all proposed construction of structures and site improvements, including but not limited to, determination of substantial conformance, building permits and grading permits. For each of the measures not included, the applicant shall describe why the measure was not included. The GCRP shall present estimated reductions in GHGs and CAPs based on available information source.

No certificate of occupancy for any phase, or portion thereof, of the project shall be granted until all of the applicable measures have been implemented by the project proponent. The proponent shall demonstrate that measures that must be implemented throughout the life of the project are included in all applicable CC&Rs, commercial center rules and regulations, and draft tenant lease agreements.

The measures below would reduce emissions of GHGs and CAPs; however, the effectiveness and adequacy of these measures for the entire Specific Plan or any future phase is unknown, precluding definitive quantitative analysis of emission reductions. For this reason, the regional air pollutants and precursors and the GHG emissions of the Specific Plan were considered to be significant and unavoidable. Following the example list of mitigation measures is a table from the BAAQMD's CEQA Guidelines showing the range of possible GHG and CAP reductions possible from similar measures.

Besides the on-site measures (or after implementation of all feasible on-site mitigation), another potentially feasible mitigation measure is an offsite mitigation program to assist lead agencies and project applicants in achieving emission reductions. A project applicant would enter into an agreement with the City or Air District and pay into a GHG reduction fund. The City or Air District would commit to reducing the type and amount of emission identified in the agreement. The City or Air District would identify, implement, and manage offsite mitigation projects. For guidance see the following website: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/baaqmd_offsite_guidance_5_3_10.ashx.

Example GHG and CAP Reduction Measures:

Energy Efficiency and Non-Fossil Fuel Energy Measures

NOTE: The project must comply with the most current State of California Building Code in effect at the time of building permit application submittal (see Mitigation Measure #4.3-6 in the Final EIR) and with the City of Soledad's Zoning Ordinance, Section 17.38.110 (Energy Conservation), that requires passive or natural heating or cooling opportunities and other measures to conserve nonrenewable energy resources in subdivision design.

- Design buildings to be energy efficient. Specifically, require that buildings exceed Title 24 energy efficiency standards. Buildings shall take advantage of shade, prevailing winds, landscaping and sun screens to reduce energy use. Applicant shall consider pursuing Leadership in Energy and Environmental Design (LEED) Building Platinum Certification and LEED-ND certification.[1]

[1] The LEED certification attempts to accomplish a whole building approach to sustainability by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection, and indoor environmental quality. The process ensures that all building

- Install efficient lighting and lighting control systems. Use daylight as an integral part of lighting systems in buildings. A typical LEED requirement is that developments ensure that at least 75% of all regularly occupied spaces receive a minimum daylight illumination of 25 foot-candles.
- Install light colored cool pavements, and strategically placed shade trees. Plant shade trees within 40 feet of the south side or within 60 feet of the west side of buildings.
- Install energy efficient heating and cooling systems, appliances and equipment, and control systems. Including requiring:
    - smart meters and programmable thermostats.
    - tank-less water heaters.
    - Heating, Ventilation, and Air Condition (HVAC) ducts sealing.
    - increased roof/ceiling insulation.
- Install light emitting diodes (LEDs) for traffic, street and other outdoor lighting.
- Limit the hours of operation of outdoor lighting.
- Provide electrically powered landscape equipment and outdoor electrical outlets.
- Provide onsite renewable energy system(s) and solar water heaters. Nonpolluting and renewable energy potential includes solar, wind, geothermal, low-impact hydro, biomass and bio-gas strategies. When applying these strategies, projects may take advantage of net metering with the local utility.
- Project shall orient 75% or more of homes and/or buildings to face either north or south (within 30° of N/S). Building design includes roof overhangs that are sufficient to block the high summer sun, but not the lower winter sun, from penetrating south facing windows. Trees, other landscaping features and other buildings are sited in such a way as to maximize shade in the summer and maximize solar access to walls and windows in the winter.
- Install a vegetated/green roof that covers at least 50% of roof area, or alternatively, a "cool roof." The reduction assumes that a vegetated roof is installed on a least 50% of the roof area or that a combination high albedo and vegetated roof surface is installed that meets the following standard: (Area of SRI Roof/0.75)+(Area of vegetated roof/0.5) $\geq$ Total Roof Area. Design of the green roof shall incorporate water consumption reduction measures.

Water Conservation and Water Use Efficiency Measures [2]

NOTE: The project must comply with the City of Soledad Municipal Code (SMC) Chapter 13.09 requiring ultra-low flow toilets, low-flow shower fixtures, water recirculating systems and xeriscape landscaping.

- Install only high efficiency toilets and water fixtures, such as automatic timed faucets. **NOTE: This is a requirement of the SMC Chapter 13.09.**
- Create water-efficient landscapes by using landscape designs with drought tolerant local native, non-invasive plants only, including trees with low carbon emissions and high carbon sequestration potential.
- Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls. Restrict watering methods (e.g., prohibit systems that apply water to non-vegetated surfaces) and control runoff.
- Use reclaimed water for landscape irrigation in new developments and on public property when such reclaimed water is made available. Install the infrastructure to deliver and use reclaimed water as part of required onsite and offsite improvements.
- Design buildings to be water-efficient. Design and install rainwater harvesting and storage systems for at least 50% of the project's roof area for use as landscape irrigation.
- Restrict the use of water for cleaning outdoor surfaces and vehicles.

---

systems perform interactively according to the contract documents, the design intent and the owner's operational needs to optimize energy performance. LEED-ND is a similar certification program that applies to districts, areas or neighborhoods.

[2] Water conservation measures reduce energy consumption for production, treatment and conveyance of potable water, and therefore, reduce air pollutant emissions resulting from electricity generation.

- Implement low-impact development practices such as retaining storm water and using it onsite that maintain the existing hydrologic character of the site to manage storm water and protect the environment. **NOTE: This is a requirement of the SMC Chapter 13.52.**
- Coordinate the design of landscaped areas with the project's stormwater management plan to promote biofiltration, infiltration, reduce impervious surfaces and treat stormwater runoff from at least 90% of the average annual rainfall. **NOTE: This is a requirement of the SMC Chapter 13.52.**
- Develop a comprehensive water conservation strategy appropriate for the project and location. The strategy may include many of the specific items listed above, plus other innovative measures that are appropriate to the specific project.

Transportation and Traffic Demand Management Measures

- In compliance with Title 13, California Code of Regulations, Section 2485 (c) (1), all diesel-fueled commercial motor vehicles with gross vehicular weight ratings of greater than 10,000 pounds that are or must be licensed for operation on highways (1) shall not idle the vehicle's primary diesel engine for greater than 5.0 minutes at any location; and (2) shall not operate a diesel-fueled auxiliary power system (APS) to power a heater, air conditioner, or any ancillary equipment on that vehicle during sleeping or resting in a sleeper berth for greater than 5.0 minutes at any location when within 100 feet of a restricted area, except as noted in Title 13, California Code of Regulations, Section 2485 (d). **NOTE: This is a State requirement.**
- Provide shuttle service to public transit. The project shall be required to provide a shuttle to/from the airport and the public transit (i.e., train or light rail) stations.
- Provide public transit incentives such as free or low-cost monthly transit passes.
- Include pedestrian and bicycle-only streets and plazas within developments. Create travel routes that ensure that destinations may be reached conveniently by public transportation, bicycling or walking.
- Orient the project and provide access to existing transit, bicycle, or pedestrian corridors. Minimize or eliminate setback between project and existing or planned adjacent uses and sidewalks, and between different buildings on project site. Buildings shall be oriented towards existing or planned street frontage. Primary entrances to buildings shall be located along planned or existing public street frontage.
- Provide safe and convenient bicycle/pedestrian access to transit stop(s) and provide essential transit stop improvements (i.e., shelters, route information, benches, and lighting). **NOTE: This is a requirement of Mitigation Measure 4.3-5 of the Final EIR.**
- Include pedestrian/bicycle safety and traffic calming measures in excess of jurisdiction requirements. Design roadways to reduce motor vehicle speeds and encourage pedestrian and bicycle trips by featuring traffic calming features. Roadways that converge internally within the project shall be routed to avoid "skewed intersections;" which are intersections that meet at acute, rather than right, angles. Intersections internal and adjacent to the project shall feature one or more of the following pedestrian safety/traffic calming design techniques: marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, raised intersections, median islands, tight corner radii, and roundabouts or mini-circles. Streets internal and adjacent to the project shall feature pedestrian safety/traffic calming measures such as on-street parking, planter strips with street trees, and chicanes/chokers (variations in road width to discourage high-speed travel).
- If available at the time of issuance of the first certificate of occupancy for the project, the applicant shall provide for permanent Transportation Management Association (TMA) membership and funding requirement. Funding to be provided by Community Facilities District or County Service Area or other nonrevocable funding mechanism. Transportation Demand Management Measures (TDMs) have been shown to reduce employee vehicle trips up to 28% with the largest reductions achieved through parking pricing and transit passes. The transportation demand management measures will include one or more of the following:
    - Employee Telecommuting Program

    - Compressed Work Schedule 3/36
    - Compressed Work Schedule 4/40
    - Compressed Work Schedule 9/80
    - Guaranteed Ride Home Program
    - Car-Sharing Services
    - Information Provided on Transportation Alternatives
    - Dedicated Employee Transportation Coordinator
    - Carpool Matching Program
    - Preferential Carpool/Vanpool Parking
- Provide on-site shops and services for employees.
- Provide adequate bicycle parking near building entrances to promote cyclist safety, security, and convenience. For large employers, provide facilities that encourage bicycle commuting, including locked bicycle storage or covered or indoor bicycle parking. (e.g., one bike rack space per 20 vehicle/employee parking spaces).
- Create bicycle lanes and walking paths directed to the location of schools, parks and other destination points.
- Provide "end-of-trip" facilities including showers, lockers, and changing space (e.g., four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).
- Includes designated bicycle route connecting all units, onsite bicycle parking facilities, offsite bicycle facilities, site entrances, and primary building entrances to existing Class I or Class II bike lane(s) within one half mile. Bicycle route shall connect to all streets contiguous with project site. Bicycle route shall have minimum conflicts with automobile parking and circulation facilities.
- Provide a pedestrian access network that internally links all uses and connects to all existing/planned external streets and pedestrian facilities contiguous with the project site. Project design shall include a designated pedestrian route interconnecting all internal uses, site entrances, primary building entrances, public facilities, and adjacent uses to existing external pedestrian facilities and streets. Pedestrian routes shall have minimal conflict with parking and automobile circulation facilities. Streets (with the exception of alleys) within the project shall have sidewalks on both sides. All sidewalks internal and adjacent to project site shall be a minimum of five feet wide. All sidewalks shall feature vertical curbs. Pedestrian facilities and improvements such as grade separation, wider sidewalks, and traffic calming shall be implemented wherever feasible to minimize pedestrian barriers. All site entrances shall provide pedestrian access.
- Site design and building placement shall minimize barriers to pedestrian access and interconnectivity and shall eliminate physical barriers such as walls, berms, landscaping, and slopes between on- and off-site uses that impede bicycle or pedestrian circulation.
- Establish an employee and/or customer paid parking system, including a permanent and enforceable method of maintaining user fees for all parking facilities. To optimize the effectiveness, the facility shall not provide customer or employee validations, and daily charge for parking must be equal to or greater than the cost of a transit day/monthly pass plus 20%.
- Provide minimum amount of parking required. Once land uses are determined, the trip reduction factor associated with this measure can be determined by utilizing the Institute of Transportation Engineers (ITE) parking generation publication. The reduction in trips can be computed as shown below by the ratio of the difference of minimum parking required by code and ITE peak parking demand to ITE peak parking demand for the land uses multiplied by 50%. Percent Trip Reduction = 50 * [(min parking required by code – ITE peak parking demand)/ (ITE peak parking demand)]
- Provide parking reduction less than code. This measure can be readily implemented through a shared parking strategy, wherein parking is utilized jointly among different land uses, buildings, and facilities in an area that experience peak parking needs at different times of day and day of the week.
- Locate parking facilities away from street frontage.
- Provide parking lot areas with 50% tree cover within 10 years of construction, in particular low emitting, low maintenance, native drought resistant trees. This measure reduces urban heat island

effect and requirement for air conditioning, effective when combined with other measures (e.g., electrical maintenance equipment and reflective paving material).

Waste Diversion and Reduction

NOTE: The project must comply with applicable State of California requirements for waste reduction, diversion, and recycling and with the City of Soledad's Municipal Code Chapter 13.05 that requires 100% diversion (i.e., reuse/ recycling)of inert solids (e.g., concrete, asphalt, brick) and a minimum diversion of 50% (by weight of non-inert materials) for certain projects.

- Provide composting facilities at residential uses.
- Created food waste and green waste curb-side pickup service.
- Require the provision of storage areas for recyclables and green waste in new construction.

Miscellaneous

- The fireplaces and stoves shall be gas-fired and meet U.S. Environmental Protection Agency certification requirements. The installation or operation of a wood-burning fireplace or a wood-burning stove shall be prohibited in perpetuity on all residential properties in the Miravale III Specific Plan Development. This restrictive covenant shall be recorded on the title of all parcels in the Miravale III Specific Plan area and shall run with the land. **NOTE: This measure is required by Mitigation Measure 4.3-4 in the Final EIR.**
- Use only low-volatile organic compound (low-VOC) paints (i.e., paints that contain the lowest feasible VOC content by volume). **NOTE: This measure reduces CAPs only and not GHGs. Specifically, it reduces reactive organic gases (an ozone precursor).**

The following tables are provided from the Bay Area Air Quality Management District's (BAAQMD) CEQA Guidelines (June 2010) in order to provide information regarding anticipated GHG and CAP reduction effectiveness relevant to the above mitigation measures. Measures are categorized as follows:

- **Operational Mobile Source (can be estimated using the Urbemis2007 modeling program)**
- **Area Source (can be estimated using the Urbemis2007 modeling program)**
- **Energy Efficiency**
- **Waste Reduction**

Mitigation Measures for Operational Mobile Source Emissions

Measure	Sector Reductions	Applicable Pollutants	Sector	Notes	Additional Comments
Mix of Uses	-3% to 9%	CAPs, GHGs	Mobile sources	-3 when no housing or employment centers within ½ mile	Residential: % reduction is taken from base trips (9.57) and subtracted from ITE trip generation; Nonresidential: % reduction from ITE trip generation
Local serving retail within ½ mile of project	2%	CAPs, GHGs	Mobile sources	Uses lower end of reported research to avoid double counting with mix of uses measure	
Transit Service	0% to 15%	CAPs, GHGs	Mobile sources		
Bike & Pedestrian	0%-9%	CAPs, GHGs	Mobile sources	Credit is given based on intersection density, sidewalk completeness, and bike network completeness; No reduction if entire area within ½ mile is single use	

Affordable Housing	0% - 4%	CAPs, GHGs	Mobile sources		
Transportation Demand Management Parking, Transit Passes					
Daily Parking Charge	0%-25%	CAPs, GHGs	Only resident/ employee trips, no visitor/ shopper trips		
Parking Cash-Out	0%-12.5%	CAPs, GHGs		Shoup, Donald. 2005. Parking Cash Out. American Planning Association. Chicago, IL.	
Free Transit Passes	25% of Transit Service Reduction	CAPs, GHGs			
Telecommuting					
Employee Telecommuting Program	1%-100%	CAPs, GHGs	Mobile sources, Worker Trips only		
Compressed Work Schedule 3/36	1%-40%	CAPs, GHGs			
Compressed Work Schedule 4/40	1%-20%	CAPs, GHGs			
Compressed Work Schedule 9/80	1%-10%	CAPs, GHGs			

Mitigation Measures for Operational Mobile Source Emissions					
Measure	**Sector Reductions**	**Applicable Pollutants**	**Sector**	**Notes**	**Additional Comments**
Other Transportation Demand Measures					
Secure Bike Parking (at least 1 space per 20 vehicle spaces)	At least 3 elements: 1% reduction, plus 5% of the reduction for transit and pedestrian/bike friendliness; At least 5 elements: 2% reduction, plus 10% of the reduction for transit and pedestrian/bike friendliness	CAPs, GHGs	Mobile sources, Worker Trips only		
Showers/Changing Facilities Provided					
Guaranteed Ride Home Program Provided					
Information Provided on Transportation Alternatives (Bike Schedules, Maps)					
Dedicated Employee Transportation Coordinator					
Carpool Matching Program					
Preferential Carpool/Vanpool Parking					
Parking Supply	0%-50%	CAPs, GHGs	Mobile sources		
On Road Trucks	As input by user in URBEMIS	CAPs, GHGs	Mobile sources		

Mitigation Measures for Operational Area-Source Emissions				
Measure	**Sector Reductions**	**Applicable Pollutants**	**Sector**	**Notes**
Increase Energy Efficiency Beyond Title 24	Same as % improvement over Title 24	Caps, GHGs	Natural gas sector in URBEMIS for applicable land use only	User should specify baseline year for the Title 24 standards
Electrically powered landscape equipment and outdoor electrical outlets	Same as % of landscape equipment emissions	Caps, GHGs	Landscape emissions: residential only	
Low VOC architectural coatings	Same as % VOC reduction in applicable coatings (Interior/Exterior)	ROG Only	Architectural coating	

Energy Efficiency Mitigation Measures					
Measure	**Sector Reductions**	**Applicable Pollutants**	**Sector**	**Notes**	**Additional Comments**
Plant shade trees within 40 feet of the south side or within 60 feet of the west sides of properties	30%	GHGs	R,C A/C Electricity	USDA Forest Service, Pacific Northwest Research Station. "California Study Shows Shade Trees Reduce Summertime Electricity Use." Science Daily 7 January 2009. 20 February 2009 <http://www.sciencedaily. Com/releases/2009/01/ 090105150831.htm>	Electricity-related measures reduce CAPs off-site, but they are not typically quantified as part of a CEQA analysis.
Require cool roof materials (albedo >= 30)	34%	GHGs	C A/C Electricity	U.S. EPA Cool Roof Product Information, Available: <http://www.epa.gov/heatisland/resources/pdf/CoolRoofsCompendium.pdf>	
	69%	GHGs	R A/C Electricity		
Install green roofs	1%	GHGs	R,C A/C Electricity	Reductions are based on the Energy & Atmosphere credits (EA Credit 2) documented in the Leadership in Energy & Environmental Design (LEED), Green Building Rating System for New Constructions and Major Renovations, Version 2.2, October 2005. The reduction assumes that a vegetated roof is installed on a least 50% of the roof area or that a combination high albedo and vegetated roof surface is installed that meets the following standard: (Area of SRI Roof/0.75)+(Area of vegetated roof/0.5) >= Total Roof Area.	
Require smart meters and programmable thermostats	10%	CAPs, GHGs	R, C Electricity and natural gas space heating	U. S. Environmental Protection Agency. 2009. Programmable Thermostat. http://www.energystar.gov/ia/new_homes/features/ProgThermostats1-17-01.pdf	

Energy Efficiency Mitigation Measures (cont.)					
Measure	**Sector Reductions**	**Applicable Pollutants**	**Sector**	**Notes**	**Additional Comments**
Meet GBC standards in all new construction	17%	GHGs	R electricity	California Energy Commission [CEC] 2007. Impact Analysis 2008 Update to the California Energy Efficiency Standards for Residential and Nonresidential Buildings	
	7%	GHGs	C electricity		
	9%	CAPs, GHGs	R natural gas		
	3%	CAPs, GHGs	C natural gas		
Retrofit existing buildings to meet CA GBC standards	38%	GHGs	R electricity	California Energy Commission [CEC] 2003. Impact Analysis 2005 Update to the California Energy Efficiency Standards for Residential and Nonresidential Buildings; California Energy Commission [CEC] 2007. Impact Analysis 2008 Update to the California Energy Efficiency Standards for Residential and Nonresidential Buildings	
	12%	GHGs	C electricity		
	18%	CAPs, GHGs	R natural gas		
	12%	CAPs, GHGs	C natural gas		
Install solar water heaters	70%	CAPs, GHGs	R natural gas water heating	Energy Star. 2009. Solar Water Heater. http://www.energystar.gov/ia/new_homes/features/WaterHtrs_062906.pdf; Department of Energy. California Energy Commission [CEC] 2007. 1.0 INTRODUCTION

1.1 AUTHORIZATION AND PURPOSE

This document is an Environmental Impact Report (EIR) for the proposed Miravale III Specific Plan, prepared in accordance with the California Environmental Quality Act (CEQA) of 1970 and CEQA Guidelines, as amended. This EIR has been prepared by Denise Duffy and Associates, Inc. (DD&A) for the City of Soledad as the "Lead Agency," in consultation with the appropriate local, regional and state agencies.

The purpose of the EIR is to inform the public and decision makers of the significant environmental effects of the project, identify possible ways to minimize the significant effects, and describe reasonable alternatives that support the objectives of the project. As defined by the CEQA Guidelines, Section 15382, "significant effect on the environment" means:

> *"... a substantial, or potentially substantial adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance."*

This EIR addresses implementation of Miravale III Specific Plan on 920-acres located within unincorporated lands of Monterey County on the northern edge of the City of Soledad. Full implementation of the Miravale III Specific Plan allows for mixed-use development consisting of approximately 1,470 single-family residential units, 2,730 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. The project also proposes three school sites (two elementary schools and one middle school), a fire and police substation, a recycled water plant,[1] and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system. The project proposes sphere of influence amendments and annexation by the City of Soledad from the County of Monterey and future subdivision of the site. The project site is located generally between San Vicente Road and Orchard Lane, and is surrounded by agricultural land to the north and east, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the west.

1.2 EIR PROCESS

CEQA Guidelines require preparation of an EIR when a Lead Agency determines that there is evidence that a project may have a significant effect on the environment. The need to prepare an EIR for the project was established by the City of Soledad as a result of preliminary evaluation of the likely environmental effects of the project.

This EIR is tiered from the Final Program Environmental Impact Report for the City of Soledad General Plan, certified on September 21, 2005. "Tiering" refers to the analysis of general matters in broader, programmatic EIRs with subsequent narrower EIRs for individual projects that concentrate on site-specific issues and incorporate by reference the general discussions in the programmatic EIR. CEQA encourages the use of tiered EIRs to reduce delays and excessive paperwork in the environmental review process. The concept of tiering is described in State CEQA Guidelines Section 15152 as follows:

[1] The proposed recycled water plant is also referred to as a "scalping plant" in other City documents, but for the purposes of this EIR it is referred to as a "recycled water plant."

> (a) "Tiering" refers to using the analysis of general matters contained in a broader EIR (such as one prepared for a general plan or policy statement) with later EIRs and negative declarations on narrower projects; incorporating by reference the general discussions from the broader EIR; and concentrating the later EIR or negative declaration solely on the issues specific to the later project.
> (b) Agencies are encouraged to tier the environmental analyses which they prepare for separate but related projects including general plans, zoning changes, and development projects. This approach can eliminate repetitive discussions of the same issues and focus the later EIR or negative declaration on the actual issues ripe for decision at each level of environmental review. Tiering is appropriate when the sequences of analysis is from an EIR prepared for a general plan, policy or program to an EIR or negative declaration for another plan, policy, or program of lesser scope, or to a site-specific EIR or negative declaration. Tiering does not excuse the lead agency from adequately analyzing reasonably foreseeable significant environmental effects of the project and does not justify deferring such analysis to a later tier EIR or negative declaration. However, the level of detail contained in a first tier EIR need not be greater than that of the program, plan, policy, or ordinance being analyzed.

The tiering of the environmental analysis for this project allows the EIR to rely on the General Plan EIR for 1) a discussion of general background and setting information; 2) overall growth related issues; and 3) issues that were previously evaluated in sufficient detail in the General Plan EIR where conditions have not changed. This EIR incorporates by reference appropriate information from the General Plan program EIR. Additional environmental review has been completed in accordance with CEQA to evaluate the project-specific effects of the Miravale III Specific Plan.

In accordance with the requirements of CEQA, the City of Soledad circulated a Notice of Preparation (NOP) in August and September 2006 for the required 30-day review period to interested agencies, groups and individuals. The City also conducted a public scoping meeting to solicit input. All comments received were considered during the preparation of this Draft EIR preparation. The NOP and comments received in response to the NOP are contained as Appendix A of the Draft EIR.

This Draft EIR will be circulated for agency and public review during a 45-day public review period. Comments received by the City on the Draft EIR will be reviewed and responses to comments will be provided in the Final EIR. The City must certify that it has reviewed and considered the information in the Final EIR and that the Final EIR has been completed in conformity with the requirements of CEQA.

Although the EIR does not control the lead agency's ultimate decision on the project, the City must consider the information in the EIR and respond to each significant effect identified in the EIR. If significant adverse environmental effects are identified in the EIR, approval of the project must be accompanied by written findings, as follows:

A. Changes or alterations have been required in, or incorporated into, such project that mitigate or avoid the significant environmental effects thereof as identified in the completed EIR.

B. Such changes or alterations are within the responsibility and jurisdictions of another public agency and such changes have been adopted by such other agency, or can and should be adopted by such other agency.

C. Specific economic, social or other considerations make infeasible the mitigation measures or project alternatives identified in the EIR.

State law requires that a public agency adopt a monitoring program for mitigation measures that have been incorporated into the approved project to reduce or avoid significant effects on the environment. The purpose of the monitoring program is to ensure compliance with environmental mitigation during project implementation and operation. A Monitoring Program will be included in the Final EIR.

This page left intentionally blank.

2.0 SUMMARY

2.1 Introduction

This summary provides a brief description of the proposed project, project alternatives, and the significant impacts identified during the environmental analysis. Responsibility for implementation of mitigation measures is with the project applicant, unless otherwise noted. This summary is intended as an overview and should be used in conjunction with a thorough reading of the EIR. The text of this report, including figures, tables and appendices, serves as the basis for this summary.

2.2 Summary of Project Description

The project consists of the development and implementation of the Miravale III Specific Plan. The Specific Plan site is located within unincorporated lands of Monterey County on the northern edge of the City of Soledad. The 920-acre site is generally between San Vicente Road and Orchard Lane, and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east.

The Specific Plan calls for a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. Conceptual plans include a variety of residential types, including apartments, townhouses, and attached homes on small and large lots. The project also proposes three school sites (2 elementary schools and 1 middle school), a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system. A full project description is provided in Section 3.0 of this Draft EIR.

2.3 Alternatives Evaluated in this EIR

In compliance with CEQA, this section evaluates the comparative advantages and disadvantages of a range of project alternatives. The alternatives considered in the EIR are summarized below.

- *No Project Alternative – No Development*
- *Buildout Consistent with General Plan*
- *Reduced Project Alternative*
- *No Golf Course Alternative*
- *Alternative Design: Increased Senior Housing Alternative*

No Project – No Development: The No Development scenario consists of leaving the site in its current undeveloped condition. The No Development alternative would avoid both the adverse and beneficial effects of the project. It would eliminate all of the significant environmental impacts of the project, but would fail to meet any of the project's objectives.

Buildout Consistent with General Plan: Development under this scenario would assume buildout of the project site consistent with existing policies contained within the General Plan. Under this scenario, a Specific Plan would be prepared, as required by the General Plan. Single family residential uses would be prohibited above the 400 foot elevation contour and the project would consist of the construction of approximately 2,680 units. Additional units identified in other expansion areas would not be applied to this alternative and no General Plan amendments would be required. This alternative would consist of an

array of residential uses, including low, medium, and high density land uses, as well as commercial, and public uses.

Reduced Project: This alternative consists of reducing development on the project site to avoid significant impacts. More specifically, development of this alternative would result in the reduction of residential uses on the project site by 50 percent. As a result, this alternative would result in the construction of 2,100 residential units. The Reduced Project alternative would also result in a 50 percent reduction of commercial uses on the project site as well. More specifically, this alternative would allow approximately 125,000 square feet of commercial space. All development under this scenario would occur within the predominantly level portions of the project site and no development would occur within the foothill areas. Development would primarily be concentrated adjacent to existing residential areas within the City of Soledad.

No Golf Course: This alternative consists of eliminating the golf course and associated infrastructure in order to avoid potential significant adverse environmental impacts associated with agricultural resources, biological resources, cultural resources, hazardous materials, public services, utilities, and traffic. This alternative would still allow for the development of up to 4,200 residential units and commercial uses. As currently proposed, the golf course, driving range, and other associated infrastructure occupy approximately 160 acres of the 920 acre site. This area may be developed at some future time consistent with the program and policies identified in the General Plan, but additional impacts could result from additional development within the existing golf course alignment. These impacts would be beyond the scope of analysis contained in this EIR. Potential impacts include increased traffic, noise, deterioration of air quality, increased demands for public services and similar. For the purposes of this analysis, it is assumed that the existing golf course alignment would be utilized for low-intensity public recreational uses.

Alternative Design: Increased Senior Housing Alternative: This alternative consists of increasing the number of senior level housing from 500 to 1,500 units in order to minimize and/or avoid potential impacts to public services and traffic. Build-out of this alternative would still result in the construction of 4,200 units and commercial uses; however, a larger proportion of these units, approximately 35 percent, would be restricted for senior level housing. This alternative is anticipated to result in approximately the same impacts as the proposed project in terms of aesthetics, agricultural resources, biological resources, cultural resources, geology and soils, hazards, hydrology, land use and planning, noise, and utilities. Development of this alternative, however, would lessen project impacts to school facilities.

2.4 SUMMARY OF PROJECT IMPACTS

A summary of significant project impacts and mitigation measures are provided in Table 2-1. Mitigation measures have been identified to either avoid the impact or reduce the level of significance. In addition, the following table also identifies significant and unavoidable project impacts that cannot be reduced to a less-than-significant through the incorporation of mitigation. The significance after mitigation implementation is also stated.

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation		Level of Significance After Mitigation
4.1 Aesthetics			
The project would permanently alter a scenic vista, consisting of a portion of the Gabilan Mountain Range foothills, by causing changes to topography, removing vegetation, and adding roads, buildings, pavement, and lighting.	4.1-1	Building heights of all new structures shall adhere to the limits set forth in the Miravale III Specific Plan dated June 2007. Additionally, all new structures shall adhere to the applicable Development Standards as established in Section 2.0 of the Specific Plan. Prior to the issuance of any building permit for development within the Specific Plan area, the project applicant shall submit detailed plans, including elevations, site plans, and/or other documentation detailing compliance with applicable development standards, subject to the review and approval of the City of Soledad.	Significant and unavoidable.
	4.1-2	In order to minimize potential adverse visual impacts associated with development within the hillside portions of the project site, the project applicant shall submit and have approved, prior to the recordation of the final map for Phases three and four, building envelopes for each new residential lot proposed above the 400 foot elevation contour. The proposed building envelopes shall be located in the least visually sensitive area of each lot. No new structures shall be constructed outside of the approved building envelopes, unless otherwise approved by the City of Soledad.	
	4.1-3	In order to minimize aesthetic-related impacts due to development within the hillside portion of the site, the project applicant, prior to project approval, shall submit a revised Specific Plan that includes the following policy in Section 2.6 Low Density Residential (LDR & LDR-H/M3-R-1): All new residential units proposed within areas of the project site above the 400 foot elevation contour shall be subject to a Design Review approval process or similar. As part of the design review process, vertical building envelopes shall be identified and staking and flagging shall be required to demonstrate the extent of proposed development. All new structures shall be designed to minimize visual impacts to the greatest extent feasible.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	4.1-4 Final design plans for proposed development shall utilize natural landforms and vegetation for screening structures, access roads, building foundations, cut and fill slopes, and exterior lighting. Roads, parking, and utilities shall be designed to minimize visual impacts. Prior to the issuance of any grading and/or building permit, the project applicant shall submit design-level drawings demonstrating compliance with this measure, subject to the review and approval of the City of Soledad. If an alternative design would minimize impacts, the applicant shall submit evidence demonstrating that the alternative design is infeasible. 4.1-5 The applicant shall provide landscape screening appropriate to the surrounding area in order to integrate the development with the existing natural landscape. Landscaping plans shall be submitted to the City of Soledad for review and approval prior to the issuance of any building or grading permit. 4.1-6 All buildings shall be designed with colors and materials that effectively blend the structures with the surrounding landscape. Building applications for new structures shall include color and material sample photo sheets and shall be approved by the City of Soledad, prior to the issuance of any building permit. 4.1-7 A site-specific geotechnical report shall be prepared for new development on hillsides in order to ensure that the development will not cause or worsen natural hazards, such as erosion and sedimentation, and will minimize risk to life and property from slope failure, landslides, and flooding. The report shall include erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas. Prior to the issuance of any grading and/or building permit for new development within the hillside portions of the project site, the project applicant shall submit a geotechnical report prepared by a qualified professional to the City of Soledad Department of Public Works for review and approval. The site-specific	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		geotechnical report shall identify feasible recommendations and avoidance measures to minimize potential impacts.	
	4.1-8	Land alterations within areas above the 400 foot elevation shall be minimized by keeping cuts and fills to a minimum, limiting grading to the smallest practical area of land, limiting land exposure to the shortest practical amount of time, replanting graded areas to insure establishment of plant cover before the next rainy season, and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur. Prior to the issuance of any grading permit, the project applicant shall submitted detailed grading plans consistent with the intent of this mitigation, subject to the review and approval of the City of Soledad.	
Development of the proposed project may impact scenic resources within view of a State Scenic Highway.	No Mitigation Measures identified.		Less-than-significant
The project would permanently alter the existing visual character of the site by causing changes to topography, removing vegetation, and adding roads, buildings, pavement, parking areas, and lighting.	4.1-9	In order to minimize tree removal and associated visual impacts, final design-level improvements plans shall retain existing mature eucalyptus and other tree species to the greatest extent possible. Final design-level plans shall be prepared in consultation with a registered arborist/forester to minimize tree removal and ensure the health of remaining trees. Prior to the issuance of any grading and/or building permits, final plans shall be subject to the review and approval of the City of Soledad Director of Public Works. If the removal of existing mature eucalyptus is required the applicant shall submit evidence demonstrating that there are no feasible design alternatives to avoid tree removal. In the event that tree removal is required, the project proponent shall prepare a tree removal and replacement plan for each phase of construction, subject to the review and approval of the City of Soledad Community Development Director. The tree removal and replacement plan shall identify specific grading limits that minimize tree removal, as well as appropriate tree replacement ratios and replanting locations.	Significant and unavoidable.
	4.1-10	Final design plans for the proposed gateways shall include elements,	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		such as signage, landscaping and landscaped center medians, and appropriate architectural detailing consistent with the Miravale III Specific Plan. Prior to issuance of any permit for the construction of any of the four gateways, the project applicant shall submit detailed plans that include the above referenced elements, subject to the review and approval of the City of Soledad.	
	4.1-11	Final design plans for proposed residential development shall include form, scale, and character elements which emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks. Prior to the issuance of any building permit for residential development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad.	
	4.1-12	Final design plans for proposed multi-family development shall include useable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood. Prior to the issuance of any building permit for multi-family development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad.	
	4.1-13	Final design plans for proposed development shall include a tree planting plan in order to increase the number and density of tree cover within new development areas. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed tree planting plan, subject to the review and approval of the City of Soledad.	
The project would create a new source of light or glare that would adversely affect day or nighttime views in the area.	4.1-14	All buildings shall be designed so that exterior lighting is down-lit and illuminates the intended area only. Building applications for new structures shall include an exterior lighting plan subject to approval of the Soledad Planning Department that includes the following	Less-than-significant.

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation	Level of Significance After Mitigation
	requirements: 1) exterior lighting shall be directional; 2) glare from exterior lighting shall be adequately minimized; 3) the source of directional lighting shall not be directly visible; and 4) vegetative screening shall be considered, where appropriate, as a means of reducing development-related light and glare. The project applicant shall submit an exterior lighting plan to the City of Soledad Planning Department prior to the issuance of any building permit. 4.1-15 Ornamental lighting use for streets, parks, public open spaces, trails, bike paths, parking lots, and walkways shall utilize fixtures consisting of metal halide with cut-off luminaries in order to control light and glare. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department. 4.1-16 Light reduction and screening measures shall be required in order to reduce nighttime ambient light increases in the area. Lighting levels in commercial areas shall be kept as low as feasible and controlled to minimize operating time. Light sources shall be installed, so there is no light radiation above the horizontal plane (i.e., dark sky). Lighting shall be focused downward to prevent the splay of ambient light to other areas. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department	
4.2 Agricultural Resources		
The proposed project would include the conversion of prime agricultural land.	No feasible mitigation.	Significant and unavoidable.

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation	Level of Significance After Mitigation
Development of land designated for urban development as part of Phase 4 of the Specific Plan will require the cancellation of Land Conservation Act Contract 73-25 within the project site.	No feasible mitigation.	Significant and unavoidable.
The proposed project will be sited adjacent to existing agricultural uses located on the boundary of the project footprint. This has the potential to cause an increase in land use compatibility problems and nuisance complaints due to urban uses being sited adjacent to agricultural uses. In order to minimize these potential land use conflicts, the project has been designed with a minimum 60' buffer zone between the residential and agricultural uses along the western boundary of the project site. Additional buffers, however, are warranted along the northern and eastern project boundaries. Moreover, as currently proposed, the 60' buffer does not meet the minimum buffer distance recommended by the Monterey County Agricultural Commissioner. To ensure that residential uses are adequately buffered from agricultural uses, additional measures are necessary to protect human health and the environment resulting from potential conflicts between agricultural and urban uses.	4.2-1 Adequate buffer areas between urban and agricultural uses, including a minimum 50' buffer along the northern and eastern boundary of the project site, shall be incorporated into the proposed project. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report, subject to the review and approval of the City of Soledad. 4.2-2 In order to ensure the adequacy of the proposed 60' agricultural buffer located along the western boundary of the project site, the project applicant shall submit a detailed landscape plan that includes vegetative screening in addition to physical barriers, such as fences, walls, or similar to protect human health and safety. One or more of the following options may also be used in combination with landscaping requirements to create an average 60 foot buffer between the agricultural parcel property line and habitable structures within the Plan area: a. Public or private road right-of-ways; b. Landscaped islands and planting areas; c. Recreational trail corridors; and/or d. Placing dwellings in the rear portion of lots. Prior to the recordation of any final map along the western project boundary, an agricultural buffer setback shall be delineated on the final map, subject to the review and approval of the City of Soledad. 4.2-3 Prior to the issuance of any certificate of occupancy for residences adjacent to on-going agricultural uses on the western project boundary, the project applicant shall provide documentation demonstrating that	Less-than-significant

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact		Mitigation	Level of Significance After Mitigation
		adequate screening and landscaped improvements have been installed and/or constructed within the 60' agricultural buffer, subject to the review and approval of the City of Soledad.	
The proposed project has the potential to impact routine and on-going agricultural activities on the areas adjacent to the northern, eastern, and western boundaries of the project site.	4.2-4	Access for agricultural equipment and vehicles to the adjoining row crop land on the western boundary shall continue to be provided from the ramp to Highway 101 North (see Figure 2 in Technical Appendix T-1, Agricultural Report). The current access road to the Braga property should remain at the current width to allow for passing and ensure adequate turnaround space for field equipment. Implementation of this measure would reduce impacts to routine and on-going agricultural operations on lands west of the proposed project site.	Significant and unavoidable.
	4.2-5	Prior to the issuance of any permit, the project applicant shall have recorded a right-to-farm notice on parcels adjacent to existing and on-going agricultural uses consistent with the requirements of the City of Soledad General Plan, subject to the review and approval of the City of Soledad.	
4.3 Air Quality			
Construction activities, such as clearing, excavation and grading operations, construction vehicles traffic on unpaved ground, and wind blowing over exposed earth would generate dust and particulate matter.	4.3-1	Prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall, at a minimum, include the following measures: • Limit grading activity to a maximum of 2.5 acres daily. As more detailed construction information becomes available, emissions from grading activities could be reassessed to determine if the area of grading could be increased. Such an assessment would have to be conducted using appropriate assumptions and mitigation measures.	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		• Water all active construction areas at least twice daily and more often during windy periods. Active areas adjacent to existing businesses should be kept damp at all times. If necessary, during windy periods, watering is to occur on all days of the week regardless of onsite activities. • Cover all trucks hauling trucks or maintain at least two feet of freeboard. • Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites. • Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites. • Sweep streets daily (with water sweepers) if visible soil material is deposited onto the adjacent roads. • Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more). • Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles. • Limit traffic speeds on unpaved roads to 15 mph. • Replant vegetation in disturbed areas as quickly as possible. • Suspend excavation and grading activity when hourly-average winds exceed 15 mph and visible dust clouds cannot be contained within the site.	
Construction activities would involve use of the heavy-duty off-road equipment and large trucks that use diesel fuel resulting in emissions of diesel particulate matter and NOx.	4.3- 2	Projects developed under the specific plan should be evaluated for individual construction period air quality impacts. Project-specific mitigation measures would be identified at that time. However, the following mitigation measures should be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment: • Use off-road construction equipment, manufactured during or after 1996 that meets the NOx emissions standard of 6.9 grams per brake-horsepower hour or use of alternative fuels (such as	Less-than-significant

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		biodiesel) that result in lower particulate emissions. • The contractor shall install temporary electrical service whenever possible to avoid the need for independently powered equipment (e.g. compressors). • Diesel equipment standing idle for more than two minutes shall be turned off. This would include trucks waiting to deliver or receive soil, aggregate, or other bulk materials. Rotating drum concrete trucks could keep their engines running continuously as long as they were onsite and staged away from residential areas. • Properly tune and maintain equipment for low emissions. • Stage large diesel powered equipment (i.e. wheeled tractor, wheeled loader, roller by using gasoline-powered equipment to reduce NOx emissions. • Limit the hours of operation for heavy-duty equipment.	
Implementation of the proposed specific plan would result in increases in long-term operational emissions of ozone precursor pollutants. These emissions would exceed significance thresholds established by the MBUAPCD.	4.3- 3	The project shall apply the following measure to the extent appropriate for the specific land uses proposed: • Develop a Transportation Demand Management Program with the intent of reducing vehicle trips and vehicle miles traveled associated with build out of the specific plan. Components of this plan may include: o Develop parking strategies for commercial and retail uses that reduce single occupant vehicle trips. o Provide bicycle storage/parking facilities. o Provide shower/locker facilities in light industries and office uses. o Provide onsite or near site child care centers for large employment centers. o Develop park-and-ride lots. o Provide opportunities to include or increase transit service to plan area. • Include plans to incorporate safe and efficient modes of bicycle and pedestrian transportation. Bicycle routes and pedestrian paths should include amenities such as signs and traffic signal activation	Significant and unavoidable.

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation	Level of Significance After Mitigation
	(e.g., loop activators). • Identify energy efficiency goals for new developments that would conserve energy beyond requirements of the State Title 24 building code. • Provide exterior electrical outlets on new buildings that encourage use of electrical landscape equipment. • Prohibit open wood burning fireplaces in new residences unless they are natural gas-fired or EPA certified wood heaters that meet EPA's particulates emission standard of 7.5 grams per hour.	
Development of residential uses adjacent to agricultural uses has the potential to result in nuisances and odors due to ongoing agricultural operations.	Please refer to Mitigation Measures 4.2-1 through 4.2-3.	Less-than-significant.
4.4 Biological Resources		
The proposed project would represent temporary and permanent impacts to all habitats and the vast majority of vegetation within project boundaries, and will result in the removal of 3 or more oak trees plus all Eucalyptus and/or Tamarisk trees lining San Vicente Road. Temporary impacts to vegetation included grubbing and grading associated with development of the site; permanent impacts include the conversion of open vegetated areas to urban housing through placement of structures, homes, roads, driveways, etc.	4.4-1 A Forest Management Plan shall be prepared for the project due to proposed tree removals. The City approved Forest Management Plan (and associated replanting plan) shall be incorporated as a condition of project approval to satisfy General Plan Conditions C/OS 17-19. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a Forest Management Plan, subject to the review and approval of the City of Soledad. 4.4-2 Trees and vegetation not planned for removal shall be protected during construction to the maximum extent feasible. This shall include the use of exclusionary fencing of herbaceous and shrubby vegetation, such as hay bales and protective wood barriers for trees. Only certified weed-free straw shall be used to avoid the introduction of non-native, invasive species. 4.4-3 Following construction, the disturbed areas that are proposed as parks and native landscaping areas shall be restored to pre-project contours to the maximum extent feasible and revegetated using locally-occurring native species and native erosion control seed mix.	Less-than-significant

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation	Level of Significance After Mitigation
	4.4-4 Protective fencing shall be placed so as to keep construction vehicles and personnel from impacting vegetation adjacent to the project site outside of work limits. 4.4-5 Grading, excavating, and other activities that involve substantial soil disturbance shall be planned and carried out in consultation with a qualified hydrologist, engineer, or erosion control specialist, and shall utilize standard erosion control techniques to minimize erosion and sedimentation to native vegetation. 4.4-6 No construction equipment shall be serviced or fueled outside of designated staging areas.	
The presence/absence of jewelflower has not been determined at this time, but appropriate habitat is present within project boundaries. This species could be permanently impacted by proposed grading, excavation, and other activities that may result in the permanent loss or disturbance of individual jewelflowers and/or jewelflower habitat.	4.4-7 A qualified botanist shall be retained to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species. If no Lemmon's jewelflower is present, no additional mitigation is required. If Lemmon's jewelflower is present, a qualified biologist shall prepare a mitigation plan to be approved by CDFG prior to initiation of construction. The City of Soledad Planning Department shall be provided verification of CDFG concurrence and satisfaction prior to issuance of grading permits.	Less-than-significant.
Project development would fragment (i.e., divide and disrupt) the vast majority of the existing wildlife habitat on the site, and would represent an urban encroachment into the foothills of the Gabilan Range (an important wildlife corridor). The ongoing presence of homes, roads, cars, people, firearms, pets, etc. would adversely impact any wildlife currently utilizing the site, particularly in the grassland portions of the site (i.e. deer, coyote, fox, jackrabbits, squirrels, and raptors). Comparable development is present immediately south of the proposed project, but does not extend into the grassland/foothill portions of the site.	4.4-8 Prior to approval of each final map, the applicant shall prepare and submit draft Covenant, Conditions, and Restrictions (CC&Rs) applicable to that phase that shall include the following: a) restrict installation fencing to the immediate vicinity of residences, and where fencing is placed adjacent to open space areas and areas of natural, undisturbed habitat, fences shall be installed such that a six inch space is left between the bottom of the fence and the surface of the ground; b) prohibit off-road vehicle use; c) prohibit illegal discharge of firearms; d) prohibit the installation of road medians throughout the development. These CC&Rs shall be reviewed and approved by the City of	Significant and unavoidable.

Table 2-1 **Summary of Significant Environmental Impacts and Mitigation**			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
	Soledad prior to approval of each final map.		
Suitable foraging/dispersal habitat for San Joaquin kit fox is present throughout project boundaries, with potential denning habitat present in the annual grassland, rocky outcrop, and fallow agricultural portions of the site (see Early Evaluation Report in Appendix C). The vast majority of the habitats present within project boundaries would be directly impacted by the proposed project (grubbing and grading, construction phase impacts, permanent placement of structures and impermeable surfaces, etc.). Impacts proposed in the grassland portions of the site will likely result in kit fox abandonment of the property due to ongoing disturbance. For this reason, the project is assumed to have a significant and unavoidable adverse affect on San Joaquin kit fox (i.e. direct mortality, loss of habitat, loss of dens, etc.).	4.4-9	The applicants shall enter into consultation with USFWS and CDFG and shall provide evidence of their compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act prior to the issuance of building permits.	Significant and unavoidable.
	4.4-10	Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. Pre-construction surveys shall be conducted by a qualified biologist no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites. In addition to pre-construction surveys, a qualified biologist, meeting the required qualifications described in the *U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance*, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox. In the event that an active kit fox den is found, then the standard mitigation actions outlined in the USFWS Recommendations for SJKF, are recommended to avoid possible take of kit fox during future construction activities. These actions are general in nature; therefore, site specific strategies for the project site shall be based upon consultation with USFWS and CDFG, as stated above in Mitigation Measure #4.4-10. If active kit fox den sites are found and/or kit fox individuals are observed during the survey, the applicant will be required to comply with all mitigation actions required by USFWS and CDFG and the City shall monitor implementation of those actions.	
Multiple badger dens and badger diggings were observed in the vicinity of the onsite reservoir and within other portions of the annual grassland habitat. An adult badger was observed emerging from an onsite den by Biosearch biologists. Badger diggings were also observed in fallow agricultural portions of the site, demonstrating badger utilization of these areas as foraging habitat. Therefore, construction activities in grassland portions of the	4.4-11	The applicant shall retain a qualified biologist to conduct focused preconstruction surveys for potential American badger dens. These surveys shall be conducted no sooner than 2 weeks prior to the start of construction. Surveys for badger dens may be conducted at the same time as burrowing owl surveys. Please refer to the mitigation measures in the Preliminary BA (June 2008) for measures that may be implemented based on the results of these surveys.	Significant and unavoidable.

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation		Level of Significance After Mitigation
site have the potential to impact badger dens, and construction within fallow agricultural portion of the site will impact badger foraging habitat. Project-related construction activities (i.e. grading, excavation, development, etc.) may result in a permanent loss or disturbance of American badgers and their habitat.			
Two special-status bat species may be present onsite (pallid bat and Townsend's big-eared bat); several other bat species may also be present. Removal of onsite trees, removal of onsite buildings, and development of the site (including encroachment/disruption of rocky outcrops) may result in direct impacts to bats and/or bat roosts (day, night, foraging, and maternity) and would remove the vast majority of onsite foraging habitat for these species.	4.4-12	A qualified bat specialist shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist). Please refer to the mitigation measures in the Preliminary BA (June 2008) for measures that may be implemented based on the results of these surveys.	Less-than-significant.
Salinas pocket mouse is known to occur onsite; presence was confirmed in September 2006. As the vast majority of the onsite grassland habitat will be converted to residential usage and the remaining portions will be fragmented from surrounding habitat and subject to ongoing disturbance (cars, lights, noise, sound, vibration, etc.), significant impacts to this species are anticipated (direct and indirect mortality).	4.4-13	The applicant shall contract a qualified biologist to coordinate with CDFG and prepare a mitigation and monitoring plan for Salinas pocket mouse. Verification of CDFG concurrence/approval shall be submitted to the City of Soledad prior to initial grubbing and grading of the site.	Significant and unavoidable.
Tree removal (i.e., Eucalyptus and Tamarisk trees lining San Vicente Road and oaks present in the northeast corner of the site) and disturbance associated with construction of the proposed project would likely impact any nesting birds and/or raptors present within project boundaries (harassment, stress, brood-less, nest abandonment, injury, mortality). Per the CDFG Guidelines, impacts to burrowing owls are defined as disturbance or	4.4-14	Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the Miravale site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
harassment within 160 feet of occupied burrows, destruction of burrows and burrow entrances, and degradation of foraging habitat adjacent to occupied burrows. In addition, the project would require grading, grubbing, tree removal, excavation, and other activities that may result in a permanent loss or disturbance of raptors and migratory birds and their habitat.		survey shall conform to the CDFG 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied). Please refer to the mitigation measures regarding burrowing owl in the Preliminary BA (June, 2008) for avoidance and mitigation measures that may be implemented based on the results of these surveys.	
	4.4-15	If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area. If active nests are found, a suitable construction buffer shall be established by a qualified biologist, and no work shall occur within that buffer until August 1 when young are assumed fledged. Alternatively, a qualified biologist can conduct weekly nest checks to gauge nestling/fledgling status, and construction may proceed once fledglings have dispersed from the nest provided written concurrence from CDFG. No active nest shall be impacted or removed without a depredation permit from CDFG, and a depredation permit will not be issued for impacts to Fully Protected Species such as the white-tailed kite. For activities that occur outside of the nesting season (generally September 1 through February 14), preconstruction surveys are not required. If construction is initiated outside of the nesting season and continues into the nesting season, preconstruction surveys are required if construction will occur in areas not previously accessed and/or disturbed (>300 feet from previous construction activities).	
	4.4-16	A preconstruction survey shall be conducted no more than 14 days prior to modification, demolition, or removal of onsite buildings. If no owls or other nesting birds are observed, then demolition or removal may proceed. If barn owls (or any other nesting birds) are observed	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		during the preconstruction survey, a determination shall be made on whether birds are roosting or nesting. If a single owl is roosting, demolition or removal of the structure can proceed after the owl has been persuaded to move from the roost area. Non-invasive techniques include light shining into the roost space for one or two nights and days. If barn owls (or other nesting avian species) are found to be actively nesting in the barn, work on or demolition of the structure shall be postponed until one of the following conditions have been met: 1) a qualified biologist monitoring the nest determines that the owls have abandoned the nest without any outside interference or 2) a qualified biologist monitoring the nest has determined that the young have fledged and are capable of relocating and using another roost site. Once the young have fledged, non-invasive techniques may be used to encourage the owls to leave the barn. Under either scenario, the monitor shall ensure that all owls have left the building prior to construction or demolition activities. The barn owl nesting period is typically between February 15 and July 15.	
The presence of California red-legged frog and/or Western spadefoot has not been determined at this time. The project as currently designed would fill the onsite reservoir to establish home-sites, removing a potential breeding resource for these species. Pond 3 would likewise be permanently filled as a result of the proposed project. If CRLF or spadefoot are present, proposed impacts to onsite agricultural basins (particularly the reservoir) would result in direct impacts to these species including "take." (i.e. loss of individuals and habitat, loss of a breeding resource, direct mortality, etc.). In addition, grading and other earthmoving activities proposed would represent an adverse affect on upland estivation habitat for these species, if present.	4.4-17	Protocol-level CRLF surveys (USFWS, August 2005) shall be completed at each aquatic resource present within project boundaries. Protocol-level CRLF surveys would likely detect Western spadefoot, if present. If it is determined that CRLF are present, the applicant shall coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA (e.g., applying for an Incidental Take Permit [Section 7 and/or 10 depending on lead agency]) and implementing the permit requirements. Any mitigation and avoidance measures required by USFWS for potential impacts to CRLF (if applicable) would likewise reduce impacts to Western spadefoot given their overlapping habitat characteristics. If it is determined that spadefoot are present, but CRLF are not, coordination with CDFG regarding appropriate mitigation to reduce impacts to this species shall be required.	Significant and unavoidable.
Proposed development of the majority of the onsite	4.4-18	The applicant shall retain a qualified biologist to conduct a	Significant and

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation		Level of Significance After Mitigation
grassland habitat and fragmentation of remaining grassland habitat represents a significant impact to coast horned lizards and black-legless lizards (and other wildlife species).		construction monitoring program for black legless lizards, coast horned lizards, and San Joaquin coachwip which shall include procedures for capture and release. The biologist shall remain on-site during initial grading activities to salvage and relocate these species that may be uncovered during earthmoving activities. Recovered individuals shall be placed in appropriate habitat outside of the project site in accordance with the MOU with CDFG. The biologist shall walk alongside the grading equipment in each new area of disturbance and shall have the authority to halt construction temporarily if necessary to capture and relocate an individual. Any individual captured in the grading zone shall be relocated as soon as possible to adjacent suitable habitat outside of the area of impact, pursuant to the MOU.	unavoidable.
	4.4-19	The applicant shall conduct an employee education program for construction crew and City staff prior to construction activities. A biological monitor shall meet with the construction crew at the onset of construction to educate the construction crew on the following: 1) the appropriate access route in and out of the construction area; 2) how biological monitor will examine the area and agree upon a method which will ensure the safety of the monitor during such activities, 3) the special-status species that may be present; 4) the specific mitigation measures that will be incorporated into the construction effort; and 5) the proper procedures if a special-status animal or any other animal is encountered within the project site.	
	4.4-20	A representative shall be appointed by the City who will be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. The representative shall be legally responsible to notify USFWS and CDFG immediately in the event that "take" of any special-status wildlife species occurs. The representative shall be identified during the Employee Education Program and his/her contact information shall be provided to USFWS and CDFG. It is imperative that this individual will be present onsite every day and will be accessible to regulatory	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		agency personnel.	
	4.4-21	All food-related and other trash shall be disposed of in closed containers and removed from the project area at least once a week during the construction period or more often if trash is attracting avian or mammalian predators. Construction personnel shall not feed or otherwise attract wildlife to the area. These instructions to the construction crew shall be reiterated during the employee education program and during update meetings with construction crews. The instructions shall also be posted conspicuously on the site.	
Implementation of the proposed project would result in impacts to wildlife movement and nursery sites.	See above.		Significant and unavoidable.
4.5 Cultural Resources			
Development of the project and the resulting move of the historical resource to another location would cause a substantial, adverse change to a historical structure eligible for listing in the California Register on the site.	4.5-1	Relocation of House. The project proponent shall ensure that the design and implementation of the relocation project is consistent with the *Secretary of the Interior's Standards for* Rehabilitation *and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992),* the California Historical Building Code, and the Mitigation Monitoring and Reporting Plan (MMRP) for the project. Prior to recordation of the final map, the project applicant shall submit a relocation plan prepared by a qualified professional in accordance with the general recommendations of *Moving Historic Buildings*, a publication of the National Park Service, to the City of Soledad for review and approval. The relocation plan shall discusses planning, research, and recording prior to the move. In addition, the relocation plan shall identify siting, foundation construction, building reassembly, and restoration work after a successful move. See John Obed Curtis, *Moving Historic Buildings*, Heritage Conservation and Recreation Service, Publication No. 9, US Department of Interior (1979) for further details. Prior to the relocation, the applicant shall provide verification of compliance with related mitigations to the City of Soledad Community Development Department Director for review and approval. In addition, the structure shall be relocated prior to the issuance of any building and/or grading	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	permit for development within the Specific Plan area. 4.5-2 Protective Measures. The project proponent shall develop and implement measures to protect the character-defining features of the Lorentzen House building from damage by the relocation project. The features include, but are not limited to scale, massing, and layout of the house, as well as siding and wood frame fenestration. Protective measures shall be prepared by a qualified professional in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, *Moving Historic Buildings*, and the MMRP for the project. Prior to the recordation of the final map, the project applicant shall submit a relocation plan, consistent with Mitigation Measure 4.5-1, which incorporates protective measures consistent with the intent of this measure. Prior to the relocation of the structure, the applicant shall submit evidence from a qualified professional demonstrating that protective measures have been implemented, subject to the review and approval of the City of Soledad. 4.5-3 Repair of Inadvertent Damage. The project proponent shall ensure that any inadvertent damage to the character-defining features of the Morris Lorentzen House resulting from the rehabilitation project is repaired in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992) and California Historical Building Code. A qualified professional shall be consulted prior to any repairs. The condition of the building shall be photographed as part of the proposed recordation document and/or video documentation, prior to the start of the relocation, and this will help to establish the baseline condition for assessing inadvertent damage. The project applicant shall submit detailed documentation prepared by a qualified professional demonstrating that all repairs have been completed in accordance with	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	applicable standards prior to the issuance of any building and/or grading permit. 4.5-4 Professional Standards. All activities regarding historical architectural resources and historic preservation carried out as part of this project shall be carried out by or under the direct supervision of persons meeting, at a minimum, the Secretary of the Interior's professional qualifications standards (48 FR 44738-9) in these disciplines. Prior to the relocation of the Lorentzen House, the applicant shall submit evidence to the City of Soledad demonstrating compliance with this measure. 4.5-5 Monitoring. The mitigation measures applying to the relocation of the Lorentzen House shall be set forth in a Mitigation Monitoring and Reporting Program (MMRP) for the project. The MMRP will guide project-specific mitigation, monitoring, and/or reporting programs for various aspects of mitigation monitoring, reporting, and enforcement in order to ensure full compliance with the conditions of project approval. 4.5-6 Coordination. The project proponent shall coordinate with and inform interested parties, including, but not limited to the Soledad Historical Society and the Monterey County Historical Society, regarding the status of its compliance with the mitigation measures set forth in the MMRP, as necessary. 4.5-7 Recordation to Historic American Building Survey standards. Prior to the start of any project work, the project proponent shall ensure that the Lorentzen House property is recorded and documented in accordance with the Level II recordation standards of the Historic American Building Survey/Historic American Engineering Record (HABS/HAER) program. This level of recordation would include: ▪ Archival reproduction of any existing historic images of the property and grounds; ▪ Archival reproduction of any existing maps, sketches, or	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		drawings of the house; ▪ Production of measured architectural plans and drawings; ▪ Production of large-format photographs of exterior and interior views of the house, and exterior views of the house and current setting, including relationship to non-eligible outbuildings; and ▪ Narrative history and description of the property (based on the narrative provided in the Seavey (2006) evaluation of the property, and the Monterey County survey(s) of similar properties. The original archival set of recordation documents and photograph prints will be submitted to the Soledad Historical Society (or its designee), and archival quality photocopies of the documentation set will be provided to the following interested parties and local repositories: the Monterey County Historical Society; the Monterey County Libraries (Soledad and Salinas branches), and the UC Santa Cruz Library Special Collections Department. The project proponent would ensure that this recordation documentation was prepared prior to carrying out any other treatment and would make the content of the document available for other mitigation measures, such as the preparation of interpretive material.	
Construction of the project may result in the discovery and disturbance of unknown archaeological resources and/or human remains.	4.5-8	In order to ensure that project-impacts to potentially unknown resources are avoided, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If archaeological resources or human remains are accidentally discovered during construction, work shall be halted within 150 feet (50 meters) of the find until a qualified professional archaeologist can evaluate it. Work shall not recommence until the project archaeologist has submitted documentation to the City indicating that discovered resources have been adequately salvaged and no further resources have been identified within the area of disturbance	Less-than-significant.

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation		Level of Significance After Mitigation
	4.5-9	In order to ensure that the proposed project does not impact buried human remains during project construction, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If buried human remains are encountered during construction, work in that area must halt and the archaeologist and the coroner immediately notified. If the remains are determined to be Native American, then the NAHC must be notified within 24 hours as required by Public Resources Code 5097. The NAHC will notify designated Most Likely Descendants who will provide recommendations for the treatment of the remains within 24 hours. The NAHC will mediate any disputes regarding treatment of remains. Work shall not recommence until the project archaeologist, coroner, and NAHC, submit documentation to the City indicating that buried human remains have been adequately salvaged and no further remains have been identified within the area of disturbance.	
4.6 Geology, Soils and Mineral Resources			
The project would be exposed to potential adverse effects from strong seismic ground shaking that may result in damage to proposed structures.	4.6-1	To minimize the potential effects from strong seismic ground shaking on project components, a project-specific geotechnical analysis shall be performed by a registered professional engineer with geotechnical expertise, and all recommendations shall be incorporated into final design plans. Prior to the issuance of any building and/or grading permit, the project applicant shall submit a project-specific geotechnical analysis to the City of Soledad Public Works Director for review and approval. The project engineer shall develop project-level plans based upon and in response to the observations and recommendations made in the project specific geotechnical analysis.	Less-than-significant.
	4.6-2	In order to minimize potential seismic-related hazards, the project engineer shall incorporate the seismic shaking analysis contained within the Geologic Hazards Investigation Update prepared by Nolan	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		Associates (September 2006) into project design. Prior to the issuance of any building and/or grading permits, the project applicant shall submit design level plans demonstrating that the recommendations of the Geologic Hazards Investigation Update are incorporated into project design, subject to the review and approval of the City of Soledad Public Works Director. In addition, all structures shall be designed to the most current standards of the California Building Code, at a minimum.	
	4.6-3	In order to minimize seismic-related hazards to new public facilities, a site-specific probabilistic seismic hazards assessment shall be incorporated into the design of any schools, hospitals, fire or police stations, or any other critical facilities planned for the project site. An individual assessment shall be performed for each site by an engineering geologist. Prior to the issuance of any grading and/or building permit for new public facilities, including but not limited to new schools, hospitals, and fire or police stations, a probabilistic seismic hazards assessments shall be prepared and submitted to the City of Soledad Director of Public Works for review and approval.	
Construction of the project could result in substantial soil erosion or loss of topsoil.	4.6-4	In order to reduce wind and water erosion on the project site, an erosion control plan and Storm Water Pollution Prevention Plan (SWPPP) shall be prepared for the site preparation, construction, and post-construction periods. The erosion control plan shall incorporate best management practices consistent with the requirements of the National Pollution Discharge Elimination System (NPDES). The erosion component of the plan must at least meet the requirements of SWPPP required by the California State Water Resources Control Board. If earth disturbing activities are proposed between October 15 and April 15, these activities shall be restricted per the requirements of Soledad Municipal Code Chapter 15.08. Prior to the issuance of any permit, the project proponent shall submit detailed plans to the satisfaction of the City of Soledad Public Works Director. The components of the erosion control plan and SWPPP shall be monitored for effectiveness by City of Soledad Public Works. The following measures shall be implemented, where appropriate, to control erosion:	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	1) Keep construction machinery off of established vegetation as much as possible, especially the vegetation on the upwind side of the construction site; 2) Establish specific access routes at the planning phase of the project, and limits of grading prior to development, which should be strictly observed; 3) Utilize mechanical measures (i.e. walls from sand bags and/or wooden slat or fabric fences) to reduce sand movement; 4) Immediate revegetation (plus the use of temporary stabilizing sprays), to keep sand movement to a minimum; and 5) For larger-scale construction, fabric or wooden slat fences should be placed around the construction location to reduce sand movement. 4.6-5 Areas disturbed by grading shall be stabilized with adequate landscaping vegetative cover. A re-vegetation and landscaping plan shall be prepared by a landscape architect with experience in working with the type of soils that are characteristic of the site, subject to the review and approval of the City of Soledad. Prior to the issuance of any certificate of occupancy and concurrent with project construction, disturbed areas shall be re-vegetated consistent with the City approved landscaping plan. All project replanting shall be continually monitored by the landscape architect for a duration of three years. The landscape architect shall submit annual monitoring reports to the City of Soledad after each successive year detailing the success of landscaping. Success shall be based on an 80% survival rate. If it is determined that the replanting has not been successful, additional replanting shall be required by the City of Soledad. 4.6-6 All drainage from improved surfaces shall be captured by closed pipe or lined ditches and carried to neighborhood storm sewers or natural drainages. At no time shall any concentrated discharge be allowed to	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		spill directly onto the ground adjacent to structures or to fall directly onto steep slopes. The control of runoff is essential for erosion control and prevention of water ponding against foundations and other improvements. Prior to the issuance of any grading and/or building permit for each new structure, the project applicant shall submit an erosion control plan consistent with this measure, subject to the review and approval of the City of Soledad Public Works Director.	
The project could be exposed to localized liquefaction and collapse.	4.6-7	In order to reduce the risk of localized liquefaction and collapse, and allow for adequate foundation and structural fill support, grading plans shall be consistent with a project-specific geotechnical analysis. The project geotechnical engineer shall prepare a quantitative assessment of liquefaction and seismically-induced settlement potential for the project as part of a comprehensive site geotechnical evaluation, prior to the recordation of each final map. Measures to ensure adequate reduction of risk to standard acceptable levels in accordance with standard geotechnical practice shall be incorporated into project design and specifications, subject to the review and approval of the City of Soledad Public Works Director.	Less-than-significant.
The project could be exposed to potential adverse effects from on- or off-site landslides and lateral spreading that may result in damage to proposed structures.	4.6-8	Portions of the project located within debris flow hazard areas as described in the Geological Hazards Investigation Update prepared by Nolan Associates (September 2006, see pg. 14) shall incorporate design measures to mitigate this hazard to acceptable levels in accordance with standard engineering practices. Suitable measures include: 1) Restricting development to outside these areas; 2) Constructing artificial channels or diversion walls, designed to divert fluidized debris away from habitable structures; or 3) Constructing impact walls, designed to withstand anticipated debris flow volumes and velocities. An engineering geologist shall be retained to provide site-specific geologic design criteria for debris flow hazard areas once the final project plans are available. Diversion or retaining structures shall be designed based on recommendations by a geotechnical engineer, subject to review and approval of the City of Soledad Public Works Director. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate design measures are incorporated to mitigate potential hazards to acceptable	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		engineering standards, subject to the review and approval of the City of Soledad.	
The project could be exposed to localized soil expansion.	4.6-9	In order to minimize potential hazards associated with expansive soils, the expansion potential of site soils shall be evaluated as part of a site-specific geotechnical study to ensure hazards are reduced to an acceptable level of geotechnical and Uniform Building Code practices. The recommendations of a geotechnical engineer for mitigating soil shrink-swell hazards shall be incorporated into project design. These measures may include replacement of soil with engineered backfill or treatment of expansive soil with lime. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad Director of Public Works.	Less-than-significant.
4.7 Hazards and Hazardous Materials			
The project proposes a variety of uses in an area that may be contaminated with hazardous materials. Release of these contaminants could pose a health risk to construction workers and future users on the site.	4.7-1	Prior to the recordation of any final map, the applicant shall arrange for a Phase II Environmental Site Assessment to be prepared which assesses the localized environmental conditions described in the Phase I Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. (September 2006) and identifies any required remedial actions for the safe handling, removal and special needs for any identified materials. The Phase II Assessment shall include site-specific soil sampling in order to assess the presence of potential soil contamination and to identify special needs for soil handling during construction/grading activities and possible health risks to construction workers and future users consistent with the recommendations contained in the Phase 1 Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. If results indicate the presence of such materials in excess of screening levels for residential, educational, or commercial uses, a Remediation Plan shall be prepared and implemented to reduce contamination to acceptable levels, maintain the safety of construction workers and future site users, and assure proper management of contaminated	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	materials in accordance with state and local regulatory requirements. This plan shall be subject to review and approval by the Monterey County Division of Environmental Health. Prior to the issuance of any building and/or grading permit, the project applicant shall submit evidence to the City of Soledad for review and approval demonstrating compliance with this measure. 4.7-2 Prior to commencement of new development, the applicant shall obtain approval of a Soil Management Plan from the Monterey County Division of Environmental Health, which establishes management practices for handling potentially contaminated soil, if encountered, during construction/grading activities. 4.7-3 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to survey all buildings to be demolished for asbestos under the National Emissions Standards for Hazardous Air Pollutants (NESHAP) guidelines prior to demolition activities. If asbestos containing material is documented within existing on-site structures, all potentially friable asbestos shall be removed prior to building demolition in accordance with NESHAP guidelines. Prior to the issuance of a grading permit, the project proponent shall submit written evidence to the City of Soledad Director of Public Work from a qualified consultant demonstrating that all asbestos containing material, if present, has been properly removed and demolition activities may proceed without exposing construction personnel to asbestos related-hazards. 4.7-4 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to conduct a lead-based paint survey to evaluate the presence of lead-based paint residues in site soils adjacent to existing structures. If lead contamination is documented on-site, all peeling and flaking lead-based paint shall be removed and properly disposed of separately from building debris, in accordance with current	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		Department of Toxic Substances Control policies. In addition, all existing structures within the Specific Plan area that were constructed prior to 1978 shall be surveyed for lead-based paint prior to any demolition activities. Prior to the issuance of any permit for each phase of development, the project proponent shall submit written evidence from a qualified consultant documenting that all lead-based paint hazards have been appropriately removed and disposed of in accordance with industry standards, subject to the review and approval of the City of Soledad.	
Due to the proximity of the Soledad Sanitary Landfill to the proposed school sites, there is the potential for hazardous emissions and/or other environmental hazards to affect the health and safety of students attending new schools within the project area. More specifically, the existing landfill has the potential to expose several of the proposed school sites to environmental hazards. Although the landfill is listed as "closed" and no known hazardous incidents have been reported, releases of emissions may, nevertheless, adversely affect the health of students.	4.7-5	If, during the course of the Phase II Environmental Site Assessment, it is determined that the existing Soledad Sanitary Landfill would expose the proposed school sites to an environmental hazard that cannot be reduced to an acceptable level through remediation, the project applicant, in conjunction with the Soledad Unified School District and the City of Soledad, shall identify new school sites within the Miravale III project area that would not be exposed to known environmental hazards, prior to the recordation of any final map. If new school locations are necessary, the applicant shall amend the Specific Plan and submit a revised tentative map demonstrating the new school locations, subject to the review and approval of the City of Soledad, prior to the recordation of any final map. Any new school site shall be coordinated with the Soledad Unified School District.	Less-than-significant.
Future development could involve the use/storage of hazardous materials and/or be located in proximity to existing agricultural use/storage of hazardous materials. Accidental release of hazardous materials could result in significant impacts on public health and the environment.	The following mitigation measure is in addition to mitigation previously identified in **Section 4.2 Agricultural Resources** that are intended to reduce potential land use conflicts associated with agricultural operations.		Less-than-significant.
	4.7-6	The applicant shall prepare a Chemical Application Management Plan (CHAMP). This plan shall detail the procedures to construct, operate, and maintain the golf course. The CHAMP shall provide technical public disclosure regarding pesticides, fertilizers and other chemicals to be used on the golf course, as well as methods of application and handling. This plan shall be submitted to the Monterey County Environmental Health Division for review and approval. Prior to the issuance of any permit for golf course development, the project applicant shall submit documentation to the City of Soledad	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	demonstrating that a CHAMP has been prepared and approved by the County of Monterey. The following provisions shall be included in the CHAMP: ▪ Drought, pest, and disease resistant grass species shall be selected. ▪ Pesticides shall be handled, applied, and disposed of by a licensed (State-certified) spray technician. ▪ Only approved and legal chemicals shall be used. All county, state, and federal guidelines must be strictly adhered to regarding storage, handling, and application of pesticides. ▪ Advanced technology/monitoring equipment shall be used to insure minimal application of pesticides, herbicides, and fertilizers. This equipment shall be maintained and in proper calibration. ▪ A controlled and designated area/facility shall be used for the proper mixing and loading of pesticides into application equipment. The facility shall consist of an impermeable pad with controlled and contained drainage, and should be at least 50 feet from open ditches, ponds, or other water bodies. Rinse water shall be properly stored and hauled for disposal at an approved facility. ▪ Selection of pesticides shall be based on the ability to achieve treatment goals and criteria to minimize off-site movement. Selection of less toxic, less mobile, and less persistent pesticides shall be a priority management criterion. ▪ Pesticide applications shall be carefully timed and combined with other pest management practices; pests shall be accurately identified and pesticide applications made only when necessary, using the least amount required for all seasons. ▪ Pesticides shall not be applied when soil moisture is high during the rainy season. Applications shall be restricted prior to any anticipated late or early season storm events to preclude potential impacts from runoff. ▪ Irrigation applications shall be consistent with turf grass	

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation		Level of Significance After Mitigation
		evapotranspiration requirements. Over-watering shall be avoided.	
4.8 Hydrology and Water Quality			
Construction and operation of the project could impact water quality through substantial soil erosion during grading activities, loss of topsoil, and surface runoff from the proposed development.	4.8-1	In order to ensure that impacts are minimized to the greatest extent feasible, the project shall be designed to meet the BMP standards for operational phase storm water runoff and to maintain the onsite BMPs. The project shall implement BMPs to manage water quality by providing onsite runoff treatment in line with the onsite infiltration system. Prior to the issuance of any grading and/or building permit, the project applicant shall prepare a Construction Management Plan that identifies a designated construction supervisor responsible for the continued implementation of all construction BMPs throughout the duration of project construction. Moreover, the Construction Management Plan shall also identify BMPs to be implemented as part of the project and associated monitoring activities. The Construction Management Plan shall be reviewed by the City of Soledad Public Works Director prior to the issuance of any permit.	Less-than-significant.
	4.8-2	In order to prevent excess sediment buildup and ensure that all percolation basins are functioning in accordance with project-level plans, the project applicant and/or his/her successor in interest, shall be responsible for the long-term maintenance of all percolation basins and related private on-site drainage improvements and shall enter into a maintenance agreement with the City to provide for such. Bi-annually a basin maintenance report shall be submitted to the City of Soledad, subject to the review and approval of the Public Works Director, demonstrating that the basins have been properly maintained and cleaned in accordance with City standards. Prior to the issuance of any building and/or grading permit, the project applicant shall enter into a maintenance agreement with the City of Soledad.	
Construction and operation of the project could potentially result in flooding impacts to off-site properties if adequately sized drainage facilities are not provided within the proposed development.	4.8-3	In order to ensure that project-induced impacts related to changes in the existing drainage patterns on the project site are minimized, the project applicant shall submit design-level improvement plans for the project's storm drainage collection and retention system. Final design-	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		level plans shall be supported with appropriate soils and hydrologic data in accordance with City standards. All conveyance system and retention basins shall be sized and designed in accordance with applicable City design standards and shall be appropriately sized to accommodate stormwater runoff from a 100-year storm event. Prior to the recordation of any final map, the project applicant shall submit all design-level plans and supporting details to the City of Soledad Director of Public Works for review and approval. The VTM and Specific Plan shall be revised as necessary to reflect final locations of drainage facilities, subject to the review and approval of the City of Soledad.	
4.9 Land Use and Planning			
The proposed project would conflict with several policies intended to avoid and/or mitigate environmental impacts.		Mitigation measures have been identified in this EIR to reduce the extent of project-induced impacts, but these impacts cannot be minimized to a less-than-significant level. Measures have been identified in **Section 4.1 Aesthetics** and **4.4 Biological Resources.** No additional measures are feasible.	Significant and unavoidable.
As proposed, the Miravale III Specific Plan has the potential to conflict with adopted planning documents pertaining to public services.	4.9-1	In order to maintain project consistency with adopted City-wide facility planning documents, the project applicant/developer shall revise Section 5.0 of the Specific Plan to incorporate revisions identified by the City of Soledad Director of Public Works, prior to project approval. The following policy revisions have been identified as necessary. Revisions are <u>underlined.</u> Revise Wastewater Policy 2 to read as follows, "Design and construct the wastewater treatment system for Miravale III in accordance with applicable requirements of the Soledad Urban <u>Water</u> Management Plan, Long-Term Wastewater Management Plan<u>, and the Recycle Water Service Ordinance No. 645.</u> Revise Water Policy 1 to read as follows, "Design and construct the water supply and distribution system for Miravale III that expands upon and is integrated with the City's water distribution system and which meets the needs of future project developments of the Specific Plan area <u>consistent with the Urban Water Management Plan and the</u>	Less-than-significant.

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact		Mitigation	Level of Significance After Mitigation
		City's 2005 Water Master Plan." Revise Stormwater Policy 5 to read as follows, "Design and construct a stormwater collection and retention system that adequate retains peak storm flows onsite, avoids aggravating or causing offsite downstream from the project site, and ensures separation of stormwater drainage from Recycled water generated within the Plan area and that is consistent with the 2007 Stormwater Management Plan, Stormwater Master Plan, and Ordinance No. 617" Add a new policy to the Section 5.2.2 Law Enforcement and Fire Protection/Medical Services. The new policy shall read as follows: "9. Police and fire services will be maintained with funding from a public safety benefit assessment district or similar district."	
4.10 Noise			
Future residential uses developed at the project site would be exposed to exterior noise levels greater than 65 dBA CNEL, which exceeds the noise and land use compatibility standards presented in the City of Soledad's General Plan. Interior noise levels would be expected to exceed 45 dBA CNEL without the incorporation of noise insulation features into the project's design.	4.10-1	Maintain a sufficient buffer distance between transportation noise sources and future sensitive land uses, or alternatively, construct noise barriers or create acoustically shielded outdoor use areas utilizing buildings to achieve noise exposures of 65 dBA CNEL or less. The specific determination of necessary mitigation measures will occur during project level environmental review and design. Results of the analysis shall be submitted to the City prior to issuance of a building permit.	Less-than-significant.
	4.10-2	Retain a qualified Acoustical Specialist to prepare for City review and approval a detailed acoustical analysis of interior noise reduction requirements and specifications for all projects proposed within the 60 dBA CNEL contours of area roadways, in accordance with State and City standards. Interior noise levels must be maintained at or below 45 dBA CNEL. Building sound insulation requirements will include forced air mechanical ventilation in noise environments exceeding 60 dBA CNEL. Special building construction techniques (e.g., sound-rated windows and building facade treatments) may be required where exterior noise levels exceed 65 dBA CNEL. These treatments include,	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		but are not limited to, sound rated windows and doors, sound rated exterior wall assemblies, and acoustical caulking. The specific determination of required treatments will be made on a unit-by-unit basis during project design. Results of the analysis, including the description of the necessary noise control treatments, will be submitted to the City along with the building plans prior to issuance of a building permit. Feasible construction techniques such as these would adequately reduce interior noise levels to 45 L_{dn} or lower.	
	4.10-3	Non-residential development will comply with the noise standards established in the Zoning Code at existing or planned residential properties in the vicinity. Further, efforts will be made to reduce noise impacts through the following planning and equipment requirements: ▪ Development site planning will be utilized in a fashion that reduces noise impacts for nearby sensitive receptors, such as by not locating loading docks near residences. ▪ Equipment screens, fan silencers, and engine mufflers will be used to mitigate noise from mechanical equipment. ▪ Noise barriers will be used to control noise from parking and vehicle circulation. ▪ For recreational uses, proposed development must consider impacts upon the adjacent residential development in terms of the location of active sports areas, their orientation on the site, whether or not lights are included, and speech amplification systems.	
Traffic volume increases from the project would increase traffic noise along the local roadway network. In some locations, there would be a substantial, permanent increase in noise levels at sensitive receptors.	4.10-4	The project shall incorporate noise reduction methods, subject to the review and approval of the City of Soledad. Methods to reduce noise on the project site may include the following measures: ▪ Pave and re-pave streets with "quieter" pavement types, such as Open-Grade Rubberized Asphaltic Concrete, that would reduce noise levels by 2 to 3 dBA depending on the existing pavement type, traffic speed, traffic volumes, and other factors. All new and improved streets within the project area shall use quieter pavement types.	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		▪ Implement new or larger noise barriers that may reduce noise levels by 5 dBA CNEL in areas that would not impair access requirements. Final design of such barriers, including an assessment of their feasibility and reasonableness, must be approved by the City during project-specific development applications. An increase in barrier height per foot equates to approximately 1 dBA noise reduction. However, noise barriers must be considered as a last resort to alternative noise reduction methods per the City of Soledad General Plan. ▪ Install traffic calming measures to slow traffic and provide qualitative improvement by smoothing out the rise and fall in noise levels caused by speeding vehicles. For each 5 mph reduction in average speed, noise generation is reduced by approximately 1 dBA. ▪ Provide affected residences with building sound insulation, such as sound rated windows and doors on a case-by-case basis to reduce interior noise levels to below the 45 dBA CNEL noise standard.	
Existing and proposed noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one construction season.	4.10-5	Noise-generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturdays, unless otherwise approved by the City. No construction activities should occur on Sundays or holidays, including New Years and 4th of July.	Significant and unavoidable.
	4.10-6	Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.	
	4.10-7	Locate stationary noise generating equipment (e.g., portable concrete crusher) as far as possible from sensitive receptors. Construct temporary noise barriers to screen stationary noise generating	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	equipment when located near adjoining sensitive land uses. 4.10-8 Utilize "quiet" air compressors and other stationery noise sources where technology exists. 4.10-9 Route all construction traffic to and from the project site via designated truck routes where possible. Prohibit construction related heavy truck traffic in residential areas where feasible. 4.10-10 Control noise from construction workers' radios to a point that they are not audible at existing residences bordering the project site. 4.10-11 Consider the use of multiple-pile drivers to expedite construction where pile driving is required. (Although noise levels generated by multiple pile drivers would be higher than the noise generated by a single pile driver, the total duration of pile driving activities would be reduced.) 4.10-12 Use temporary noise control blanket barriers to shroud pile drivers or erect in a manner to shield the adjacent land uses. Such noise control blanket barriers can be rented and quickly erected. 4.10-13 Pre-drill foundation pile holes to minimize the number of impacts required to seat the pile. Pre-drilling reduces the number of blows required to seat the pile and is a standard construction noise control technique. 4.10-14 The contractor shall prepare a detailed construction management plan identifying the schedule for major noise-generating construction activities. The construction management plan shall identify a procedure for coordination with the adjacent noise sensitive facilities so that construction activities can be scheduled to minimize noise disturbance. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed construction management plan to the City of Soledad for review and approval.	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	4.10-15 The project applicant shall designate a "disturbance coordinator" who shall be responsible for responding to any local complaints about construction noise. The disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shll require that reasonable measures warranted to correct the problem are implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule. Prior to the issuance of any grading and/or building permit, the project proponent shall provide the City of Soledad with the contact information for the designated "disturbance coordinator."	
4.11 Population and Housing		
The project would represent an increase in overall residential holding capacity identified in the 2005 General Plan EIR for portions of the Mirassou, San Vincente and Northwest Expansion Areas within the project area and could be considered growth inducing if annexations and development in the remaining expansion areas exceed development potential addressed in the General Plan EIR.	4-11.1 Phase approval of development applications and annexations in the Mirassou, San Vincente and Northwest Expansion Areas to maintain holding capacity and population projections in Table 4.11-5 of the General Plan EIR. Monitor development approvals in these expansion areas to limit overall density and population growth to the holding capacity identified to ensure consistency with projections in approved City planning documents. 4-11.2 Implement General Plan policies L-2 to L-7 and other applicable policies for phased development and population growth in the project and expansion areas. General Plan policies L-2 to L-7, (below) identify expansion area requirements and applicable policies for annexation of these areas: L-2 Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council. L-3 A specific plan shall be required for all annexations and development of properties designated *Expansion Area*. Specific plans shall be prepared in accordance with the standards provided in Appendix B of the General Plan. L-4 The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services. L-5 New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development. L-6 New development shall pay its fair share of providing additional public services needed to accommodate such development. L-7 Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City.	
Although the project site is located in an area that has been identified for future population growth in City's General Plan, the project would result in a significant growth-inducing impact through the introduction of new sources of employment and a significant portion of the City's projected population growth, which would result in additional	No Mitigation Measures identified.	Significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
demands on existing facilities.			
The Miravale III Specific Plan is inconsistent with the Housing Element, which requires affordable housing to be fully integrated with market rate housing.	4.11.3	The applicant shall enter into a Development Agreement per Program 4.3 of the City's Housing Element with the City that prescribes the parameters of the development of affordable housing consistent with the City's Housing Element, Inclusionary Housing Ordinance, and the revised Specific Plan. The Development Agreement shall be reviewed and approved by the City of Soledad prior to or concurrent with project approval.	Less-than-significant.
The Miravale III Specific Plan is inconsistent with affordable housing requirements of the City's Inclusionary Housing Ordinance.	4.11.4	Prior to project approval, the Specific Plan shall be revised to provide 20% of the units proposed in each Planned Development area and the Low Density Residential area to be affordable housing units. Alternatively, the project applicant shall dedicate real property for affordable housing or submit payment of in-lieu fees in order to ensure project consistency with the requirements of the City of Soledad's Inclusionary Housing Ordinance, subject to the approval of the City of Soledad. The project's consistency with the City's Inclusionary Housing Ordinance shall be evidenced in the Development Agreement (DA) prepared for the project, subject to the approval of the City of Soledad. The DA shall be reviewed concurrently with the project's General Plan amendments, Specific Plan and the Vesting Tentative Map.	Less-than-significant.
4.12 Public Services and Recreation			
The project would result in an increased demand for police and fire services.	4.12-1	Prior to the initiation of construction for Phase 2 of the proposed development, the proposed fire and police facilities located on West Street shall be constructed and operational. Prior to the issuance of any building permit for new residential and commercial development in Phase 2, the project applicant shall obtain written documentation from the Soledad Fire and Police Departments indicating that the fire and police substations are operational, subject to the review and approval of the City of Soledad.	Less-than-significant.
	4.12-2	Prior to the issuance of building permits, the applicant/developer shall pay a City Public Facilities Development Impact Fee for each type of new development in accordance with the adjusted impact fee in effect	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		at the time of building permit issuance. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.	
	4.12-3	Prior to the recordation of each final map for development within areas currently designated as "State Responsibility Areas," the applicant shall submit evidence, subject to the review and approval of the City of Soledad Fire Department, demonstrating that a minimum 100-foot defensible space will be provided around any structure constructed within the foothill area. The defensible space shall be cleared of and maintained free of brush and combustible debris, and any landscaping placed within the defensible space shall be irrigated.	
The project would result in an increased demand for educational services.	4.12-4	Prior to project approval, the project applicant shall submit evidence, including a revised Specific Plan and tentative map, demonstrating that an additional two elementary school sites of sufficient size and a 40-acre high school site will be designated within the project boundaries to meet project demands, subject to the review and approval of the City of Soledad and the Soledad Unified School District. The 40-acre high school site shall be operational prior to the issuance of any certificate of occupancy for Phase II of the proposed project, unless otherwise approved by the City of Soledad and the Soledad Unified School District[1]	Less-than-significant.
	4.12-5	The applicant/developer shall pay a school impact fee for each type of development pursuant to the criteria set forth within California Government Code Section 65995. Prior to the issuance of building permits, the applicant shall pay required school mitigation fees. As indicated above, the fees set forth in Government Code Section 65996 constitute the exclusive means of both "considering" and "mitigating" school facilities impacts of projects [Government Code Section	

[1] Alternatively, if additional school sites will not be provided in conjunction with project development, the project applicant shall obtain written documentation from the Soledad Unified School District demonstrating that adequate school facilities, including a 40-acre high school and two appropriately sized middle schools, will be available within the City of Soledad to accommodate anticipated project demands. If, however, adequate capacity does not exist, development shall be restricted until such time that additional capacity is available to accommodate subsequent phases of development.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		65996(a)]. They are "deemed to provide full and complete school facilities mitigation" [Government Code Section 65996(b)].	
As proposed, the project does not meet the minimum required parkland ratio of three acres per 1,000 residents.	4.12-6	In order to ensure adequate improved parkland is provided as part of project development, the applicant shall submit detailed plans, including a revised Specific Plan and Tentative Map, demonstrating that adequate parkland (3 acres/1,000 residents) is designated within the project boundaries consistent with the requirements of the General Plan and Miravale III Specific Plan dated June 2007, prior to project approval, subject to the review and approval of the City of Soledad.	Less-than-significant.
Population growth anticipated under the Miravale III Specific Plan would create additional demands on park and recreational facilities.	4.12-7	Prior to the issuance of any building permit, the applicant/developer shall submit payment of a Park Facilities Impact Fee in accordance with the adjusted impact fee in effect at the time of building permit issuance, if determined to be applicable. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.	Less-than-significant.
4.13 Traffic and Circulation			
Based on the significance criteria, the project has the potential to increase hazards due to a design feature or incompatible uses.	4.13-1	Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings shall not be permitted along streets classified as collectors or arterials. Prior to the issuance of any building and/or grading permit for development associated with the golf course facility, the project applicant shall submit detailed design-level plans demonstrating compliance with this measure, subject to the review and approval of the Director of Public Works. Improvements shall be constructed in accordance with this measure prior to the issuance of any certificate of occupancy or final permit for development associated with the golf course.	Less-than-significant.
Based on the significance criteria, the project will have a significant impact on eleven study intersections, five roadway segments, and signal warrants would be met on nine intersections under project conditions.	4.13-2	*Moranda Road and Front Street:* Widen NB Front Street to two lanes, add a second NB through lane, EB free-right-turn lane and widen Front Street between Moranda road and San Vicente Road. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-3 *San Vicente Road and Front Street:* Widen NB Front Street to two lanes, NB San Vicente Road to three lanes, add two EB left-turn lands and a SB free-right-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-4 *San Vicente and Gabilan Drive:* Signalize this intersection and add a second westbound left-turn land, exclusive northbound right-turn lane, and southbound left-turn land. SB San Vicente Road will need to be widened to accommodate the dual left-turn lanes from Gabilan. Prior to the issuance of any building permit for each phase of development,	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. If this alternative is selected the project applicant shall submit payment of the projects fair share towards the construction of this improvement in accordance with the traffic impact fee in effect at the time of building permit issuance for each phase of the project. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-5 *West Street and Gabilan Drive:* Signalize the intersection and add exclusive left-turn lanes with protected phasing on all approaches. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-6 *Main Street and Gabilan Dive:* Signalize the intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-7 *Andalucia Drive and Gabilan Drive:* Signalize this intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. 4.13-8 *Orchard Land and Metz Road:* Signalize this intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect that the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact	**Mitigation**		**Level of Significance After Mitigation**
		Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.	
	4.13-9	*Oak Street and Front Street:* Widen Front Street to four lanes between Nestles Road and Oak Street and add a second EB left-turn lane at the intersection of Nestles Road and Oak Street. Alternatively, the construction of the US 101/SR 146 bypass would alleviate impacts at this intersection. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance. All fees shall be paid prior to the issuance of any building permits for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.	
The project will have a significant impact on two freeway ramps and four freeway segments.	4.13-10	*Moranda Road and US 101 NB Ramps:* Signalize the intersection and widen the NB US 101 on ramp to add a second NB left-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. In addition the US 101 interchange at Moranda Road/Front Street will require reconfiguration/reconstruction to provide more efficient access to the project site and north Soledad in	Less-than-significant with mitigation. However, if these improvements are determined to be infeasible impacts would be significant and unavoidable.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
	general. As this is a regional improvement, funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee, which includes regional improvements, would mitigate the project's regional impact at this location. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-11 *Front Street and US 101 SB Ramps:* Signalize this intersection, widen southbound Front Street to two lanes and add a second lane on the off-ramp. In addition, the volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. As this is a regional improvement, funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee would mitigate the project's impact at this location. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. 4.13-12 The project applicant shall be required to pay towards the City's TIF	

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		program, which includes regional improvements. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. The payment of fees is considered mitigation for project impacts to freeway facilities. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable.	
The project together with the cumulative developments will have a significant impact on two intersections	4.13-13	*Moranda Road and Front Street:* Addition of an east leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.	Less-than-significant.
	4.13-14	*San Vicente Road and Gabilan Drive:* Addition of a west leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.	
4.14 Utilities and Service Systems			

Table 2-1
Summary of Significant Environmental Impacts and Mitigation

Environmental Impact	Mitigation		Level of Significance After Mitigation
Development of the proposed project would require or result in the construction of new water and recycled water facilities and the expansion of existing facilities. Project development would also require the construction of additional distribution and storage systems, transmission mains and improvements. Potential significant environmental effects could be realized through construction of the facilities if not planned and constructed consistent with Citywide infrastructure improvement plans.	4.14-1	Design and construct the water supply and distribution system for the project that is integrated with the City's water distribution system and consistent with the Urban Water Management Plan and the City's 2005 Water Master Plan. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.	Less-than-significant.
	4.14-2	All water and recycled water facilities and infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.	
	4.14-3	All water and recycled water pipelines shall be placed underground and in the utilities right-of-way and constructed to comply with all applicable state and local standards. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.	
	4.14-4	The project shall be required to construct new infrastructure that is of adequate capacity to serve the project's projected water and fire flow demand in addition to the provider's existing commitments. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.	
Development of the proposed project would potentially exceed existing and planned wastewater treatment capacity.	4.14-5	In order to ensure that the proposed wastewater treatment system is consistent with the applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and Chapter 13.11 Recycled Water Service, the project applicant shall submit detailed design-level plans in accordance with these requirements, prior to the issuance of any building and/or grading	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
		permit, subject to the review and approval of the City of Soledad Public Works Director.	
	4.14-6	Prior to the approval of the first final map within the Specific Plan area, all required permits for the on-site recycled water facility, including, but not limited to, a Waste Discharge Permit from the Regional Water Quality Control Board and approval of the system design, shall be obtained. The project applicant shall submit written evidence to the City of Soledad documenting compliance with this measure.	
	4.14-7	In order to ensure that adequate wastewater treatment is available to accommodate each phase of project development, the treatment capacity for the on-site recycled water facility shall be increased to accommodate each phase of the project prior to the final approval of the first building permit or occupancy permit for each of the respective project phases as appropriate. Subject to the review and approval of the Director of Public Works, excess treatment capacity shall be added to the plant and disposal facilities, as needed, for each phase of the project, to accommodate future increases in wastewater flow rates, based on estimates of future development. In addition, flows shall be metered and records of the flows shall be provided to the RWQCB for review and approval. No building permits shall be issuance unless sufficient capacity exists to accommodate additional phases of development.	
	4.14-8	Prior to the issuance of any building permit, the applicant/developer shall submit payment of the current City Development Impact Fee for each type of development in accordance with the adjusted impact fee in effect at the time of building permit issuance. Additionally, the applicant/developer shall submit payment of all fees necessary to fund the construction of the expansion of the treatment plant located within the project site, as required by the City of Soledad. All fees shall be subject to the review and approval of the Director of Public Works.	
Development of the proposed project would require	4.14-9	All water and wastewater infrastructure shall be designed with	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation			
Environmental Impact		**Mitigation**	**Level of Significance After Mitigation**
or result in the construction of new water or wastewater treatment facilities and expansion of existing facilities, including the construction of water and wastewater facilities, transmission mains and improvements which could cause significant environmental effects through construction of the facilities if not planned and constructed consistent with Citywide infrastructure improvement plans.		sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building and/or grading plan, the project applicant shall submit detailed evidence, including but not limited to design-level infrastructure plans, consistent with the requirements of this mitigation, subject to the approval of the Director of Public Works. 4.14-10 All wastewater pipelines shall be placed underground and in the utilities right-of-way. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works. 4.14-11 The project would be required to construct new infrastructure that is of adequate capacity to serve the project's projected demand in addition to the wastewater provider's existing commitments. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level documentation, in addition to written documentation from the City of Soledad, documenting that design-level plans are in accordance with City standards, as well as documenting that the City has sufficient capacity to accommodate project demands in addition to existing commitments, subject to the approval of the Director of Public Works.	
Project construction would result in significant construction-generated waste. The following mitigation has been identified by the Salinas Valley Solid Waste Authority to ensure that all construction-generated waste is recycled to the greatest extent feasible in order to minimize impacts to existing facilities within their jurisdiction.		4.14-12 Prior to the commencement of construction related activities, the applicant/developer shall prepare and submit a Construction and Demolition Diversion Plan consistent with the requirements of the City's adopted Diversion Plan Ordinance, subject to the review and approval of the Salinas Valley Solid Waste Authority and the City of Soledad. This plan shall identify on-going implementation measures for the diversion and separation of construction waste to ensure that all construction-generated solid waste is recycled to the greatest extent possible.	Less-than-significant.
Development of the proposed project would increase demands for electricity and natural gas		The following mitigation measure is necessary to reduce project demands for electricity and natural gas and is in addition to other mitigation measures	Less-than-significant.

Table 2-1 Summary of Significant Environmental Impacts and Mitigation		
Environmental Impact	**Mitigation**	**Level of Significance After Mitigation**
consumption.	identified **Section 4.3 Air Quality.** 4.14-13 In order to prevent the wasteful use of energy, all new residential, commercial, and hospitality oriented structures shall incorporate the principles of passive solar design to the maximum extent feasible. Typical passive solar design principles may include the following; 1) large south-facing windows; 2) tile, brick, or other thermal mass material used in flooring or walls to absorb natural heat; 3) improved insulation; 4) building orientation that takes advantage of the sun, shade, and wind; and 5) energy efficient building materials. For new structures that are unable to incorporate these principles, the project applicant shall submit detailed evidence, such as site plans, landscape plans, and similar, to the City of Soledad Public Works Director demonstrating that there are no viable design alternatives to accommodate these principles. Prior to the issuance of each individual building permit for new structures, the project applicant shall submit evidence, including but not limited to, site plans, proposed building materials, and landscape plans, to the City of Soledad Public Works Director for review and approval.	
5.0 CEQA Considerations		
Development of the proposed project would contribute to a number of potentially significant cumulative impacts.	Implementation of mitigation measure identified above, in addition to adherence to applicable General Plan policies.	Cumulative impacts would be reduced to a less-than-significant level for geology and soils, utilities and service systems. Significant unavoidable cumulative impacts include aesthetics, agricultural resources, air quality, transportation and traffic, and biological resources

This page left intentionally blank.

3.0 PROJECT DESCRIPTION

This section presents the project description as required by CEQA Guidelines Section 15124. The proposed project consists of the development and implementation of the Miravale III Specific Plan. The Specific Plan calls for a mixed-use development including 1,470 single-family residential units, 116 duplex/small lot single-family residential units, 2,614 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. Conceptual plans include a variety of residential types, including apartments, townhouses, and attached homes on small and large lots. The project also proposes three school sites (two elementary schools and one middle school), a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system. The Specific Plan is based upon a preliminary Vesting Tentative Map, which shows proposed lotting and infrastructure improvements (refer to Figure 3-1).

The project site is currently zoned by the County for farmland and permanent grazing uses and is being used for agricultural cultivation, with portions of the site fallow. It includes 14 existing single family units, four of which will be removed as part of the project. Two parcels, located within the northwestern portion of the project boundaries, are under Williamson Act contract. According to the City's General Plan, the entire project site is located within designated Expansion Area, comprising all or a portion of three areas: Northwest Expansion, San Vicente West, and Mirassou Expansion Area. A specific plan is required by the City in advance of annexation and development of each Expansion area. Development of the project site will require annexation to the City pursuant to Local Agency Formation Commission of Monterey County (LAFCO) regulations.

The project is proposed to be developed over a 20 year period beginning in 2008 with development of basic infrastructure. The project proponent proposes to develop the site in four phases as described below.

Phase 1 – Approximately 100 acres, containing a golf clubhouse and nine-hole golf course, approximately 23 acres of future commercial and/or hotel site, and 407 residential units having a mix of single family and duplex/small lots, workforce housing, affordable housing, and senior housing. It will include approximately 1.2 miles of collector streets (including approximately 0.8 miles of relocated San Vicente Road) and approximately 1.1 miles of local streets. It will also include a combined golf driving range and stormwater percolation holding pond.

Phase 2 – Approximately 400 acres, containing the second nine holes of the golf course and approximately 1,744 residential units with a combination of single family and duplexes/small lots, workforce housing, affordable housing, and senior housing. This phase would also include 15 acres of commercial, a public service parcel (fire and police) and two parks, all served by approximately 1.2 miles of extended West Street, 0.9 miles of extended Orchard Lane, and 5.2 miles of local streets.

Phase 3 – Approximately 200 acres, containing the easterly upper slopes, approximately 575 residential units which consist of single family and duplexes/small lots, workforce housing, affordable housing, and senior housing. As proposed, this phase would also include an elementary school, several parks, four water tanks (two existing) and three booster pump stations all served by 2.5 miles of residential streets. This phase also contains approximately 1.5 miles of hillside hiking trails.

Phase 4 – Approximately 200 acres, containing approximately 1,475 residential units which consist of single family and duplexes/small lots, workforce housing, affordable housing, and senior housing. This phase also includes an elementary school and a park, all served by 1.2 miles of local streets. It also

contains a tank site for the Zone A water tank. A middle school and an agricultural education facility are also proposed. Phase 4 also contains approximately 70 acres of agricultural land (Williamson Act) which is reserved for development of a Senior Housing Village, mobile home park, single family housing.

3.1 PROJECT LOCATION

The project is located within unincorporated lands of Monterey County on the northern edge of the City of Soledad, approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of the San Francisco Bay Area (refer to Figure 3-2). The 920-acre project site is generally between San Vicente Road and Orchard Lane and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east. (Refer to Figure 3-3). The Assessor's Parcel Numbers are: 417-151-082, 417-151-083, 417-151-084, 417-151-085, 257-081-005, 257-081-026, 257-081-027, and 257-081-032.

The project site consists primarily of undeveloped land. The site's topography is comprised of a natural slope from the southwest corner of the site to the northeast with steeper slopes located at the eastern boundary. The majority of the site ranges in elevation between approximately 180 and 600 feet above mean sea level. The site generally drains to the southwest toward Miravale Road and a large detention basin is proposed at the golf practice range just south. Several small drainages occur in the eastern and western portions of the site. Site vegetation can be characterized primarily with areas of open annual grassland and minimal trees. Existing trees are located near two single family homes, and a row of eucalyptus trees line one side of San Vicente Road.

The City of Soledad is located in the Salinas Valley in Central Monterey County. Downtown Soledad is located 1.5 miles south of the project site. Two freeway interchanges connect the local surface streets to Highway 101, providing access to the remainder of the County. These interchanges are located 2 miles south and 1.25 miles southwest of the project. The Salinas River is located approximately one and a half miles south of the project site.

3.2 PROJECT OBJECTIVES

The Miravale III Specific Plan proposes to develop a mix of uses on predominantly undeveloped land designated for future build-out by the City of Soledad 2005 General Plan. The project objectives are as follows:

- Provide a range of moderate-income housing for the existing and future residents of Soledad.
- Provide a mixed-use development of housing, parks, schools and neighborhood commercial uses to serve the local area and provide a balance of uses.
- Reserve land for commercial development to allow for future economic growth within the City and assist in maintaining a local jobs/housing balance.
- Provide public park lands to serve the recreational needs of the proposed development and surrounding community.
- Support the local economy by increasing income on the site through permits, fees, property taxes, and job creation.

Another project objective of the Specific Plan and development project is to implement the goals of the City of Soledad 2005 General Plan and 2003 Housing Element. A summary of these plans' goals are included in pertinent sections of this EIR.

3.3 PROJECT CHARACTERISTICS

Land Use

The project consists of completion and implementation of a Specific Plan that would allow for the creation of a phased development consisting of residential, commercial, and recreational uses. The project also proposes three school sites (two elementary schools and one middle school), a fire and police substation, a recycled water plant, an 18-hole golf course, and approximately 76 acres of open space and recreation areas, including parks, playgrounds, and a trail system. The proposed land use plan is presented in Figure 3-4.

The Specific Plan calls for a variety of residential types, including apartments, townhouses, and attached homes on small and large lots. The land use designations identified in the Specific Plan consist of Single Family Residential, Planned Development/Multi-Family, Commercial, Public/Institutional/Recreational, Open Space/Parks, Agriculture, Golf Course, and Urban Reserve. Corresponding zoning districts include Single Family Residential, Planned Development, Commercial, Public Facility, Open Space/Park, and Agriculture. A description of the proposed land use zones is provided below.

The Specific Plan is a regulatory document, adopted by an ordinance or resolution, which rezones the project area site with a Specific Plan Overlay. As a component of the General Plan, the Specific Plan is a legislative document that is controlled by the City. The Specific Plan implements the General Plan, interpreting broad goals and policies into specific regulations and guidelines that control the orderly development of land. The Specific Plan will be the primary body of standards considered by the City in the review and approval of development within the area. The standards and requirements of the Specific Plan supersede the City's existing Zoning Code, Public Works Standards, and other applicable regulations. Where the Specific Plan is silent, City Codes, effective upon the date of adoption of the Plan, will apply. The design and development standards for each zone are provided in the Specific Plan (Section 2.0). Permitted uses within each zone are presented in Appendix B of this EIR.

Single Family Residential (M3 – R-1)

Single Family Residential zones occur on approximately 241 acres of the Plan area. These low density areas are located throughout the project site. A total of 1,470 units are proposed within this designation, at a density of approximately one to six dwelling units per acre. The single-family residential development will include a mix of architectural styles, lot sizes, and structure heights. Lot sizes range from 6,000 square feet to 30,000 square feet (for hillside homes).

Village Residential (M3 – VR)

Multi Family Residential zones occur on approximately 147 acres of the Plan area. These medium to high density areas are also located throughout the project site. A total of 2,614 units are proposed within this designation, at a density averaging 19 dwelling units per acre. The multi-family residential development will include affordable housing, workforce housing, and senior housing units. Housing types consist of attached and detached single family homes, apartment complexes, townhouses, and condominiums with lot sizes ranging from 3,000 square feet to 30,000 square feet. The mix of housing is intended to provide a diverse neighborhood with housing offered at a broad range of price levels.

Table 3.0-1
Proposed Land Uses

Land Use	Zone	Acres	% of Site	Dwelling Units	Population[1]	Bldg Square Footage	Jobs[2]
Single Family Lots (6.10 du/ac average)	M3 – R-1	240.88	26.1%	1,470	5,880	-	-
Townhomes/Apartments[3] (18.99 du/ac average[4])	M3 - VR	146.97	15.9%	2,730	9,321	-	-

Recycled Water Plant	M3 - PF	1.82	0.2%	-	-	-	-
Roads	-	121.78	13.2%	-	-	-	-
Williamson Act Properties: - Agriculture – 1 ac - Middle School – 19 ac - Urban Reserve – 84.8 ac	M3 - AG, M3 - PF	104.8	11.4%				
Agricultural Buffer	M3 - AG	1.61	0.2%	-	-	-	-
Total	**-**	**921.77**	**100%**	**4,200**	**15,201**	**275,000**	**550**

[1]Based on 4.0 persons per single-family unit. 4.5 persons per 3 bedroom multi-family unit, 4.0 persons per 2 bedroom multi-family unit and 1.75 persons per senior or studio/one bedroom multi-family unit (Miravale III Specific Plan, June 2007).
[2]Assumes 1 job per 500 square feet of non-residential development (City of Soledad General Plan EIR, September 2005).
[3]Assumes 1,229 affordable housing units with a minimum of 500 senior housing units and 1,047 workforce housing/senior housing units.
[4]Assumes that parks, roads, and parking required for PD zone is included in the 18.99 du/ac.

Source: RRM Design, Inc., 2006

Village Commercial (M3 – VC)

Village commercial zones occur on approximately 15 acres of the Plan area. These commercial areas are located centrally in the project site, and are designated for future retail uses. A total of 175,000 square feet of commercial space is proposed within this designation.

Gateway Commercial (M3 – GC)

Gateway commercial zones occur on approximately 18 acres of the Plan area. These commercial areas are located in the southern portion of the project site, and are designated for future retail and hotel uses. A total of 100,000 square feet of commercial space is proposed within this designation.

Public Facility (M3 – PF)

Public facility zones occur on approximately 207 acres of the Plan area. Specific uses will include police and fire, schools, roads, infrastructure and utilities, and quasi-public golf course. Public facility development is proposed throughout the project site.

Open Space/Park (M3 – OSP)

As currently proposed, the Specific Plan designates 77 acres of land for park and open space uses. A total of approximately 66 acres consists of open space/passive park use, and approximately 11 acres consists of active park use. The active park use includes community parks, neighborhood parks, and playfields, as well as picnic and garden areas. The open space areas will include a walking trail system within the Gabilan Mountain Range foothills. An additional 24 acres of improved parks will be provided in conjunction with the development of the six Village Residential areas. Figure 4.12-2 provides a graphic representation of proposed open space, parks, and future park sites within the areas designated as Village Residential. For more information regarding parks and recreation, please refer to **Section 4.12 Public Services.**

Agriculture (M3 – AG)

The Specific Plan designates 86 acres for agricultural uses. This area is located within the northwest corner of the project site and has the land use designation of Urban Reserve. The area is currently farmed and will continue to be farmland until the property is taken out of the Williamson Act. The Urban Reserve area is a future expansion area for the City.

Grading

The project will require extensive grading on the site to facilitate construction of proposed uses. Proposed grading would occur throughout most of the site and for the purposes of this EIR it is anticipated that the entire site would be disturbed to accommodate projected development. According to Bestor Engineers, Inc., proposed grading will average slightly more than one foot on the lower lots, except at downhill rear lots, where adjacent to practice range/detention pond will be 0 to 10 feet of fill. Upper lots will average slightly more than four feet of cut and fill. Preliminary estimates indicate that all grading is proposed to balance upon completion of the project; however, a preliminary grading plan was not submitted as part of the project application and actual cut and fill may be subject to variation depending on the final grading plan.

Building Construction

Residential structures will generally be of wood-frame construction. The proposed single family residential units will be one and two story structures; apartment buildings will be three to four stories; and retail will generally be two stories. Residential building heights would not exceed 35 feet except for the apartment buildings which could approach 45 feet. Building heights within the proposed Village Commercial area would not exceed 35 feet; however, approximately 45 foot building heights would be allowed for commercial buildings in the Gateway Commercial area with an approximately 72 foot height limit (or 7 stories) allowed for the proposed hotel.

Street System

The project proposes a public street system to serve the development. San Vicente Road, West Street, and Miravale Road are considered arterials and provide the backbone circulation within the Plan area. Orchard Lane will be extended as a collector street. Local streets are located throughout the residential neighborhoods. Pedestrian sidewalks are provided on all public streets. Class II bike lanes would be provided on all collector and arterial streets.

The Specific Plan contains a roadway circulation plan and street sections. The circulation plan is presented in the traffic section in Figure 4.13-4. Roadways within the plan area are proposed in accordance with the standards and policies of the Soledad General Plan and will be built to City engineering standards.

Storm Drainage System

The project proposes to construct a storm drainage system to collect and store runoff from the project site. Storm water flows generated by the development will be collected in an underground piping system and directed to two existing detention ponds located within the Plan area. The two existing ponds are proposed to be enlarged and converted into detention basins in order to improve their function for downstream protection and for groundwater recharge. The proposed drainage plan is evaluated in **Section 4.8 Hydrology and Water Quality**.

Sanitary Sewer System

The City of Soledad is responsible for treatment and disposal of wastewater for the project area. The sanitary sewer collection system is also operated and maintained by the City. Buildout of the project would generate approximately 1,579,500 gallons per day of wastewater. The existing treatment plant will need to be enlarged and improved. These upgrades are scheduled to be in service by 2010. Sanitary sewer lines will be located within the proposed street right-of-ways and connect to the existing sanitary sewer lines that serve the City. The sanitary sewer system is evaluated in **Section 4.14 Utilities and Service Systems**.

Water System

Upon completion of required upgrades to the existing water system, water would be provided to the project site by the City of Soledad. The required upgrades include upgrades to the existing distribution system and construction of new facilities within the Plan area. The project would generate the demand for an average of about 1,900 acre feet of water per year. Irrigation needs for the proposed 18-hole golf course and park facilities are intended to be met using reclaimed wastewater. Consistent with the requirements of SB 221 Kuehl, which stipulates that a water purveyor must provide documentation that a

"sufficient water supply" is available to accommodate proposed development, the City has determined that there is sufficient water supply allocated to serve the project under various conditions for the next 20 years. For more information regarding water availability please refer to **Section 4.8 Hydrology and Water Quality.** Water lines will be installed within the proposed street right-of-ways and connect the existing water lines that serve the City. The water system is evaluated in **Section 4.14 Utilities and Service Systems**.

Public Improvements

The project would provide public improvements including the following: public roads, curb and gutter, sidewalks, pedestrian paths, streetlights, and public parks. In addition, roadway and intersection modifications would be provided to provide mitigation improvements to accommodate project traffic volumes (refer to **Section 4.13 Traffic and Circulation** of this EIR).

Energy and Communications

All new public utilities and equipment within the Plan area will be placed underground. It is anticipated that the following utility services will be provided for the project: 1) natural gas lines and facilities – PG&E; 2) electricity – PG&E; 3) cable television – Charter Communications; and 4) telephone – AT&T.

Schedule/Phasing

Construction of the project is planned to begin in 2008 with development of basic infrastructure. The project will be broken into 4 phases. The proposed phasing plan is presented in Figure 3-5. Total development of the site would occur over a 15 to 20-year period with buildout occurring between 2023 and 2028.

Project Implementation

The Specific Plan identifies the following implementation measures for development of the project.

- Amendment of the General Plan –both policy provisions and diagrams—concurrently with the adoption of the Specific Plan to incorporate the land use designations illustrated in the Land Use Plan, and policies included in the text of the Specific Plan.

- Amendment of the Zoning Ordinance to rezone the property "MIIISP" within the Specific Plan area.

- Preparation of a final tentative map for subdivision of the Specific Plan area consistent with the design and zoning standards described in the Specific Plan.

- Development of individual projects consistent with the land use designations and with the policies and implementation measures contained in the Specific Plan. Requests for modifications to the land uses or zoning standards identified in the Specific Plan may be approved by the City provided they are in substantial conformance with city goals and criteria of the Specific Plan.

- Application for a Sphere of Influence Amendment and subsequent Annexations approvals from LAFCO of Monterey County.

General Plan Amendments

Implementation of the Specific Plan would require a series of amendments to the City of Soledad General Plan. Proposed General Plan amendments provided by City of Soledad staff as follows:

- Revision of General Plan land use diagrams to reflect Specific Plan's proposed planning area boundary and land use designations—i.e., Figures II-4 (Northwest Expansion Area), II-6 (San Vicente West Specific Plan Area), II-7 (Mirassou Specific Plan area) and Figure II-9-Land Use Diagram and Figure VI-1-Parks and Trails.

- Revision of Figure V-2, Circulation Diagram, to reflect the circulation system proposed by the VTM/Specific Plan contingent upon demonstration that the proposed circulation achieves the same objectives—connectivity/service levels, etc.—as that shown by the Fig. V-2.

- Revision of the land use descriptions and development potential tables for the affected Expansion Areas—Northwest Expansion Area (pp. II-11 –II-12), San Vicente West (p.II-16), and Mirassou Specific Plan area (p. II-18) to reflect the alternative land use concept of the proposed Specific Plan. Revisions may include deletion of the L-shaped block from the Mirassou Specific Plan Expansion area.

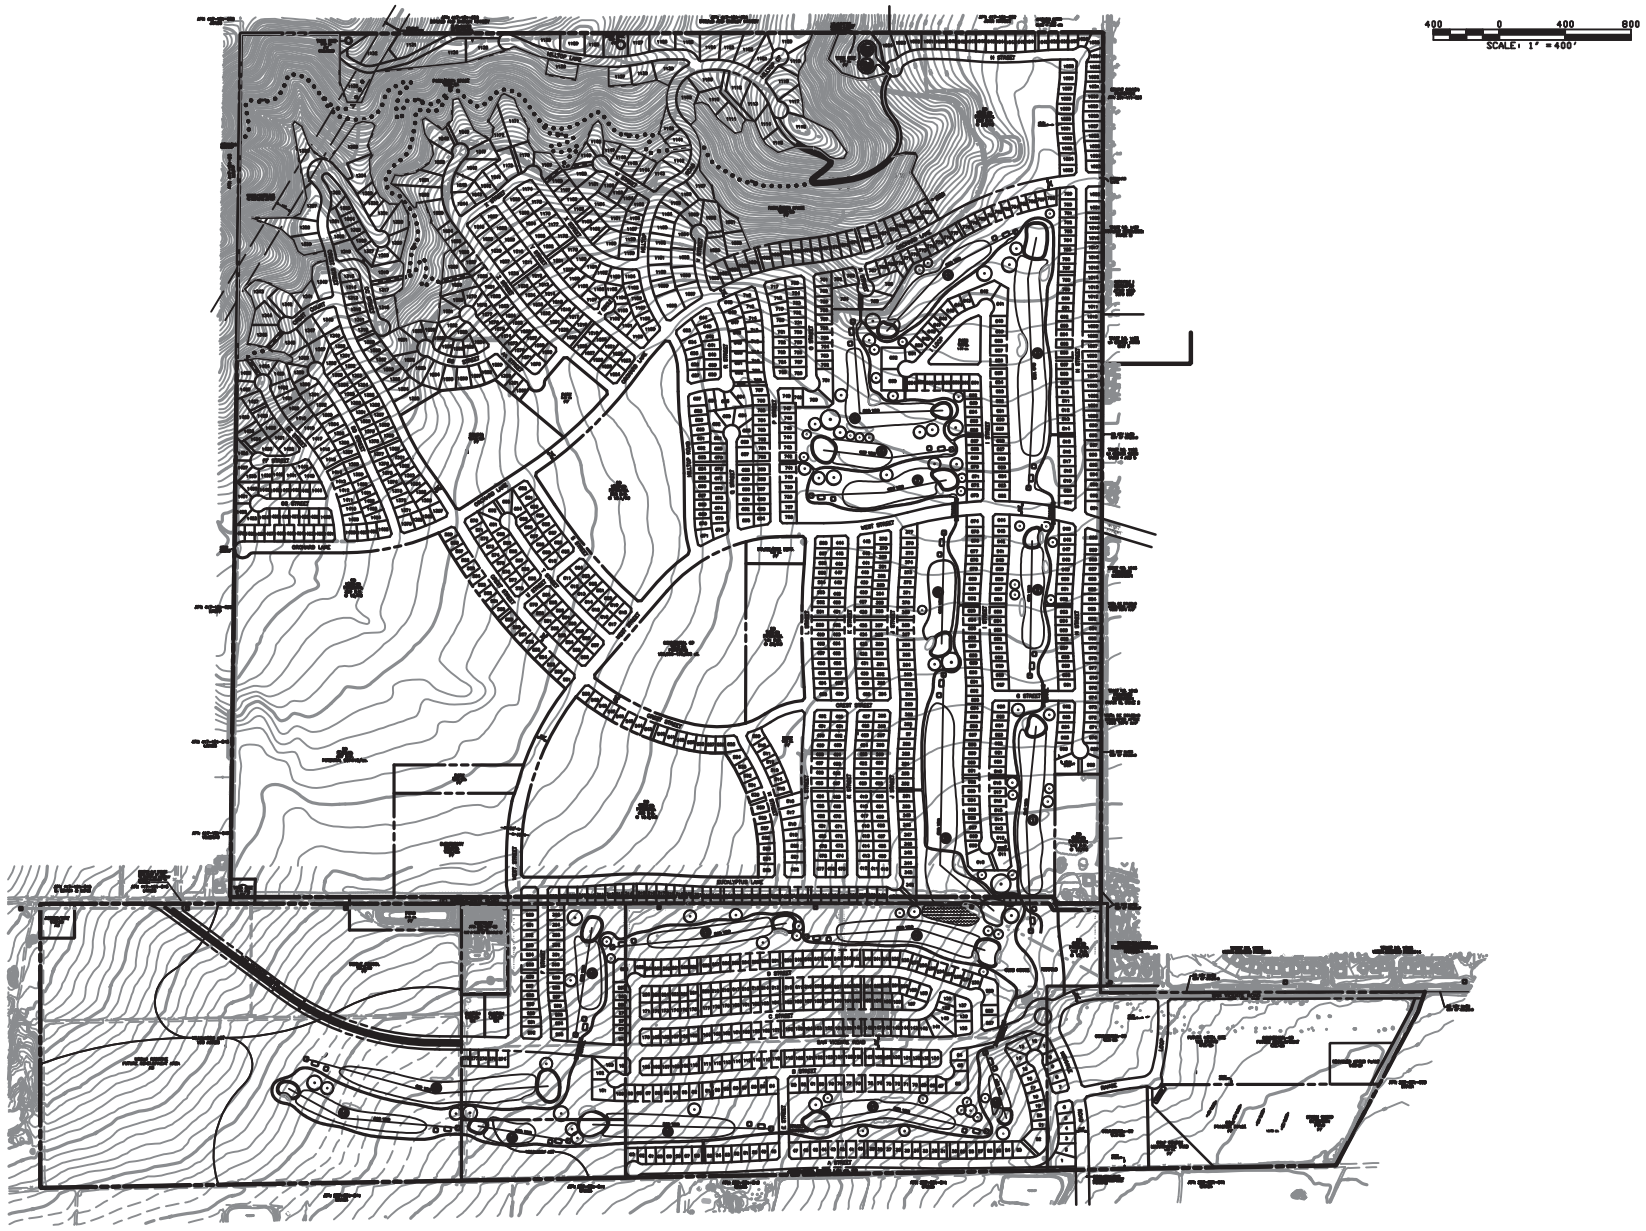
- Modification of Table II-1, General Plan Development Potential, to allow an additional 1,050 - 1,550 units—over and above the maximum development currently allowed (number of additional units varies depending upon the extent to which development is reduced in the NW Expansion area)

- Modification of Land Use Policy L-45 to allow exceptions to the restriction on ridgeline development per the proposed Specific Plan/VTM.

- Modification of Land Use Policy L-5 and Policy S-1 and S-23 to allow exceptions to the requirements that adequate public services, including schools, be provided concurrent with new development (or demonstration that the existing middle school and high school—with or without improvements—can accommodate the majority of students generated by the project.

- Possible need for modification of PR-33 to allow exception to the requirement that new development provide its fair share of public park and recreation opportunities (the minimum standard of 3.0 acres per 1000 residents is being met through the implementation of project-specific mitigation but this includes approximately 8 acres of trails and park connections; further, the General Plan goal is 5 acres of parkland for each 1,000 persons).

3.4 REQUIRED PERMITS AND APPROVALS



This Draft EIR is an informational document for both agency decision-makers and the public. The City of Soledad is the lead agency responsible for certification of the Final EIR and approval of potential future project permits. Project entitlements will include, but not be limited to, General Plan Amendment, Specific Plan, Zone Change (Pre-Zoning), Architectural Review, Sphere of Influence Amendment, Annexation, Tentative Subdivision Map, and Development Agreements to allow for the proposed development. The following is a listing of permits and approvals under the City and other jurisdictions.

CITY OF SOLEDAD

- Amendment of the General Plan to incorporate the land use designations illustrated in the Land Use Plan, and certain provisions proposed by the Draft Specific Plan.
- Amendment of the Soledad Zoning Ordinance to add the zoning designation of "SP" for all properties within the Specific Plan area.
- Adoption of the Miravale III Specific Plan.
- Approval of the vesting tentative map consistent with the adopted Specific Plan area design and zoning standards.
- Approve and execute a Development Agreement governing development of the project, including financing and installation of infrastructure.
- Approval of inclusionary housing agreement.
- Approval of Subdivision Improvement Agreements and Final Maps.
- Approval of Conditional Use Permits for all planned developments and commercial projects.
- Review and approve all required permits, including, but not limited to, building, grading, encroachment, and occupancy permits.

AGENCIES

- Monterey County Local Agency Formation Commission (LAFCO) for the approval of sphere of influence amendment and annexation required for development within the incorporated limits of the City.
- Monterey County for Williamson Act lands revocation.
- Other agencies with permit or review authority over some aspect of the project include Monterey County, the Regional Water Quality Control Board, Caltrans, Dept. of Conservation, AMBAG, MBUAPCD, Soledad Unified School District , TAMC, and the Dept. of Fish & Game and/or the U.S. Fish and Wildlife Service.

4.0 ENVIRONMENTAL SETTING, IMPACTS AND MITIGATION MEASURES

This section describes each of the environmental categories affected by the proposed project. Each category consists of three parts: Introduction, Environmental Setting, and Impacts and Mitigation Measures. Environmental impacts can be described as: less-than-significant impacts, potentially significant, significant adverse impacts, and unavoidable significant impacts. The specific criteria for determining the significance of a particular impact are identified prior to the impact discussion in each issue section, and are consistent with significance criteria set forth in CEQA Guidelines and local, regional, state or federal standards. Although not required by CEQA, mitigation measures may be identified for less-than-significant impacts to further reduce potential effects.

A separate Mitigation Monitoring Program will be developed in conjunction with the Final EIR, which outlines the mitigation measures and the monitoring and reporting methods that would be employed. The Mitigation Monitoring Program will be considered for adoption by the City Council at the time the Final EIR is certified.

Under CEQA, a significant impact is defined as a substantial, or potentially substantial, adverse change in the environment (Public Resources Code 21068). The guidelines implementing CEQA direct that this determination be based on scientific and factual data. The specific criteria for determining the significance of a particular impact are identified prior to the impact discussion in each section, and are consistent with significance criteria set forth in the guidelines implementing CEQA.

Regional Setting

The project site is located within unincorporated lands of Monterey County (County) on the northern edge of the City of Soledad, approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of the San Francisco Bay Area. The 920-acre project site is generally between San Vicente Road and Orchard Lane and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east. The City of Soledad is located in the Salinas Valley; downtown Soledad is located approximately 1 mile south of the project site. Two freeway interchanges connect the local surface streets to Highway 101 providing access to the remainder of the County. These interchanges are located 1.75 miles south and 0.5 mile southwest of the project. The Salinas River is located 1.25 miles south of Metz Road, which is located 1.25 miles south of the project site (2.5 miles to Salinas River from project site).

The Salinas River is located approximately 2.5 miles south of the project site. The Salinas River Watershed covers approximately 4,600 square miles of San Luis Obispo and Monterey counties. The Salinas River flows northwesterly through the Salinas valley, emptying into the Monterey Bay National Marine Sanctuary. The Salinas Valley lies in the Coast Ranges and is defined to the west by the Sierra de Salinas and to the east by the Gabilan Range. The valley is approximately 10 miles wide and 155 miles long. The primary land uses in the Salinas Valley (Salinas River watershed) are row crops, vineyards, pasture, and grazing lands, as well as urban areas, military bases, and public open space. The County portion of the watershed includes the Salinas River and its primary tributaries, the Arroyo Seco, Nacimiento, and San Antonio rivers.

This page left intentionally blank.

4.1 AESTHETICS

Introduction

This section assesses the existing visual quality of the project site and potential changes to the visual and aesthetic environment that would result from the proposed development. In assessing the visual quality of a site, it is important to consider that visual quality is not determined solely by the physical attributes of a project, but also by the relationship between the project and the total visual environment. The primary aesthetic concerns associated with the proposed project are potential changes in aesthetic character of the site and impacts to a scenic vista.

The visual analysis is based on the potential for the proposed project to alter the existing visual character of the site and surrounding areas. The EIR consultant conducted a field survey, and photos were taken of the project site from various vantage points and circulation routes (refer to map on Figure 4.1-1). The various vantage points were selected to be representative of the existing aesthetic quality of the area and to further assess the potential aesthetic/visual impacts associated with project development from Highway 101 and adjoining residential areas, where the proposed project would be most visible to the greatest number of people. Photographs from the various vantage points are presented in Figure 4.1-2. In addition, several internal site locations were also selected to provide a general assessment of the existing visual character of the site. Prior to the site visit, aerial photographs and maps were studied and areas of special interest or potential scenic value were noted for assessment during the field survey. Available data in the Miravale III Specific Plan, including proposed design guidelines, setbacks and height limits, and zoning, was also analyzed as part of the visual assessment.

Setting

The project is located within the unincorporated area of Monterey County on the northern edge of the City of Soledad. The visual character of the Soledad area is comprised of nearby foothills, distant mountain ranges, farmland, grazing land, urban development, and Highway 101. The 920-acre project site is generally located between San Vicente Road and Orchard Lane and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east.

The project site has a rural/agricultural appearance with a majority of the site reserved for agricultural uses. The site is generally vacant of structures and other physical features except for a couple of farm houses and associated support structures, farming equipment, detention and percolation ponds, pumping houses and equipment, and access roads. Much of the site is in active agricultural production for row crops and vineyards. A portion of the site has been left fallow, and dryland grasses and weeds have established. An existing row of mature eucalyptus trees along San Vicente Row provide a physical barrier between the existing cultivated areas of the western portion of the site and the vineyard and fallow land on the eastern portion. The existing row of mature eucalyptus trees are highly visible from distant land uses, including Highway 101, and provide a visual barrier between the existing row crops and portions of the City of Soledad located east of the site. The eastern edge of the site contains predominantly undeveloped foothills currently utilized for grazing activities. Existing development within these foothills include ranch roads, water tanks, electrical power lines, and small-scale communication equipment. The project site is bounded on the south by the City of Soledad city limits, which consist predominately of residential uses that are suburban in nature and include single family residences comparable in density to the single family residential units proposed along the southern boundary of the project site. The project site's southwestern and eastern edges are visible by cars traveling on Highway 101. Other views of the project site are available from surrounding urban areas, primarily those areas adjacent to San Vicente Road.

Regulatory Environment

City of Soledad General Plan

The Land Use and Conservation/Open Space Elements of the General Plan guide the City's future physical and spatial form, and appearance. Numerous goals and policies of the General Plan are intended to protect the visual character of the City and surrounding scenic resources. The following aesthetic and visual resource policies apply to development within the project area.

Policy C/OS-7 The City shall require new public and private development to protect scenic resources by:

a. Prohibiting structures along ridgelines, steep slopes (above the 400 foot elevation contour), or in other highly visible locations unless no practical alternative is available, or such a location is necessary to protect public health and safety;
b. Utilizing natural landforms and vegetation for screening structures, access roads, building foundations, and cut and fill slopes;
c. Requiring landscaping which provides a landscape transition between development areas and adjacent open space or undeveloped areas; and is compatible with the scenic resources being protected;
d. Incorporating sound Soil Conservation Service practices and minimizing land alterations. Land alterations shall be minimized by: keeping cuts and fills to a minimum; limiting grading to the smallest practical area of land; limiting land exposure to the shortest practical amount of time; replanting graded areas to ensure establishment of plant cover before the next rainy season; and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur;
e. Designing roads, parking, and utilities to minimize visual impacts. If possible, utilities shall be underground. Roadways and parking shall fit the natural terrain; and
f. Designing projects to fit the sites scale and character. Structures shall be designed and located so: they do no silhouette against ridgeline, or hilltops; roof lines and veridical architectural features blend with and do not detract from the natural background or ridge outline; residential density and massing is decreased with increased elevation where it would mar the scenic quality of the scenic resources; they fit the natural terrain, and they utilize building materials, colors, and textures that blend with the natural landscape and avoid the creation of high-contracts situations.

Policy C/OS-8 The City shall require public or private development to:

a. The City shall designate hillside areas above the 400 foot elevation contour as Open Space/Grazing, Public Facility (parkland) or Agriculture.
b. Locate primary structures, accessory structures, paving, and grading at the base of a hill (generally that are below the 400 foot contour or 15 percent slope) unless: 1) no practicable alternative is available, 2) the location on a greater slope or at a greater elevation provides more aesthetic quality, or 3) the location is necessary to protect public health and safety.
c. Utilize design, construction, and maintenance techniques that: 1) preserve and enhance the hillsides; 2) ensure that development near or on portions of a hill do not cause, or make worse natural hazards (such as erosion, sedimentation, fire, or water quality concerns); 3) include erosion and sediment control practices including temporary vegetation sufficient to stabilize disturbed areas; 4) minimize risk to life

and property from slope failure, landslides, and flooding; 5) maintain the character and visual quality of the adjacent hillside.

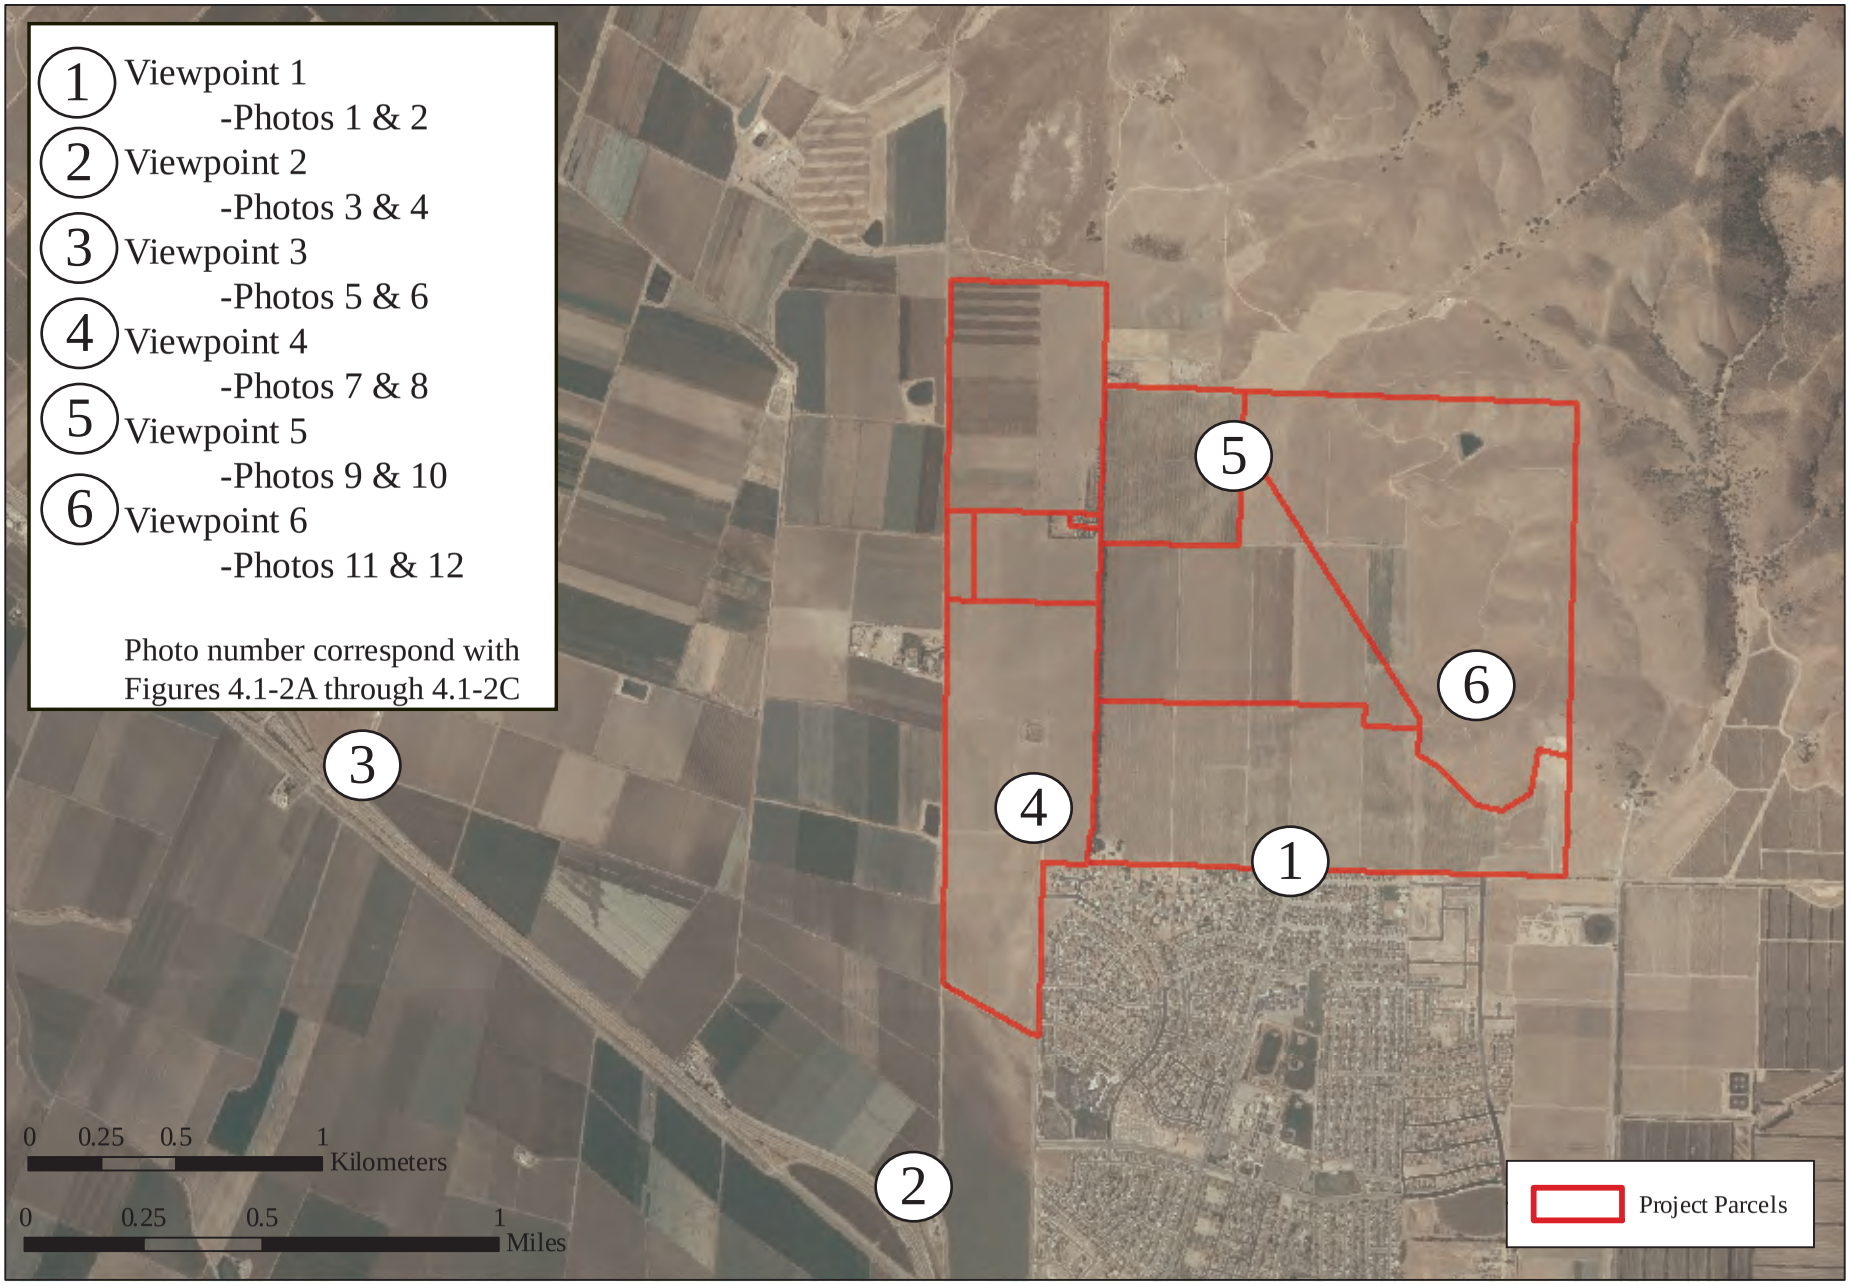
Policy C/OS-9 The City shall support the preservation and enhancement of natural land forms, natural vegetation, and natural resources to the maximum extent feasible.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential aesthetic impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III project. According to the General Plan EIR, the following aesthetic impacts were identified:

- Development of the various land uses contemplated in the General Plan would alter the visual character and/or quality of the area. This impact was identified as significant and unavoidable.

- Temporary construction related impacts were identified due to buildout according to the General Plan. This impact was identified as adverse, but not significant.

- Buildout of the General Plan would result in additional sources of light and glare, which would be visible from adjoining areas and from Highway 101. This impact was considered significant, unless mitigated.



Miravale III Specific Plan

Section 2.0 of the Miravale III Specific Plan identifies land use goals and policies regarding the physical development of the approximately 920-acre project site. More specifically, Section 2.0 identifies land uses within the project area and provides corresponding development standards and policies for each respective land use category (i.e. residential, commercial, etc.). Each land use category is further classified according to density type (i.e. low density residential, medium to high density, etc.). Specific policies and goals are provided for each respective type of land use category according to density type. The following summarizes applicable Land Use goals regarding the aesthetic character of site.

- Land Use Goal LU-8 states that the project shall create new, attractive residential neighborhoods that are in close proximity to parks, open spaces, schools, and neighborhood commercial.

- Land Use Goal LU-10 states that project development should protect the scenic vistas of the hills above Soledad through careful siting and design standards that minimize grading and visibility of new hillside development.

In addition to the aforementioned Land Use Goals, the Miravale III Specific Plan identifies specific policies and guidelines regarding the development of the project site, including building scale and massing, landscaping, signage, lighting, and articulation. Moreover, to minimize potential impacts due to hillside development, specific Hillside Development Standards were developed as part of the Specific Plan. The Hillside Development Standards and Guidelines identify specific grading practices and designs, including the preservation of the natural topography, to minimize potential visual impacts. Additionally, specific measures are included to address fire related hazards, drainage issues, and building design within the hillside portion of the site.

Relevant Project Characteristics

The majority of the project site is vacant and has historically been utilized for agricultural cultivation and grazing. There are several existing buildings located on the site, including equipment storage areas, and a worker housing area with assorted other buildings and water detention facilities. The Specific Plan calls for the replacement of the existing agricultural and grazing uses with a mixed-use urban development consisting of new roads and infrastructure, single-family and multi-family residential units, retail commercial space, a golf course, school and public safety sites, and open space and recreation areas. The project would require extensive grading on the site to facilitate construction of proposed uses. Proposed grading would occur throughout most of the site and would involve approximately 2.05 million cubic yards (CY) of cut/fill. All grading is proposed to balance upon completion of the project. In addition to extensive site grading, development of the proposed project would also result in the removal of existing mature eucalyptus and other tree species along San Vicente Road to facilitate project infrastructures and proposed uses. Existing mature trees located along San Vicente Road contribute to the overall visual character of the site and represent a visual landmark as perceived from distant and adjacent land uses.

As identified above, the Miravale III Specific Plan establishes specific development standards for each of the respective land use categories. Development standards establish maximum allowable building heights, lot coverage, setbacks, parking requirements, and allowable density. As such, the physical development of the project site will be guided by these standards. The proposed single family residential units would be one and two story structures; apartment buildings would be a maximum of three stories; and commercial uses would generally range between three and four stories.

Thresholds of Significance

In accordance with the California Environmental Quality Act (CEQA) Guidelines, a project impact would be considered significant if the project would:

- have a substantial adverse effect on a scenic vista;
- substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within view from a state scenic highway;
- substantially degrade the existing visual character or quality of the site and its surroundings; or
- create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

Impacts and Mitigation

Scenic Vista

The project site currently consists of relatively undeveloped agricultural and grazing lands. The highly visible foothills of the Gabilan Mountain Range are located on the eastern edge of the project site and serve as a dramatic backdrop to the flat valley land below. The City's General Plan recognizes the scenic value of these foothills and contains numerous policies to protect this scenic resource by limiting new development below the 400 foot elevation contour. Moreover, according to the General Plan EIR, policies prohibiting development above the 400 foot elevation contour were identified as mitigation measures to ensure that adverse impacts to scenic resources, including the Gabilan Mountain Range, were minimized to the extent feasible. These measures were incorporated as part of the City's General Plan in order to ensure the preservation of the City's unique scenic resources. Due to the relative importance of the

Gabilan Mountain Range, development above the 400 foot contour would constitute a potentially significant impact. Therefore, for the purposes of this analysis, these foothills are considered a scenic vista and development above the 400 foot elevation contour would constitute a significant impact.

Development of the proposed project would result in the conversion of agricultural and grazing lands, including a portion of the Gabilan Mountain Range foothills, into a predominately residential and commercial development, thus permanently altering views of the area, especially those views of the project site as perceived from Highway 101 and the surrounding urban areas (See Figure 4.1-2). Development within that portion of the foothills located within the project boundary would consist of grading for new roads, associated infrastructure, and large lot single-family residential building pads. Some of this development, including new residential structures and exterior lighting for roads and residences, would be located above the 400 foot elevation contour. Although the Miravale III Specific Plan contains specific policies governing development within the Hillside portion of the project site, development within this area represents a significant impact. Figure 4.1-3 depicts development above the 400 foot elevation contour. A copy of the Hillside Development standards, which govern development within the hillside areas of the project site are contained in Appendix C of this document.

Implementation of the project would introduce substantial new development, including structures of various heights and densities, which would result in decreased views of open space, especially within that portion of the Gabilan Mountain Range foothills located within the project boundaries. This increased visibility and intensity of development would have a substantial adverse effect on a scenic vista. Moreover, the introduction of new urban features on a previously undeveloped, highly visible, portion of the project site would substantially alter the existing visual character of the site. Mitigation measures 4.1-1 to 4.1-5 would help reduce the extent of visual impacts. However, the loss of natural open space and introduction of urban development within and above the foothill portions of the project site would result in a significant and unavoidable impact to a scenic vista. Implementation of the following mitigation measures would not result in any new environmental impacts beyond those identified in this EIR.

Impact **The project would permanently alter a scenic vista, consisting of a portion of the Gabilan Mountain Range foothills, by causing changes to topography, removing vegetation, and adding roads, buildings, pavement, and lighting.** ***To the extent that this change is considered a substantial degradation of this scenic vista, this represents a significant unmitigable impact.***

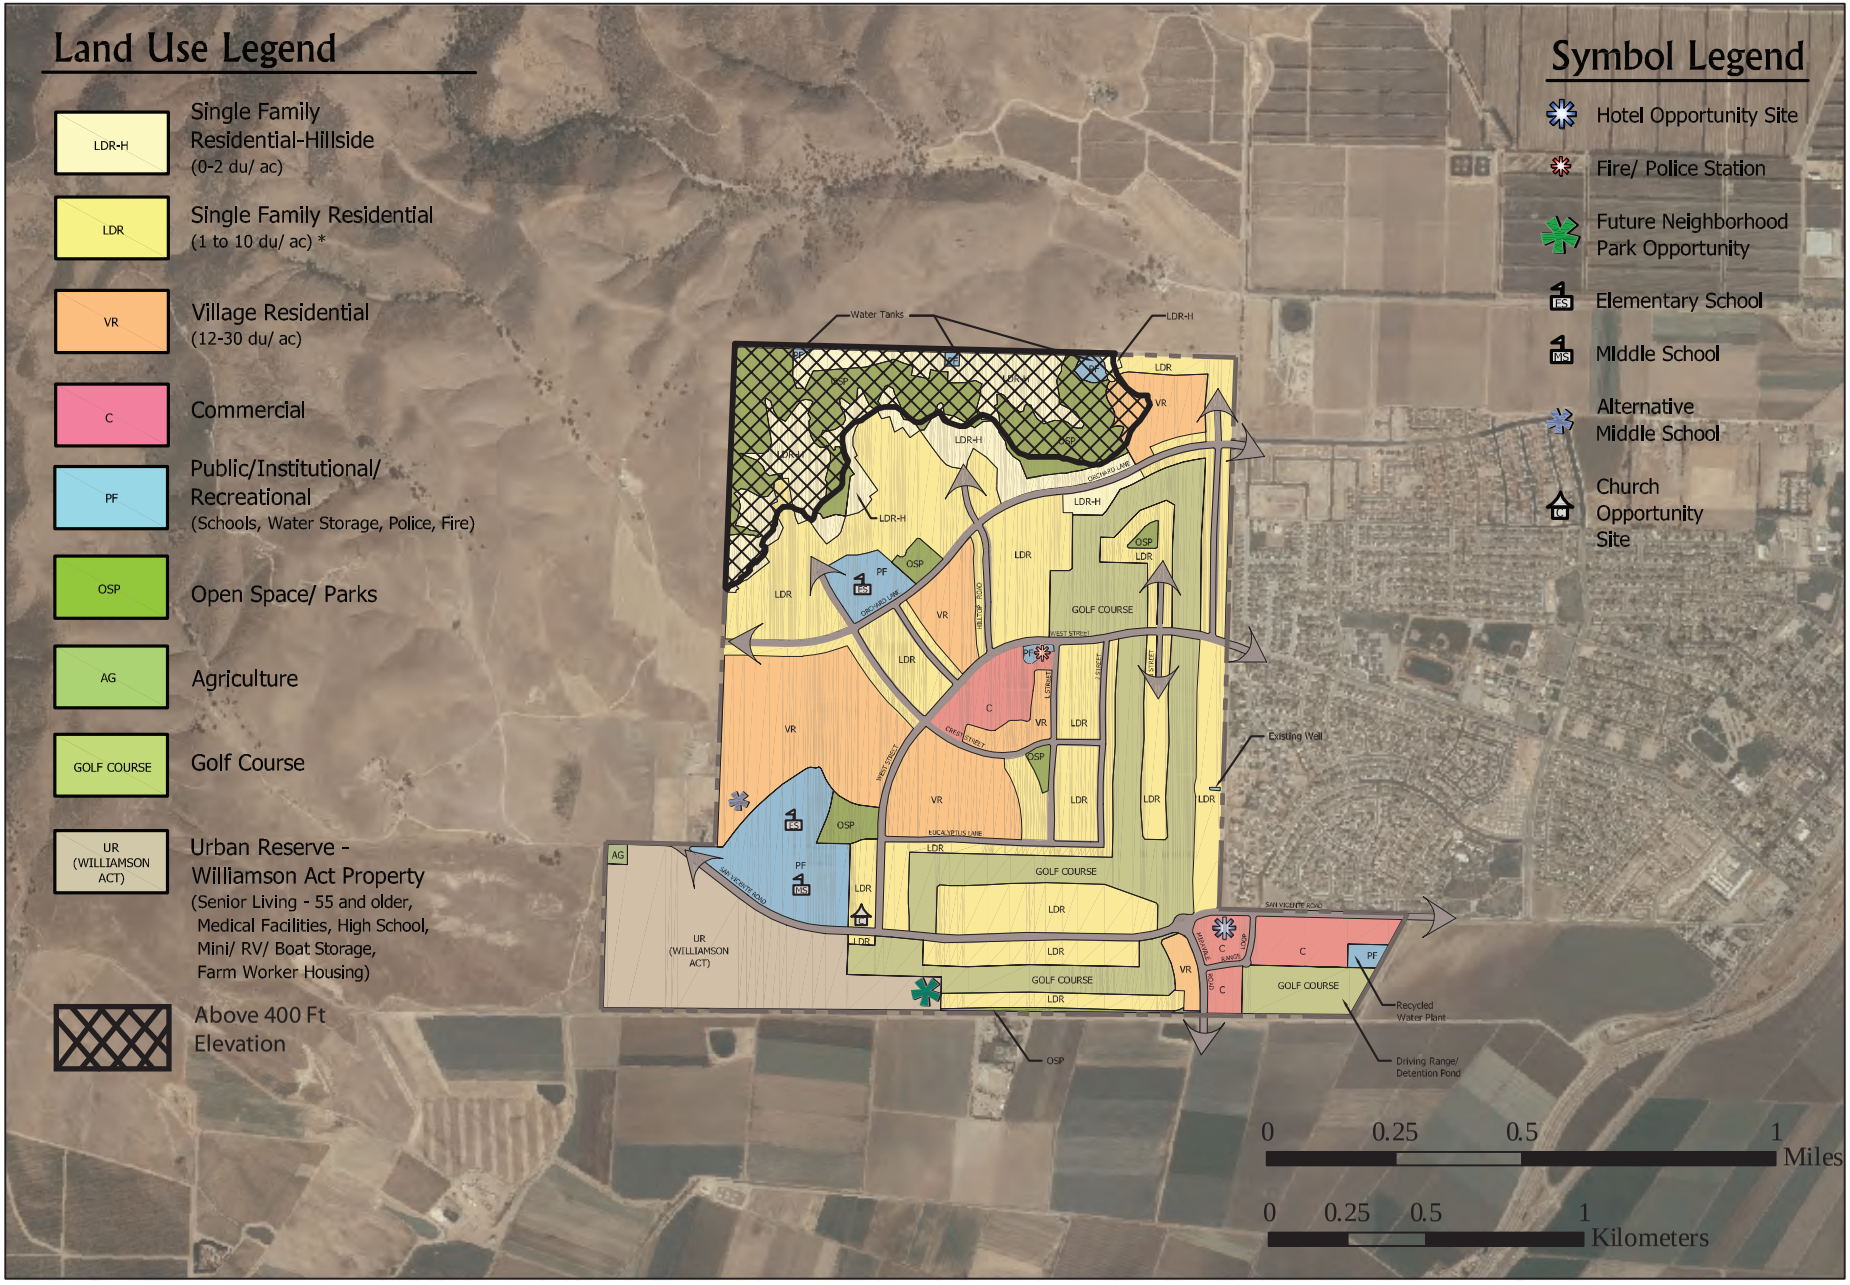
Mitigation

4.1-1 Building heights of all new structures shall adhere to the limits set forth in the Miravale III Specific Plan dated June 2007. Additionally, all new structures shall adhere to the applicable Development Standards as established in Section 2.0 of the Specific Plan. Prior to the issuance of any building permit for development within the Specific Plan area, the project applicant shall submit detailed plans, including elevations, site plans, and/or other documentation detailing compliance with applicable development standards, subject to the review and approval of the City of Soledad.

4.1-2 In order to minimize potential adverse visual impacts associated with development within the hillside portions of the project site, the project applicant shall submit and have approved, prior to the recordation of the final map for Phases three and four, building envelopes for each new residential lot proposed above the 400 foot elevation contour. The proposed building envelopes shall be located in the least visually sensitive area of each lot. No new structures shall be constructed outside of the approved building envelopes, unless otherwise approved by the City of Soledad.

4.1-3 In order to minimize aesthetic-related impacts due to development within the hillside portion of the site, the project applicant, prior to project approval, shall submit a revised Specific Plan that includes the following policy in Section 2.6 Low Density Residential (LDR & LDR-H/M3-R-1):

All new residential units proposed within areas of the project site above the 400 foot elevation contour shall be subject to a Design Review approval process or similar. As part of the design review process, vertical building envelopes shall be identified and staking and flagging shall be required to demonstrate the extent of proposed development. All new structures shall be designed to minimize visual impacts to the greatest extent feasible.



4.1-4 Final design plans for proposed development shall utilize natural landforms and vegetation for screening structures, access roads, building foundations, cut and fill slopes, and exterior lighting. Roads, parking, and utilities shall be designed to minimize visual impacts. Prior to the issuance of any grading and/or building permit, the project applicant shall submit design-level drawings demonstrating compliance with this measure, subject to the review and approval of the City of Soledad. If an alternative design would minimize impacts, the applicant shall submit evidence demonstrating that the alternative design is infeasible.

4.1-5 The applicant shall provide landscape screening appropriate to the surrounding area in order to integrate the development with the existing natural landscape. Landscaping plans shall be submitted to the City of Soledad for review and approval prior to the issuance of any building or grading permit.

4.1-6 All buildings shall be designed with colors and materials that effectively blend the structures with the surrounding landscape. Building applications for new structures shall include color and material sample photo sheets and shall be approved by the City of Soledad, prior to the issuance of any building permit.

4.1-7 A site-specific geotechnical report shall be prepared for new development on hillsides in order to ensure that the development will not cause or worsen natural hazards, such as erosion and sedimentation, and will minimize risk to life and property from slope failure, landslides, and flooding. The report shall include erosion and sediment control measures, such as temporary vegetation sufficient to stabilize disturbed areas. Prior to the issuance of any grading and/or building permit for new development within the hillside portions of the project site, the project applicant shall submit a geotechnical report prepared by a qualified professional to the City of Soledad Department of Public Works for review and approval. The site-specific geotechnical report shall identify feasible recommendations and avoidance measures to minimize potential impacts.

4.1-8 Land alterations within areas above the 400 foot elevation shall be minimized by keeping cuts and fills to a minimum, limiting grading to the smallest practical area of land, limiting land exposure to the shortest practical amount of time, replanting graded areas to insure establishment of plant cover before the next rainy season, and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur. Prior to the issuance of any grading permit, the project applicant shall submitted detailed grading plans consistent with the intent of this mitigation, subject to the review and approval of the City of Soledad.

400 Foot Elevation Contour Map

Figure 4.1-3

DENISE DUFFY & ASSOCIATES, INC.

Scenic Resources

Many state highways are located in areas of outstanding natural beauty. California's Scenic Highway Program was created by the Legislature in 1963. Its purpose is to preserve and protect scenic highway corridors from change which would diminish the aesthetic value of lands adjacent to highways. The State Scenic Highway System includes a list of highways that are either eligible for designation as scenic highways or have been so designated.

There are two state highways within the project vicinity. These include Highway 101 and Highway 146. Neither of these highways are included on the State Scenic Highway System list of highways that are either eligible for designation as scenic highways or have been so designated. Implementation of the project is not expected to substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within view from a state scenic highway. **This would represent a less-than-significant impact.**

Visual Character

As identified in the General Plan EIR, the City of Soledad consists of two towns: the historic city center east of Front Street and the conventional residential subdivisions extending outward from the city center to the east toward the foothills of the Gabilan Range. Surrounding this urbanized landscape are agricultural fields and the Gabilan Range foothills. The project site is currently undeveloped and has historically been used for agriculture and cattle grazing purposes. Surrounding land uses consist predominantly of agricultural uses to the north, west, and east of project site. Existing residential development is located to the south. The project site is located within an area designated for future expansion under the City's General Plan.

Development of the proposed project would permanently alter the visual character of the site, transforming what is currently 920 acres of relatively undeveloped agricultural and grazing land into an urban landscape. Substantial grading would be required in order to accommodate project development. As a result, project development would alter the existing visual character of the site by causing changes to topography, removing vegetation, including mature eucalyptus along San Vicente Road, and adding roads, residences and commercial uses. Although the Miravale III Specific Plan has incorporated design measures, including height restrictions, landscape screening, appropriate color and architectural schemes, light and glare reduction and screening measures, and the use of non-reflective building materials, to minimize visual impacts, the introduction of urban features would permanently alter the existing visual character of the project site as perceived from adjacent public vantage points, including Highway 101 and adjacent residential uses. Currently, the project site, as perceived from adjacent and distant land uses, consists predominantly of existing mature eucalyptus trees, agricultural uses, and associated infrastructure. Removal of existing vegetation, particularly the mature eucalyptus trees, would substantially alter the existing visual character of the project site. This would constitute a significant impact to the existing visual character of the site. Below is a description of the project's primary development components, uses, and their resulting visual effects.

According to the Miravale III Specific Plan, single-family residential development would occur on approximately 241 acres of the project site. The single-family residential development would include a mix of architectural styles, lot sizes, and structure heights. The majority of single-family residential development is proposed within the eastern and southern portions of the project site. Portions of this development would be visible from Highway 101 and adjacent residential areas, particularly proposed residential structures above the 400 foot elevation contour line. Development above the 400 foot elevation contour line would substantially alter the existing visual character of the project site.

Multi-family residential development would occur on approximately 150 acres of the project site designated as Village Residential. Pursuant to Section 2.10 of the Miravale III Specific Plan, permitted uses under the Village Residential designation consist of single-family dwellings, duplexes, triplexes, apartments clustered homes, townhouses, condominiums and other similar uses. Moreover, the multi-family residential development within the Village Residential areas would include a mix of architectural styles, lot widths, and structure heights consistent with the development standards and policies contained in Section 2.10 of the Specific Plan. The majority of multi-family residential development is proposed within the northern portion of the project site.

Two locations, totaling approximately 40 acres, have been designated within the Specific Plan area for future commercial development. More specifically, an area designated as "Village Commercial" is centrally located within the Specific Plan area and is intended to provide area residents with easy and convenient access to retail uses. Another commercial area is designated as "Gateway Commercial" and is located within the southwestern area of the proposed development near the intersection of San Vicente Road and Miravale Road. Allowable uses under both the Village Commercial and Gateway Commercial designations allow for a variety of commercial uses. Section 2.11 of the Miravale III Specific Plan identifies development standards and policies regarding commercial development within the Specific Plan area. Building heights in these areas would extend up to three stories with the exception of the Gateway Commercial district, which allows building heights of up to four stories. Further, the Gateway Commercial district has been identified as the future location for a hotel, although no formal plans have been submitted. According to the development standards for the Gateway Commercial district contained in Section 2.8.1 of the Specific Plan and Appendix H of this document, the maximum allowable building height for a hotel is 75 feet. Development of commercial uses, especially in the Gateway Commercial district, would be highly visible from adjacent residential uses and vehicular traffic along Highway 101. Moreover, the construction of a hotel up to approximately 75 feet would create a prominent visual landmark that would be visible from adjacent and distant land-uses.

The proposed project also consists of the development of public facilities, including project infrastructure, parks, police and fire facilities, schools, and open space, on approximately 285 acres of the project site. Recreational uses would include both passive and active uses, including open space areas and formal parks, such as playfields, picnic areas, and similar. A walking and biking trail system would also be provided. The project also proposes an approximately 159 acre golf course. In addition to open space and park land, public facilities within the proposed project area include locations for future police and fire substations, schools, roads, infrastructure and utilities, and urban reserve uses. Public facility development is proposed throughout the project site.

In addition to the aforementioned land uses, project development also includes the establishment of four project gateways. These gateways are intended to provide a visual entrance to the Specific Plan area and are proposed along Orchard Lane, West Street, the intersection of San Vicente Road and Miravale Road, and San Vicente Road near the primary entrance to the site. Section 2.12 of the Specific Plan identifies numerous guidelines regarding the aesthetic character and quality of the gateways. Development of the proposed gateways would be readily visible from adjacent land uses and Mitigation 4.1-9 is intended to ensure consistency with each of the four gateways.

In summary, the project would permanently alter the existing visual character of the site by causing changes to topography, removing vegetation, and adding roads, buildings, pavement, parking areas, and lighting. These impacts were previously considered in the environmental analysis for the 2005 General Plan. As described in the General Plan, the project site is located within designated urban growth expansion areas, comprising all or a portion of three sub-areas: Northwest Expansion, San Vicente West, and Mirassou. These areas will eventually be developed in accordance with the urban land uses identified in the General Plan. Mitigation measures 4.1-1 to 4.1-5 will help reduce the visual impacts. The loss of

agricultural land and natural open space and introduction of urban development, however, would result in significant and unavoidable impact to the visual character of the site. In order to minimize the extent of project-induced impacts, the following mitigation measures are necessary. These mitigations, however, would not reduce the impact to a less-than-significant level. Implementation of the following mitigation measures would not result in any new environmental impacts beyond those identified in this EIR.

Impact **The project would permanently alter the existing visual character of the site by causing changes to topography, removing vegetation, and adding roads, buildings, pavement, parking areas, and lighting.** ***To the extent that this change is considered a substantial degradation of the existing visual character/quality of the site and its surroundings, this represents a significant unavoidable impact.***

Mitigation

4.1-9 In order to minimize tree removal and associated visual impacts, final design-level improvements plans shall retain existing mature eucalyptus and other tree species to the greatest extent possible. Final design-level plans shall be prepared in consultation with a registered arborist/forester to minimize tree removal and ensure the health of remaining trees. Prior to the issuance of any grading and/or building permits, final plans shall be subject to the review and approval of the City of Soledad Director of Public Works. If the removal of existing mature eucalyptus is required the applicant shall submit evidence demonstrating that there are no feasible design alternatives to avoid tree removal. In the event that tree removal is required, the project proponent shall prepare a tree removal and replacement plan for each phase of construction, subject to the review and approval of the City of Soledad Community Development Director. The tree removal and replacement plan shall identify specific grading limits that minimize tree removal, as well as appropriate tree replacement ratios and replanting locations.

4.1-10 Final design plans for the proposed gateways shall include elements, such as signage, landscaping and landscaped center medians, and appropriate architectural detailing consistent with the Miravale III Specific Plan. Prior to issuance of any permit for the construction of any of the four gateways, the project applicant shall submit detailed plans that include the above referenced elements, subject to the review and approval of the City of Soledad.

4.1-11 Final design plans for proposed residential development shall include form, scale, and character elements which emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks. Prior to the issuance of any building permit for residential development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad.

4.1-12 Final design plans for proposed multi-family development shall include useable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood. Prior to the issuance of any building permit for multi-family development within the Specific Plan area, the project applicant shall submit design-level drawings consistent with the intent of this measure, subject to the review and approval of the City of Soledad.

4.1-13 Final design plans for proposed development shall include a tree planting plan in order to increase the number and density of tree cover within new development areas. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed tree planting plan, subject to the review and approval of the City of Soledad.

Light and Glare

The project site currently consists of 920 acres of unlit agricultural and grazing land. Various existing uses provide a source of light which affect the project area. These are predominantly residential uses located south of the project site.

The project would provide a new source of light and glare and would accentuate existing sources due to changes in topography, removing vegetation, and adding roads, buildings, pavement, and parking areas. The proposed project would require night lighting in parking lots and along streets for safety, as well as for the traffic in the area. The residential component of the project would also contribute to the increased light and glare in the area. Commercial/retail uses would contribute increased nighttime lighting by providing security/safety lighting for businesses, as well as associated parking areas.

Overall, the proposed project would increase the intensity of development within an existing undeveloped area, and therefore the amount of artificial light produced by the site. The Highway 101 corridor and surrounding urban uses would be most affected by this increase in light and glare. Artificial lighting within the project site would impact nighttime views by altering the natural landscape and, in sufficient quantity, lighting up the nighttime sky and reducing the visibility of astronomical features. In addition, the additional lighting within the project site, especially unshielded light, could result in spillover light that could impact surrounding land uses. Further, daytime glare could occur as light reflects off pavement, vehicles, rooftops, and structures.

In order to minimize the extent of visual impacts associated with the development of the proposed project, mitigation measures are necessary. The following mitigation measures would reduce the extent of impacts by requiring that all site lighting comply with specific standards to avoid excess glare and new sources of light. Implementation of the following mitigation measures would not result in any new environmental impacts beyond those identified in this EIR.

Impact **The project would create a new source of light or glare that would adversely affect day or nighttime views in the area.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.1-14 All buildings shall be designed so that exterior lighting is down-lit and illuminates the intended area only. Building applications for new structures shall include an exterior lighting plan subject to approval of the Soledad Planning Department that includes the following requirements: 1) exterior lighting shall be directional; 2) glare from exterior lighting shall be adequately minimized; 3) the source of directional lighting shall not be directly visible; and 4) vegetative screening shall be considered, where appropriate, as a means of reducing development-related light and glare. The project applicant shall submit an exterior lighting plan to the City of Soledad Planning Department prior to the issuance of any building permit.

4.1-15 Ornamental lighting use for streets, parks, public open spaces, trails, bike paths, parking lots, and walkways shall utilize fixtures consisting of metal halide with cut-off luminaries in order to control light and glare. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department.

4.1-16 Light reduction and screening measures shall be required in order to reduce nighttime ambient light increases in the area. Lighting levels in commercial areas shall be kept as low as feasible and controlled to minimize operating time. Light sources shall be installed, so there is no light radiation above the horizontal plane (i.e., dark sky). Lighting shall be focused downward to prevent the splay of ambient light to other areas. Prior to the issuance of any building permit, the project applicant shall provide documentation as part of the exterior lighting plan described in Mitigation Measure 4.1-12 demonstrating that these measures are incorporated into site lighting, subject to the review and approval of the Soledad Planning Department

4.2 AGRICULTURAL RESOURCES

Introduction

An *Agricultural Resources Report* was prepared by Buchanan Associates (August 17, 2007). The report utilized the California Agricultural Land Evaluation and Site Assessment model (LESA) to assess the project area agricultural resources. The following discussion incorporates this analysis; the entire report is included as Technical Appendix T-1 and is included in Volume II of this DEIR.

Agricultural resources are afforded protection under various federal and state acts (such as the Williamson Act), programs, and local governance (General Plans, specific and other types of plans, zoning ordinance, etc.). Some of the agencies involved with stewardship of agricultural resources include the U.S. Department of Agriculture (USDA), the Natural Resources Conservation Service (NRCS), and the California Department of Conservation's Division of Land Resource Protection. In California, agricultural land is also given consideration under CEQA. According to Public Resources Code §21060.1, "agricultural land" means prime farmland, farmland of statewide importance, or unique farmland, as defined by the USDA land inventory and monitoring criteria, as modified for California.

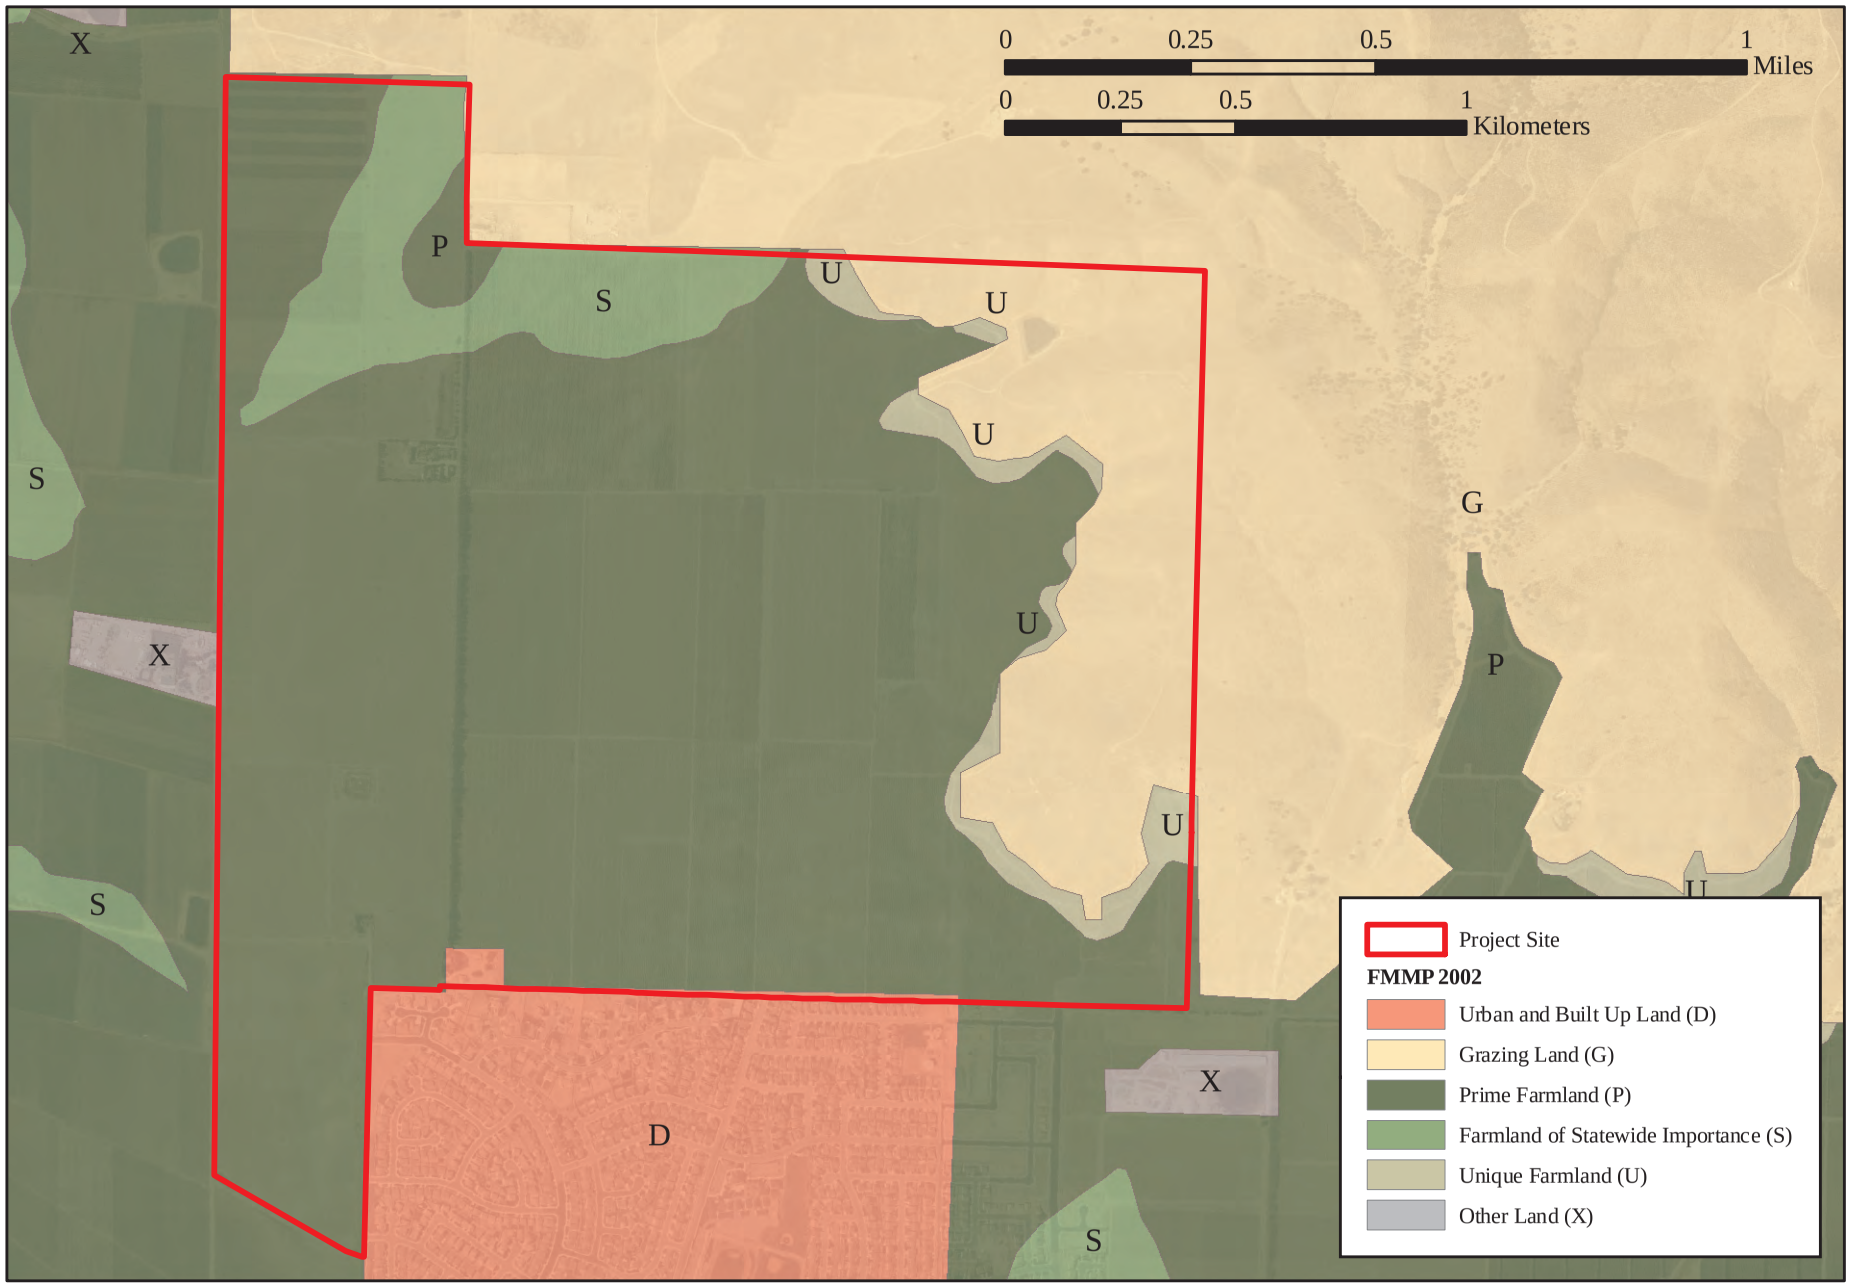
The Farmland Mapping and Monitoring Program (FMMP) produces maps and statistical data that are used for analyzing impacts on California's agricultural resources. The FMMP was established in 1982 in response to a critical need for assessing the location, quality, and quantity of agricultural lands and conversion of these lands over time. The FMMP is a non-regulatory program and provides a consistent and impartial analysis of agricultural land use and land use changes throughout California. The goal of the FMMP is to provide consistent and impartial data to decision makers for use in assessing present status, reviewing trends, and planning for the future of California's agricultural land resources. Under the FMMP, agricultural land is rated according to irrigation status and soil quality; the best quality land is called Prime Farmland. The FMMP produces Important Farmland Maps, Figure 4.2-1, which are a hybrid of resource quality (soils) and land use information.

Setting

The project site is located in an area north and west of the current Soledad City limits currently undergoing a transition from agricultural to residential and commercial uses. Currently, approximately 430 acres of the 929 acre project site appear to be used for the production of irrigated row crops, including grapes (approximately 155 acres), lettuce, and leafy greens (approximately 275 acres). Approximately 330 acres of the project site are not planted to any crops, while the remaining non-irrigated lands (approximately 170 acres) are non-grazed lands. Equipment storage areas, worker housing, other buildings, and water detention and impoundment ponds comprise approximately 7 acres of the non-cropped area. Within the project site, two parcels totaling approximately 107 acres are under Williamson Act contract (See Appendix D). According to the Agricultural Resources Report, the property owner has filed for non-renewal status with cancellation pending in 2016.

Land uses surrounding the proposed project site are varied. The northern and eastern boundaries are largely grazing and fallow lands; although, approximately 2,000 feet in the southwest corner is adjacent to San Vicente Road and existing residential areas. The southern boundary is predominantly residential, while the entire western boundary is adjacent to irrigated row crop land. Current crop production is within approximately 50 feet of the residential areas on the southern boundary, while residential development at the southeastern corner of the project site is approximately 150 feet from adjacent crop land.

Fourteen soil types are found on the project site as identified in Figure 4.2-2 and Table 4.2-1. Total potentially irrigated land within the project site is approximately 82 percent of the total project site or 760 acres. As shown in Table 4.2-1, Land Capability Classes (LCC), or Units, classify soils according to their characteristics and slopes. These classifications range from a 'high' of I-1 to a 'low' of VIIIs-1. The soils within the project site range from a soil classification of I to VII, as detailed in Table 4.2-1. Classes I and II are generally considered to be of prime agricultural significance.



The NRCS also assigns a Storie Index Rating to types of soils; the rating is based exclusively on soil characteristics. Lands which qualify for a Storie Index Rating of 80 to 100 are generally considered agriculturally significant. As presented in Table 4.2-1, there are several soil types in the Study Area with a Storie Index Rating above 80. Figure 4.2-2 shows the location of these soils types within the project site. Also shown in Table 4.2.1, is the classification of prime soils based upon the California Department of Conservation Important Farmlands Mapping Program. According to the 1998 Monterey County Important Farmlands Map (see Figure 4.2-2), there are 760 acres of potentially irrigated soils on the site that are classified as Prime Farmland and Farmland of Statewide Importance by the California Department of Conservation Important Farmlands Mapping Program.

Table 4.2-1
Soil Series and Land Capability Class and Storie Designations within the Project Site

Soil Type	Acres	Prime	Land Capability Class (LCC) Or Unit	Storie Index Rating
Arroyo Seco gravelly loam, 2 to 5 percent slopes	38.9	x	II	72
Arroyo Seco gravelly sandy loam, 0 to 2 percent slopes	127.9	x	III	63
Arroyo Seco gravelly sandy loam, 2 to 5 percent slopes	8.9	x	III	60
Chualar loam, 0 to 2 percent slopes	212.6	x	I	85
Chualar loam, 2 to 5 percent slopes	283.4	x	II	81
Gloria sandy loam, 2 to 9 percent slopes	6.4		III	27
Gloria sandy loam, 0 to 5 percent slopes	2.4		IV	25
Hanford gravelly sandy loam, 0 to 5 percent slopes	22.0	x	II	60
Placentia sandy loam, 0 to 2 percent slopes	9.1	x	III	45
Placenta sandy loam, 2 to 9 percent slopes	53.1	x	IV	37
Salinas clay loam, 0 to 2 percent slopes	4.4	x	I	85
Vista coarse sandy loam, 15 to 30 percent slopes	45.2		VI	29
Vista coarse sandy loam, 30 to 75 percent slopes	70.1		VII	12
Vista-rock outcrop complex	44.7		VII	6
Total acres	**929.0**	**760.2**		

Agricultural Land Capability

Overall, there are three separate land classification systems which are primarily used to determine an area's suitability for agriculture and/or provide definition for prime agricultural lands. Increasingly in California, the Department of Conservation's Farmland Mapping criteria are being applied to the assessment of agricultural land capability and determination of impacts due to development of these lands. The following discusses the classification systems and the resultant project characteristics.

State Farmland Mapping & Monitoring Program

The State of California's Farmland Mapping and Monitoring Program (FMMP) monitors land use change affecting California's agricultural land. The program, administered by the California Department of Conservation's Office of Land Conservation, produces maps and statistical data to be used for assessing the importance of agricultural lands, which is rated according to soil quality and irrigation status. The best quality land is called Prime Farmland; other classifications, in descending order according to their suitability, include Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Grazing Land, Urban and Built-up Land, and Other Lands.

Table 4.2-2
State Important Farmland Mapping Classifications

Category	Description
Prime	**Prime farmland** is land with the best combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date of 1992 (or since 1988).
Farmland of Statewide Importance	**Farmland of Statewide Importance** is land similar to prime farmland, but with minor shortcomings, such as greater slopes or with less ability to hold and store moisture. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date (or since 1988).
Unique Farmland	**Unique Farmland** is land of lesser quality soils used for the production of the State's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards, as found in some climatic zones in California. The land must have been cultivated at some time during the two update cycles prior to the mapping date (or since 1988).
Farmland of Local Importance	Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.
Other Land	**Other Land** is not included in other mapping category. For example, low density rural development; brush, timber; wetlands and riparian areas not suitable for livestock grazing; confined livestock; poultry or aquaculture facilities; strip mines, borrow pits; and water bodies smaller than 40 acres. Vacant and nonagricultural land surrounded on all sides by urban development and greater than 40.
Urban and Built-Up Land	**Urban and Built-Up Land** is occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. Common examples include residential, industrial, commercial, institutional facilities, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, and water control structures.
Grazing Land	**Grazing Land** is land on which the existing vegetation is suited to the grazing of livestock. The minimum mapping unit for this category is 40 acres.

Source: California Department of Conservation

State of California's Farmland Mapping and Monitoring Program (FMMP) Classification. The 760 acres of potentially irrigated land have soils classified as Prime Farmland and Farmland of Statewide Importance by the Important Farmlands Mapping Program.

Natural Resources Conservation Service (NRCS) Land Capability Class System. Land Capability Classes (LCC) rate soils according to their characteristics and slopes. These classifications range from a 'high' of I-1 to a 'low' of VIIIs-1. Classes I and II are generally considered to be of prime agricultural significance. The NRCS also assigns a Storie Index Rating to soils, which is based exclusively on soil characteristics only. Lands which qualify for a Storie Index Rating of 80 to 100 are considered agriculturally significant.

NRCS Classification. Based on this system's criteria, approximately 561 acres are considered prime agricultural land due to their Capability Class I and II rating (Table 4.2-1).

Cortese-Knox Local Government Reorganization Act of 1985. The Cortese-Knox Act, defines "prime agricultural land" as an area of land, whether a single parcel or contiguous parcels, which has not been developed for a use other than agriculture and which meets any of the following qualifications identified below.

The Cortese-Knox Act

1. Land which qualifies for rating as class I or class II in the Soil Conservation Service land use capability classification and that qualifies for rating 80 through 100 Storie Index Rating.
2. Land which is used to maintain livestock for commercial purposes, which has an annual carrying capacity equivalent to at least one animal unit per acre as defined by the United States Department of Agriculture in the National Handbook on Range and Related Grazing lands.
3. Land planted with fruit or nut-bearing trees, vines, bushes, or crops which have a nonbearing period of less than five years and which will return during the commercial bearing period on an annual basis for the production of unprocessed agricultural plant production not less than two hundred dollars ($200) per acre.
4. Land which has returned from the production of unprocessed agricultural plant products an annual gross value of not less than two hundred dollars ($200) per acre for three of the previous five calendar years.

Cortese-Knox Capability Classification. Three of the four criteria above apply to classifying prime lands within the project site. Approximately 500 acres meet criteria #1 exclusively, approximately 430 acres meet criteria #3, and the total potentially irrigated land area of 760 acres (actively cropped plus recently fallowed) could meet criteria #4. It should be noted that the City General Plan EIR provides an assessment of land in and around Soledad and acknowledges that almost all of the soils surrounding the urban area of the City meets at least one of these qualifications and, therefore, can be considered prime agricultural land with the exceptions of GhC (Gloria sandy loam 2 to 9 percent slopes) and Xb (Xerorthents, sandy).

California Agricultural Land Evaluation and Site Assessment

In 1993, Senate Bill 850 directed the State Resources Agency, in consultation with the Governor's Office of Planning and Research, to "…develop an amendment to Appendix G to provide lead agencies with an optional methodology to ensure that significant effects on the environment of agricultural land conversions are quantitatively and consistently considered in the environmental review process." The

result was the formulation of the California Agricultural Land Evaluation and Site Assessment Model (LESA). LESA is a point-based approach to assessing the relative value of agricultural land resources that relies on two separate sets of factors: land evaluation, which are primarily soil-based qualities of land, and site assessment factors that are intended to measure social, economic, and geographic attributes.

The California Agricultural LESA Model is composed of six different factors. Two Land Evaluation factors are based upon measures of soil resource quality. Four Site Assessment factors provide measures of a given project's size, water resource availability, surrounding agricultural lands, and surrounding protected resource lands (e.g. open space, conservation easement, or Williamson Act contract). For a given project, each of these factors is separately rated on a 100 point scale. The factors are then weighted relative to one another and combined, resulting in a single numeric score for a given project, with a maximum attainable score of 100 points. It is this project score that becomes the basis for making a determination of a project's potential significance, based upon a range of established scoring thresholds.

Buchanan Associates prepared a LESA model for this project site (included as Technical Appendix T-1). The California LESA Model is weighted so that 50 percent of the total LESA score of a given project is derived from the Land Evaluation factors and 50 percent from the Site Assessment factors. Individual factors are weighted with the sum of the factor weights required to equal 100 percent. A score of 80 to 100 points is considered significant under the California LESA Model Scoring Thresholds for Significance. A score between 60 to 79 points is also considered significant unless either the Site Assessment or Land Evaluation subtotals are less than 20. As indicated below, neither subtotal is less than 20 points.

LESA Evaluation Rating: The results of the LESA model determined that the proposed project would result in a significant rating, as shown in Table 4.2-3. This is largely due to the predominance of prime soils and large land area of the project site, as well as, a high percentage of agricultural land in the Zone of Influence surrounding the project site.

Table 4.2-3
LESA Model Project Score Results

Land Evaluation Factors	**Weighted Rating**
Land Capability Classification	18.25
Storie Index Rating	15.95
Land Evaluation Subtotal	**34.2**
Site Assessment Factors	
Project Size	15.0
Water Resource Availability	12.1
Surrounding Agricultural Lands	14.25
Surrounding Protected Resource Lands	0.0
Site Assessment Subtotal	**41.4**
Total LESA Score	**75.6**

Monterey County Agricultural Commissioner

In addition to qualitative and quantitative methods used to determine potential impacts of agricultural land conversion, Monterey County also relies on the Agricultural Commissioner to assess the potential for development activities to impact the agricultural productivity of a given site. Among the criteria used by the Commissioner are the soil type(s) and their suitability for agriculture as defined by the USDA Natural Resources Conservation Service (NRCS); present and past agricultural use of the site; size, shape, and

slope of the site in question; availability and use of irrigation and agricultural practices on surrounding properties.

According to the USDA Soil Survey for Monterey County, total potential irrigated land within the project site is approximately 82 percent of the total project site or 760 acres. According to the 1998 Monterey County Important Farmlands Map (see Figure 4.2-1), these 760 acres of potentially irrigated soils are classified as Prime Farmland and Farmland of Statewide Importance by the California Department of Conservation Important Farmlands Mapping Program.

Monterey County Agricultural Resources

Monterey County is one of the primary agricultural regions in the State of California. The total value of agricultural products produced has been increasing steadily in real dollars (accounting for inflation) since 1990. Monterey County ranked third in the state in the value of crops produced in 2002 and as of 2005 was ranked fourth. Table 4.2.4 shows important crop revenues for Monterey County in 2002 and 2005. The data reflect the continuing importance of leaf lettuce and strawberries, as well as, the increasing importance of wine grapes and nursery crops. Conversely, the recent significant expansion of spinach production may be tempered in the near term. The gross value of agricultural production is multiplied by a factor of two to three times through the local economy due to the involvement of other sectors of the economy, including industry, retail trade, and commercial services. Table 4.2.4 also identifies changes in the value of selected Monterey County crops between 2002 and 2005.

Table 4.2-4
Changes In Value of Selected Monterey County Crops
Between 2002 and 2005

Crop	Value	
	2002	2005
Leaf lettuce	$429,400,000	$600,800,000
Head lettuce	$309,150,000	$311,800,000
Broccoli	$265,900,000	$156,100,000
Strawberries	$226,850,000	$385,750,000
Nursery	$218,700,000	$276,200,000
Grapes	$147,100,000	$254,600,000
Spinach	$49,100,000	$164,800,000
Spring Mix	$119,320,000	$132,277,000

Regulatory Framework

Williamson Act Contract

The California Environmental Quality Act requires the review of projects that would convert Williamson Act contract land to non-agricultural uses. The main purposes of the Williamson Act are to preserve agricultural land and to encourage open space preservation and efficient urban growth. The Williamson Act provides incentives to landowners through reduced property taxes to deter the early conversion of agricultural and open space lands to other uses.

According to CEQA Guidelines Section 15206 cancellation of Williamson Act contracts for parcels exceeding 100 acres is considered to be "of statewide, regional, or areawide significance," and thus

subject to additional noticing and review requirements under CEQA. The Williamson Act of 1965 is the state's principal policy for the preservation of agricultural and open-space land. The program encourages landowners to work with local governments to protect important farmland and open-space. Landowners can enroll parcels for a minimum of 10 years. This program helps local governments to restrict land to agricultural and compatible open space use. In doing so, land is assessed for property taxes at a rate consistent with its actual use, rather than the potential value of the land. The main purposes of the Williamson Act are to preserve agricultural land and to encourage open space preservation and efficient urban growth.

City of Soledad General Plan

The City of Soledad General Plan provides policies for the protection of agricultural resources. Please refer to Table 4.9-2 of the Land Use section for a detailed analysis of the project's consistency with the City's General Plan agricultural policies. There are a number of policies and programs in place that attempt to limit the loss of farmland. As the City of Soledad is largely surrounded by agricultural land, the City may have limited options other than conversion of farmland if it is to grow to meet population and housing demand. The policies of the City of Soledad and policies in the current and draft County of Monterey General Plans strongly encourage new development to occur only within areas that are within the City's urbanizing area and discourage the conversion of agricultural lands to urban uses where urban services are not available.

The Agricultural Resources section of the Soledad General Plan contains goals and policies that seek to limit adverse impacts to agricultural operations due to new development and, further, to protect and preserve agricultural land. The following are relevant:

Policy C/OS-1 The City shall discourage "leapfrog" development and development in peninsulas extending into agricultural lands to avoid adverse effects on agricultural operations.

Policy C/OS-2 The City shall retain the agricultural land use designation on lands within its planning area until the land is needed for urban development.

Policy C/OS-3 The City shall ensure that new development and public infrastructure projects do not encourage expansion of urban uses outside the general plan area into areas designated Agriculture by the Monterey County General Plan.

Policy C/OS-4 The City shall support the agricultural economy by encouraging the location of agricultural support industries in the City, establishing and promoting marketing of local farm products, and providing its regional fair share of adequate housing to meet the needs of agricultural labor.

Policy C/OS-5 The City shall require a right-to-farm condition to all future subdivision maps adjacent to farmlands.

Policy C/OS-6 The City shall require development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses.

The impacts to agricultural lands due to development accommodated by the Land Use Element was identified as a Class I unavoidable significant impact due to the conversion of state-identified prime agricultural land including the project site.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential agricultural impacts associated with the adoption and implementation of the Soledad General Plan. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III project. According to the General Plan EIR, the following agricultural impacts were identified:

- Development as contemplated in the General Plan would result in the permanent conversion of 2,750 acres of Prime and Farmland of Statewide Importance. This impact was identified as significant and unavoidable.

- Expansion of urban uses as envisioned in the General Plan would generate potential land use incompatibilities between urban and agricultural land uses. This impact was identified as significant unless mitigated.

Miravale III Specific Plan

Section 6.0 "Implementation" of the Specific Plan identifies policies and implementation measures to identify conservation of a portion of the agricultural resources in the plan area during the first phases of the project and provides implementation policies for agricultural conflicts. Section 6.0 Implementation of the Specific Plan has the following implementation proposed:

Policy 6.2.1 Williamson Act Contracts. Under the California Land Conservation Act of 1965 local governments could enter into contractual agreements with private landowners for the purposes of restricting land use on a property to agriculture or related open space use. Properties under Williamson Act Contracts are assessed at their consistent usage, rather than their potential market value, substantially reducing the amount of owed property taxes. Contracts are subject to a rolling 10-year term whereby agreements are automatically renewed yearly, unless either party files a "notice of non-renewal." Once such a notice has been filed, a 10-year non-renewal process commences; at the end of the non-renewal process, the contract terminates. There is one Williamson Act Contract within the Plan Area. The contract, consisting of 2 parcels located within the urban reserve area at the northwestern property boundary, has a notice of non-renewal filed against it. These parcels shall not be developed until the contract is terminated.

Policy 6.2.3 Agriculture Interface. New residential units will abut the existing Urban Expansion and Agriculture zones. Within a small portion of the east side of the Specific Plan Area and on portions of the north and west boundaries some agricultural operations may take place. It is the declared policy of the County of Monterey, the governing jurisdiction to these parcels, to conserve, enhance, and encourage Agricultural Operations within the County and to minimize potential conflict between agricultural and nonagricultural land uses within the County.

The Monterey County Code Chapter 16.40 - Protection of Agricultural Activity states "Where nonagricultural land uses, especially residential development, extend into agricultural lands or are located in the vicinity of agricultural lands, Agricultural Operations may be the subject of complaints. Such complaints may cause the curtailment of Agricultural Operations and discourage investments for the improvement of agricultural land to the detriment of the economic viability of the agricultural industry of the County. It is the purpose and intent of this Chapter (16.40) to prevent the loss to the County of its agricultural resources by limiting the circumstances under which

Agricultural Operations may be considered a nuisance. This policy can best be implemented by educating residents about the laws protecting Agricultural Operations and Farm Operations from conflicts with non-agricultural uses and by notifying residential users of property adjacent to or near Agricultural Operations and Farm Operations of circumstances relative to agricultural activities which may be objectionable to owners and/or users of non-agricultural properties. These potentially objectionable circumstances may include, but are not limited to, the noises, odors, dust, chemicals, smoke, and extended hours of operation that may accompany Agricultural Operations."

It is the intention of the developer to disclose potential agricultural activities to future owners in keeping with intention of the Monterey County code. In addition, a 60' minimum landscaped buffer including a trail will be constructed along the west boundary of the Specific Plan area in order to buffer residences from potential agriculture uses.

Relevant Project Characteristics

The project proposes a primarily residential development consisting of residential, commercial, public facility, recreational and visitor serving uses and will include recreational trails, remainder parcels of open space, and agricultural buffers, as well as some agricultural use and recreation areas. The proposed site will be located on approximately 929 acres of which 430 acres are currently being used for the production of irrigated row crops. Total development of the site will be phased over a 15- to 20-year period with buildout occurring between 2027 and 2028.

The 760 acres of potentially irrigated land have soils classified as Prime Farmland and Farmland of Statewide Importance by the Important Farmlands Mapping Program. According to the *NRCS Land Capability Classification* criteria, approximately 561 acres are considered prime agricultural land due to their Capability Class I and II rating. Under Cortese-Knox, three of the four criteria apply to classifying prime lands within the project site.

Within the Specific Plan area, two parcels totaling approximately 107 acres are under Williamson Act contract, but are currently in non-renewal status with cancellation pending in 2016.

The Specific Plan states that there is "a 60' minimum landscaped buffer including a trail will be constructed along the west boundary of the Specific Plan area in order to buffer residences from potential agriculture uses." The Vesting Tentative Map identifies a buffer of varying width along this boundary.

Thresholds of Significance

A project that would convert prime agricultural land to non-agricultural use or impair the agricultural productivity could have a significant effect on the environment. No set acreage threshold of prime farmland conversion has been determined by case law or regulatory framework that would constitute a significant impact.

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;

- Conflict with existing zoning for agricultural use, or a Williamson Act contract; or

- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use.

Impacts and Mitigation

Conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance

The proposed project will convert a total of 929 acres of agricultural and grazing land to residential and commercial uses. Of this total, the project would convert approximately 760 acres of Prime Farmland to non-agricultural use. As the City of Soledad is largely surrounded by agricultural land, the City may have limited options other than conversion of farmland. City of Soledad policies in the General Plan strongly encourage new development to occur only within areas that are within the City's urbanizing area and discourage the conversion of agricultural lands to urban uses where urban services are not available.

The project site is contiguous to the City's current boundaries and part of "expansion areas" identified in the General Plan, which are considered appropriate areas for accommodation of the City's planned growth over the next 25 to 50 years. The impacts to agricultural lands due to development accommodated by the Land Use Element of the General Plan was identified as a Class I unavoidable significant impact due to the conversion of state-identified prime agricultural land including the project site.

Impact **The proposed project would include the conversion of state-identified prime agricultural land.** ***This impact to conversion of agricultural lands due to proposed development is considered significant and unavoidable.***

Conflict with Existing Zoning for Agricultural Use or Williamson Act Contract

Two parcels totaling approximately 107 acres (APN 257-001-026 and APN 257-001-027) and located on the northwestern portion of the Plan Area are currently under Williamson Act contract. The California Land Conservation Act (Williamson Act), California Government Code Section 51290 et seq., encourages conservation of agricultural lands by providing a tax incentive to land owners who contract with the County to restrict land uses to agriculture and compatible uses. Williamson Act contracts remain in effect for 10 years (minimum) unless the property owner files for a "Notice-of Non-Renewal" with the County. A notice of non-renewal has been filed and approximately 9 years (as of 2007) remain on the contract unless it can be cancelled prior to the expiration of this term.

Impact **Development of land designated for urban development as part of Phase 4 of the Specific Plan will require the cancellation of Land Conservation Act Contract 73-25 within the project site.** ***This is considered a significant and unavoidable impact due to the conversion of state-identified prime agricultural land.***

Conversion of Farmland Due to Changes in Existing Environment

The single most important factor in the decline of agricultural acreage in Monterey County has been the rapid spread of urban development. In the South Monterey County area, significant development pressures have resulted in the conversion of agricultural land to urban uses.

According to a study by the California Department of Conservation, conversions of farmland to urban uses adversely affect the efficiency of remaining farming operations in the area. For example, agricultural production decreases as a result of increased air pollution, livestock predation by pets, crop diseases resulting from inadequate care of off-farm ornamental plants, restriction on pesticide use and burning, and

requirements to set aside on-farm buffer zones. Production costs increase because of rising land costs, water scarcity, theft and vandalism of farm equipment, crop pilferage, road congestion, and personal injury liability associated with farm trespass.

Additionally, the conversion of agricultural land to urban uses can cause increases in land use compatibility problems and nuisance complaints due to urban uses being sited adjacent to agricultural uses. For example, farmers have to deal with vandalism, increased traffic on urban roads, and potential restrictions on the use of pesticides or the operation of certain equipment. Urban residents, on the other hand, are impacted by noise, odors, slow moving farm equipment on local roads, and pesticide or herbicide spray drift. As identified in the Specific Plan (6.0 Implementation), it is the developers intent to conform to Monterey County Code Chapter 16.40 - Protection of Agricultural Activity in order to minimize potential land use conflicts.

To further minimize potential conflicts, including human health concerns, between urban and agricultural uses, the Monterey County Agricultural Commissioner generally recommends at least a 200 foot buffer between agricultural and non-agricultural uses. The inclusion of an agricultural buffer is necessary to protect the public health, safety, and welfare of people and protect the economic viability of agricultural production. Buffers are required to lessen public and animal exposure to agricultural chemicals, dust, noise, and odors and protect agricultural uses from vandalism, pilferage, trespassing, and complaints against standard legal practices. For the purpose of this analysis, the Monterey County Agricultural Commissioner's recommended buffer distance is considered the minimum distance to ensure appropriate separation between agricultural and non-agricultural uses.

As currently proposed, the project includes a 60 foot landscaped buffer including a trail along the west boundary of the Specific Plan area to buffer residences from existing agriculture uses. The Buchanan Agricultural Report (Technical Appendix T-1), as summarized below, discusses areas of buffer and agricultural uses in the project site.

> **Western Boundary Buffer** - All of the land on the western edge and southwest corner of the project site adjoins row crop lands used for vegetable production. Routine and on-going operations will typically generate dust and noise, and require application of pesticides (likely ground applied). The current access road immediately adjacent to this boundary has heavy agricultural equipment traffic and is used for temporary storage of field equipment, as well as two surface impoundments for irrigation close to the project boundary. Prevailing wind direction and duration will increase the likelihood for potential conflict between agricultural and residential land uses during application of pesticides in this area.
>
> Therefore, an adequate buffer shall require some type of physical barrier combined with adequate distance in areas where residential and commercial structures are to be located. This is required to minimize the potential liabilities related to safety and potential injury, theft, and vandalism. The proposed Urban Reserve and golf course fairways in the northwest area (currently Williamson Act contract lands) would provide adequate buffer distance as long as access to adjacent fields can be restricted. Vegetation in the area will need to be managed to be consistent with agricultural pest and food safety management requirements for leafy green and vegetable crops. As previously identified, the proposed project includes a 60' agricultural buffer along the residential areas adjacent to existing agricultural uses.

Northern Boundary Buffer - Most of the land on the northern edge of the project site adjoins rural residential and grazing lands or non-agricultural land owned by the City of Soledad. Routine operations on these lands are less likely to generate conflicts between land uses, therefore adequate buffer could be achieved with physical barriers and a minimum 50 foot distance from residential structures. As a significant portion of the northern boundary towards the east will be park open space, this should serve as an adequate buffer as long as public access to adjacent private lands is restricted.

Eastern Boundary Buffer - All of the land on the eastern edge of the project site adjoins rural residential and grazing lands. Routine operations on these lands are less likely to generate conflicts between land uses, therefore adequate buffer could be achieved with physical barriers and a minimum 50 foot distance from residential structures.

Although the proposed 60 foot western buffer does not meet the minimum distance recommended by the Agricultural Commissioner's office, additional measures such as vegetative/landscaped berms, screening, and other similar measures can be incorporated to achieve similar results. Moreover, as identified in the Buchanan Agricultural Report, the requirements for and attributes of functional buffers may differ depending on the nature of routine and on-going agricultural operations and practices. Generally agricultural buffers can include constructed fences or walls, earthen berms, roadways, drainage ditches, parking areas, landscaped or other vegetated areas. To ensure that adequate measures, such as those identified above, are incorporated into the proposed buffer area, project-specific mitigation measures have been incorporated to reduce project impacts to a less-than-significant level. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified in this EIR.

Impact **The proposed project will be sited adjacent to existing agricultural uses located on the boundary of the project footprint. This has the potential to cause an increase in land use compatibility problems and nuisance complaints due to urban uses being sited adjacent to agricultural uses. In order to minimize these potential land use conflicts, the project has been designed with a minimum 60' buffer zone between the residential and agricultural uses along the western boundary of the project site. Additional buffers, however, are warranted along the northern and eastern project boundaries. Moreover, as currently proposed, the 60' buffer does not meet the minimum buffer distance recommended by the Monterey County Agricultural Commissioner. To ensure that residential uses are adequately buffered from agricultural uses, additional measures are necessary to protect human health and the environment resulting from potential conflicts between agricultural and urban uses.** ***This impact can be reduced to less-than-significant with the following mitigation.***

Mitigation

4.2-1 Adequate buffer areas between urban and agricultural uses, including a minimum 50' buffer along the northern and eastern boundary of the project site, shall be incorporated into the proposed project. Prior to the recordation of any final map, the project applicant shall submit evidence in the form of agricultural setbacks delineating buffer locations consistent with the recommendations contained in the Agricultural Resources Report, subject to the review and approval of the City of Soledad.

4.2-2 In order to ensure the adequacy of the proposed 60' agricultural buffer located along the western boundary of the project site, the project applicant shall submit a detailed landscape plan that includes vegetative screening in addition to physical barriers, such as fences, walls, or similar to protect human health and safety. One or more of the following options may also be used in combination with landscaping requirements to create an average 60 foot buffer between the agricultural parcel property line and habitable structures within the Plan area:

a. Public or private road right-of-ways;
b. Landscaped islands and planting areas;
c. Recreational trail corridors; and/or
d. Placing dwellings in the rear portion of lots.

Prior to the recordation of any final map along the western project boundary, an agricultural buffer setback shall be delineated on the final map, subject to the review and approval of the City of Soledad.

4.2-3 Prior to the issuance of any certificate of occupancy for residences adjacent to on-going agricultural uses on the western project boundary, the project applicant shall provide documentation demonstrating that adequate screening and landscaped improvements have been installed and/or constructed within the 60' agricultural buffer, subject to the review and approval of the City of Soledad.

Impact **The proposed project has the potential to impact routine and on-going agricultural activities on the areas adjacent to the northern, eastern, and western boundaries of the project site.** ***The following mitigation measures are recommended to reduce these impacts to the extent possible, project related impacts, however, are considered significant and unavoidable.***

4.2-4 Access for agricultural equipment and vehicles to the adjoining row crop land on the western boundary shall continue to be provided from the ramp to Highway 101 North (see Figure 2 in Technical Appendix T-1, Agricultural Report). The current access road to the Braga property should remain at the current width to allow for passing and ensure adequate turnaround space for field equipment. Implementation of this measure would reduce impacts to routine and on-going agricultural operations on lands west of the proposed project site.

4.2-5 Prior to the issuance of any permit, the project applicant shall have recorded a right-to-farm notice on parcels adjacent to existing and on-going agricultural uses consistent with the requirements of the City of Soledad General Plan, subject to the review and approval of the City of Soledad.

4.3 AIR QUALITY

Introduction

This section presents the potential air quality impacts associated with construction and operation of the proposed Miravale III Specific Plan project. It is based on an air quality analysis prepared for the project by Illingworth & Rodkin, Inc (June 26, 2007; Revised August 29, 2007). The analysis of regional operational emissions using the Urbemis 2007 model and the analysis of greenhouse gas and climate change issues was completed by DD&A in December 2007. The sources of information for this analysis are: 1) Monterey Bay Unified Air Pollution Control District, CEQA Air Quality Guidelines (February 2008), and 2) Monterey Bay Unified Air Pollution Control District, 2008 Air Quality Management Plan (June 2008). The air quality analysis calculation sheets and air quality consistency determination are provided in Appendix E. A copy of the Air Quality Study prepared by Illingworth & Rodkin, Inc. is included as Technical Appendix T-2 and is included in Volume II of this DEIR.

The proposed project is located in the North Central Coast Air Basin (NCCAB), which includes Monterey, Santa Cruz, and San Benito counties. Although the NCCAB is in attainment of all federal air quality standards, it is designated as nonattainment with respect to the more stringent state PM_{10} standard and the state eight-hour ozone standard. Plans to attain these standards already accommodate the future growth projections available at the time these plans were prepared. Any development project capable of generating air pollutant emissions exceeding regionally-established criteria is considered significant for purposes of CEQA analysis, whether or not such emissions have been accounted for in regional air planning. Furthermore, any project that would directly cause or substantially contribute to a localized violation of an air quality standard would generate substantial air pollution impacts. The same is true for a project that generates a substantial increase in health risks from toxic air contaminants, or introduces future occupants to a site exposed to substantial health risks associated with such contaminants.

In response to the Notice of Preparation (NOP) for this EIR, the Monterey Bay Unified Air Pollution Control District (MBUAPCD) made recommendations for the scope of work for the EIR's air quality analysis. The City has followed those recommendations.

Setting

Regional and Local Climate and Topography[1]

Climatological conditions, an area's topography, and the quantity and type of pollutants released commonly determine ambient air quality. The proposed project is located in the NCCAB, which covers an area of 5,159 square miles along the central California coast. The northwest sector of the NCCAB is dominated by the Santa Cruz Mountains. The Diablo Range marks the northeastern boundary. The Santa Clara Valley extends into the northeastern tip of the basin. Further south, the Santa Clara Valley becomes the San Benito Valley, which runs northwest-southeast, with the Gabilan Range as its western boundary. To the west of the Gabilan Range is the Salinas Valley, which extends from Salinas at the northwest end to south of King City. The coastal Santa Lucia Range defines the western side of the valley.

Climate, or the average weather condition, affects air quality in several ways. Wind patterns can remove or add air pollutants emitted by stationary or mobile sources. Inversion, a condition where warm air traps cooler air underneath it, can hold pollutants near the ground by limiting upward mixing (dilution).

[1] The greenhouse gas and global climate change environmental setting is included in **5.0 CEQA Considerations** in this Draft EIR.

Communities with cold climates may burn wood or other fuels for residential heating, whereas areas with hot climates may have higher emissions or some pollutants from automobiles. Topography also plays a part, as valleys often trap emissions by limiting lateral dispersal.

A semi-permanent high pressure cell in the eastern Pacific, the Pacific High, is the basic controlling factor in the climate of the NCCAB. In the summer, the high pressure cell is dominant and causes persistent west and northwest winds over the entire California coast. Air descends in the Pacific High, forming a stable temperature inversion of hot air over a cool coastal layer of air. The onshore air currents pass over cool ocean waters to bring fog and relatively cool air into the coastal valleys. The warmer air aloft acts as a lid to inhibit vertical air movement. The generally northwest-southeast orientation of mountainous ridges tends to restrict and channel the summer onshore air currents. Surface heating in the interior portion of the Salinas and San Benito Valleys creates a weak low pressure that intensifies the onshore air flow during the afternoon and evening. In the fall, the surface winds become weak, and the marine layer grows shallow, dissipating altogether on some days. The air flow is occasionally reversed in a weak offshore movement, and the relatively stationary air mass is held in place by the Pacific High pressure cell, which allows pollutants to build up over a period of a few days. It is most often during this season that the north or east winds develop to transport pollutants from either the San Francisco Bay Area or the Central Valley into the NCCAB.

During the winter, the Pacific High migrates southward and has less influence on the NCCAB. Air frequently flows in a southeasterly direction out of the Salinas and San Benito Valleys, especially during night and morning hours. The general absence of deep, persistent inversions and the occasional storm systems usually result in good air quality for the basin as a whole in winter and early spring.

The project site is located east of Highway 101 on the eastern border of the City of Soledad, about 35 miles southeast of Monterey Bay, and about 25 miles south of Salinas. Winds from the northwest are most common in Soledad and the rest of the Salinas Valley. In general, wind flow is aligned along the valley orientation. In the winter, winds tend to flow down the Salinas Valley from the southeast toward Monterey Bay, averaging about 2.6 miles per hour (mph). In the spring, winds tend to blow from the west (on-shore) averaging about 6.5 mph. In the fall, winds flow from the southeast during the night, and switch to the west and northwest by about 10 a.m., and average about 2.4 mph.[2] Rainfall in the area averages about 13.4 inches per year, with almost all substantial precipitation occurring between November and April. The presence or absence of winter storms and rainfall affect dust generation on plowed fields, wildfires, and other factors influencing local air quality. Temperatures are generally mild, with little winter frost, and summer maxima rarely exceeding 100 F.

Regulatory Context

Federal

Criteria Air Pollutants. The Federal Clean Air Act (CAA) authorized the establishment of federal air quality standards and set deadlines for their attainment. The CAA identifies specific emission reduction goals, requires both a demonstration of reasonable further progress and attainment, and incorporates more stringent sanctions for failure to meet interim milestones. The U.S. EPA is the federal agency charged with administering CAA and other air quality-related legislation. The North Central Coast Air Basin is classified as in attainment for all federal air quality standards since the revocation of the federal 1-hour ozone standard in June of 2005. The most recent Federal Plan prepared by Monterey Bay Unified Air Pollution Control District to maintain the federal 8-hour ozone standard is the 2007 Federal Maintenance

[2] *California Surface Wind Climatology,* California Air Resources Board, Modeling and Meteorology Branch, June 1989.

Plan for Maintaining the National Ozone Standard in the Monterey Bay Region (March 2007). This plan was prepared pursuant to the Clean Air Act because the North Central Coast Air Basin had an approved Maintenance Plan for the 1-hour ozone standard that has since been revoked, and the basin is in attainment of the 8-hour ozone standard.

The CAA of 1970, as amended, establishes air quality standards for several pollutants. National Ambient Air Quality Standards (NAAQS) are established for six "criteria" air pollutants: carbon monoxide (CO), nitrogen oxides (NO_x), ozone (O_3), respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), sulfur oxides (SO_x), and lead. Pursuant to the California Clean Air Act, the State of California has also established ambient air quality standards, the California Ambient Air Quality Standards (CAAQS). These standards are generally more stringent than the corresponding federal standards and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride and visibility reducing particles. Table 4.3-1 identifies the characteristics, health effects and typical sources of the six federal air pollutants.

Hazardous Air Pollutants (HAPs). One means by which the U.S. EPA addresses HAP exposure is through the National Emission Standards for Hazardous Air Pollutants (NESHAPS)[3] that include source-specific regulations that limit allowable emissions of such pollutants.

State

The California Air Resources Board (CARB) coordinates and oversees both state and federal air pollution control programs in California. As part of this responsibility, CARB monitors existing air quality, establishes state air quality standards, and limits allowable emissions from vehicular sources. Regulatory authority within established air basins is provided by local air pollution control agencies, which control stationary-source and most categories of area-source emissions and develop regional air quality plans. The project is located within the jurisdiction of the Monterey Bay Unified Air Pollution Control District.

The state and federal standards for the criteria pollutants are presented in Table 4.3-2. These standards are designed to protect public health and welfare. The "primary" standards have been established to protect the public health. The "secondary" standards are intended to protect the nation's welfare and account for air pollutant effects on soils, water, visibility, materials, vegetation and other aspects of general welfare.

Criteria Air Pollutants. California has established its own set of ambient air quality standards that are generally more stringent than the corresponding federal standards. The California Clean Air Act, effective January 1, 1989, provides a planning framework for attaining the state standards. Nonattainment areas in the state were required to prepare plans for attaining these standards. Attainment plans are required to demonstrate a five percent per year reduction in the emissions of nonattainment pollutants or their precursors, unless all feasible measures are being employed. The attainment status of the NCCAB with respect to these criteria pollutants is described under the section titled: "Air Pollutant Concentrations, Standards Violations and Risk Levels" below.

Toxic Air Contaminants (TACs). The state regulates TACs primarily through the Tanner Air Toxics Act (AB 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588). The Tanner Act institutes a formal procedure for designating substances as TACs. The procedure includes research, public participation, and scientific peer review before CARB designates a substance as a TAC.

[3] The NESHAPS are promulgated under Title 40 of the Code of Federal Regulations (CFR), Parts 61 & 63.

Table 4.3-1
Criteria Pollutants

Pollutant	Characteristics	Health Effects	Major Sources
Ozone (O_3)	A highly reactive photochemical pollutant created by the action of sunshine on ozone precursors (primarily reactive hydrocarbons and oxides of nitrogen). Often called photochemical smog. Highest concentrations of ozone are found downwind of urban areas.	▪ Respiratory function impairment.	Sources of ozone precursors (nitrogen oxides and reactive hydrocarbons) are combustion sources, such as factories and automobiles, and evaporation of solvents and fuels.
Carbon Monoxide (CO)	Carbon monoxide is an odorless, colorless gas that is highly toxic. It is formed by the incomplete combustion of fuels. CO concentrations are highest in the winter, when radiation inversions over large areas can limit vertical dispersion.	▪ Impairment of oxygen transport in the bloodstream. ▪ Aggravation of cardiovascular disease. ▪ Fatigue, headache, confusion, dizziness. ▪ Can be fatal in the case of very high concentrations.	Automobile exhaust, combustion of fuels, combustion of wood in woodstoves and fireplaces.
Nitrogen Dioxide (NO_2)	Reddish-brown gas that discolors the air, formed during combustion. Nitrogen dioxide levels in California have decreased in recent years due to reduced power plant and improved automobile emissions. Ambient standards are typically not exceeded in NCCAB.	▪ Increased risk of acute and chronic respiratory disease. ▪ Also, it is an ozone precursor.	Automobile and diesel truck exhaust, industrial processes, fossil-fuel powered plants. Also formed via atmospheric reactions.
Sulfur Dioxide (SO_2)	Sulfur dioxide is a colorless gas with a pungent, irritating odor. Ambient standards for sulfur dioxide are rarely exceeded in the NCCAB.	▪ Aggravation of chronic obstruction lung disease. ▪ Increased risk of acute and chronic respiratory disease.	Diesel vehicle exhaust, oil-powered power plants, industrial processes.
PM_{10} & $PM_{2.5}$	Solid and liquid particles of dust, soot, aerosols and other matter which are small enough to remain suspended in the air for a long period of time. PM_{10} is particulate matter with diameter less than 10 microns. $PM_{2.5}$ is particulate matter with diameter less than 2.5 microns. $PM_{2.5}$ has been found to be more harmful to humans.	▪ Aggravation of chronic disease and heart/lung disease symptoms.	Combustion, automobiles, field burning, factories and unpaved roads. Also, formed secondarily by photochemical processes of combustion emissions. $PM_{2.5}$ is primarily a secondary pollutant.

Table 4.3-2
Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	State Standard	Federal Standard	
			Primary	Secondary
Ozone	1-Hour 8-Hour	0.09 ppm (180 µg/m^3) 0.07 ppm (137 µg/m^3)	- - 0.08 ppm (157 µg/m^3)	- - 0.08 ppm (157 µg/m^3)
Carbon Monoxide	8-Hour 1-Hour	9.0 ppm (10 mg/m^3) 20 ppm (23 mg/m^3)	9.0 ppm (10 mg/m^3) 35.0 ppm (40 mg/m^3)	- - - -
Nitrogen Dioxide	Annual 1-Hour	0.030 ppm (56 µg/m^3) 0.18 ppm (338 µg/m^3)	0.053 ppm (100 µg/m^3) - -	0.053 ppm (100 µg/m^3) - -
Sulfur Dioxide	Annual 24-Hour 3-Hour 1-Hour	- - 0.04 ppm (105 µg/m^3) - - 0.25 ppm (655 µg/m^3)	0.03 ppm (80 µg/m^3) 0.14 ppm (365 µg/m^3) - - - -	- - - - 0.5 ppm (1,300 µg/m^3) - -
PM_{10}	Annual 24-Hour	20 µg/m^3 50 µg/m^3	- - 150 µg/m^3	- - 150 µg/m^3
$PM_{2.5}$	Annual 24-Hour	12 µg/m^3 no separate state standard	15 µg/m^3 35 µg/m^3	15 µg/m^3 35 µg/m^3
Lead	Calendar quarter	- -	1.5 µg/m^3	1.5 µg/m^3
	30-day	1.5 µg/m^3	- -	- -
Sulfate	24-Hour	25 µg/m^3	- -	- -
Hydrogen Sulfide	1-Hour	0.03 ppm (42 µg/m^3)	- -	- -
Vinyl Chloride	24-Hour	0.010 ppm (26 µg/m^3)	- -	- -
Visibility Reducing Particles	8-hours (10 am - 6 pm)	Extinction coefficient of 0.23 per km - visibility of ≥ 10 miles due to particles when relative humidity is < 70%.	- -	- -

mg/m^3 = milligrams per Cubic Meter
µg/m^3 = micrograms per Cubic Meter
Annual = annual arithmetic mean
ppm = parts per million

CARB adopts an Airborne Toxics Control Measure for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure below the threshold. If there is no safe threshold, the measure must incorporate Best Available Control Technology (BACT) to minimize emissions. For source categories under the regulatory jurisdiction of the individual air districts (as previously described), those air districts adopt and enforce the control measure locally.

Within California, the Office of Environmental Health Hazard Assessment (OEHHA) works with CARB to address health risk issues associated with TACs. The OEHHA establishes Reference Exposure Levels (RELs) as indicators of potential adverse health effects. An REL is a concentration level of a TAC at or below which no adverse health effects are anticipated. The OEHHA has published health *Risk Assessment Guidelines* for the Air Toxics Hotspots program. Within California, those guidelines are commonly referenced in the adoption of general health risk policies, assessment guidelines and thresholds at the regional level. OEHHA representatives have indicated that a comprehensive update to these guidelines is currently in the late stages of internal development, and is expected to include more specific guidance on addressing cancer risk in the context of relatively short-term exposures. OEHHA staff hopes to release the draft update and have the public review phase completed sometime in 2008. The published chronic inhalation REL for diesel particulate matter is 5 $\mu g/m^3$.

In August 1998 CARB listed "Particulate Matter Emissions from Diesel-Fueled Vehicles" as a TAC. In 2000, CARB developed a Risk Reduction Plan (RRP) to address this source of TACs, and is currently in the process of implementing this Plan. The RRP estimated cancer risk levels from diesel particulate matter (DPM) emissions associated with various source categories, including freeways, stationary engines, distribution (trucking) centers, truck stops and locations with concentrations of school bus idling. The RRP contains the following three components:

1) New regulatory standards for all new on-road, off-road, and stationary diesel-fueled engines and vehicles to reduce DPM emissions by about 90 percent overall from 2000 levels;

2) New retrofit requirements for existing on-road, off-road, and stationary diesel-fueled engines and vehicles where determined to be technically feasible and cost-effective; and

3) New Phase 2 diesel fuel regulations to reduce the sulfur content levels of diesel fuel to no more than 15 ppm to provide the quality of diesel fuel needed by the advanced DPM emission controls.

According to the RRP, "the projected emission benefits associated with the full implementation of this plan, including proposed federal measures, are reductions in DPM emissions and associated cancer risks [relative to a year 2000 baseline] of 75 percent by 2010 and 85 percent by 2020." Since adoption of the RRP, CARB has conducted regulatory activities to implement all three plan components. Examples include the "Diesel Particulate Matter Control Measure for On-road Heavy-duty Diesel-fueled Residential and Commercial Solid Waste Collection Vehicles" and Airborne Toxic Control Measures for stationary compression ignition engines; portable engines rated at 50 horsepower and greater; in-use diesel-fueled transport refrigeration units (TRU) and TRU generator sets, and facilities where TRUs operate; and diesel-fueled commercial motor vehicle idling.

In July of 2007, CARB approved a new regulation to reduce emissions from existing off-road diesel vehicles in California in construction, mining and other industries. The regulations requires vehicle fleets to either meet a set of fleet average targets for NOx and particulate matter or to turn over and apply exhaust retrofits to a certain percent of the fleets' horsepower (hp) per year. The first compliance date for large fleets is 2010, and for small fleets is 2015. This regulation is relevant to future construction under the Miravale III plan that would occur in 2010 or later depending upon the size and type of fleet of the relevant contractor(s).

In 2005, CARB published their *Air Quality and Land Use Handbook: A Community Health Perspective* (referred to hereafter as "Air Quality and Land Use Handbook"). This document includes various siting recommendations for proposed sensitive land uses relative to localized air pollution sources. Some of its recommendations are driven by exposure to TACs in general and DPM in particular. The *Air Quality and Land Use Handbook* recommends avoiding the siting of "new sensitive land uses within 500 feet of a

freeway, urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles/day." This recommendation is driven largely by the contribution of DPM to the overall air pollution impact from such transportation sources.

Regional

The MBUAPCD regulates air quality in the NCCAB, is responsible for attainment planning related to criteria air pollutants, and conducts district rule development and enforcement. It also reviews air quality analyses prepared for CEQA assessments and has published the *CEQA Air Quality Guidelines* document for use in evaluation of air quality impacts.

Criteria Air Pollutants. The California Clean Air Act, effective January 1, 1989, provides a planning framework for attaining the state standards. Nonattainment areas in the state were required to prepare plans for attaining these standards. Attainment plans are required to demonstrate a five percent per year reduction in the emissions of nonattainment pollutants or their precursors, unless all feasible measures are being employed. The North Central Coast Air Basin's designation with respect to the state ozone and PM_{10} standards is nonattainment. The County (and the remainder of the North Central Coast Air Basin) is designated as attainment with respect to the state CO and $PM_{2.5}$ standards. Therefore, the two key regional criteria pollutants in the North Central Coast Air Basin are ozone and PM_{10}. The California Clean Air Act (Health & Safety Code sections 40910 et seq.) requires each nonattainment district to adopt an Air Quality Management Plan showing how the California Ambient Air Quality Standards for ozone would be met in their area of jurisdiction. The fifth and most recent update to the original (1991) Air Quality Management Plan was adopted by Monterey Bay Unified Air Pollution Control District in June of 2008.

MBUAPCD have not recorded violations of the federal or state CO standard at monitoring stations. In connection with proposed land development projects, the MBUAPCD addresses potential CO exposure issues primarily through guidance on how and under what conditions local ambient CO "hot-spot" analysis should be performed in the context of air quality assessments for documents prepared pursuant to the CEQA.

MBUAPCD planning related to attainment of the state's PM_{10} standard was addressed in the *2005 Report on Attainment of the California Particulate Matter Standards in the Monterey Bay Region* (which updated corresponding 1995, 1996, and 1998 reports), *(Senate Bill 656 Implementation Plan).* This plan describes the greater vulnerability of coastal locations within the NCCAB to PM_{10} standard violations, due largely to the contribution from sea salt. It focuses primarily on controlling particulate sources related fugitive dust and smoke related to combustion, but also addresses NO_x- and ROG-related particulate formation. Consistent with the requirements of SB 656, and with the difficulty in estimating future ambient concentrations of particulate matter substantially influenced by fugitive dust sources (even disregarding unusual burn events), this plan concentrates on identification of and implementation scheduling for available PM emission control measures.

MBUAPCD regulates the creation of air pollutant emissions that would cause public nuisances while operating within the District under Rule 402. This rule states: "No person shall discharge from any source whatsoever such quantities of air contaminants or other materials which cause injury, detriment, nuisance, or annoyance to any considerable number of person or to the public; or which endanger the comfort, repose, health or safety of any such person or the public; or which cause, or have a natural tendency to cause, injury or damage to business or property." (HSC Section 41700)

Toxic Air Contaminants. MBUAPCD Rule 1000 (Permit Guidelines and Requirements for Sources Emitting Toxic Air Contaminants) addresses exposure issues for TACs in general. It applies to stationary

sources for which the state has not adopted an Air Toxics Control Measure (ATCM). It considers new and modified TAC source review and risk assessment requirements. The MBUAPCD's CEQA Air Quality Guidelines provide the following guidance to evaluate the potential significance of project-related TAC impacts:

> "Construction, equipment or processes not subject to Rule 1000 that emit noncarcinogenic TACs could result in significant impacts if emissions would exceed the threshold that is based on the best available data [i.e., acute (1-hour) REL, chronic (annual) REL, PEL/420] In addition, temporary emissions of a carcinogenic TAC that can result in a cancer risk greater than one incident per 100,000 population are considered significant.
>
> Likewise, a project which would be located adjacent to a source of TACs unregulated by Rule 1000 may also result in significant impacts to air quality and human health and require modeling. Common sources of TACs include diesel fueled internal combustion engines."

The MBUAPCD assumes that diesel particulate matter is the key element of diesel exhaust with respect to cancer risk. In November 2007, the Office of Environmental Health Hazard Assessment (OEHHA) released a draft document titled, Air Toxics Hot Spots Program Technical Support Document (TSD) for the Derivation of Noncancer Reference Exposure Levels for public review. This revised draft TSD presents methodology revised to reflect scientific knowledge and techniques developed since the previous guidelines were prepared, and to explicitly consider effects on the health of infants, children and other sensitive subpopulations, in accordance with the mandate of the Children's Environmental Health Protection Act (Senate Bill 25, Escutia, chapter 731, statutes of 1999, Health and Safety Code Sections 39669.5 et seq.). The MBUAPCD Board suspended application of the reference exposure level (REL, i.e., threshold) for acute impacts of acrolein in June 2007. MBUAPCD staff had planned to return to the Board in September 2007 with a recommendation regarding reinstatement. Due to the ongoing delay by the OEHHA in adopting a revised REL (expected in the fall of 2008 at the earliest), MBUAPCD suspension of the acute acrolein REL will continue through the end of 2008.

Local

The City of Soledad's Municipal Code Section 17.30.240.C Air Pollutants specifies a process whereby the City intends to ensure air pollution control "No emission of fly ash, dust, fumes, vapors, gases, or other forms of air pollution which can damage the health of humans or animals, or to vegetation or other forms of property is permitted."

Existing Ambient Air Quality

Air quality in the region is controlled by the rate of pollutant emissions and meteorological conditions. Meteorological conditions such as wind speed, atmospheric stability, and mixing height may all affect the atmosphere's ability to mix and disperse pollutants. Long-term variations in air quality typically result from changes in air pollutant emissions, while frequent, short-term variations result from changes in atmospheric conditions. While the City of Soledad enjoys air quality that meets most State and Federal standards, other parts of the air basin do not. Surface winds often move pollutants from their emission source to other areas where an impact may be felt. The primary determinant of concentrations of non-reactive pollutants (such as CO and PM_{10}) is proximity to major sources. As previously discussed, ambient CO levels usually closely follow the spatial and temporal distributions of vehicular traffic.

CARB (occasionally with the assistance of private sector partners) and relevant air pollution control districts operate a number of ambient air quality monitoring stations throughout the County and the remainder of the NCCAB. The MBUAPCD monitors air quality at 10 monitoring stations in the NCCAB. The National Park Service also operates a station at Pinnacles National Monument. The closest monitoring stations in the project vicinity are in Salinas (855 E. Laurel Dr.) and King City (at 750 Metz Road, and beginning in 2007, at 415 Pearl Street). Pollutants monitored on a continuous basis at the Salinas site include ozone, PM_{10} and $PM_{2.5}$, CO, and $NO_X - NO_2$, and at the King City sites include ozone and PM_{10}.

Areas that do not violate ambient air quality standards are considered to have attained the standard. Violations of ambient air quality standards are based on air pollutant monitoring data and are judged differently for each air pollutant. The NCCAB as a whole does not meet state ambient air quality standards for PM_{10} and ground level O_3. The U.S. EPA considers the region to be a maintenance area for the federal ozone standards since the 8-hour ozone standard has been attained. For all other standards, the U.S. EPA and the State have classified the region as attainment.

For three recent monitoring years (2005 – 2007), there was only one recorded exceedance of the state 8-hour ozone standard (0.078 ppm on July 22, 2006) at the King City monitoring station. There were no other exceedances of a state or national air quality standards for ozone at the King City or Salinas monitoring stations recorded during that period. In addition, there were no exceedances of the CO, $PM_{2.5}$, and NO_2 standards at the Salinas Station and King City did not measure those pollutants. The exceedances of the state PM_{10} standard and highest concentrations measured at the Salinas and King City monitoring stations are shown in Table 4.3-3. The highest measurements and the only exceedance were reported at the Salinas monitoring station in 2006.

Table 4.3-3
Exceedances of the State PM_{10} Air Quality Standard*

Year	King City Monitoring Station	Salinas Monitoring Station
2005	0 days (38 $\mu g/m^3$)	0 days (37 $\mu g/m^3$)
2006	0 days (50 $\mu g/m^3$)	1 days (51 $\mu g/m^3$)
2007	0 days (25 $\mu g/m^3$)	0 days (39 $\mu g/m^3$)
*Number of days (highest concentration in micrograms/cubic meter, $\mu g/m^3$)		

Sensitive Receptors

Sensitive receptors or populations are more susceptible to the effects of air pollution than are the general population. Sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, and convalescent and retirement homes. The receptors that should be considered in the analysis of carbon monoxide levels include the following, as set forth in the MBUAPCD CEQA Air Quality Guidelines:

- Sidewalks where general public has access on a continuous basis (1-hour)
- Parking lots where pedestrians have continuous access (1-hour)
- Property lines of hospitals, rest homes, schools, playgrounds (1-hour and 8-hour)
- Property lines of residences where continuous outdoor exposure is expected (1- and 8-hour)
- Setbacks of residences where continuous exposure is expected (1-hour and 8-hour)

Existing sensitive receivers in the project vicinity include the Rose Farrero School and existing residences within the City of Soledad that abut the project site along most of its south-facing boundary.

Emissions

Criteria Air Pollutants. Table 4.3-4, summarizes the most recent emissions inventories for Monterey County and the NCCAB as a whole. As shown in Table 4.3-4, on-road motor vehicles represent only one of many categories of emissions sources within the County and NCCAB. However, such vehicles account for nearly half of total human-generated CO and NO_x emissions. Both area-wide and mobile sources contribute substantially to emissions of ROG. For PM_{10}, emissions from "miscellaneous processes" are dominant. Construction-related activities also contribute to regional air pollutant emissions. Such activities account for an estimated six percent of County- and Basin-wide PM_{10} emissions under the "Area-Wide Sources: Miscellaneous Processes" category, a large proportion of the approximately six percent of "Area-Wide Sources: Solvent Evaporation" emissions of ROG attributed to the application of architectural coatings and asphalt paving, and a small proportion of the estimated emissions in the "Mobile Sources: Other Mobile" category.

Toxic Air Contaminants. Table 4.3-5 summarizes estimated County-wide emissions of TACs relevant to the project. (No data were available for asbestos from this reference.) While Table 4.3-4 reported emissions estimates in units of tons per day, this table reports such estimates in units of tons per year. Note that "Other Mobile" sources are estimated to account for more than half of County-wide emissions of DPM, while County-wide lead emissions are attributed primarily to area-wide sources (which, for the latter, could include demolition-related activities).

For TACs, impacts are often evaluated ultimately in terms of cancer risk or (for non-cancer effects) in terms of proportions of applicable risk exposure levels (RELs). At the present time, one can infer from the cancer risk mapping published by the ARB's Emission Inventory Branch that areas within the City of Soledad – including all of the designated land use areas within the proposed project site – are exposed to average inhalation cancer risk levels between 50 and 250 cases per million people, based on a lifetime of breathing air toxics. While this range is wide, it puts into context the incremental cancer risk thresholds that are discussed later in this section.

Greenhouse gas emissions and climate change existing conditions are discussed in 5.0 CEQA Considerations of this Draft EIR.

City of Soledad General Plan

The Conservation/Open Space Element of the General Plan guide the City's future appearance and protection of natural resources. Numerous goals and policies of the General Plan are intended to protect and conserve natural resources. The following air quality policies apply to development within the project area.

Policy C/OS-13 The City will encourage the improvement of air quality in Soledad and in the region by implementing the measures described in the Monterey County Air Quality Management Plan. Such measures include, but are not limited to, measures to reduce dependence on the automobile and encourage the use of alternate modes of transportation such as buses, bicycles and walking.

Policy C/OS-14 The City shall, to the extent feasible, separate sensitive land uses from significant sources of air pollution.

Policy C/OS-16 The City shall promote and encourage the use of alternate modes of transportation by incorporating public transit, bicycle, and pedestrian modes in City transportation planning and by requiring new development to provide adequate pedestrian and bikeway facilities.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential air quality impacts associated with the adoption and implementation of the General Plan, including future development within the project area. This program level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III Specific Plan project. According to the General Plan EIR, the following air quality impacts were identified:

- The General Plan accommodates a considerable increase in the City's population over the next twenty or more years which may hamper the efforts to achieve and maintain federal and state air quality standards. This impact was identified as adverse but not significant.

- Motor vehicle trips associated with buildout of the General Plan will contribute to a cumulative adverse impact on regional air quality. This impact is considered significant, adverse and unavoidable.

- Buildout of the General Plan will degrade the operation of intersections within the City's Plan area which may lead to CO "hotspots" where the sate or federal standard may be violated. This impact is considered adverse but not significant.

Miravale III Specific Plan

The project incorporates many policies that act as mitigation measures consistent with *CEQA Guidelines* recommendations. Such measures include the following Specific Plan Circulation policies:

- Traffic calming devices may be implemented on collector roads to discourage excessive traffic speeds.

- Bus stops linking to the MST (Monterey-Salinas Transit) system shall be provided at logical locations within the Plan Area.

- Bus service connecting the Plan Area to the proposed train station shall be explored.

- Bike lanes and paths shall be designed and maintained to improve bicycling safety, convenience, and encourage people to use bicycles to commute to work or school.

- New development shall provide bike lanes and paths, secure bicycle storage and parking facilities.

Relevant Project Characteristics

The Miravale III Specific Plan proposes a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course.

Construction of the project is anticipated to begin in 2008 and be completed no later than 2028. Approximately 2.05 million cubic yards of earthmoving is anticipated to occur on site with no import or export of soil.

Thresholds of Significance

The project site is located within the jurisdictional boundary of the Monterey Bay Unified Air Pollution Control District (MBUAPCD). Based on the *CEQA Air Quality Guidelines* adopted by the MBUAPCD, significant impacts would occur when: [4],[5]

- Specific plans or projects conflict with or obstruct implementation of the applicable air quality plan.
- Projects affect the attainment and maintenance of regional ozone levels by emitting 137 pounds per day (lb/day) or more of an ozone precursor air pollutant, which are VOC or NO_x.
- Projects locally affect particulate matter levels by emitting greater than 82 lbs/day of PM_{10} on site and cause an exceedance of the State PM_{10} standard at an existing or reasonably foreseeable receptor as averaged over 24 hours.
- Specific plans or projects cause or contribute to an exceedance of a CO standard as measured by Level of Service (LOS) degradation at a project-effected intersection and confirmed by dispersion modeling. This applies to project-affected intersections with substantial traffic that are degraded from a LOS of E or worse.
- Specific plans or projects expose sensitive receptors or the general public to substantial levels of toxic air contaminants.
- Specific plans or projects create or expose a substantial number of people to objectionable odors or nuisances.

The MBUAPCD emissions thresholds apply to projects and not specific plans. Since the project includes a vesting tentative map, the MBUAPCD thresholds would apply to each phase. For cumulative impacts, the MBUAPCD recommends that the project be assessed for consistency with the 2008 Air Quality Management Plan for the North Central Coast Air Basin. This was done by requesting a formal consistency determination from the Association of Monterey Bay Area Governments (AMBAG). In their letter dated February 21, 2007, AMBAG determined that the proposed project is consistent with the Monterey Bay area AQMP. A copy of this determination is included in Appendix E..

The specific plan does not include siting of sensitive receptors (e.g. residences) near roadways with sufficient volumes to expose sensitive receptors to unhealthy air pollution levels. CARB recommends a

[4] *CEQA Air Quality Guidelines,* Monterey Bay Unified Air Pollution Control District, 1995, with revisions through February 2008.
[5] Letter from MBUAPCD, dated September 19, 2006, commenting on the NOP for Miravale III Specific Plan from Jean Getchell to Mr. Don Fleming, City of Soledad.

buffer of 500 feet between sensitive receptors and freeways or rural roads with an average of 50,000 vehicles or more per day.[6]

Greenhouse Gas Emissions/Global Climate Change Significance Thresholds

No air districts have approved significance thresholds for greenhouse gas (GHG) emissions or a methodology for analyzing air quality impacts related to greenhouse gas emissions. With the adoption of AB 32, the state has set a goal of reducing GHG emissions to 1990 levels by 2020. It has been acknowledged by previous EIRs addressing this issue that it is not always possible to determine if a project would be consistent with the AB 32 goals. CO_2 emissions do not create environmental effects; rather it is the cumulative increased concentration of CO_2 (and other GHGs) in the atmosphere that results in global climate change and associated consequences. While it is possible to estimate the project's CO_2 emissions, it is typically not possible to determine whether those emissions (however small) would manifest into significant environmental impacts. The complexity of global and regional-scale physical, chemical, atmospheric, terrestrial, and aquatic systems preclude a meaningful determination of whether the CO_2 emitted by a single project would result in a measurable or even, non-negligible change in climate. A quantitative standard of significance is not used in this EIR because of the global nature of the analysis required. This Draft EIR addresses global climate change issues within the cumulative section (see 5.0 CEQA Considerations). The discussion in 5.0 CEQA Considerations, states that the Specific Plans contribution to cumulative global climate change (and associated significant cumulative impacts) may be considered significant if, due to the size or nature of the project, it would generate a substantial increase in GHG emissions relative to existing or cumulative conditions. In addition, the discussion in 5.0 CEQA Considerations considers whether or not the project would result in greenhouse gas emissions that would hinder or delay the State's ability to meet the reduction targets contained in AB 32.

Impacts and Mitigation

Construction Period Impacts –PM_{10} from Fugitive Dust

Construction would primarily be accomplished using diesel powered heavy equipment. Dust is generated from a variety of project construction activities that include grading, import/export of fill material, and vehicle travel on unpaved surfaces. Dust from construction includes PM_{10}. Soil can also be tracked-out onto paved roads where it is entrained in the air by passing cars and trucks. Additionally, dust can be generated by wind erosion of exposed areas. The rate of dust emissions is related to the type and size of the disturbance, meteorological conditions, and soil conditions. Construction activities can result in localized high concentrations of PM_{10} and affect regional levels of PM_{10}. High levels of PM_{10} can lead to adverse health effects, nuisance concerns, and reduced visibility.

The MBUAQMD CEQA Guidelines consider on-site emissions of 82 pounds per day or greater of PM_{10} from construction activity to be significant. Due to the variables that affect construction emissions, quantification of construction period emissions is difficult. The initial phases of construction that generate the highest emissions of PM_{10} from fugitive dust would be of most concern. The site would be constructed in four phases, each lasting about 5 years and assumed to begin in 2008.

Detailed grading plans were not available, although total cut and fill has been estimated. Therefore, detailed construction emissions cannot be quantified. During other construction phases, additional material would be imported to the site. This would include base rock, select soil/gravel for trenches and building pads, concrete, and asphalt for paving. Building materials would also be imported to the site.

[6] *Air Quality and Land Use Handbook: A Community Health Perspective*, California Air Resources Board, April 2005

Fugitive dust emissions would occur during each of the construction phases. The greatest amount of dust emissions would be generated during the initial grading phase where the soil disturbance activities would be the most intense (i.e., cut and fill activities involving scrapers and other equipment). The other construction phases would generate dust emissions, but of a lesser degree than grading since the intensity of soil disturbance activities would be reduced.

Uncontrolled daily fugitive dust emissions can be approximated for grading construction activities using emission factors developed as part of a study conducted for the South Coast Air Quality Management District (MRI, 1996). This study developed fugitive dust (PM_{10}) emission factors for construction activities at seven sites in Las Vegas, Coachella Valley, the South Coast area, and in the San Joaquin Valley. A general overall emission factor of 0.11 tons per acre per month would represent typical daily emissions. On the most active days during grading, emissions may be higher. The identified worst-case overall emission factor that would apply to the most intense construction sites was 0.42 tons per acre per month. The study developed specific emission factors that require specific construction information such as the amount of earthwork and the detail of control measures. Since that type of information is generally not available, overall emission factors were used to estimate daily emissions.

One of the sites studied in the MRI report was in the San Joaquin Valley, a 40-acre commercial development in Fresno (Site 5.2). This site was the most similar to the proposed project site, and therefore, those emission factors were applied to this project. For the Fresno site, an overall typical worst-day construction emission factor of 4.1 pounds per acre per work hour was developed. This emission factor includes emissions associated with general construction activities, as well as those from intensive earth-moving activities. Using this emission factor for the proposed project would result in emissions of 82 pounds per day if 2.5 acres were actively graded in one day with some dust control measures. Grading activity that encompasses more than 2.5 acres in a single day could result in on-site PM_{10} emissions exceeding 82 pounds per day without additional mitigation. When specific project details and grading activities are known, better emission estimates could be made to refine construction plans and possibly remain below the 82 pound per day threshold with a larger area of disturbance.

In addition, PM_{10} emissions would occur as a result of wind erosion over disturbed areas during dry windy conditions and from vehicle track out. These emissions are not accounted for in the emission factors applied to grading and construction activities. Ordinarily, these emissions would be considerably small in comparison with grading activities. Emissions from wind erosion are difficult to predict since one has to know the area that is disturbed enough so that wind could cause erosion and then a wind speed above a certain threshold has to occur for a known duration. Wind erosion emissions would vary considerably, but could be controlled through active watering of the site throughout the construction period, including days that construction is not occurring, but soils are disturbed.

Given the size of the project sites likely to be built out under the specific plan and the possibility that construction could occur simultaneously on different areas throughout the site, grading activity areas could exceed 2.5 acres per day. This would result in a significant impact to air quality. Implementation of the following mitigation measure would not result in any new environmental impacts beyond those identified in this EIR.

Impact **Construction activities, such as clearing, excavation and grading operations, construction vehicles traffic on unpaved ground, and wind blowing over exposed earth would generate dust and particulate matter.** ***This is a significant and unavoidable impact.***

Mitigation

4.3-1 Prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall, at a minimum, include the following measures:

- Limit grading activity to a maximum of 2.5 acres daily. As more detailed construction information becomes available, emissions from grading activities could be reassessed to determine if the area of grading could be increased. Such an assessment would have to be conducted using appropriate assumptions and mitigation measures.
- Water all active construction areas at least twice daily and more often during windy periods. Active areas adjacent to existing businesses should be kept damp at all times. If necessary, during windy periods, watering is to occur on all days of the week regardless of onsite activities.
- Cover all trucks hauling trucks or maintain at least two feet of freeboard.
- Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.
- Sweep daily all paved access roads, parking areas and staging areas at construction sites.
- Sweep streets daily if visible soil material is deposited onto the adjacent roads.
- Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more).
- Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles.
- Limit traffic speeds on unpaved roads to 15 mph.
- Replant vegetation in disturbed areas as quickly as possible.
- Suspend excavation and grading activity when hourly-average winds exceed 15 mph and visible dust clouds cannot be contained within the site.

The combined effect of the above measures, including the use of a dust suppressant, which represent Best Management Practices, and limiting the size of the grading area would reduce project impacts to a l*ess-than-significant* level only if emissions can be limited to 82 pounds per day or subsequent dispersion modeling of construction activities demonstrates that PM_{10} concentrations from construction activity would not cause an exceedance of the State ambient air quality standard, as averaged over 24 hours. Since limits to construction activities are probably not feasible for this project and dispersion modeling conducted at this time (due to lack of detailed construction plans), the impact is considered to remain **significant with mitigation.**

Construction Period Impacts –Diesel exhaust from equipment

The California Air Resources Board has identified diesel particulate matter as a toxic air contaminant. It is one of many toxic air contaminants; however, it is estimated to contribute about 70% to the overall potential inhalation cancer risk. Improved diesel engines technologies along with reformulated diesel fuel are expected to substantially lower the risk from diesel exhaust.

The heavy construction equipment utilized to construct this project would be diesel fueled. Grading of the site is expected to result in the highest emissions of diesel particulate matter during the construction period. Grading plans are not known at this time, therefore, the amount and types of equipment and their schedule cannot be determined. The projects could be constructed in a series of projects over many years.

There are typically two different periods of grading: a "rough" grading phase that requires excavators and a dozers and then a "fine" grading phase that may include motor graders, rollers, scrapers, and loaders. This equipment is typically used from 4 to 8 hours per day. Other phases of construction use smaller sized equipment (e.g., some loaders, forklifts, etc.), but include numerous heavy-duty truck deliveries for cement, asphalt, building materials, and landscape materials.

The Miravale III site is fairly open and flat. There are residential neighborhoods bounding the southern project border. Since the projects are likely to be constructed in phases, new occupants of earlier phases of the project could become sensitive receptors affected by construction.

Construction equipment can emit substantial amounts of NOx that could have a small, but potentially cumulative affect on ozone concentrations or other health effects. The MBUAPCD CEQA guidelines do not have thresholds that apply to these emissions. Therefore, the impact is considered less-than-significant if reasonable and feasible measures to reduce emissions are employed.

Diesel exhaust includes air contaminants that can cause health effects. The increased health risk from these types of emissions (i.e., increased cancer risk) are calculated over a 70-year continuous exposure period at locations of sensitive receptors. Truck travel and construction equipment exhaust may result in elevated levels of diesel particulate matter for short time periods. However, these activities would occur for such a relatively short period that the impact would be considered as less-than-significant provided that mitigation measures are implemented to minimize exposure to sensitive receptors. Implementation of the following mitigation measure would not result in any new environmental impacts beyond those identified in this EIR.

Impact **Construction activities would involve use of the heavy-duty off-road equipment and large trucks that use diesel fuel resulting in emissions of diesel particulate matter and NOx.** ***This is a significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation.***

Mitigation

4.3- 2 Projects developed under the specific plan should be evaluated for individual construction period air quality impacts. Project-specific mitigation measures would be identified at that time. However, the following mitigation measures should be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment:

- All off-road construction vehicles/equipment greater than 100 horsepower that will be used on site for more than one week shall: 1) be manufactured during or after 1996, and 2) shall meet the NOx emissions standard of 6.9 grams per brake-horsepower hour. Alternatively, the project shall implement a combination of the following emission reduction measures on some or all of the above described vehicles equipment, subject to approval by the MBUAPCD:
  - Use alternative fuels (such as biodiesel blends),
  - Require diesel particulate matter filters on equipment,
  - Require diesel oxidation catalyst on equipment.
- The contractor shall install temporary electrical service whenever possible to avoid the need for independently powered equipment (e.g. compressors).
- Diesel equipment standing idle for more than five minutes shall be turned off. This would include trucks waiting to deliver or receive soil, aggregate or other bulk materials. Rotating drum concrete trucks could keep their engines running continuously as long as they were onsite and staged away from residential areas.

- Properly tune and maintain equipment for low emissions.
- Stage large diesel powered equipment at least 200 feet from any active land uses (e.g., residences).
- Limit the pieces of equipment used at any one time.
- Minimize the use of diesel-powered equipment (i.e., wheeled tractor, wheeled loader, roller) by using gasoline-powered equipment.
- Limit the daily hours of operation for heavy-duty equipment.

Plan Generated Operational Impacts

Regional Pollutants

The Specific Plan proposes development of 1,470 single-family residences and 2,730 multi-family residences, in addition 120-room hotel, 275,000 square feet of retail, an 18-hole golf course as well as schools and parks. The project's traffic analysis forecasts that the Miravale III specific plan would generate about 35,504 daily vehicle trips. Emissions from these trips would affect regional air quality in terms of contributing to possible exceedances of ambient air quality standards for ozone. Direct and indirect emissions from each phase of the proposed specific plan were calculated using the latest available version of the URBEMIS model (i.e., URBEMIS 2007 ver. 9.2.2) distributed by Rimpo Associates through www.urbemis.com and the updated model template provided through the MBUAPCD website. Specific Plan related emissions were calculated in accordance with the proposed phasing schedule.

The model predicts daily emissions associated with the land use developments. The model combines predicted daily traffic activity associated with the different land use types, with emission factors from the State's mobile emission factor model (i.e., EMFAC2007). The project sizes and estimated traffic generation were input to the URBEMIS 2007 model to predict daily emissions of ROG, CO, NOx and PM_{10}. Specific plan traffic generation provided by Hexagon Transportation Consultants, Inc. for the DEIR, was used in the model to provide daily traffic generation estimates based on selected land uses. The URBEMIS 2007 model default for passby trips was used as a worst-case estimate, rather than trip reduction percentages provided by the traffic engineer. In addition, the mix of uses mitigation and local serving retail mitigation were used based on the reduction of internal trips due to proposed mixed uses.

The URBEMIS 2007 model also predicted area source emissions associated with the build out of the specific plan uses. Area source emissions of CO were predicted for winter in accordance with the MBUAPCD CEQA Guidelines. The project emissions were predicted for a normal weekday representative of the traffic generated used for the traffic study. Daily emissions from the build out of the specific plan are reported in Table 4.3-6. Complete model output is provided in the Air Quality Report contained in Technical Appendix T-2. Emissions from the project would vary over time as the project is built out and emission rates change due to improvements in overall vehicle emission controls. MBUPAPCD does not have quantifiable thresholds that apply to specific plans. The emissions information provided are for informational purposes.

Table 4.3-6
Daily Project Emissions based on URBEMIS2007 Modeling

Scenario	Volatile Organic Compounds (VOC) - Summer	Nitrogen Oxides (NOx) – Summer	Carbon Monoxide (CO) – Winter	Respirable Particulates (PM_{10}) - Summer
Phase 1 (2008 – 2013)				
Area Emissions	27 lbs.	7 lbs.	24 lbs.	>1.0
Operational Emissions	48 lbs.	64 lbs.	509 lbs.	71 lbs.
Total	75 lbs.	71 lbs.	534 lbs.	71 lbs.
Phase 2 (2013 – 2018)				
Area Emissions	133 lbs.	26 lbs.	73 lbs.	>1.0
Operational Emissions	122 lbs.	160 lbs.	1304 lbs.	278 lbs.
Total	255 lbs.	187 lbs.	1377 lbs.	278 lbs.
Phase 3 (2018 – 2023)				
Area Emissions	167 lbs.	32 lbs.	91 lbs.	>1.0
Operational Emissions	106 lbs.	116 lbs.	1049 lbs.	337 lbs.
Total	274 lbs.	149 lbs.	1139 lbs.	337 lbs.
Phase 4 (2023 – 2028)				
Area Emissions	252 lbs.	46 lbs.	116 lbs.	>1.0
Operational Emissions	112 lbs.	109 lbs.	1061 lbs.	426 lbs.
Total	364 lbs.	155 lbs.	1178 lbs.	426 lbs.

Source: URBEMIS2007 Air Emissions From Land Use Ver. 9.2.2

Note: These numbers reflect URBEMIS "mitigated emissions" which are proposed design features of the project.

Emissions from the project would vary over time as the project is built out and emission rates change due to improvements in overall vehicle emission controls. During the interim build-out period, NOx emissions would be highest after build out of Phase 2, which is assumed to occur in 2018. Future total NOx emissions after 2023, with buildout of Phases 3 and 4, would be less than combined Phase 1 and 2 emissions. Combined build out of Phase 1 through 4 would have NOx emissions below the combined build out of Phase 1 and 2 even though additional traffic trips would be generated. This is due to the implementation of more stringent vehicle emissions standards and fleet turnover. Turnover occurs when older, more polluting vehicles, are replaced with newer and cleaner vehicles that have durable emission control systems.

On the other hand, VOC emissions are affected by use of consumer products and new motor vehicle trips. Substantial VOC emissions would occur from increased emissions of consumer products associated with new residential development in the air basin. A wide variety of consumer products that include air fresheners, household cleaners, automotive products, and personal care products result in VOC emissions. CARB does develop requirements for consumer products aimed at reducing VOC emissions. Current CARB estimates used to develop the countywide emissions inventory indicate that these emissions may be lower than reported in Table 4.3.7. In any event, emissions of ROG/VOC would be expected to

exceed the MBUAPCD thresholds when projects under this specific plan are developed. This would continue to be mostly attributable to the use of consumer products by new residences. As a result, significant impacts to regional air quality, with respect to emissions of ozone precursors are predicted.

The MBUAPCD thresholds for PM_{10} only apply to onsite emissions of PM_{10}. These would include wood smoke emissions. The addition of new residences for all phases could result in significant emissions from wood burning in open-type fireplaces. Use of low-emitting wood burning devices or elimination of wood burning stoves and fireplaces would mitigate this impact and should be considered in the Specific Plan.

Since build-out of the Miravale III Specific Plan would result in emissions of NOx and VOCs that exceed MBUAPCD thresholds, the impact is considered significant. Implementation of the following mitigation measure would not result in any new environmental impacts beyond those identified in this EIR.

Impact **Implementation of the proposed specific plan would result in increases in long-term operational emissions of ozone precursor pollutants. These emissions would exceed significance thresholds established by the MBUAPCD.** ***This represents a significant and unavoidable impact since these emissions could contribute to potential exceedances of ambient air quality standards for ozone.***

Mitigation

4.3- 3 The project shall apply the following measure to the extent appropriate for the specific land uses proposed:

- Develop a Transportation Demand Management Program with the intent of reducing vehicle trips and vehicle miles traveled associated with build out of the specific plan. Components of this plan may include:
  - Develop parking strategies for commercial and retail uses that reduce single occupant vehicle trips.
  - Provide bicycle storage/parking facilities.
  - Provide shower/locker facilities in light industries and office uses.
  - Provide onsite or near site child care centers for large employment centers.
  - Develop park-and-ride lots.
  - Provide opportunities to include or increase transit service to plan area.
- Include plans to incorporate safe and efficient modes of bicycle and pedestrian transportation. Bicycle routes and pedestrian paths should include amenities such as signs and traffic signal activation (e.g., loop activators).
- Identify energy efficiency goals for new developments that would conserve energy beyond requirements of the State Title 24 building code.
- Provide exterior electrical outlets on new buildings that encourage use of electrical landscape equipment.
- Prohibit open wood burning stoves or fireplaces in new residences unless they are EPA certified wood heaters that meet EPA's particulates matter emission standard of 7.5 grams per hour.

<u>Local Carbon Monoxide Concentrations</u>

Emission thresholds established for carbon monoxide apply to direct or stationary sources. Emissions of carbon monoxide (CO) emitted from traffic generated by the project are first evaluated by assessing the

impacts of specific plan-generated traffic on existing and future traffic conditions. The MBUAPCD guidelines require CO hotspot analysis under the following project conditions:

- Intersections where the Level of Service (LOS) would degrade below D
- Volume to capacity ratio increases by 0.05 at LOS E or F intersections
- The delay at LOS E or F intersections increases by 10 seconds or more
- Reserve capacity at unsignalized LOS E or F intersection decrease by 50 or more

Highest CO concentrations typically occur during the winter where traffic congestion occurs. Congested intersections with high volumes of traffic could cause CO "hot spots", where localized high concentrations of CO occur. This specific plan area is located in a fairly rural setting where traffic volumes are much lower than urban settings such as Salinas. The highest CO level measured in the District, which is representative of more urban settings, is well below the state standard.

The traffic study for the specific plan evaluated operations at intersections in the area. Several intersections with stop sign controls were predicted to have LOS E or F conditions in the future. However, these intersections would not have large enough volumes to warrant a CO "hot spot". The degraded LOS is the result of a single approach being delayed by a stop sign. Mitigation measures were identified by the Traffic Engineer to improve the LOS to an acceptable level. As a result, modeling of CO concentrations was not conducted to analyze the specific plan impacts. CO impacts associated with acceptable intersection operation would not exceed State or federal ambient quality standards. As a result, the impacts are considered **less-than-significant**.

Project Stationary Sources

Stationary sources of air pollutants that could be associated with uses of the light industrial or commercial uses have not been identified. Light industrial or commercial uses could include sources of air pollution that may adversely affect sensitive receptors such as nearby proposed residences. Such common sources are emergency generators that use diesel fuel, dry cleaning operations, gas stations, and truck loading areas. The exact nature of possible on-site stationary sources cannot be determined at this time; thus specific air impacts from these potential sources to future occupants of project cannot be estimated. However, these types of sources may require construction and operational permits from MBUAPCD, which would include new source review and possible application of Best Available Control Technology emission control measures. Since they would need to comply with all applicable MBUAPCD regulations, regulated stationary on-site sources are generally not considered to have significant air quality impact. Stationery sources that are exempt from MBUAPCD permit requirements because they fall below emissions thresholds for permitting would not be considered to have a significant air quality impact. For this reason, this impact is considered *less-than-significant.*

The Miravale III project does not include any known light industrial or commercial uses with potential air pollutants sources that could adversely impact adjacent or nearby residences proposed as part of the project. **This would be a less-than-significant impact.**

Nuisances and Odors

Typical sources of objectionable odors include chemical plants, sewage treatment plants, large composting facilities, rendering plants, and other large industrial facilities that emit odorous compounds. This specific plan would not include any such activities and thus would not create objectionable odors. The project is not considered to create significant odors.

Land uses near the specific plan area are generally vacant undeveloped land or lands used for agricultural uses. Vacant or undeveloped lands with no approved future uses do not pose a potential for nuisances caused be odors or dust generation. The plan would include residences along the western boundary that would be adjacent to active farming lands. Agricultural activities could result in short-term nuisances that could affect these lands. The most common nuisance could be blowing dust. The project would lie downwind of these fields most of the time, especially during spring and summer when northwest winds are persistent. New residences may experience frequent episodes of dust blowing across their property. This would result in conflicts between existing agricultural and new residential uses. With adequate buffers to reduce wind blown dust to new residences, this impact would be reduced to **less–than-significant impact.** For more information regarding agricultural buffers, please refer to **Section 4.2 Agricultural Resources.**

Greenhouse Gas Emissions/Global Climate Change

The environmental impact and mitigation measures discussions regarding greenhouse gas emissions and global climate change issues are provided in 5.0 CEQA Considerations of this Draft EIR.

4.4 BIOLOGY

Introduction

This section assesses the existing biological conditions within the proposed project, identifies the potential occurrence of special-status plant species, wildlife species, and sensitive habitats at the project site, and discusses potential project-related impacts to those resources. In addition, this section recommends mitigation measures to avoid or reduce any potential impacts that have been identified.

This section provides the results of the *Preliminary Biological Assessment Report for the Proposed Miravale Phase III Specific Plan, City of Soledad, CA.* prepared by Denise Duffy & Associates, Inc. (Preliminary BA, DD&A June 2008), field reconnaissance surveys, a wetland assessment, and special-status species assessments and surveys conducted by Denise Duffy & Associates, Inc. (DD&A) and subconsultants. A copy of these reports are included as Technical Appendix T-3 in Volume II of this EIR.

Based on the data collected from these surveys and a review of applicable laws and policies, this section includes the following: 1) description of applicable policies, regulations, and agency permits that may be required (Regulatory Environment); 2) identification of the special-status botanical and wildlife species and sensitive habitats that occur or may occur within the project site; and 3) assessment of the impacts to biological resource and identification of avoidance and mitigation measures to reduce impacts in accordance with CEQA. A discussion of consistency with local policies protecting biological resources is contained in **Section 4.9 Land Use**.

Regulatory Environment

Federal Endangered Species Act

Provisions of the federal Endangered Species Act (ESA) of 1973 (16 USC 1532 *et seq.*, as amended) protect federally listed threatened or endangered species and their habitats from unlawful take. Listed species include those for which proposed and final rules have been published in the Federal Register U.S. Fish and Wildlife Service or NOAA Fisheries (formerly known as the National Marine Fisheries Service). The ESA is administered by the USFWS and NOAA Fisheries. In general, NOAA Fisheries is responsible for the protection of ESA-listed marine species and anadromous fish, whereas other listed species are under USFWS jurisdiction.

Federal Candidate species are "taxa for which (USFWS) has on file sufficient information on biological vulnerability and threats to support issuance of a proposed rule to list, but issuance of the proposed rule is precluded." Federal Candidate species are not afforded formal protection, although USFWS encourages other federal agencies to give consideration to Candidate species in environmental planning. In 1996, the USFWS discontinued the Category 3 and 4 classifications for federal Candidate species (USFWS, 1996). Species either are identified as Candidate species with a listing priority classification, designated as federal "species of concern" or are no longer given any federal status.

Section 9 of ESA prohibits the take of any fish or wildlife species listed under ESA as endangered. Take, as defined by ESA, is "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Harm is defined as "any act that kills or injures the species, including significant habitat modification." In addition, Section 9 prohibits removing, digging up, and maliciously damaging or destroying federally listed plants on sites under federal jurisdiction. Section 9 does not prohibit take of federally listed plants on sites unless those sites are under federal jurisdiction. If there is the potential for take of a federally listed species, a Section 7 (federal agency) or Section 10 (private land owner) USFWS Incidental Take Permit may be required to authorize the "incidental take" of

that species. Federal agency actions include activities that are on federal land, conducted by a federal agency, funded by a federal agency, or authorized by a federal agency (including issuance of federal permits).

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1918 prohibits killing, possessing, or trading migratory birds except in accordance with regulation prescribed by the Secretary of the Interior. Most actions that result in "take" or in permanent or temporary possession of a protected species constitute violations of the MBTA. The USFWS is responsible for overseeing compliance with the MBTA.

Wetlands and Waters of the U.S.

Natural drainage channels and wetlands are considered Waters of the United States (Waters). The U.S. Army Corps of Engineers (USACOE) regulates the filing or grading of such Waters under Section 10 of the Rivers and Harbors Act and Section 404 of the Clean Water Act. The extent of jurisdiction within drainage channels is defined by Ordinary High Water (OHW) marks on the banks of the feature. Jurisdictional wetlands are delineated by the presence of hydrophytic soils, hydrology, and vegetation. Activities that involve discharge or fill into jurisdictional waters are subject to the permit requirements of the ACOE. Discharge permits are typically issued on the condition that the project proponent provides mitigation which results in no net loss of wetland function or value. In addition to individual discharge permits, the ACOE issues nationwide permits applicable to certain activities. Under the nationwide permits, discharge of fill must be minimized to the extent practicable. No discharge permit can be issue until the Regional Water Quality Control Board (RWQCB) issues a certification (or waiver) that the proposed activity will meet state water quality standards. The RWQCB is also responsible for enforcing National Pollutant Discharge Elimination System (NPDES) permits, including the General Construction Activity Storm Water Permit.

State Laws and Regulations

California Endangered Species Act

The California Endangered Species Act (CESA) was enacted in 1984. The California Code of Regulations (Title 14, Section 670.5) lists animal species considered endangered or threatened by the state. Section 2090 of CESA requires state agencies to comply with endangered species protection and recovery and to promote conservation of these species. Section 2080 of the Fish and Game Code prohibits "take" of any species that the commission determines to be an endangered species or a threatened species. "Take" is defined in Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." It does not include habitat destruction in the definition of take. A Section 2081 Incidental Take Permit from the CDFG is required to "take" any state listed species.

Native Plant Protection Act

The California Native Plant Protection Act (NPPA) of 1977 directed the CDFG to carry out the legislature's intent to "preserve, protect, and enhance rare and endangered plants in the state." The Act prohibits importing rare and endangered plants into California, taking rare and endangered plants, and selling rare and endangered plants. The CESA and NPPA authorized the California Fish and Game Commission to designate endangered, threatened, and rare species and to regulate the taking of these species (§2050-2098, Fish and Game Code). Plants listed as rare under the NPPA are not protected under CESA.

California Fish and Game Code

CDFG has jurisdiction over the bed and bank of natural drainages according to provisions of Section 1601 and 1603 of the California Fish and Game Code. Activities that would disturb these drainages are regulated by CDFG via a Streambed Alteration Agreement. Such an agreement typically stipulates certain measures that will protect the habitat values of the hydrologic feature being impacted.

Raptors (e.g., eagles, hawks, and owls) and their nests are protected under both federal and state laws and regulations. Section 3503 of the CDFG Code prohibits the killing, possession, or destruction of bird eggs or bird nests. Section 3503.5 and 3513 prohibit the killing, possession, or destruction of all nesting birds (including raptors and passerines). Section 3503.5 states that it is "unlawful to take, possess, or destroy the nest or eggs of any such bird except otherwise provided by this code or any regulation adopted pursuant thereto." Section 3513 prohibits the take or possession of any migratory non-game birds designated under the federal MBTA. Section 3800 prohibits take of non-game birds.

The classification of Fully Protected was the state's initial effort in the 1960's to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish (Section 5515), mammals (Section 4700), amphibians and reptiles (Section 5050), and birds (Section 3511). Most Fully Protected species have also been listed as threatened or endangered species under the more recent endangered species laws and regulations. Fully Protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation for the protection of livestock.

The CDFG also maintains a list of animal "species of special concern," most of which are species whose breeding populations in California may face extirpation if current population trends continue. Although these species have no legal status, the CDFG recommends considering these species during analysis of proposed project impacts to protect declining populations and avoid the need to list them as endangered in the future.

The Natural Heritage Division of the CDFG administers the state Rare Species Program. The CDFG maintains lists of designated endangered, threatened, and rare plant and animal species. Listed species either were designated under the NPPA or designated by the Fish and Game Commission. In addition to recognizing three levels of endangerment, the CDFG can afford interim protection to Candidate species while they are being reviewed by the CDFG Commission.

Other State Conservation Programs

Under provisions of Section 15380(d) of CEQA, the project lead agency and CDFG, in making a determination of significance, must treat non-listed plant and animal species as equivalent to listed species if such species satisfy the minimum biological criteria for listing. In general, the CDFG considers plant species on List 1 or 2 of the California Native Plant Society's (CNPS) *Inventory of Rare and Endangered Vascular Plants of California* (Tibor 2001) as qualifying for legal protection under this CEQA provision. Species on CNPS List 3 or 4 may, but generally do not, qualify for protection under this provision.

City of Soledad General Plan

The Conservation and Open Space Elements of the General Plan guide the City's future physical and spatial form, and appearance. Numerous goals and policies of the General Plan are intended to protect sensitive biological resources. The following "Plant, Animal, and Related Habitat Protection" and "Tree Preservation/Landscaping" resource policies apply to development within the proposed project area.

Policy C/OS-10 The City shall support State and federal laws and policies to preserve populations of rare, threatened, and endangered species by ensuring development does not adversely affect such species in a significant way or by fully mitigating adverse effects.

Policy C/OS-11 The City shall require that significant natural, open space, and cultural resources be identified in advance of development and incorporated into site-specific development project design to the extent feasible.

Policy C/OS-17 When considering the approval of activities that result in the removal of mature trees, the following factors shall be considered:

a. The size, age, health and species of tree(s) to be removed.
b. Whether or not the removal of the tree(s) is necessary for the reasonable development and use of the site.
c. Whether the tree(s) to be removed is (are) a native or introduced species.

Policy C/OS-18 The City shall institute and promote a vigorous program of tree planning in new development areas and in older portions of the City to increase the number and density of tree cover.

Policy C/OS-19 When mature trees are removed to accommodate new development, they shall be replaced at a ratio of at least two new trees for every one tree removed, or such additional number and size.

In addition, the following Programs are recommended in the General Plan:

Program 8.7 The City shall work toward the public acquisition as open space of areas with significant ecological resources where such resources cannot be effectively preserved through the regulatory process. Public protection may take the form of free acquisition and/or open space easements and may be carried out in cooperation with other local, State and federal agencies, and private entities.

Program 8.8 The City shall develop and adopt an ordinance requiring the dedication of open space lands, or the payment of open space mitigation fees, to provide and maintain open space. The ordinance shall further define geographic areas of benefit.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential biological impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale Phase III project. The General Plan EIR identified significant impacts due to the permanent conversion of 3,500 acres of potential foraging habitat for certain special status animal species. The EIR also cited potential disturbance of special status plant or animal species (nesting raptors, burrowing owls, etc.) and increased erosion potential as a potential significant impact. The EIR concluded that urbanization will result in long-term indirect impacts, including light, and noise, and would contribute to the cumulative loss of foraging areas for special status species within the Salinas Valley.

Miravale Phase III Specific Plan

Section 4.0 of the Miravale Phase III Specific Plan identifies Parks, Recreation, and Open Space goals and policies regarding the physical development of the proposed project site. For instance, approximately

28 percent of the 920 acre Plan Area is devoted to parks, open space, and recreation including a golf course, public parks, and natural open space. Four neighborhood parks, six village parks, a linear park, and a trail system are also available to serve Plan Area residents. Finally, approximately 62 acres of passive open space have been designated to preserve viewsheds and provide a recreational trail system.

Although the proposed project requires open space and parkland, proposed open spaces and parks are not designed or intended to conserve existing biological conditions of the site. Specific guidance for the preservation and/or protection of sensitive habitats and/or special-status plant and wildlife species are not presented in the Miravale Phase III Specific Plan. However, the "Hillside Development Standards & Guidelines" present the following general guidelines:

> "The City of Soledad is situated in the mid-Salinas Valley at the base of the Gabilan Mountains. The mountains provide a backdrop to the City of Soledad. It is the intent to preserve this natural asset by assuring that development on the hillside:"

- Maintains the existing open rural character;
- Is in harmony with the natural setting;
- Conserves land forms and other features of the natural landscape;
- Preserves wildlife habitat and movement corridors;
- Protects and preserves viewsheds of the mountains; and
- Promotes the establishment of native trees and shrubs.

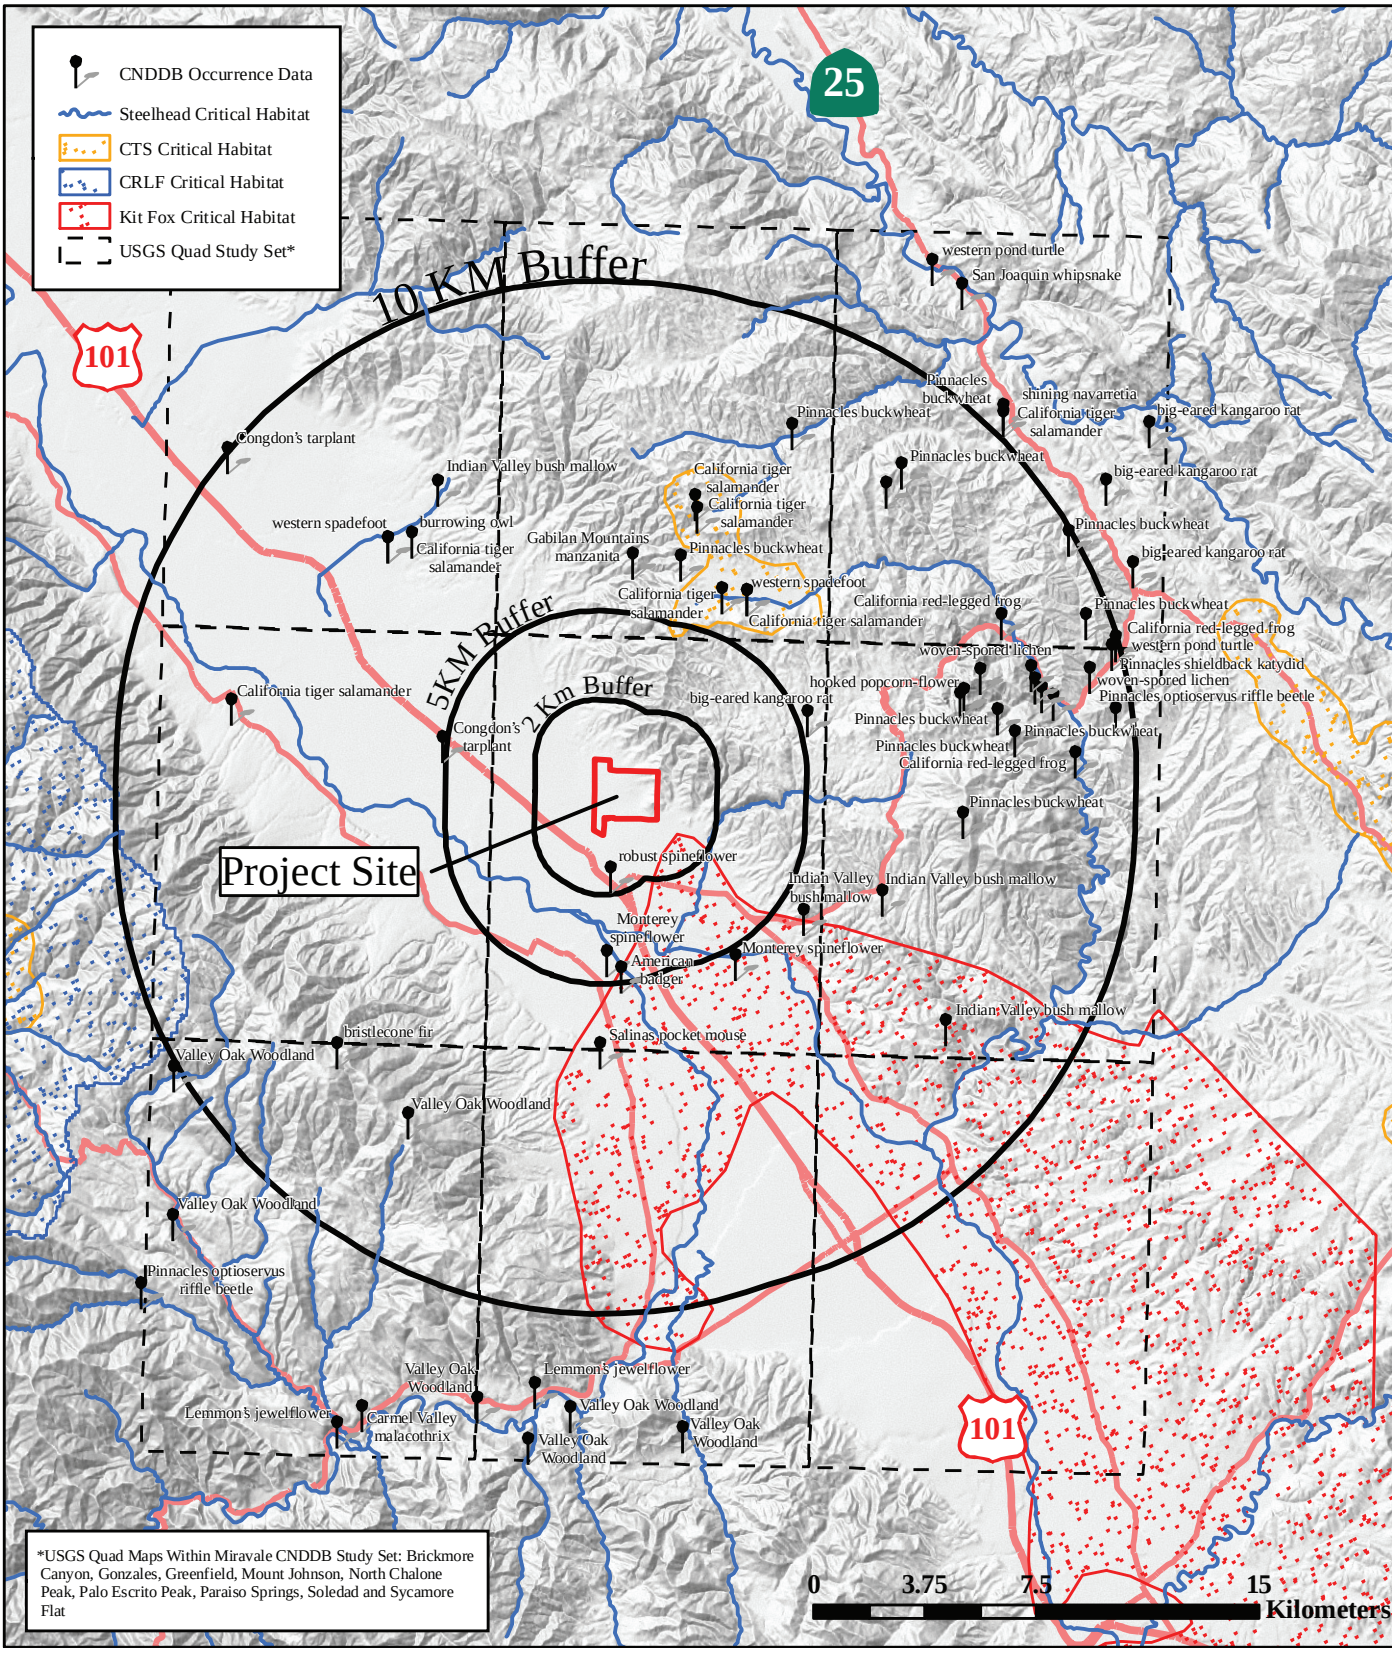
Relevant Project Characteristics

The majority of the lowland portion of the project site is currently in active agricultural production or fallow but typically dedicated to agricultural production. Active and fallow agricultural areas represent appropriate foraging and dispersal habitat for a variety of wildlife species and limited habitat for special-status plant species. The grassland portions of the site associated with the Gabilan foothills are relatively undeveloped and are not currently grazed; these areas provide valuable plant and wildlife habitat and habitat connectivity. The Specific Plan calls for the replacement of the existing agricultural and grazing uses with a mixed-use urban development consisting of new roads and infrastructure, single-family and multi-family residential units, retail commercial space, a golf course, school and public safety sites, and open space and recreation areas. The project would require extensive grading on the site to facilitate construction of proposed uses. According to the project applicant's engineer, proposed grading would occur throughout most of the site and would involve approximately 2.05 million cubic yards (CY) of cut/fill.

The proposed project would result in direct impacts to the vast majority of available onsite plant and wildlife habitat through grading and conversion to a residential area. The proposed project would remove a linear arrangement of Eucalyptus and Tamarisk trees along San Vicente Road, and several oak trees in the northeast corner of the site. The proposed project would also result in the removal of an onsite reservoir and agricultural basin that represent sensitive habitats. Although substantial grading to pre-project conditions is planned, proposed "open space" portions of the site (including the 62 acres of grasslands) are not designed or suitable as plant and wildlife habitat conservation areas. The pedestrian trail proposed in the grassland portion of the site would result in ongoing disturbance to any wildlife utilizing this area.

Description of the Existing Conditions

Biological Assessment

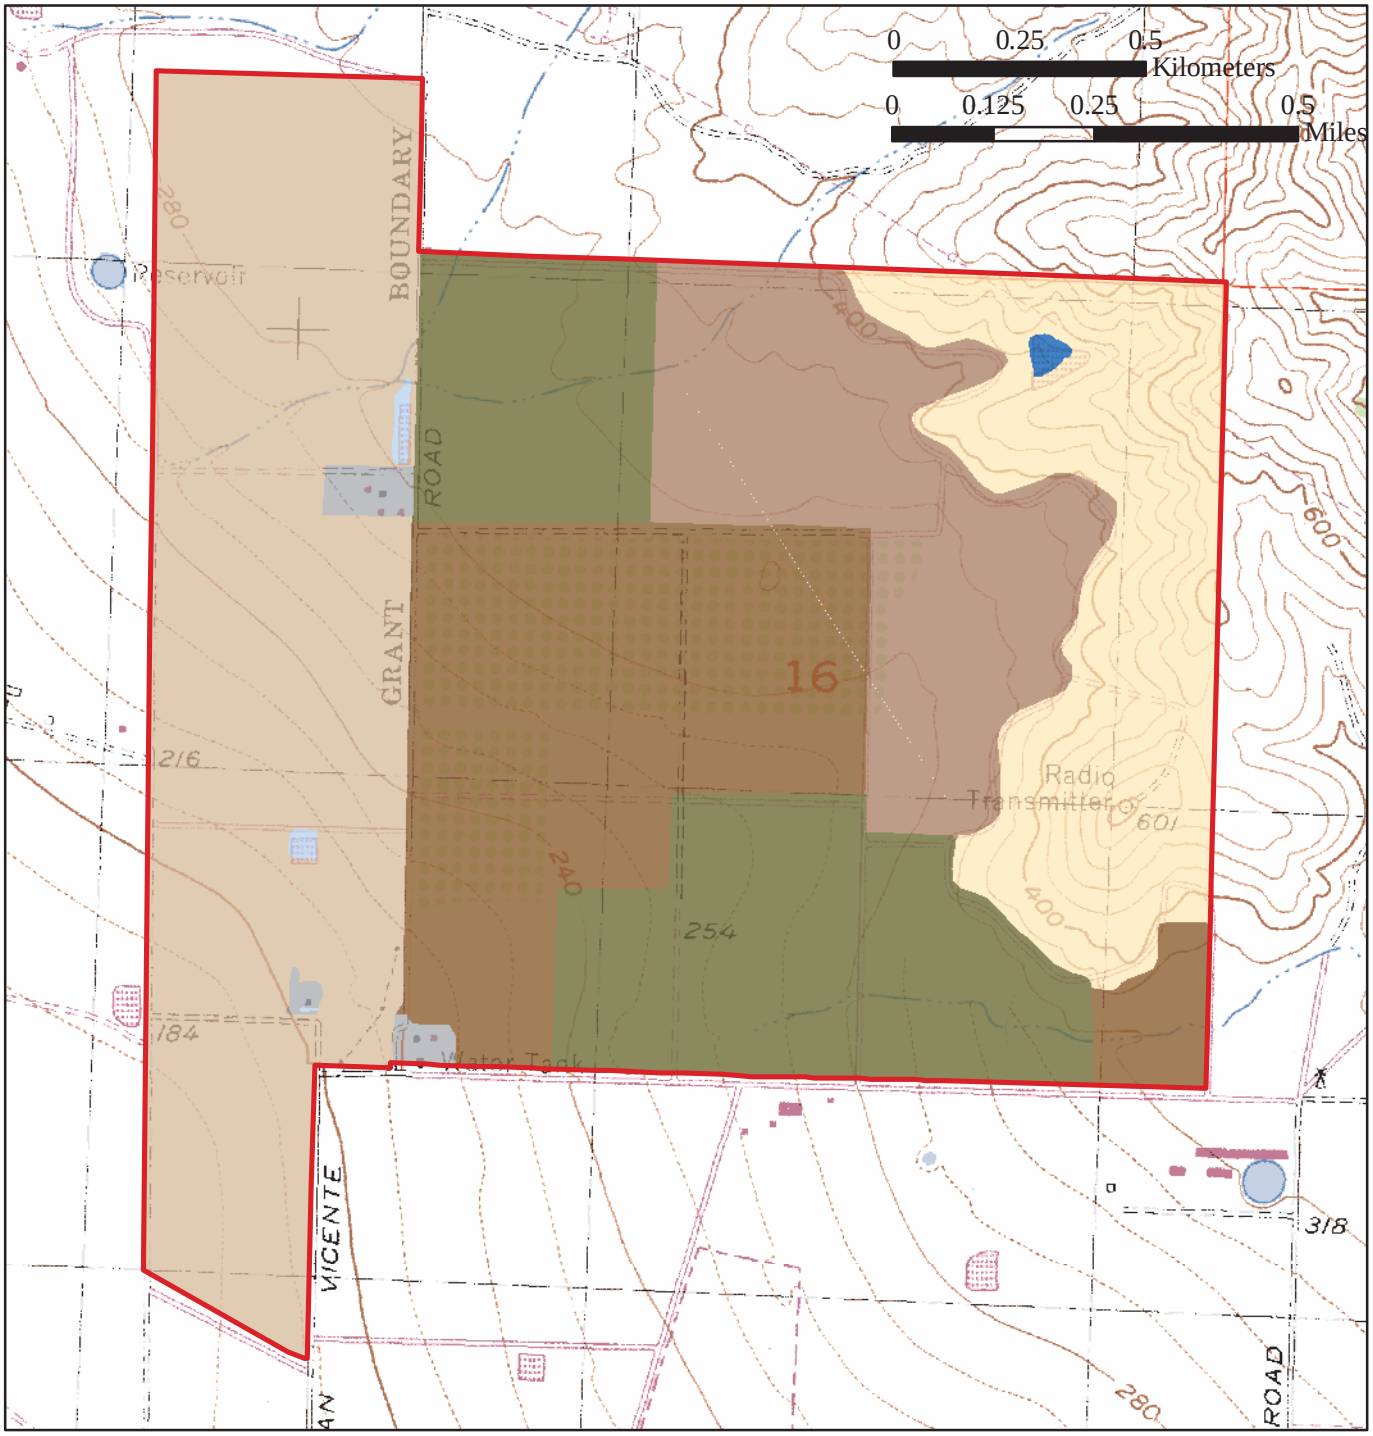


DD&A was contracted to assess the potential presence of special-status plants, animals, and/or habitats within the proposed Miravale III residential development in the City of Soledad, CA, and prepared the Preliminary BA in June 2008. Please refer to the Preliminary BA for a thorough presentation of methods, surveying personnel (including subconsultants), general site characteristics, and vegetative communities. As presented within the Preliminary BA, the project site supports seven generalized habitat types; active agriculture (461.7 acres), fallow agriculture (314.8 acres), mixed grasslands (141.3 acres), rocky outcrops, reservoir (1.2 acres), agricultural basins (< 0.5 acres each), and disturbed areas (home sites). Please refer to Figure 4.4-1 for a presentation of special-status species occurrences in the vicinity of the Miravale III project site as reported by the California Natural Diversity Database (CNDDB, CDFG 2007). Please refer to Figure 4.4-2 for aerial imagery and habitat mapping of the project site, and to Figures 4.4-3a and 4.4-3b for representative site photos.

Sensitive Habitats

Based on a review of the CNDDB in combination with the DD&A site assessments, the following sensitive habitat types are present: aquatic resources (reservoir and agricultural basins) and federal and state listed wildlife species habitat.

No wetland delineations were undertaken at the Miravale III project site, but a wetland assessment was completed that documented the presence of fringe wetlands. A small vegetated fringe wetland exists adjacent to the onsite reservoir. In addition, fringe wetlands are associated with the agricultural basins to the east of San Vicente Road. A total of approximately 0.17 acres of fringe wetlands of marginal habitat value were documented on site. Please note that these types of fringe wetlands are not typically USACOE jurisdictional given current regulations regarding Section 404 of the Clean Water Act. Moreover, existing on-site wetlands are not hydrologically or geographically linked with other bodies of water or jurisdictional wetlands and are therefore not considered jurisdictional for the purposes of this analysis. Although only the USACOE can determine whether on-site wetlands are considered jurisdictional, the onsite fringe wetlands are not considered to be jurisdictional for the purposes of this analysis for the reason provided above. Impacts to these areas would also be regulated by ESA if any listed or special-status wildlife species utilize these areas as breeding habitat.



Although mixed grassland habitats are not typically considered a "sensitive habitat," San Joaquin kit fox are known or assumed present within project boundaries, particularly in the mixed grassland portions of the site. Any impact to a habitat which is known or assumed to support a federally listed wildlife species may represent "take" under the Endangered Species Act. In addition to the known federally listed wildlife species in the grassland portions of the site, these areas were documented to support the following California species of special concern: American badger (*Taxidea taxus*), Salinas pocket mouse (*Perognathus inornatus psammolphilus*), western burrowing owl, loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). As such, impacts to grassland habitat would impact a variety of federal and/or state protected species and this habitat; mixed grasslands represent a sensitive habitat under CEQA.

Special-status Plant Species

The CNDDB reports an occurrence of robust spineflower (*Chorizanthe robusta* var. *robusta*) approximately 2 km south of the project site. In addition, the CNDDB reports occurrences of Congdon's tarplant (*Centromadia parryi* ssp. *congdonii*), Indian valley bush mallow (*Malacothamnus aboriginum*), and Gabilan Mountains manzanita (*Arctostaphylos gabilanensis*) within 5 miles of the project site. The CNDDB also reports that Monterey spineflower (*Chorizanthe pungens* var. *pungens*) critical habitat is present within 2 km of the project site. However, appropriate habitat does not exist on site to support any of these species. Lemmon's jewelflower (*Caulanthus coulteri* var. l*emmoni*) is known to occur approximately 10 miles from the project site. Jolon's clarkia (*Clarkia jolonensis*) has been reported to occur within 1.25 miles of the project site. The CNDDB does not report the presence of any special-status plant species within or immediately adjacent to the proposed project boundaries and none were identified by DD&A biologists during any of the site visits. The only plant species with the potential to occur within the project boundaries, Lemmon's jewelflower, is discussed below. Please note that no other special-status plant species are anticipated within project boundaries for the species-specific reasons provided in Appendix F of this EIR.

Lemmon's jewelflower

Lemmon's jewelflower is a CNPS List 1B species. Lemmon's jewelflower is an annual herb associated with open, grassy areas; on hillside slopes and in fields, canyons, and arroyos. Typical soils include alkaline, shaley clay, sandstone talus, and decomposed serpentine. As this species is associated with valley grassland communities, and was not identifiable at the time of the site assessments, it is possible that this species occurs within project boundaries but was not identified. For this reason, it is recommended that a Spring-time (March-May) floristic survey of appropriate portions of the site be conducted to assess the presence/absence of this species within project boundaries.

Special-status Wildlife Species

The CNDDB reports occurrences of the following species within 10 km of the project site: big-eared kangaroo rat (*Dipodomys elephantinus*), American badger, Salinas pocket mouse, Western spadefoot (*Spea hammondii*), San Joaquin whipsnake, Western burrowing owl, California tiger salamander, California red-legged frog (*Rana draytonii*), and a variety of bat and raptor species. The following species are assessed for their potential presence/absence within project boundaries. Please note that no other special-status wildlife species are anticipated within project boundaries for the species-specific reasons provided in Appendix F.

American badger

The American badger is a California State Species of Special Concern. The CNDDB reports an occurrence of this species approximately 3.5 km south of the project site. DD&A and Biosearch biologists observed a badger emerge from an onsite den on July 11, 2007. In addition, DD&A and Biosearch observed badger, burrows/dens in multiple locations of the grassland portions of the site and noted the presence of "badger diggings" in both grassland and fallow agricultural portions of the site. Therefore, American badger are known to be present within project boundaries.

Salinas pocket mouse

The Salinas pocket mouse is a California state Species of Special Concern. The CNDDB reports an occurrence of Salinas pocket mouse approximately 6.5 km south of the project site. Presence of this species was confirmed on September 1, 2006 when a male Salinas pocket mouse was trapped at the site.

Therefore, Salinas pocket mouse are known to occur in the mixed grassland/foothill portions of the project site.

San Joaquin kit fox

The San Joaquin kit fox (SJKF) is a federally Endangered and state Threatened species. The kit fox typically inhabits valley alkaline scrub, valley and foothill grasslands, and open oak woodlands of low to moderate relief. Kit foxes are largely dependent on rodent burrows, such as those of California ground squirrel, which they enlarge as den sites. Home ranges vary in size, depending on prey availability, however average home range is approximately 500 hectares. The CNDDB reports several occurrences of SJKF approximately 10 km east of the project site (Figure 4.4-1). In addition, the CNDDB reports the presence of SJKF critical habitat within 10 km of the Miravale III site. One active "natal den" was identified onsite by the Biosearch biologists.

The Miravale III project site is located within the historic distribution of SJKF and represents an encroachment in the foothills of the Gabilan Range (a known corridor for this species). Biosearch wildlife biologists prepared a "San Joaquin Kit Fox Early Evaluation Report" of the project site for USFWS review. Based on USFWS Ventura review of this early evaluation report, protocol-level SJKF northern-range protocol-level surveys were recommended (pers. comm. Roger Root, USFWS). A determination of SJKF absence from the proposed project site could only be supported by completing the protocol for this species and having a negative finding. Rather than completing protocol-level surveys for this species, the City of Soledad is assuming SJKF presence.

Pallid bat

The pallid bat (*Antrozous pallidus*) is a California Species of Special Concern. The CNDDB does not report any occurrences of this species within 10km of the project site, although they are known to occur at Pinnacles National Park, approximately 17 km northwest of the Miravale III project site. DD&A biologists did not observe or identify any pallid bats while onsite, however, this species is considered potentially present within and/or adjacent to the Miravale III project site given the mixed availability of appropriate foraging and roosting habitat.

Townsend's big-eared bat

Townsend's big-eared bat (*Corynorhinus townsendii townsendii*) is a California Species of Special Concern. The CNDDB does not report any occurrences of this species within 10km of the project site, however big-eared bats are considered potentially present within and/or adjacent to the Miravale III project site given the mixed availability of appropriate foraging and roosting habitat.

Western mastiff bat

Western mastiff bats (*Eumops perotis*) are a California Species of Special Concern. The CNDDB presents occurrences of this species approximately 8-10 km east to northeast of the Miravale III project site. DD&A biologists did not observe this species at the project site, but Mastiff bats are considered potentially present within and/or adjacent to the Miravale III project site given the availability of appropriate foraging and roosting habitat.

Western spadefoot

Western spadefoot is a California State Species of Special Concern. The CNDDB reports an occurrence of this species approximately 5km northwest of the project site. DD&A biologists did not observe any

adult spadefoot within the project boundaries however the project site is within the range of spadefoot and marginally appropriate breeding habitat is present at the onsite reservoir and associated fringe wetlands. As such, spadefoots are potentially present within project boundaries.

California tiger salamander

California tiger salamander is a federally Threatened and is also a designated California state Species of Special Concern. Critical Habitat for CTS (70 FR 49379-49458) went into effect on September 22, 2005. CTS is a large, stocky salamander that inhabits grasslands and oak savanna habitats in the valleys and low hills of central and coastal California. Adults spend most of their lives underground, typically in burrows of small mammals. During winter rains between November and February, adults emerge from underground retreats to breed. Adults have been found more than 2 km (1.24 miles) from breeding sites. Eggs are laid singly or in clumps on both submerged and emergent vegetation and on submerged debris in shallow water.

The CNDDB reports several occurrences of this species approximately 4.5 km north of the project site. In addition, the CNDDB reports the presence of CTS critical habitat within 4.5 km of the project site. Upland grassland habitats surrounding the pond represent appropriate estivation habitat for CTS. Tiger salamander larvae and paedomorphs were routinely detected at the onsite reservoir in the course of protocol-level surveys (aquatic sampling only) for this species (see below).

Brad Shaffer of U.C. Davis reports that multiple introductions on non-native tiger salamanders occurred in the nearby city of Gonzales, and that this portion of the Salinas Valley is a known "epicenter" of non-native genes in Monterey County (David Keegan, pers. comm.). The Shaffer Lab conducted genetic testing on 23 larval CTS tissue samples collected at the reservoir and reports that these animals range between highly hybridized to completely non-native (note: only 22 samples were successfully analyzed). The "nativeness" of these animals is summarized by the Shaffer Lab Report (Appendix E of the June 2008 Preliminary BA) via a Hybrid Index Score (HIS). HIS can range from 0.00 (pure native) to 1.00 (pure non-native). For the samples collected from the onsite reservoir, HIS values ranged from 0.8889-1.00 (i.e., 89-100% non-native). No genotyped individual can be described as "pure native." As such, coordination with USFWS regarding ESA jurisdiction over onsite hybrid/non-native tiger salamanders was initiated by DD&A on November 6, 2007. USFWS Ventura subsequently determined that tiger salamanders present at Miravale Pond 1 (onsite reservoir) are not subject to regulation under ESA and are therefore not within the regulatory jurisdiction of USFWS regulation (USFWS concurrence letter issued February 26, 2008 and presented in Appendix I of the June 2008 Preliminary BA).

California red-legged frog

California red-legged frogs (CRLF) are federally Threatened and are a state species of special concern. Critical Habitat for CRLF was designated by USFWS in April 2006 (FR 71 19243). The CNDDB reports several occurrences of this species approximately 8 km northeast of the project site. In addition, the CNDDB reports the presence of CRLF critical habitat approximately 10 km west of the project site. DD&A biologists did not observe any CRLF within project boundaries; however, given the presence of potential breeding habitat at the onsite reservoir and associated upland/estivation habitat, combined with the fact that the project site is located within the historic range of this species, CRLF are considered potentially present within project boundaries.

Coast horned lizard

The coast horned lizard (*Phrynosoma coronatum frontale*) is a California Species of Special Concern. The CNDDB does not report any occurrences of this species within 10 km of the project site. However,

given the availability of relatively undisturbed appropriate habitat for this species in the foothill portions of the site, it is anticipated that this species may be present at the project site.

Black-legless lizard

The black legless lizard (*Anniella pulchra ssp. nigra*), is a California Species of Special Concern. The CNDDB does not report any occurrences of this species within 10 km of the project site, however appropriate habitat for this species is present in the foothill/grassland portions of the site, particularly where sandy and/or friable soils are supported. Therefore, it is anticipated that this species may be present at the project site.

San Joaquin coachwhip

The San Joaquin coachwhip (a.k.a. whipsnake) is a California Species of Special Concern. The CNDD reports an occurrence of this species approximately 8 km south of the Miravale III project site. Appropriate habitat for this species is present within project boundaries, and it is therefore anticipated that this species may be present at the project site.

Western burrowing owl

Burrowing owls are a California Species of Special Concern. Burrowing owls are a year round resident of open, dry grasslands and shrublands with perches and burrows. Burrowing owls use rodent burrows (often California ground squirrel) for roosting and nesting cover. The CNDDB reports an occurrence of this species approximately 5 km northwest of the project site. DD&A and Biosearch biologists documented the presence of 3 burrowing owls and multiple active dens/burrows in the grassland/foothill and fallow agricultural portions of the site during the non-breeding season. Although an onsite grower related that burrowing owls had been observed in active agricultural portions of the site during the breeding season as recently as June 2006, the recent removal of grazing from grassland portions of the site may have reduced overall breeding season habitat quality for this species. Based on these observations, Western burrowing owls are known to utilize various habitats within the Miravale III project site during the non-breeding season.

White-tailed kite

The white-tailed kite is listed as a California Fully Protected species. In addition, this species is protected under both federal and state laws and regulation, including the Migratory Bird Treaty Act (1918, as amended) and CDFG Fish and Game Code Section 3503.5. The CNDDB does not report any occurrences of this species within 10 km of the Miravale III location; however, this species certainly occurs within that offset. Appropriate foraging habitat for this species is present throughout the mixed grassland and fallow agricultural portions of the site; however, typical nesting habitat is sparse. DD&A and BioSearch biologists have consistently observed white-tailed kites foraging over mixed grassland and fallow agricultural portions of the site during site assessments conducted in preparation of this report. White-tailed kites are assumed present, or occasionally present, within project boundaries.

Northern harrier

The northern harrier is a California Species of Special Concern. The CNDDB does not report any occurrences of this species within 10km of the Miravale III location; however, northern harriers certainly occur within that offset. DD&A and BioSearch biologists consistently observed Northern harriers foraging over the mixed grassland, fallow agricultural, and active agricultural portions of the site during our site assessments and field surveys. Appropriate foraging habitat for this species is present throughout

the site, and this species is assumed present, or occasionally present, within project boundaries. Potential nesting habitat for this species is present in the grassland portions of the site.

Golden eagle

Golden eagles (*Aquila chrysaetos*) are a California Fully Protected species and are an uncommon permanent resident and migrant throughout California, except in the center of the Central Valley. The CNDDB does not report any occurrences of this species within 10 km of the project site. However, Biosearch biologists monitor a known golden eagle nest in Stonewall Canyon, 3.9 km (2.4 miles) east of the site (Laabs, pers. com.). Appropriate foraging habitat for this species is present throughout the site (particularly the grasslands), and this species is anticipated to occur (or occasionally occur) within project boundaries. Nesting eagles are not anticipated within project boundaries given the lack of appropriate nesting habitat for this species.

Merlin

The merlin (*Falco columbarius*) is a California Species of Special Concern. This bird is a rare to uncommon spring and fall transient and winter visitor. They do not nest in California. The CNDDB does not report any occurrences of this species within 10 km of the project site and DD&A biologists did not observe this species during any site assessments. Although this species does not breed in Monterey County, appropriate wintering hunting/foraging habitat for this species is present throughout the project site. No resident merlins are present at the project site, but it is anticipated that this species may occasionally hunt/forage within project boundaries during the winter.

Prairie falcon

The prairie falcon (*Falco mexicanus*) is a California Species of Special Concern. The CNDDB does not report any occurrences of this species within 10 km of the project site and DD&A biologists did not observe this species during any site assessments. Although appropriate nesting habitat is not present within or immediately adjacent to the Miravale III project site, appropriate hunting/foraging habitat for this species is present throughout the project site (particularly the grasslands and fallow agricultural portions). While nesting falcons are not anticipated within or adjacent to project boundaries, this species may occasionally hunt/forage within project boundaries.

Loggerhead shrike

The loggerhead shrike is a California Species of Special Concern. The CNDDB does not report any records of this species within 10km of the project site, however the project site supports appropriate nesting and foraging habitats. Two loggerhead shrikes were observed foraging at the site on several occasions by DD&A and BioSearch biologists. Loggerhead shrikes are known to occur within project boundaries. Project build-out would result in the loss of all available foraging and nesting habitat for this species. Mitigation is presented to reduce impacts on nesting shrikes.

California horned lark

California horned larks (*Eremophila alpestris*) are a California Species of Special Concern. The CNDDB does not report any occurrences of this species within (or immediately adjacent to) the project boundaries, however appropriate nesting and foraging habitat for this species is present within the project boundaries. No horned larks have been observed onsite during site visits thus far. Given the presence of appropriate habitat, however, this species is deemed potentially present within the project boundaries.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service;
- have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service;
- have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance;
- conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan; or
- impede the use of native wildlife nursery sites or directly harm nesting species protected under the provisions of the Migratory Bird Treaty Act.

Impacts and Mitigations

Development of the proposed project has the potential to adversely impact a number of special-status and sensitive species as defined by CDFG and USFWS through habitat modification and the subsequent introduction of new urban features on a predominately undeveloped 920 acre project site. In addition, the transformation of the project site in accordance with the Miravale III Specific Plan would also directly interfere with the movement of a number of wildlife species and impede the movement of wildlife through a portion of the Gabilan Range, which is a known wildlife corridor for a number of protected and/or sensitive species as discussed above. Development of the proposed project is also anticipated to result in a number of direct and potentially significant impacts to wildlife species, including the San Joaquin kit fox, California red-legged frog, American badger, Salinas pockey mouse, black-legless lizard, coast horned lizard, San Joaquin coachwhip, and western spadefoot, as discussed in greater detail below. In addition, the proposed project also has the potential to impact special-status plant species, such as Lemmon's jewelflower. The purpose of the following analysis is to identify potential impacts associated with the development of the proposed project site and identify feasible mitigation to minimize the extent of impacts in accordance with the analysis contained in the Preliminary BA prepared by DD&A. For a more detailed analysis of project-related impacts, please refer to the Preliminary BA and supporting analysis, which is included as Technical Appendix T-3 in Volume II of the DEIR.

As discussed in greater detail below, the proposed project would represent a significant and unavoidable impact to San Joaquin kit fox. Hybridized/non-native tiger salamanders known to occur at Pond 1 (onsite reservoir) are not jurisdictional under ESA (USFWS concurrence letter issued February 26, 2008 and presented in Appendix I of the Preliminary BA). If it is determined that California red-legged frog are present onsite (protocol-level surveys required below), the project would represent a significant and unavoidable impact to this species.

The proposed project would represent a significant and unavoidable impact to several California species of special concern: American badger, Salinas pocket mouse, black-legless lizards (if present), coast-horned lizard (if present), San Joaquin coachwhip (if present), and western spadefoot (if present).

The proposed project would represent a potentially significant impact to several other California species of special concern, but these impacts can be reduced to less-than-significant with implementation of the measures presented below. These species include: nesting birds and raptors, bats (pallid and Townend's big-ear), burrowing owl (offsite mitigation), golden eagle, merlin, white-tailed kite, northern harrier, loggerhead shrike, California horned lark and Lemmon's jewelflower.

Wetlands/Sensitive Habitats

According to the Preliminary BA prepared by DD&A, development of the proposed project has the potential to directly impact sensitive habitat types, including 0.17 acres of wetlands. According to the US Army Corps of Engineer's Wetland Delineation Manual (1987), wetlands are defined as "[t]hose areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." As detailed in the Preliminary BA and discussed above, a wetlands assessment was conducted to determine whether on-site aquatic features (i.e. agricultural ponds) contained characteristics consistent with wetlands. The wetlands identified on-site exist as a thin band of emergent vegetation on the fringe of four small man made reservoirs/ponds used in conjunction with routine agricultural operations. It is assumed that this resource satisfies the soils, vegetation and hydrologic criteria set forth by the U.S. Amy Corps of Engineers (USACOE) for wetlands. However, the USACOE does not regulate wetlands that are hydrologically isolated and geographically distinct from other jurisdictional resources in the vicinity. The individual aquatic features are not contiguous with other jurisdictional wetlands and/or waters of the U.S and do not have any hydrologic connectivity or abut any permanent water body. As a result, the fringe wetlands identified on site are not under the Jurisdiction of the USACOE. Further, impacts to these wetlands would not be in conflict with federal regulation.

The function and value of these man-made wetland resources are marginal as a result of ongoing disturbance from agricultural uses. In addition, the value of the existing reservoir located in the uplands portions of the site as wildlife habitat is limited as it supports a non-native predatory amphibian: the barred tiger salamander. This salamander is known to prey on native special status amphibian species such as the California tiger salamander and the California red-legged frog when present. In addition, hybridization between the non-native barred salamander and the native tiger salamander has been identified by the U.S. Fish and Wildlife Service as a significant threat to the native California tiger salamander.

Although development of the proposed project would impact approximately 0.17 acres of fringe wetlands of marginal habitat value, impacts are considered to be less-than-significant as development of the proposed project would entail the construction of a number of aquatic resources as a component of golf course development, and storm water drainage facilities. More specifically, as identified in Section 5.1.3 of the Specific Plan, two of the existing retention ponds would be converted to storm water facilities as part of project development. While formal plans have not been submitted at this time for development of the golf course, future on-site ponds and other resources would significantly exceed the size of the existing on-site aquatic resources.

In summary, development of the proposed project would result in the removal of existing on-site agricultural ponds and reservoirs to facilitate new urban uses on the predominately undeveloped project site. These wetlands are not considered to be jurisdictional for the reasons identified above and the

project would provide suitable replacement wetlands through the construction of various stormwater drainage facilities and ponds associated with the golf course. Impacts to wildlife and other sensitive species associated with the removal of on-site aquatic features are addressed in greater detail below. **Based on this analysis, development of the proposed project would result in a less-than-significant impact on a wetland.**

Vegetation

Impact **The proposed project would represent temporary and permanent impacts to all habitats and the vast majority of vegetation within project boundaries, and will result in the removal of 3 or more oak trees plus all Eucalyptus and/or Tamarisk trees lining San Vicente Road. Temporary impacts to vegetation included grubbing and grading associated with development of the site; permanent impacts include the conversion of open vegetated areas to urban housing through placement of structures, homes, roads, driveways, etc.** ***This is a less-than-significant impact with implementation of the following measures.***

Mitigation

4.4-1 A Forest Management Plan shall be prepared for the project due to proposed tree removals. The City approved Forest Management Plan (and associated replanting plan) shall be incorporated as a condition of project approval to satisfy General Plan Conditions C/OS 17-19. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a Forest Management Plan, subject to the review and approval of the City of Soledad.

4.4-2 Trees and vegetation not planned for removal shall be protected during construction to the maximum extent feasible. This shall include the use of exclusionary fencing of herbaceous and shrubby vegetation, such as hay bales and protective wood barriers for trees. Only certified weed-free straw shall be used to avoid the introduction of non-native, invasive species.

4.4-3 Following construction, the disturbed areas that are proposed as parks and native landscaping areas shall be restored to pre-project contours to the maximum extent feasible and revegetated using locally-occurring native species and native erosion control seed mix.

4.4-4 Protective fencing shall be placed so as to keep construction vehicles and personnel from impacting vegetation adjacent to the project site outside of work limits.

4.4-5 Grading, excavating, and other activities that involve substantial soil disturbance shall be planned and carried out in consultation with a qualified hydrologist, engineer, or erosion control specialist, and shall utilize standard erosion control techniques to minimize erosion and sedimentation to native vegetation.

4.4-6 No construction equipment shall be serviced or fueled outside of designated staging areas.

Special-Status Plant Species

Lemmon's jewelflower, a California species of special concern, is the only special-status plant species deemed potentially present within project boundaries. All other special-status plant species are eliminated for the species-specific reasons provided within this document and the Preliminary BA presented in Technical Appendix T-3.

Impact **The presence/absence of jewelflower has not been determined at this time, but appropriate habitat is present within project boundaries. This species could be permanently impacted by proposed grading, excavation, and other activities that may result in the permanent loss or disturbance of individual jewelflowers and/or jewelflower habitat.** ***This impact is considered less-than-significant given implementation of the mitigation below.***

Mitigation

4.4-7 A qualified botanist shall be retained to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species. If no Lemmon's jewelflower is present, no additional mitigation is required. If Lemmon's jewelflower is present, a qualified biologist shall prepare a mitigation plan to be approved by CDFG prior to initiation of construction. The City of Soledad Planning Department shall be provided verification of CDFG concurrence and satisfaction prior to issuance of grading permits.

Special-Status Wildlife Species

Based on a review of project plans, background literature, and extensive field surveys, one listed species is assumed present; San Joaquin kit fox (federally endangered). In addition, appropriate habitat is present for the federally threatened California red-legged frog, and the project site is within the historic range of the species.

One California fully protected species is known to occur onsite: white-tailed kite. In addition, the following California species of special concern may occur, or are known to occur onsite: American badger; Salinas pocket mouse; pallid bat; Townsend's big-eared bat; Western Mastiff bat, black legless lizard; Western spadefoot; coast horned lizard; San Joaquin coachwip, burrowing owl; Golden eagle; merlin; prairie falcon; white-tailed kite; northern harrier; loggerhead shrike; Coopers hawk, and California horned lark.

Impact **Project development would fragment (i.e., divide and disrupt) the vast majority of the existing wildlife habitat on the site, and would represent an urban encroachment into the foothills of the Gabilan Range (an important wildlife corridor). The ongoing presence of homes, roads, cars, people, firearms, pets, etc. would adversely impact any wildlife currently utilizing the site, particularly in the grassland portions of the site (i.e. deer, coyote, fox, jackrabbits, squirrels, and raptors). Comparable development is present immediately south of the proposed project, but does not extend into the grassland/foothill portions of the site.** ***This fragmentation of habitat is considered a significant impact that can be partially reduced by implementation of the required mitigation below; however, cannot be fully mitigated without project redesign. Therefore, the fragmentation of habitat is considered a significant, unavoidable impact of the project as currently designed.***

Mitigation

4.4-8 Prior to approval of each final map, the applicant shall prepare and submit draft Covenant, Conditions, and Restrictions (CC&Rs) applicable to that phase that shall include the following:

a) restrict installation fencing to the immediate vicinity of residences, and where fencing is placed adjacent to open space areas and areas of natural, undisturbed habitat, fences shall be installed such that a six inch space is left between the bottom of the fence and the surface of the ground;
b) prohibit off-road vehicle use;
c) prohibit illegal discharge of firearms;
d) prohibit the installation of road medians throughout the development.

These CC&Rs shall be reviewed and approved by the City of Soledad prior to approval of each final map.

Impact **Suitable foraging/dispersal habitat for San Joaquin kit fox is present throughout project boundaries, with potential denning habitat present in the annual grassland, rocky outcrop, and fallow agricultural portions of the site. The vast majority of the habitats present within project boundaries would be directly impacted by the proposed project (grubbing and grading, construction phase impacts, permanent placement of structures and impermeable surfaces, etc.). Impacts proposed in the grassland portions of the site will likely result in kit fox abandonment of the property due to ongoing disturbance. For this reason, the project is assumed to have a significant and unavoidable adverse affect on San Joaquin kit fox (i.e. direct mortality, loss of habitat, loss of dens, etc.).** ***This impact may be reduced by implementation of the following mitigation measures; however, the impact will not be reduced to a less-than-significant level without USFWS consultation. Please note that the following measures are consistent with direction from USFWS on other projects, but greater or lesser measures may be required by the regulatory agencies (possibly including completion of protocol-level surveys to determine utilization of the site and/or project redesign).***

Mitigation

4.4-9 The applicants shall enter into consultation with USFWS and CDFG and shall provide evidence of their compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act prior to the issuance of building permits.

4.4-10 Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. Pre-construction surveys shall be conducted by a qualified biologist no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites. In addition to pre-construction surveys, a qualified biologist, meeting the required qualifications described in the *U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance*, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox. In the event that an active kit fox den is found, then the standard mitigation actions outlined in the USFWS Recommendations for SJKF, are recommended to avoid possible take of kit fox during future construction activities. These actions are general in nature; therefore, site specific strategies for the project site shall be based upon consultation with USFWS and CDFG, as stated above in Mitigation Measure #4.4-10. If active kit fox den sites are found and/or kit fox individuals are observed during the survey, the applicant will be required to comply with all mitigation actions required by USFWS and CDFG and the City shall monitor implementation of those actions.

Impact **Multiple badger dens and badger diggings were observed in the vicinity of the onsite reservoir and within other portions of the annual grassland habitat. An adult badger was observed emerging from an onsite den by Biosearch biologists. Badger diggings were also observed in fallow agricultural portions of the site, demonstrating badger utilization of these areas as foraging habitat. Therefore, construction activities in grassland portions of the site have the potential to impact badger dens, and construction within fallow agricultural portion of the site will impact badger foraging habitat. Project-related construction activities (i.e. grading, excavation, development, etc.) may result in a permanent loss or disturbance of American badgers and their habitat.** ***Given the proposed build-out of the project site and impacts to the vast majority of the grassland habitat, impacts to this species are considered significant and unavoidable impact. Mitigation is presented to reduce these impacts as much as feasible; greater or lesser measures may be required by CDFG.***

Mitigation

4.4-11 The applicant shall retain a qualified biologist to conduct focused preconstruction surveys for potential American badger dens. These surveys shall be conducted no sooner than 2 weeks prior to the start of construction. Surveys for badger dens may be conducted at the same time as burrowing owl surveys. Please refer to the mitigation measures in the Preliminary BA (June 2008) for measures that may be implemented based on the results of these surveys.

Impact **Two special-status bat species may be present onsite (pallid bat and Townsend's big-eared bat); several other bat species may also be present. Removal of onsite trees, removal of onsite buildings, and development of the site (including encroachment/disruption of rocky outcrops) may result in direct impacts to bats and/or bat roosts (day, night, foraging, and maternity) and would remove the vast majority of onsite foraging habitat for these species.** ***This impact is considered less-than-significant with implementation of the following mitigation.***

Mitigation

4.4-12 A qualified bat specialist shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist). Please refer to the mitigation measures in the Preliminary BA (June 2008) for measures that may be implemented based on the results of these surveys.

Impact **Salinas pocket mouse is known to occur onsite; presence was confirmed in September 2006. As the vast majority of the onsite grassland habitat will be converted to residential usage and the remaining portions will be fragmented from surrounding habitat and subject to ongoing disturbance (cars, lights, noise, sound, vibration, etc.), significant impacts to this species are anticipated (direct and indirect mortality).** ***This would represent a significant and unavoidable impact. The following mitigation is presented to reduce this impact as much as feasible.***

Mitigation

4.4-13 The applicant shall contract a qualified biologist to coordinate with CDFG and prepare a mitigation and monitoring plan for Salinas pocket mouse. Verification of CDFG concurrence/approval shall be submitted to the City of Soledad prior to initial grubbing and grading of the site.

Special-Status Avian Species

The following special-status avian species were observed foraging within the project site: Western burrowing owl, Northern harrier, white-tailed kite, loggerhead shrike, and Northern harrier. In addition, golden eagle, merlin, prairie-falcon, Cooper's hawk, and horned lark have the potential to utilize the site for foraging. Golden eagles, merlins, and prairie falcons have specific nesting habitat requirements (e.g., sheltered cliffs and/or large trees supporting cavities) or are known to only nest in certain geographic regions of California outside of the Monterey Bay region (e.g., Merlins), which are not present within the project site. Therefore, no suitable nesting habitat for these species occurs within the project site. However, suitable breeding habitat is present for burrowing owl, northern harrier, white-tailed kite, and loggerhead shrike. The project would result in the loss of foraging and/or nesting habitat for these species.

Raptors and their nests are protected by both federal and state regulations (MBTA and CDFG Code Sections 30503 and 3503.5), which protect birds of prey and their eggs and nests. Construction disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by CDFG. Any loss of fertile raptor eggs or nesting raptors, or any activities resulting in raptor nest abandonment, will constitute a significant impact. Construction activities such as tree removal or site grading that disturb any nesting raptors (or other avian species) on-site or immediately adjacent to the site will constitute a significant impact.

Impact **Tree removal (i.e., Eucalyptus and Tamarisk trees lining San Vicente Road and oaks present in the northeast corner of the site) and disturbance associated with construction of the proposed project would likely impact any nesting birds and/or raptors present within project boundaries (harassment, stress, brood-less, nest abandonment, injury, mortality). Per the CDFG Guidelines, impacts to burrowing owls are defined as disturbance or harassment within 160 feet of occupied burrows, destruction of burrows and burrow entrances, and degradation of foraging habitat adjacent to occupied burrows. In addition, the project would require grading, grubbing, tree removal, excavation, and other activities that may result in a permanent loss or disturbance of raptors and migratory birds and their habitat. *This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.4-14 Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the Miravale site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The survey shall conform to the CDFG 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied). Please refer to the mitigation measures regarding burrowing owl in the Preliminary BA (June, 2008) for avoidance and mitigation measures that may be implemented based on the results of these surveys.

4.4-15 If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area. If active nests are found, a suitable construction buffer shall be established by a qualified biologist, and no work shall occur within that buffer until August 1 when young are assumed fledged. Alternatively, a qualified biologist can conduct weekly nest checks to gauge nestling/fledgling status, and construction may proceed once fledglings have dispersed from the nest provided written concurrence from CDFG. No active nest shall be impacted or removed without a depredation permit from CDFG, and a depredation permit will not be issued for impacts to Fully Protected Species such as the white-tailed kite. For activities that occur outside of the nesting season (generally September 1 through February 14), preconstruction surveys are not required. If construction is initiated outside of the nesting season and continues into the nesting season, preconstruction surveys are required if construction will occur in areas not previously accessed and/or disturbed (>300 feet from previous construction activities).

4.4-16 A preconstruction survey shall be conducted no more than 14 days prior to modification, demolition, or removal of onsite buildings. If no owls or other nesting birds are observed, then demolition or removal may proceed. If barn owls (or any other nesting birds) are observed during the preconstruction survey, a determination shall be made on whether birds are roosting or nesting. If a single owl is roosting, demolition or removal of the structure can proceed after the owl has been persuaded to move from the roost area. Non-invasive techniques include light shining into the roost space for one or two nights and days. If barn owls (or other nesting avian species) are found to be actively nesting in the barn, work on or demolition of the structure shall be postponed until one of the following conditions have been met: 1) a qualified biologist monitoring the nest determines that the owls have abandoned the nest without any outside interference or 2) a qualified biologist monitoring the nest has determined that the young have fledged and are capable of relocating and using another roost site. Once the young have fledged, non-invasive techniques may be used to encourage the owls to leave the barn. Under either scenario, the monitor shall ensure that all owls have left the building prior to construction or demolition activities. The barn owl nesting period is typically between February 15 and July 15.

Special Status Reptiles and Amphibians

Protocol-level aquatic surveys began in May 2007 to determine the presence or absence of CTS at the onsite aquatic resources. The onsite reservoir was documented to support tiger salamander larvae on May 8, 2007 (personal observation, David Keegan). Genetic testing of tissue collected from onsite tiger salamander larvae and/or paedomorphs was conducted by the Shaffer Lab of U.C. Davis; onsite tiger salamanders are highly hybridized to completely non-native (89-100% non-native). Coordination with USFWS regarding ESA jurisdiction over hybrids/non-native was initiated by DD&A in November of 2007; USFWS subsequently concurred that tiger salamanders known to occur at Pond 1 (onsite reservoir) are not the regulated species "California tiger salamander" and are not subject to the jurisdiction of USFWS (USFWS concurrence later issued February 26, 2008 and presented in Appendix I of the June 2008 Preliminary BA). However, given the presence of marginally appropriate habitat, both California red-legged frog and Western spadefoot may be present within project boundaries; these species would be associated with the same aquatic resources and surrounding upland habitats as the non-native/invasive tiger salamander.

Impact **The presence of California red-legged frog and/or Western spadefoot has not been determined at this time. The project as currently designed would fill the onsite reservoir to establish home-sites, removing a potential breeding resource for these species. Pond 3 would likewise be permanently filled as a result of the proposed project. If CRLF or spadefoot are present, proposed impacts to onsite agricultural basins (particularly the reservoir) would result in direct impacts to these species including "take." (i.e. loss of individuals and habitat, loss of a breeding resource, direct mortality, etc.). In addition, grading and other earthmoving activities proposed would represent an adverse affect on upland estivation habitat for these species, if present.** ***Therefore, the proposed project would represent a significant and unavoidable impact to federal and state regulated wildlife species (if present,) as currently designed. However, implementation of the mitigation measures identified below will reduce these impacts as much as feasible; greater or lesser measures may be required by USFWS.***

Mitigation

4.4-17 Protocol-level CRLF surveys (USFWS, August 2005) shall be completed at each aquatic resource present within project boundaries. Protocol-level CRLF surveys would likely detect Western spadefoot, if present. If it is determined that CRLF are present, the applicant shall coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA (e.g., applying for an Incidental Take Permit [Section 7 and/or 10 depending on lead agency]) and implementing the permit requirements. Any mitigation and avoidance measures required by USFWS for potential impacts to CRLF (if applicable) would likewise reduce impacts to Western spadefoot given their overlapping habitat characteristics. If it is determined that spadefoot are present, but CRLF are not, coordination with CDFG regarding appropriate mitigation to reduce impacts to this species shall be required.

Impact **Proposed development of the majority of the onsite grassland habitat and fragmentation of remaining grassland habitat represents a significant impact to coast horned lizards and black-legless lizards (and other wildlife species).** ***Given the lack of unaffected portions of the grassland habitat for conservation of these species, this is considered a significant and unavoidable impact. The following mitigation is presented to reduce this impact as much as feasible; greater or lesser measures may be recommended by CDFG.***

Mitigation

4.4-18 The applicant shall retain a qualified biologist to conduct a construction monitoring program for black legless lizards, coast horned lizards, and San Joaquin coachwip which shall include procedures for capture and release. The biologist shall remain on-site during initial grading activities to salvage and relocate these species that may be uncovered during earthmoving activities. Recovered individuals shall be placed in appropriate habitat outside of the project site in accordance with the MOU with CDFG. The biologist shall walk alongside the grading equipment in each new area of disturbance and shall have the authority to halt construction temporarily if necessary to capture and relocate an individual. Any individual captured in the grading zone shall be relocated as soon as possible to adjacent suitable habitat outside of the area of impact, pursuant to the MOU.

4.4-19 The applicant shall conduct an employee education program for construction crew and City staff prior to construction activities. A biological monitor shall meet with the construction crew at the onset of construction to educate the construction crew on the following: 1) the appropriate access route in and out of the construction area; 2) how biological monitor will examine the area and agree upon a method which will ensure the safety of the monitor during such activities, 3) the special-status species that may be present; 4) the specific mitigation measures that will be incorporated into the construction effort; and 5) the proper procedures if a special-status animal or any other animal is encountered within the project site.

4.4-20 A representative shall be appointed by the City who will be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. The representative shall be legally responsible to notify USFWS and CDFG immediately in the event that "take" of any special-status wildlife species occurs. The representative shall be identified during the Employee Education Program and his/her contact information shall be provided to USFWS and CDFG. It is imperative that this individual will be present onsite every day and will be accessible to regulatory agency personnel.

4.4-21 All food-related and other trash shall be disposed of in closed containers and removed from the project area at least once a week during the construction period or more often if trash is attracting avian or mammalian predators. Construction personnel shall not feed or otherwise attract wildlife to the area. These instructions to the construction crew shall be reiterated during the employee education program and during update meetings with construction crews. The instructions shall also be posted conspicuously on the site.

Impacts to Wildlife Movement and Nursery Sites

The General Plan EIR identifies "adverse but not significant" impacts to wildlife movement based on the availability of the Salinas River and Arroyo Seco corridors in the project area. However, the General Plan EIR requires that portions of the Gabilan Range above 400-feet elevation be conserved as open space. Development above 400-feet elevation is proposed as a portion of the Miravale III project, significantly encroaching into an area proposed for conservation and impacting an upland wildlife movement corridor. As stated in the Preliminary BA, Miravale III "proposed 'open space' portions of the site (including the 62 acres of grasslands) are not designed or suitable as plant and wildlife conservation areas." An increase in the total number of roadways in the project site could be expected to result in an increase in the number of animals killed by vehicular traffic. The permanent onsite presence of homes, roads, and infrastructure would further fragment habitats surrounding the project site and represents an urban encroachment into the foothills of the Gabilan Range. As such, development of the proposed project, particularly above the 400' elevation contour, would result in a significant impact to wildlife movement. Existing mitigation measures identified elsewhere in this section would minimize project-induced impacts to the greatest extent feasible, but not to a less-than-significant level. ***This represents a significant and unavoidable impact.***

This page left intentionally blank.

4.5 CULTURAL RESOURCES

Introduction

The following discussion is based on a Preliminary Archaeological Reconnaissance prepared for the project by Archaeological Consulting (September 2006). A Phase One Historic Review was prepared by Kent Seavey (October 2006) to evaluate the historical significance of an existing farmhouse. A CEQA Impacts Analysis and Mitigation Report was also prepared by JRP Historical Consulting (July 2007) to identify impacts and identify appropriate mitigation for the existing farmhouse. These reports are included as Technical Appendix T-4, which is included in Volume II of this EIR.

The Preliminary Archaeological Reconnaissance (hereafter referred to as "Archeological Report") included an archival search of existing records, a field reconnaissance of the project site, and an assessment of potential effects on cultural resources. The Phase One Historic Review Evaluation was used to analyze the historical significance of existing buildings located on the project site. Those services included a review of Monterey County building records, taking photographs of the subject property, research on the original ownership including a full literature search, examination of photo archives, and preparation of required California DPR 523 documentation. The CEQA Impact Analysis and Mitigation Report discussed potential impacts and mitigation for the historical resources found at the project site.

Setting

Site History

The project site lies outside the city limits, along the northern edge of the City of Soledad. This area may include archeological resources from the prehistoric era (ranging from around 8000 B.C. to 1770 A.D.) and historic resources dating from 1770 to 1897 or later. The project area is located within the ethnographic territory of the Esselen linguistic group. These people roamed the land leaving little physical traces of their existence and were most likely members of the Costanoan tribe. The historical distribution of the Esselen linguistic group extended from Monterey to San Mateo County as well as the inland portions of San Benito and Santa Clara Counties prior to the first European explorers constructing the presidio in Monterey and missions in Carmel, Soledad, San Juan Bautista, and the San Antonio Valley. Sedentary occupation sites are most often found near the convergence of streams and near other sources of water such as the Salinas River.

Primary land uses changed from cattle ranching to farming around 1865, after years of flooding covered the valley floor with rich topsoil. Recent use of the project site includes row crop cultivation and grazing lands. Most of the western portion of the project site is fallow with remnants of former vineyards in some areas. There are also two existing structures on the southwest corner of Section 16 of the project site. These structures have historically been used to support farming operations on the project site.

Archaeological Resource Investigation

As part of the Archaeological Report, Archaeological Consulting conducted a records search of the files at the Northwest Regional Information Center and reviewed existing files to identify any recorded historic or prehistoric sites in the project area. There were no previously listed archaeological sites found, but one historical resource is located within one kilometer of the project area. The California Inventory of Historical Resources, California Historical Landmarks, and the National Register of Historic Places were also reviewed to identify historic resources in the project area, and no recorded resources were found.

Several historic maps were also examined for evidence of structures or other historic resources on the project site. A field survey of the project site was conducted in early September 2006. The survey consisted of a general surface reconnaissance of all visible areas. Site conditions were not consistent with typical prehistoric cultural resource site conditions, such as dark midden soil, fire altered rocks, bone fragments, flaked stone, and shell fragments. Contour transects for sloped areas and straight line transects for flatter areas were walked at regular intervals over the entire project site. Some glass and ceramics were found, but they were not consistent with historical trash sites. The remnant of a historical fence containing square cut nails was found along the northeast quadrant of the property; however, most of the fencing has been replaced with modern materials. No other materials associated with prehistoric cultural resources were identified. The existing farmhouse and barn were recommended for historical review. See Figure 4.5-1 for a map of the location of the structures.

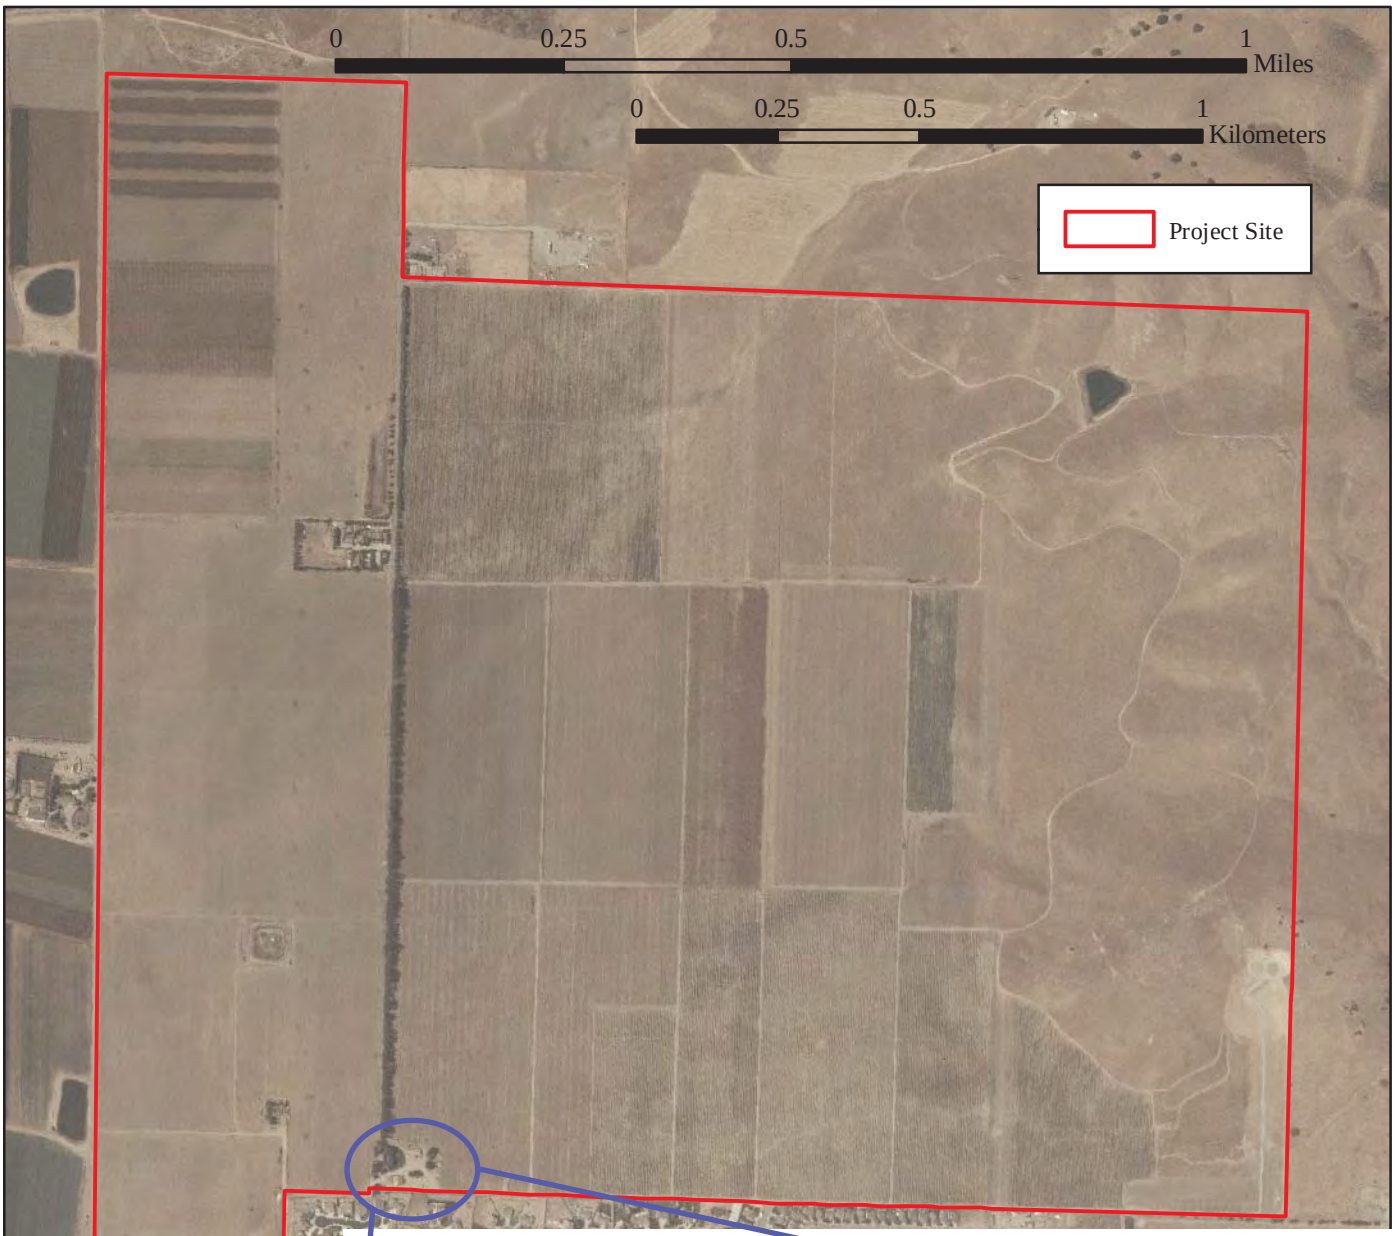
Regulatory Environment

City of Soledad General Plan

The Conservation/Open Space Element of the General Plan provides policies for protection of cultural resources. The following policies are applicable to the project site and its potential historic, cultural, and architectural resources:

Policy 8.5 The City shall amend the zoning ordinance to include the following or similar language: The demolition or remodel of buildings considered to be of historic, cultural, or architectural significance shall not occur unless the following findings can be made.

- Remodel or Alteration. The proposed remodel or alteration does not adversely affect the historic, cultural, or architectural significance of the building or site.



- Demolition. The Demolition of the building does not adversely affect the historic, cultural, or architectural character of the City of Soledad, or the building presents a clear hazard to occupants or to the public, which can not be feasibly corrected through restoration.

Policy C/OS23 If development of a site uncovers cultural resources, the recommendations of Appendix K of the Guidelines for Implementation of the California Environmental Quality Act (Public Resources Code Section 15000 et seq.) shall be followed for identification, documentation, and preservation of the resource.

Policy C/OS24 The City shall document and record data or information relevant to prehistoric and historic cultural resources which may be impacted by proposed development. The accumulation of such data shall act as a tool to assist decision makers in determinations of the potential development effects to prehistoric and historical resources located within the City.

The Land Use Element also includes specific guidelines and policies regarding the city's historic and cultural resources.

Policy L52 Historically or architecturally significant buildings shall not be demolished or substantially changed in outward appearance in a way that diminishes the historical character, unless doing so is necessary to remove a threat to health and safety and other means to avoid the threat are infeasible.

N

Historic Resources

Figure 4.5-1

Cultural and archaeological resources policies which apply to development within the project area include requirements for preservation of cultural and archaeological resources. Please refer to Table 4.9-2 of the Land Use section for a detailed analysis of the project's consistency with the City's General Plan cultural and archeological resource policies.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential cultural and historic impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the proposed project. According to the General Plan EIR, the following cultural and historic impacts were identified:

- Development of the land uses contemplated by the draft Plan could unearth or disturb previously undiscovered resources of cultural or historic significance. This impact was identified as significant unless mitigated.

- Development in accordance with the draft Plan could alter the historic character of the City. This impact was also identified as significant unless mitigated.

Miravale III Specific Plan

The Miravale III Specific Plan does not include any provisions or policies concerning archaeological, cultural, or paleontological resources.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- cause a substantial adverse change in the significance of a historical resource as defined in §15064.5;

- cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5;

- directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; or

- disturb any human remains, including those interred outside of formal cemeteries.

Impacts and Mitigation

Historic Resources

A farmhouse located along the southern property border at the intersection of San Vicente Road and the proposed H Street was identified as a potential historical resource. See Figure 4.5-1, Historic Resource Location Map, for site photos of the structure. A historic evaluation of the house was prepared by Kent Seavy, Preservation Consultant, and also by Meta Bunse, JRP Historical Consulting, to determine the significance of this resource. Their evaluations used the criteria for listing on the California and National Registers, as well as criteria set forth in Section 15064.5 of the CEQA Guidelines. These criteria are as follows:

California Register of Historical Places

In order for a resource to be eligible for the California Register, it must be significant at the local, state, or national level under one or more of the four criteria of significance listed below. These are essentially the same as National Register criteria with more emphasis on California history.

1. The resource is associated with events or patterns of events that have made a significant contribution to the broad patterns of local or regional history and cultural heritage of California or the United States.

2. The resource is associated with the lives of persons important to the nation or to California's past.

3. The resource embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values.

4. The resource has the potential to yield information important to the prehistory or history of the local area, state or the nation (this applies primarily to archaeological sites).

National Register of Historic Places

Specific criteria are used to evaluate a historic property's eligibility for the National Register. To meet the National Register standards, a resource must satisfy at least one of the below criteria, be associated with an important historic context, and retain the historic integrity of features that conveys its significance.

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, as well as:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
B. That are associated with the lives of persons significant in our pasts; or
C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinctions; or
D. That have yielded, or may be likely to yield, information important in prehistory or history.

Local Register

In addition to the above criteria, under CEQA Section 15064.5 a significant historic resource may include those resources identified in a local register or survey, or identified by the lead agency as significant based on substantial evidence. This could be “any object, building, structure, site, area, place, record or manuscript which a lead agency determines, based on substantial evidence in light of the whole record, to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military or cultural annals of California.”

Summary of Evaluation

The house and barn in the southwest corner of the project site, east of San Vicente Road, were evaluated for historical significance as recommended in the Archeological Report prepared for the project. A Phase One Historical Evaluation determined that the existing house, referred to as the Morris Lorentzen House, is significant under criterion 3 of the Public Resources Code Section 5024.1(a), in the area of architecture as an intact example of a David Jacks Corporation prefabricated farm house from the first decade of the twentieth century. Between 1908 and 1915, Monterey's David Jacks Family corporation had designed and constructed a series of up to sixty-six of these structures, known as Jacks farmhouses, on several ranches and dairies in the Salinas Valley between Chular and King City on 30,000 acres of the vast land holdings acquired by David Jacks during the nineteenth century. Currently, there are only twelve known Jacks farmhouses still in existence. As the Morris Lorentzen House is still in relatively good condition, the Phase One Historical Review concluded that the Morris Lorentzen House is an intact example of a type of rare architectural style found in the Salinas Valley. The Morris Lorentzen House embodies distinctive characteristics of a type and period of regional construction specific to the Salinas Valley; therefore, the structure qualifies thematically for listing in the California Register and such properties are considered historical resources under CEQA.

The Morris Lorentzen House is a two-story, wood-framed, front gable residence with a rectangular plan. The building makes spare use of ornament and is an example of what some architectural historians call the National Folk Gable-Front style. The roof is clad in composition shingles and has narrow boxed eaves with a plain wood fascia at the gable ends, while channel rustic siding with corner boards clad the walls. A one-story hipped roof porch appears at the front and a shed roof porch extends from the rear. Most windows are simple wood frame 1/1 double-hung sash, but aluminum frame sliding windows have been added in several of the original openings. The other structures on the parcel do not date to the same time period as the house and are not contributing elements of the property.

The proposed project would require the removal of the Lorentzen House in order to accommodate project development. This is considered a potentially significant impact due to the historical significance of structure. Implementation of the following mitigation measures would ensure that project-related impacts can be minimized to a level considered less-than-significant. Although the relocation of the Lorentzen House is necessary in order to avoid a potentially significant impact to a historically significant structure, implementation of mitigation requiring the relocation of the structure has the potential to result in additional impacts. More specifically, relocation of the Lorentzen House could result in additional impacts as a result of inadvertent damage to the structure during the relocation process. In order to ensure that potential impacts associated with the relocation of the Lorentzen House are minimized, additional mitigation measures have been incorporated. Implementation of the following mitigation measures is necessary in order to minimize project-induced impacts to a less-than-significant level. The following mitigation measures would not result in any additional environmental impacts beyond those identified in this EIR.

Impact **Development of the project and the resulting move of the historical resource to another location would cause a substantial, adverse change to a historical structure eligible for listing in the California Register on the site.** ***This represents a significant impact that can be reduced to less-than-significant levels with the following mitigation.***

Mitigation

4.5-1 Relocation of House. The project proponent shall ensure that the design and implementation of the relocation project is consistent with the *Secretary of the Interior's Standards for* Rehabilitation *and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department*

of the Interior, National Park Service, 1992), the California Historical Building Code, and the Mitigation Monitoring and Reporting Plan (MMRP) for the project. Prior to recordation of the final map, the project applicant shall submit a relocation plan prepared by a qualified professional in accordance with the general recommendations of *Moving Historic Buildings*, a publication of the National Park Service, to the City of Soledad for review and approval. The relocation plan shall discusses planning, research, and recording prior to the move. In addition, the relocation plan shall identify siting, foundation construction, building reassembly, and restoration work after a successful move. See John Obed Curtis, *Moving Historic Buildings*, Heritage Conservation and Recreation Service, Publication No. 9, US Department of Interior (1979) for further details. Prior to the relocation, the applicant shall provide verification of compliance with related mitigations to the City of Soledad Community Development Department Director for review and approval. In addition, the structure shall be relocated prior to the issuance of any building and/or grading permit for development within the Specific Plan area.

4.5-2 Protective Measures. The project proponent shall develop and implement measures to protect the character-defining features of the Lorentzen House building from damage by the relocation project. The features include, but are not limited to scale, massing, and layout of the house, as well as siding and wood frame fenestration. Protective measures shall be prepared by a qualified professional in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, *Moving Historic Buildings*, and the MMRP for the project. Prior to the recordation of the final map, the project applicant shall submit a relocation plan, consistent with Mitigation Measure 4.5-1, which incorporates protective measures consistent with the intent of this measure. Prior to the relocation of the structure, the applicant shall submit evidence from a qualified professional demonstrating that protective measures have been implemented, subject to the review and approval of the City of Soledad.

4.5-3 Repair of Inadvertent Damage. The project proponent shall ensure that any inadvertent damage to the character-defining features of the Morris Lorentzen House resulting from the rehabilitation project is repaired in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992) and California Historical Building Code. A qualified professional shall be consulted prior to any repairs. The condition of the building shall be photographed as part of the proposed recordation document and/or video documentation, prior to the start of the relocation, and this will help to establish the baseline condition for assessing inadvertent damage. The project applicant shall submit detailed documentation prepared by a qualified professional demonstrating that all repairs have been completed in accordance with applicable standards prior to the issuance of any building and/or grading permit.

4.5-4 Professional Standards. All activities regarding historical architectural resources and historic preservation carried out as part of this project shall be carried out by or under the direct supervision of persons meeting, at a minimum, the Secretary of the Interior's professional qualifications standards (48 FR 44738-9) in these disciplines. Prior to the relocation of the Lorentzen House, the applicant shall submit evidence to the City of Soledad demonstrating compliance with this measure.

4.5-5 Monitoring. The mitigation measures applying to the relocation of the Lorentzen House shall be set forth in a Mitigation Monitoring and Reporting Program (MMRP) for the project. The MMRP will guide project-specific mitigation, monitoring, and/or reporting programs for various aspects

of mitigation monitoring, reporting, and enforcement in order to ensure full compliance with the conditions of project approval.

4.5-6 Coordination. The project proponent shall coordinate with and inform interested parties, including, but not limited to the Soledad Historical Society and the Monterey County Historical Society, regarding the status of its compliance with the mitigation measures set forth in the MMRP, as necessary.

4.5-7 Recordation to Historic American Building Survey standards. Prior to the start of any project work, the project proponent shall ensure that the Lorentzen House property is recorded and documented in accordance with the Level II recordation standards of the Historic American Building Survey/Historic American Engineering Record (HABS/HAER) program. This level of recordation would include:

- Archival reproduction of any existing historic images of the property and grounds;
- Archival reproduction of any existing maps, sketches, or drawings of the house;
- Production of measured architectural plans and drawings;
- Production of large-format photographs of exterior and interior views of the house, and exterior views of the house and current setting, including relationship to non-eligible outbuildings; and
- Narrative history and description of the property (based on the narrative provided in the Seavey (2006) evaluation of the property, and the Monterey County survey(s) of similar properties.

The original archival set of recordation documents and photograph prints will be submitted to the Soledad Historical Society (or its designee), and archival quality photocopies of the documentation set will be provided to the following interested parties and local repositories: the Monterey County Historical Society; the Monterey County Libraries (Soledad and Salinas branches), and the UC Santa Cruz Library Special Collections Department. The project proponent would ensure that this recordation documentation was prepared prior to carrying out any other treatment and would make the content of the document available for other mitigation measures, such as the preparation of interpretive material.

Archaeological Resources

None of the materials associated with prehistoric cultural resources in the area (dark midden soil, bedrock mortar outcrops, marine shell fragments, bones or bone fragments, broken or fire-altered rocks, flaked or ground stone, etc.) were noted during the field survey. At the time of the field reconnaissance for the project area west of San Vicente Road, soil visibility was very good, and the soil visibility in the tended vineyard was also very good. Soil visibility in the fallow areas was generally good to fair. The steeper slops in the northeastern section of the project site were vegetated in dry grasses and weeds which greatly limited soil visibility to ranch roads, animal trails and burrows. Overall, ground surface visibility was considered adequate for the purpose of the reconnaissance.

Limited amounts of ceramic and glass were found throughout the western portion of the project site, but these materials do not represent a significant historical trash site. No other evidence of cultural resources was found on or adjacent to the project site. Construction of the project could, however, potentially uncover buried archaeological resources or human remains during excavation and clearing activities. This represents a potentially significant impact. Implementation of these mitigation measures would not result in any new environmental impacts beyond those identified in this EIR.

Impact **Construction of the project may result in the discovery and disturbance of unknown archaeological resources and/or human remains.** ***This represents a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measure.***

Mitigation

4.5-8 In order to ensure that project-impacts to potentially unknown resources are avoided, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If archaeological resources or human remains are accidentally discovered during construction, work shall be halted within 150 feet (50 meters) of the find until a qualified professional archaeologist can evaluate it. Work shall not recommence until the project archaeologist has submitted documentation to the City indicating that discovered resources have been adequately salvaged and no further resources have been identified within the area of disturbance

4.5-9 In order to ensure that the proposed project does not impact buried human remains during project construction, the project proponent shall be responsible for on-going monitoring of project construction. Prior to the issuance of any grading permit, the project proponent shall provide the City of Soledad with documentation identifying construction personnel that will be responsible for on-site monitoring. If buried human remains are encountered during construction, work in that area must halt and the archaeologist and the coroner immediately notified. If the remains are determined to be Native American, then the NAHC must be notified within 24 hours as required by Public Resources Code 5097. The NAHC will notify designated Most Likely Descendants who will provide recommendations for the treatment of the remains within 24 hours. The NAHC will mediate any disputes regarding treatment of remains. Work shall not recommence until the project archaeologist, coroner, and NAHC, submit documentation to the City indicating that buried human remains have been adequately salvaged and no further remains have been identified within the area of disturbance.

<u>Paleontological Resources</u>

No unique paleontological resources have been identified within the Miravale III area. No paleontological resources are anticipated in the project area; therefore, project development would not result in direct or indirect impacts on any unique paleontological resources. **The project would have a less-than-significant impact on paleontological resources.**

4.6 GEOLOGY, SOILS, AND MINERAL RESOURCES

Introduction

This section describes the geologic and seismic setting for the project and evaluates its potential to cause geologic impacts such as erosion during construction or to be subjected to geologic hazards such as earthquakes. In addition, this section describes known mineral resources within the project vicinity.

Several reports were completed for the proposed project including two Preliminary Geologic Hazards Investigations prepared by Nolan Associates (August 9, 1995 and September 27, 2006); a *Geotechnical Investigation for the Preliminary Design Phase*, prepared by Tharp & Associates, Inc. (August 29, 2005); and a *Preliminary Soils & Foundation Investigation*, prepared by Tharp & Associates, Inc. (October 19, 1995). These reports are included as Technical Appendix T-5 in Volume II of this DEIR.

Setting

Overview

Geologic structure in central California is primarily the result of tectonic events that occurred over the past 30 million years. It is widely believed that the numerous faults in this area are related to movement along the boundary between the Pacific and North American tectonic plates. The relative motion between these two tectonic plates is taken up largely along the northwestward-trending San Andreas Fault system, which defines the regional boundary between the two plates. Changes in sea level and tectonic uplift resulted in a complicated depositional environment that produced the complex geology of the Monterey Bay region.

The project site is situated on the eastern flank of the Salinas Valley and is bounded to the east by the foothills of the Gabilan Range, a granitic massif that forms a portion of the Coast Ranges Physiographic Province of California. The Coast Ranges Province consists of a series of coastal mountain chains paralleling the pronounced northwest-southeast structural grain of central California geology. The Gabilan Range and adjacent portions of the Salinas Valley are underlain by a large, northwest-trending, fault bounded, elongated prism of granitic and metamorphic basement rocks, known collectively as the Salinian Block. The Salinian Block is separated from contrasting basement rock types to the northeast and the southwest by the San Andreas and the Sur-Nacimiento fault systems, respectively. Overlying the granitic basement rocks on the Salinian Block is a sequence of dominantly marine sediments of Paleocene to Pliocene age and non-marine sediments of Pliocene to Pleistocene age, all of which show evidence of uplift and deformation. Refer to Figure 4.6-1 for the Regional Geologic Map.

The Salinas Valley is underlain by alluvial fill to an estimated depth between 800 and 1,000 feet. The fill is composed of mainly unconsolidated and loosely consolidated sediments. These sediments were derived through weathering and the subsequent movement of this material from upland areas to the valley floor. The valley is also underlain by a complex series of stratigraphic units. Alluvial fan deposits have built up on both sides of the valley. In addition, varying stream velocities and changing patterns of the Salinas River and its tributaries, over time, have resulted in the deposition of alternating layers of silt, sand, gravel, cobble, and boulders over the fans and in the valley. Overall, underlying geologic structure can vary considerably. Refer to Figure 4.6-2 for the Local Geologic Map.

The project site is located on the northern edge of the City of Soledad, approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of the San Francisco Bay Area. The site is composed of

contiguous parcels totaling approximately 920 acres and consists of two primary landforms, the valley floor and the foothills of the Gabilan Range.

Topography

The project site is located on a broad, gently sloping alluvial fan at the foot of the western slope of the Gabilan Range on the east side of the Salinas Valley, with the eastern-most portion of the project site extending onto the foothills of the Gabilan Range. The alluvial fan abuts flat-lying fluvial deposits of the Salinas River southwest of the site. The elevation ranges from 200 to 600 feet above sea level. The land to the east of the site is rugged ridge-and-valley topography that rises rapidly to elevations greater than 2,000 feet. Surface slopes on the alluvial portion of the site are approximately 5 to 8 percent gradient. Steep slopes on the eastern portion of the site range up to about 70 percent gradient, but more commonly fall in the range of 30 to 45 percent. Refer to Figure 4.6-3 for the Topographic Index Map.

Drainage

Drainage of surface water in the vicinity of the project site generally occurs by overland sheet flow towards shallow drainage courses. The drainages are ephemeral and it is unlikely that substantial surface flow occurs except during periods of high rainfall. The natural drainage channels are only slightly incised and there is little indication of significant erosion on the site.

Soils

The project site possesses two primary subsurface profiles. The foothill portion of the site is characterized by a thin layer (usually less than 5 feet) of colluvium and slope wash which is underlain by granitic bedrock. This bedrock is generally weathered in the upper 3 to 4 feet, becoming less weathered with increasing depth. These materials are generally hard to very hard, dry to slightly moist, nonplastic to slightly plastic, of low to moderate expansivity, with the exception of scattered deposits of highly expansive clay, and are considered only slightly compressible. The valley floor portions are underlain by a relatively thick alluvial/colluvial deposit composed of clayey sand with varying amounts of silt and gravel overlying sands and gravels with lesser clay contents. The clayey sands in the upper stratum anticipated to impact the proposed project are generally loose to medium dense, somewhat compressible, and of low expansivity. Additionally, some of the loose surficial material possess an undesirably high collapse potential. The sands and gravels, which primarily underlie the southern portions of the site, are generally medium to very dense, considered to be only slightly compressible, and of very low expansivity. Refer to Figure 4.2-2 in the Agricultural Resources Section for the Soils Map.

According to the results of the Preliminary Geologic Hazards Investigations by Nolan Associates and the Geotechnical Investigations by Tharp & Associates, Inc., a total of 51 exploratory borings were drilled on the project site. The exploratory borings were drilled to depths ranging from 10.0 to 51.5 feet below the ground surface. In addition, percolation testing was done in 11 locations. Soils encountered in each exploratory boring were visually classified in the field and a continuous log was recorded. Laboratory tests were performed on the collected soil samples to determine physical and engineering characteristics.

Groundwater

Hydrophilic vegetation on a portion of the site indicates a locally elevated groundwater level, probably perched on relatively less impermeable alluvial strata. Regional groundwater was only encountered in the extreme southern portion of the site in the sand/gravel deposits at a depth of 30 feet. However, shallow groundwater was encountered perched on the dense clayey sand layers in the central portions of the site.

This groundwater was encountered at an average depth of approximately 11 feet and appears to be perched on the denser clayey sand materials encountered at a depth of approximately 20 feet.

Events and Processes

Seismicity. The project site is located within a seismically active area. The alluvial Salinas Valley is bordered to the east and west by active or potentially active fault zones. The potential for earthquake damage from ground shaking is moderate to high in the project vicinity. The San Andreas fault lies approximately 12 miles to the northeast of the project site. This fault has generated earthquakes in excess of 7.0 on the Richter scale at many points along its 600-mile length. The Reliz-Rinconada fault lies along the other side of the valley, approximately 4.6 miles southwest of the project site. Although not considered to be as potentially strong as the San Andreas fault, the Reliz-Rinconada fault is located in closer proximity to the site, and therefore poses a significant seismic hazard. Refer to Figure 4.6-4 for the Regional Seismicity Map.

Ground Shaking. Small to moderate earthquakes (magnitude less than 5.0 on the Richter Scale) are common in Monterey County. The most significant quakes affecting the County during the last century have included the 1906 San Francisco earthquake and the 1989 Loma Prieta earthquake. Research has shown that areas underlain by layers of unconsolidated, recent alluvium and unconsolidated soil material with high ground water have an increased risk of experiencing the damaging effects of groundshaking. Due to its proximity to a number of major earthquake faults, it is reasonable to assume that all improvements in the City will experience intense groundshaking at least once within their useful life (60 years), and that unstable hillsides will be subjected to destabilizing landslide forces.

Ground Rupture. Seismically induced ground rupture is defined as the physical displacement of surface deposits in response to an earthquake's seismic waves. Ground rupture is most likely to occur along active faults. However, the potential for ground rupture also exists along potentially active faults. Therefore, development in areas overlying fault zones, whether active or potentially active, should be avoided. Any development that does take place within these areas should perform a fault hazard study to assess the potential for damage associated with fault rupture and to establish setbacks to mitigate the potential for such damage.

Ground Lurching. Ground lurching is a type of ground failure that could potentially occur in parts of the Soledad planning area during a large earthquake. This phenomenon is characterized by irregular cracks, fissures, and fractures of lengths varying from a few inches to many feet. It is caused by the shaking, settling, and sliding of soil and can be accompanied by lateral spreading, which is the horizontal movement of soil towards the open face of an embankment.

Erosion. Erosion is a natural process that occurs over time and can be caused by either wind or water moving over soils. Soil erosion can become a problem when human activities accelerate erosion rates. Non-point sources, including impervious surfaces, construction activities, and road construction, can all accelerate the rate at which soils are removed from hillsides. There is the potential for increased erosion as a result of proposed development within the foothills of the Gabilan Range.

Landslides. The occurrence of landslides is influenced by a number of factors, including slope angle, soil moisture content, vegetative cover, and the physical nature of the underlying strata. Landslides can be triggered by one or more specific events, including development-related construction, seismic activity, soil saturation, and fires. The primary factor in determining landslide potential is an unstable slope condition. No evidence of previous landslides were found during site reconnaissance and aerial photo inspection of the site and the entire property has been mapped as a "low" landslide hazard area

(Rosenberg , 2001). The only steep slopes where landsliding has the potential to occur are situated on the easternmost portion of the project site.

Lateral Spreading. Lateral spreading is a failure within weaker soil material that causes the soil mass to move towards a free face or down a gentle slope. Liquefaction, lateral spreading, and differential compaction tend to occur in loose, unconsolidated, noncohesive soils with shallow groundwater. Of these three, liquefaction is considered to be the greatest hazard to development within the project site.

Liquefaction. Liquefaction is the transformation of soil from a solid to a liquid state as a consequence of increased pore-water pressures, usually in response to strong ground shaking, such as those generated during a seismic event. Loose, granular soils are most susceptible to these effects, while more stable silty clay and clay materials are generally somewhat less affected. In general, liquefaction potential varies according to soil type, with recent, unconsolidated alluvial soils having the highest potential. Central and southern portions of the site have been identified as having the presence of potentially liquefiable soils.

Soil Expansion. Expansive soils shrink and swell as a result of moisture changes. This can cause heaving and cracking of slabs-on-grade, pavements, and structures founded on shallow foundations. At the site, soil units with elevated plasticity indexes include Gloria sandy loam, Placentia sandy loam, and Salinas clay loam.

Mineral Resources

Sand, gravel, and petroleum are the primary mineral resources extracted in Monterey County. Construction-grade aggregate (sand, gravel, and crushed stone) is the most abundant and commonly used mineral resource. Aggregate resources are classified by the State Geologist into four mineral resource zones based on the likelihood of the presence of mineral deposits and their economic value in the form of Mineral Resource Zones (MRZs) under the Surface Mining and Reclamation Act of 1975 (SMARA). This mineral land classification is used to help identify and protect mineral resources in areas within the State subject to urban expansion or other irreversible land uses that would preclude mineral extraction.

Permitted aggregate resources located within the project vicinity include Stonewall Canyon quarry, which is operated by Syar Industries and located off of Metz and Stonewall Canyon Roads, approximately 1.5 miles east of the project site. The project site is not identified by the City's General Plan or the State of California as containing potential mineral resources. Additionally, the project site is not located within a designated MRZ.

Local Requirements

City of Soledad General Plan.

The Safety, Land Use, and Conservation/Open Space Elements of the General Plan identify potential natural and human-made hazards and provide standards for the protection of people and property from such hazards, as well as for the protection of significant mineral resources. Geologic/soil hazard and mineral resource policies which apply to development within the project area include requirements for Uniform Building Code compliance, preparation of geological and soil studies, adherence to hillside/slope development and grading standards, and avoidance of urban uses adjacent to regional mineral resource deposits. Applicable policies are identified below.

Policy C/OS-8 The City shall require public or private development to:

a. The City shall designate hillside areas above the 400 foot elevation contour as Open Space/Grazing, Public Facility (parkland) or Agriculture.
b. Locate primary structures, accessory structures, paving, and grading at the base of a hill (generally that are below the 400 foot contour or 15 percent slope) unless: (1) no practicable alternative is available, (2) the location on a greater slope or at a greater elevation provides more aesthetic quality, or (3) the location is necessary to protect public health and safety.
c. Utilize design, construction, and maintenance techniques that: (1) preserve and enhance the hillsides; (2) ensure that development near or on portions of a hill do not cause, or make worse natural hazards (such as erosion, sedimentation, fire, or water quality concerns); (3) include erosion and sediment control practices including temporary vegetation sufficient to stabilize disturbed areas; (4) minimize risk to life and property from slope failure, landslides, and flooding; (5) maintain the character and visual quality of the adjacent hillside.
d. Incorporate recreation and public access on or near hillsides consistent with this Element.

Policy C/OS-9 The City shall support the preservation and enhancement of natural land forms, natural vegetation, and natural resources to the maximum extent feasible.

Policy C/OS-26 The City and County shall discourage urban uses adjacent to State-designated regional resource deposits if such uses would be incompatible with mining operations, or would restrict future extraction of significant mineral resources.

Policy HZ-5 All new development shall satisfy the applicable requirements of the Uniform Building Code.

Policy HZ-6 The City shall require the preparation of a soils engineering and geologic-seismic analysis prior to permitting development in areas prone to geologic or seismic hazards (i.e. groundshaking, landslides, liquefaction, expansive soils).

Policy HZ-7 The City shall limit development in areas of steep or unstable slopes to minimize hazards by landslides or liquefaction.

Policy HZ-8 In landslide hazard areas, the City shall prohibit alteration of land in a manner that could increase the hazard, including concentration of water through drainage or irrigation systems; removal of vegetative cover; and steepening of slopes and undercutting the bases of slopes.

Please refer to Table 4.9-2 of the Land Use section for a detailed analysis of the project's consistency with the City's General Plan geologic/soil hazard and mineral resource policies.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential area-wide geologic hazards and regional seismic characteristics and potential mineral resource impacts and the effects of geologic hazards related to the development of properties and facilities within the Plan area. These potential hazards included seismicity, grounding shaking, ground rupture, ground lurching, liquefaction, landslides, erosion and sedimentation, subsidence, and expansive soils. According to the EIR all associated impacts were found to be less-than-significant with mitigation incorporated.

- A major earthquake on the San Andreas faults could produce ground accelerations that would result in damage to structures and a potential safety hazard to occupants of such structures. This impact was considered significant unless mitigated.

- Portions of the Plan area may be subject to landslides and/or slope failure. This impact was considered significant, unless mitigated.

- Development activities associated with the various land uses contemplated by the Plan have the potential to result in soil erosion. This impact was considered significant, unless mitigated.

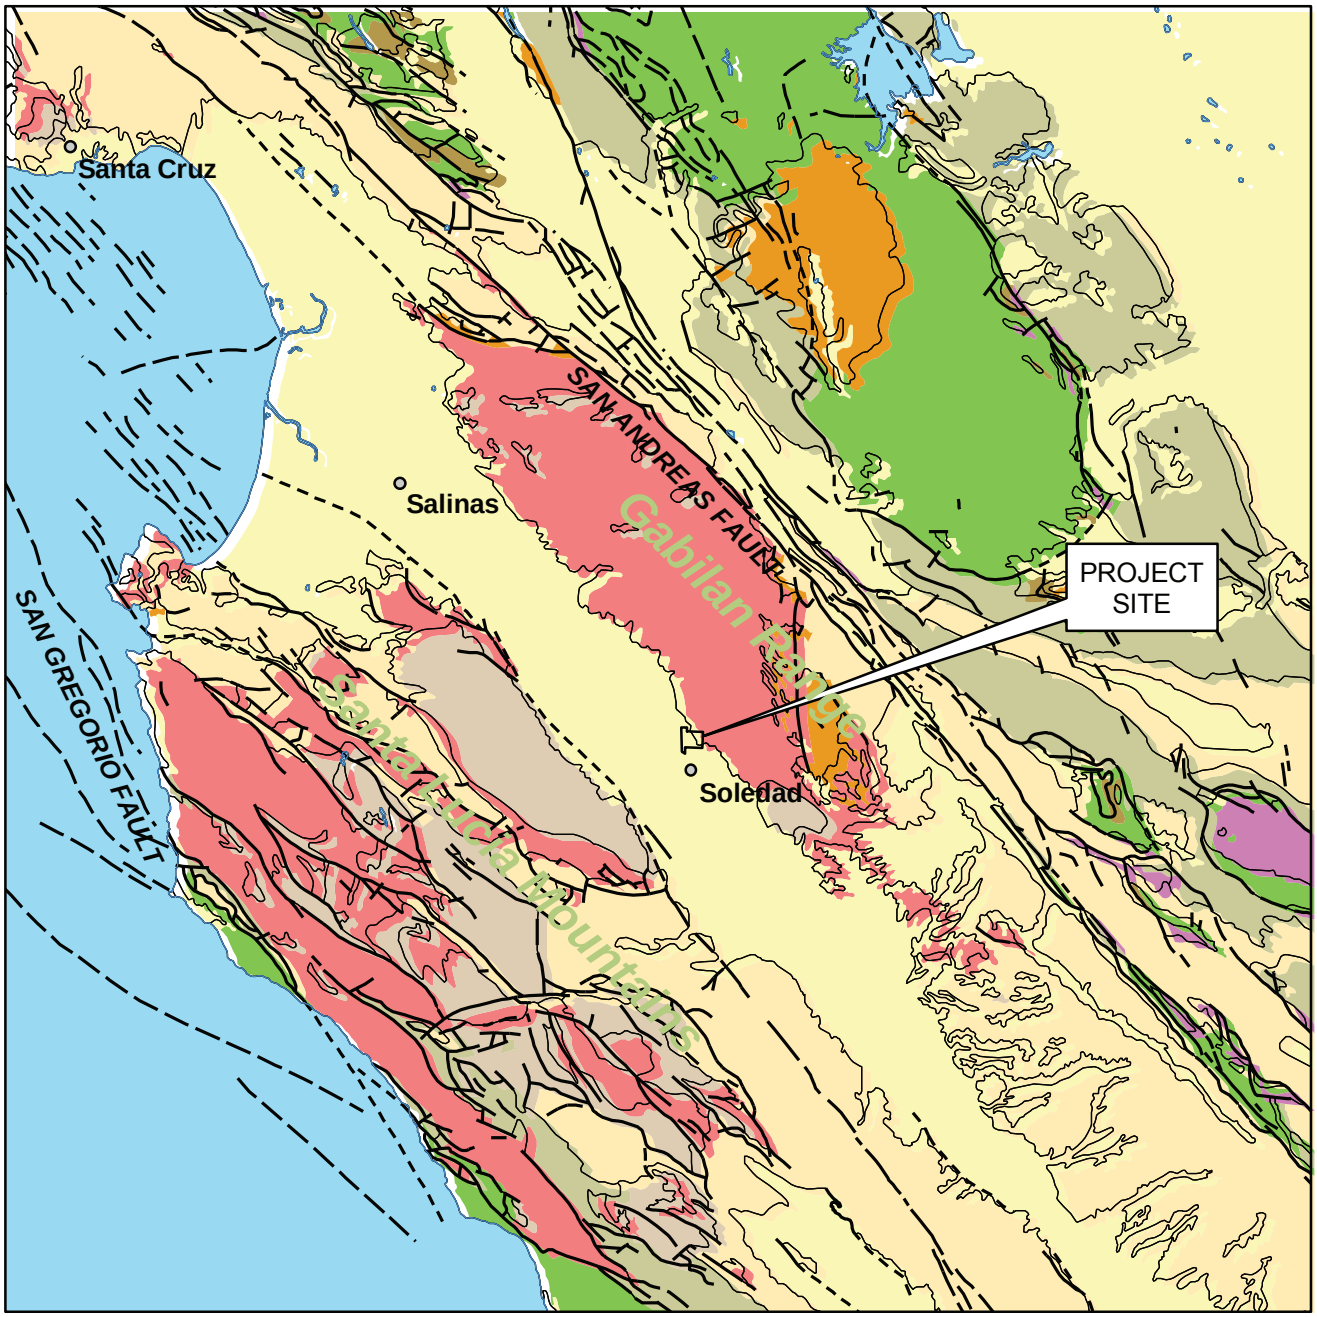
Miravale III Specific Plan

Section 2.0 (Land Use) of the Miravale III Specific Plan and the Hillside Development Standards & Guidelines both contain policies concerning geologic impacts associated with hillside development. Section 2.0 identifies land use goals and policies regarding the physical development for each respective land use category (i.e. residential, commercial, etc.). The Hillside Development Standards & Guidelines, included as Appendix A of the Specific Plan, outlines measures designed to limit impacts from proposed hillside development. The following policies are applicable regarding geologic impacts associated with hillside development.

- Land Use Goal LU-10 states that project development should protect the scenic vistas of the hills above Soledad through careful siting and design standards that minimize grading and visibility of new hillside development.

To minimize potential impacts due to hillside development specific Hillside Development Standards were developed as part of the Specific Plan. The Hillside Development Standards and Guidelines identify specific grading practices and designs, including the preservation of the natural topography, to minimize impacts. Additionally, specific measures are included to address grading design, preserving natural topography, fire related hazards, drainage issues, and building design within the hillside portion of the site.

Relevant Project Characteristics



The Specific Plan calls for a mixed-use urban development consisting of new roads and infrastructure, single-family and multi-family residential units, retail commercial space, a golf course, school and public safety sites, and open space and recreation areas. The project will require extensive grading on the site to facilitate construction of the proposed uses.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault,
  - Strong seismic ground shaking,
  - Seismic-related ground failure, including liquefaction,
  - Landslides;

- Result in substantial soil erosion or the loss of topsoil;

- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse;

- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property;

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state;

- Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Impacts and Mitigation

Seismic Hazards

During the life of the project, proposed development would be subject to seismic hazards such as ground accelerations, ground shaking, and liquefaction. The Reliz-Rinconada fault zone, passing within 6 miles of the site, is expected to generate the largest earthquake ground motion at the site. The characteristic earthquake on this fault is expected to generate estimated ground motions of up to 0.72g. Duration of strong seismic shaking from this event will be about 26 seconds. However, the recurrence interval (RI) for this earthquake is relatively long (RI = 1,764 years); therefore, the probability of this earthquake occurring within the project lifespan is relatively low. The San Andreas fault zone, passing within 12 miles of the site, is also expected to generate large earthquake ground motions. These ground motions are estimated at up to 0.26g with a duration of 7 seconds. Large earthquakes on the San Andreas fault are considered to be more likely (RI = 50-200 years) than on the Reliz-Rinconada fault. Existing building code regulations for seismic loads may not eliminate the potential for damage to structures resulting from nearby major earthquakes. Consequently, the requirements of the existing building codes should be reviewed during site design in order to provide the appropriate level of protection to new improvements. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **The project would be exposed to potential adverse effects from strong seismic ground shaking that may result in damage to proposed structures.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.6-1 To minimize the potential effects from strong seismic ground shaking on project components, a project-specific geotechnical analysis shall be performed by a registered professional engineer with geotechnical expertise, and all recommendations shall be incorporated into final design plans. Prior to the issuance of any building and/or grading permit, the project applicant shall submit a project-specific geotechnical analysis to the City of Soledad Public Works Director for review and approval. The project engineer shall develop project-level plans based upon and in response to the observations and recommendations made in the project specific geotechnical analysis.

4.6-2 In order to minimize potential seismic-related hazards, the project engineer shall incorporate the seismic shaking analysis contained within the Geologic Hazards Investigation Update prepared by Nolan Associates (September 2006) into project design. Prior to the issuance of any building and/or grading permits, the project applicant shall submit design level plans demonstrating that the recommendations of the Geologic Hazards Investigation Update are incorporated into project design, subject to the review and approval of the City of Soledad Public Works Director. In addition, all structures shall be designed to the most current standards of the California Building Code, at a minimum.

4.6-3 In order to minimize seismic-related hazards to new public facilities, a site-specific probabilistic seismic hazards assessment shall be incorporated into the design of any schools, hospitals, fire or police stations, or any other critical facilities planned for the project site. An individual assessment shall be performed for each site by an engineering geologist. Prior to the issuance of any grading and/or building permit for new public facilities, including but not limited to new schools, hospitals, and fire or police stations, a probabilistic seismic hazards assessments shall be prepared and submitted to the City of Soledad Director of Public Works for review and approval.

Grading and Soil Erosion

The project will require extensive grading on the site to facilitate construction of proposed uses. For the purposes of this analysis it is assumed that the entire project site would be disturbed in order to facilitate project development. There is the potential for increased erosion as a result of proposed development within the foothills of the Gabilan Range. The foothill portion of the site is characterized by a thin layer (usually less than 5 feet) of colluvium and slope wash which is underlain by granitic bedrock. Site preparation and construction activities would disturb soil and increase its susceptibility to erosion. Removal of soils by wind or water can undermine buildings, roads, and other developments, as well as contribute siltation of local streams or water bodies. Moreover, removal of existing mature eucalyptus and other tree species along San Vicente Road could result in additional erosion-related impacts. Erosion impacts can result from both short-term construction activities and long-term project conditions where vegetative cover is not re-established following development. Although the Hillside Development Standards & Guidelines contained in Appendix C include specific erosion control regulations, additional mitigation would be warranted in order to ensure that project-related impacts are reduced to a less-than-significant level. Moreover, mitigation measures are necessary in order to ensure that removal of existing mature eucalyptus and other tree species would not result in additional erosion-related impacts. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **Construction of the project could result in substantial soil erosion or loss of topsoil.** ***This is a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.6-4 In order to reduce wind and water erosion on the project site, an erosion control plan and Storm Water Pollution Prevention Plan (SWPPP) shall be prepared for the site preparation, construction, and post-construction periods. The erosion control plan shall incorporate best management practices consistent with the requirements of the National Pollution Discharge Elimination System (NPDES). The erosion component of the plan must at least meet the requirements of SWPPP required by the California State Water Resources Control Board. If earth disturbing activities are proposed between October 15 and April 15, these activities shall be restricted per the requirements of Soledad Municipal Code Chapter 15.08. Prior to the issuance of any permit,

the project proponent shall submit detailed plans to the satisfaction of the City of Soledad Public Works Director. The components of the erosion control plan and SWPPP shall be monitored for effectiveness by City of Soledad Public Works. The following measures shall be implemented, where appropriate, to control erosion:

1) Keep construction machinery off of established vegetation as much as possible, especially the vegetation on the upwind side of the construction site;
2) Establish specific access routes at the planning phase of the project, and limits of grading prior to development, which should be strictly observed;
3) Utilize mechanical measures (i.e. walls from sand bags and/or wooden slat or fabric fences) to reduce sand movement;
4) Immediate revegetation (plus the use of temporary stabilizing sprays), to keep sand movement to a minimum; and
5) For larger-scale construction, fabric or wooden slat fences should be placed around the construction location to reduce sand movement.

4.6-5 Areas disturbed by grading shall be stabilized with adequate landscaping vegetative cover. A re-vegetation and landscaping plan shall be prepared by a landscape architect with experience in working with the type of soils that are characteristic of the site, subject to the review and approval of the City of Soledad. Prior to the issuance of any certificate of occupancy and concurrent with project construction, disturbed areas shall be re-vegetated consistent with the City approved landscaping plan. All project replanting shall be continually monitored by the landscape architect for a duration of three years. The landscape architect shall submit annual monitoring reports to the City of Soledad after each successive year detailing the success of landscaping. Success shall be based on an 80% survival rate. If it is determined that the replanting has not been successful, additional replanting shall be required by the City of Soledad.

4.6-6 All drainage from improved surfaces shall be captured by closed pipe or lined ditches and carried to neighborhood storm sewers or natural drainages. At no time shall any concentrated discharge be allowed to spill directly onto the ground adjacent to structures or to fall directly onto steep slopes. The control of runoff is essential for erosion control and prevention of water ponding against foundations and other improvements. Prior to the issuance of any grading and/or building permit for each new structure, the project applicant shall submit an erosion control plan consistent with this measure, subject to the review and approval of the City of Soledad Public Works Director.

Liquefaction

Soil liquefaction occurs as a result of strong seismic shaking of loose, saturated sediments. A portion of the project site is mapped as being exposed to a high level of risk from liquefaction. This area of risk corresponds to Undifferentiated Flood Plain (Qfp) deposits. Based on site geologic mapping, there were no areas underlain by Qfp. However, the alluvial fan sediments underlying the central, western, and southern portions of the site can be capable of liquefaction in areas of shallow ground water.

A quantitative liquefaction analysis was performed for subsurface conditions encountered during the field exploration. The analysis was performed using empirical predictions of earthquake-induced liquefaction potential, and assumed a peak ground acceleration of 0.34g. The results of the analysis indicate that under the conditions anticipated during the design seismic event, an approximately 9 foot thick layer of poorly graded sand with trace to some clay underlying the central portion of the site at depths of approximately 11 to 20 feet are potentially liquefiable, and a 6 foot thick layer of the poorly graded sand

with trace clay underlying the southern portion of the site at depths of approximately 45 to 50 feet are also potentially liquefiable.

There is a risk of liquefaction and collapse at the project site due to the presence of recent, unconsolidated alluvial soils. Isolated and discontinuous loose and dry sands were encountered at various depths across the site. These sands are weak and potentially compressible. As the surficial soils that will be supporting the foundations and structural fill are loose to very loose, remedial grading, subexcavation, and recompaction will be necessary to improve the soils for foundation and structural fill support. Future development of the project site would be required to be built in compliance with the provisions of the Uniform Building Code. Adherence to existing building regulations, in addition to the following mitigation measure, would ensure that impacts would be less-than-significant. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **The project could be exposed to localized liquefaction and collapse.** ***This would represent a potentially significant impact that can be reduced to a less–than-significant level with implementation of the following mitigation measures.***

Mitigation

4.6-7 In order to reduce the risk of localized liquefaction and collapse, and allow for adequate foundation and structural fill support, grading plans shall be consistent with a project-specific geotechnical analysis. The project geotechnical engineer shall prepare a quantitative assessment of liquefaction and seismically-induced settlement potential for the project as part of a comprehensive site geotechnical evaluation, prior to the recordation of each final map. Measures to ensure adequate reduction of risk to standard acceptable levels in accordance with standard geotechnical practice shall be incorporated into project design and specifications, subject to the review and approval of the City of Soledad Public Works Director.

Landslides, Debris Flow and Lateral Spreading

According to the preliminary geological and geotechnical analyses prepared for the project, the entire site is mapped as a "low" landslide hazard area. There is no indication of past slope instability at the project site. The only steep slopes where landsliding could occur are situated within the foothill portion of the site. However, these slopes are underlain by granitic rock, which is typically resistant to landsliding (Jeff Nolan, personal communication, August 2007). In addition, the foothill portion of the site is characterized by a thin layer of colluvium and slope wash. Some of these soils could be considered loose and unconsolidated, and therefore have the potential for lateral spreading. These soils were observed to be located within several very steep, v-shaped drainage swales. These swales had fan shaped deposits at their mouths that are indicative of debris flow type landslide deposits during intense rainstorms. Therefore, the project could be subject to on- or off-site landslide and lateral spreading hazards. In order to ensure that project-related impacts are reduced to a less-than-significant level, project-specific mitigation is necessary. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **The project could be exposed to potential adverse effects from on- or off-site landslides and lateral spreading that may result in damage to proposed structures.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.6-8 Portions of the project located within debris flow hazard areas as described in the Geological Hazards Investigation Update prepared by Nolan Associates (September 2006, see pg. 14) shall incorporate design measures to mitigate this hazard to acceptable levels in accordance with standard engineering practices. Suitable measures include: 1) Restricting development to outside these areas; 2) Constructing artificial channels or diversion walls, designed to divert fluidized debris away from habitable structures; or 3) Constructing impact walls, designed to withstand anticipated debris flow volumes and velocities. An engineering geologist shall be retained to provide site-specific geologic design criteria for debris flow hazard areas once the final project plans are available. Diversion or retaining structures shall be designed based on recommendations by a geotechnical engineer, subject to review and approval of the City of Soledad Public Works Director. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate design measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad.

Expansive Soil

Structures or improvements built atop expansive soils may be subject to damage from soil shrinkage and swelling, associated with wetting and drying. A soil with a higher plasticity index is generally more prone to shrinkage or swelling in response to seasonal rainfall. At the site, soil units with elevated plasticity indexes include Gloria sandy loam, Placentia sandy loam, and Salinas clay loam. These soil units are restricted to flatter areas of the property. Due to the presence of potentially expansive soils, there is the potential that future development of the project site, as envisioned in the Specific Plan, could expose persons and/or structures to soil related hazards. As the project has the potential to be exposed to soil expansion on foundations and interior or exterior concrete slabs-on-grade within these areas, additional mitigation would be warranted to reduce project impacts to a less-than-significant level. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **The project could be exposed to localized soil expansion.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.6-9 In order to minimize potential hazards associated with expansive soils, the expansion potential of site soils shall be evaluated as part of a site-specific geotechnical study to ensure hazards are reduced to an acceptable level of geotechnical and Uniform Building Code practices. The recommendations of a geotechnical engineer for mitigating soil shrink-swell hazards shall be incorporated into project design. These measures may include replacement of soil with engineered backfill or treatment of expansive soil with lime. Prior to the recordation of each final map, the project applicant shall submit evidence demonstrating that adequate measures are incorporated to mitigate potential hazards to acceptable engineering standards, subject to the review and approval of the City of Soledad Director of Public Works.

Mineral Resources

Development of the project would not impact access to existing mineral resources located east of the site. Stonewall Canyon quarry is located off of Metz and Stonewall Canyon Roads, which is located on the

opposite side of the City and separated from the project site by numerous foothills of the Gabilan Range. Since the project is not located within a designated MRZ or near identified potential mineral resources, it is unlikely that proposed urban uses would be incompatible with existing mining operations, or would restrict future extraction of significant mineral resources. Therefore, the project would not result in the loss of availability of a known mineral resource. **There will be no impact to mineral resources and no mitigation measures are necessary.**

4.7 HAZARDS AND HAZARDOUS MATERIALS

Introduction

A *Phase I Environmental Site Assessment* was completed for the project by D&M Consulting Engineers, Inc. (September 7, 2006). In addition, a *Phase 1 Environmental Site Assessment* was also prepared for a portion of the subject property in 1995 by Terratech, Inc. The following discussion incorporates the information contained in both of those analyses. These reports are included as Technical Appendix T-6 and are included as part of Volume II of this DEIR. A copy of these reports and their accompanying appendices are also on file with the City of Soledad.

This section assesses the potential public health and safety impacts of the project. Hazards, such as flooding, seismic/geologic, and public service hazards, including fire and emergency response, are discussed in the Hydrology and Water Quality, Geology and Soils, and Public Services Sections, respectively.

Setting

Overview

Hazardous materials, as defined by the California Code of Regulations, are substances with certain physical properties that could pose a substantial present or future hazard to human health or the environment when improperly handled, disposed, or otherwise managed. A hazardous waste is any hazardous material that is discarded, abandoned, or slated to be recycled. Hazardous materials and waste can result in public health hazards if improperly handled, released into the soil or groundwater, or through airborne releases in vapors, fumes, or dust. Soil and groundwater having concentrations of hazardous constituents higher than specific regulatory levels must be handled and disposed of as hazardous waste when excavated or pumped from an aquifer.

Regulatory Environment

The generation, storage, and handling of hazardous materials and wastes are regulated by various federal, state, and local laws and regulations aimed at the protection of public health and the environment. A summary of regulations follows.

Federal. The U.S. Environmental Protection Agency (EPA) is responsible for enforcing regulations at the federal level pertaining to hazardous materials and wastes. The primary federal hazardous materials and wastes laws are contained in the Resources Conservation and Recovery Act (RCRA) of 1976 and in the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980. CERCLA, more commonly known as Superfund, established the National Priorities List for identifying and obtaining funding for remediation of severely contaminated sites. Federal regulations pertaining to hazardous materials and wastes are contained in the Code of Federal Regulations (40 CFR). The regulations contain specific guidelines for determining whether a waste is hazardous, based on either the source of generation or the characteristics of the waste.

Transportation of hazardous materials by truck and rail is regulated by the U.S. Department of Transportation (DOT). DOT regulations establish criteria for safe handling procedures. Federal safety standards are also included in the California Administrative Code.

State. The EPA has delegated much of its regulatory authority to individual states whenever adequate state regulatory programs exist. The Department of Toxic Substance Control Division of CAL EPA is the

agency empowered to enforce federal hazardous materials and waste regulations in California, in conjunction with the EPA.

California hazardous materials and waste laws incorporate federal standards, but in many respects are stricter. For example, the California Hazardous Waste Control Law, the state equivalent of RCRA, contains a much broader definition of hazardous materials and waste. State hazardous materials and waste laws are contained in the California Code of Regulations, Titles 22 and 26. Regulations implementing the California Hazardous Waste Control Law list hazardous chemicals; establish criteria for identifying, packaging, and labeling hazardous wastes; prescribe management of hazardous wastes; establish permit requirements for hazardous waste treatment, storage, disposal, and transportation; and identify hazardous wastes that cannot be disposed of in landfills.

Under RCRA, a facility is classified as a generator of hazardous waste if it generates and stores hazardous waste onsite for less than 90 days; such a facility is required to obtain an EPA generator's identification number from the EPA or the California Department of Toxic Substances Control (DTSC). If hazardous waste is stored on site for longer than 90 days, the facility is classified as a Transfer, Storage, or Disposal Facility and is required to obtain a RCRA Part B Storage Permit, which can take approximately two years to obtain. Transportation and disposal of hazardous materials are also regulated; hazardous waste must be characterized to determine methods of disposal and site disposal (i.e., class of landfill).

Under both RCRA and the California Hazardous Waste Control Law, hazardous waste manifests must be retained by the generator for a minimum of three years. A hazardous waste manifest lists a description of the waste, its intended destination, and regulatory information about the waste. A copy of each manifest must be filed with DTSC. The generator must match copies of hazardous waste manifests with receipts from the treatment/disposal/recycling facility to confirm that the wastes were properly handled.

Monterey County. The Monterey County Environmental Health Division requires that a Business Response Plan and Inventory be prepared for facilities that generate hazardous waste or handle hazardous materials in order to plan and prepare for possible chemical releases or emergencies. A Business Response Plan is required for businesses that generate any amount of hazardous waste or that use hazardous materials in the following amounts: 1) 55 gallons or greater for liquids, 2) 500 pounds or greater for solids, and 3) 200 cubic feet or greater for compressed gases. A Business Response Plan must include specific information on hazardous materials handled (inventory and chemical description), emergency contacts, notification procedures, evacuation plans, training procedures, and a site map.

Pesticide use is regulated and permitted by the Monterey County Agricultural Commissioner’s Office.

Phase I Assessment

In March 1995 a Phase 1 Environmental Site Assessment was prepared by Terratech, Inc. that evaluated the potential for hazardous environmental conditions on the portion of the project site located east of San Vicente Road. A supplemental Phase I Environmental Site Assessment was conducted for the entire project site by D&M Consulting Engineers, Inc. in September 2006. This report incorporated the findings of Terratech’s previous evaluation in addition to conducting additional analysis pertaining to potential environmental hazards. The purpose of this assessment was to determine the potential for hazardous materials contamination on the site. This assessment included the following: 1) a records search of all environmental agency databases and files, 2) a site reconnaissance, 3) interviews with key site personnel and regulatory officials, and 4) conclusions and recommendations. Specific discussions on the recognized environmental conditions that warrant Phase II investigation were presented in the Opinions and Conclusions section of the Phase I Assessment.

Site Characteristics and Use. The project site consists predominantly of agricultural land and is located at the northern edge of relatively new residential subdivisions. To the west and north are agricultural and grazing land, and the foothills of the Gabilan Range. There are no commercial or industrial facilities nearby. The site elevation ranges from 180 feet to 740 feet above mean sea level and slopes downward generally to the southwest. There are no streams in the immediate area but there are a number of man-made, earthen reservoirs holding irrigation water. The western and eastern portions of the site are separated by San Vicente Road. The western portion of the site is currently used for row crops. The eastern portion of the site has two vineyard areas, intervening fallow row crop area, and some rangeland. There are two existing farm residences within the project area. The residences include adjoining farm equipment storage, barn, maintenance shop, and a chemical storage shed. Other structures include two large water tanks, a radio transmission tower, and a few high-tension power line towers.

Database Search. A database search was conducted to identify recorded hazardous materials incidents in the project area. The search included recorded incidents on the National Priorities List (NPL), the Superfund Comprehensive Environmental Response Compensation and Liability Information System List (CERLIS), the EPA's emergency response notification system list (ERNS), RCRA, and other federal, state, and local agency databases. The goal of reviewing the database report is to identify facilities that have known and documented environmental aspects that may negatively impact the subject site.

The project site was not identified on any database lists. Only one facility near the project site was identified on the database report to be of potential concern. Soledad Sanitary Landfill, located immediately north of the western portion of the project site, was listed in the databases of two California agencies – Waste Management Unit Database System compiled by the State Water Resources Control Board and the Solid Waste Information System compiled by the State Integrated Waste Management Board. The closed landfill is deemed to have a low potential for generating significant quantities of leachate but does need long-term maintenance to prevent erosion and water from ponding on-site. There was no information about analytical testing of soil or groundwater near this facility.

According to Monterey County Environmental Health records, the vineyard facility within the eastern portion of the project site was designated a closed site as of April 2004. A chemical inventory lists four 500 gallon propane tanks, 1,000 gallon and 10,000 gallon diesel fuel tanks, two 10,000 gallon gasoline tanks, 55 gallon oil drum, and 55 gallon waste oil drum. It was unclear whether the site contains underground storage tanks. There were no notations regarding spills or releases and no violation notices.

The Monterey County Agricultural Commissioner's office was contacted for pesticide records. With regards to the eastern portion of the project site, by far the most heavily applied chemicals are the sulfur-based fungicides (Wilbur-Ellis and Red-Top Dusting Sulfur, and Microthiol Disperss). Other fungicides used include Pristine, Champ Formula 2, Kocide 2000, and Rally 40W. In the weed control/herbicide category, the most heavily used are Roundup and Gramoxone Max. The last main category of chemicals applied is the spreader surfactant-types, such as Latron B-1956, In-Place and R-11. With regards to the western portion of the project site, the most listed chemical is Sonata, a non-hazardous bio-fungicide. The site also uses very small amounts of Entrust insecticide and Miller Nu-Film P spreader.

Site Survey & Interviews. A site reconnaissance was performed by D&M Consulting Engineers on August 31, 2006, to look for obvious evidence of potential contamination, such as current hazardous materials storage or use; unusually stained soils, slabs, and pavements; drains, sumps, drums, tanks, and electrical transformers; stressed vegetation; and discarded hazardous materials containers. In addition, interviews were conducted with the current property owner, Nader Agha, and site operation managers Norm Braga (western portion of the project site) and Mark Mirassou (eastern portion of the project site).

Eastern Portion Observations – Approximately 160 acres are planted as a vineyard. The remaining portions are either fallow (310 acres) or too steep for cultivation. Pole-mounted transformers are located at the southwest and northeast ends of the area. A 1,000 gallon diesel AST and 500 gallon gasoline AST are located on the east side of the farm outbuildings. No spills were noted in or around the bermed area. Along the north side of the outbuildings were several 55 gallon drums containing paving oil. No significant staining was noted. The inside of some of the outbuildings are used for storage and mixing of agricultural chemicals and storage and usage of oil. No evidence of USTs was noted. In addition, no evidence of hazardous materials storage was noted.

Western Portion Observations – The majority of the site is in row crop cultivation. A 10,000 gallon diesel AST is located along the southern boundary of the site. No signs of spillage were noted. An irrigation well is located east of the AST. A square reservoir is located near the center of the area, and a rectangular reservoir is located alongside San Vicente Road at the southeast corner.

Airports

There are no public airports within the vicinity of the project site. However, a private airstrip is located southeast of the project site. The airstrip consists of a 1,000-foot by 95-foot dirt runway. The airstrip is located approximately 6,000 feet from the project's boundary. The northwest-southeast orientation of the runway does not place the project site in the line of overflight for takeoffs and landings. The airstrip is used by small planes chartered for Stonewall Canyon Vineyard. Use of the landing airstrip generally occurs in the fall during harvest season. The airstrip is occasionally used for aerial application of chemicals on crops. Use of the airstrip for chemical applications generally occurs during spring and fall when rains may hinder ground application. According to Monterey County records, use of the landing strip is not expected to exceed two daylights flights per week during the harvest season.

City of Soledad General Plan

The Safety Element of the General Plan identifies potential natural and human-made hazards and provides standards for the protection of people and property from such hazards. Numerous goals and policies of the General Plan are intended to protect residents from such hazards. The following hazards/hazardous materials policies apply to development within the project area:

Policy L-38 The City and Redevelopment Agency shall promote the development of clean industries that do not generate large amounts of air pollution, have the potential to pollute groundwater resources, or that store, use or produce large volumes of hazardous materials.

Policy HZ-9 New development shall provide fire flow, emergency access and hydrants consistent with Fire Department requirements.

Hazards/hazardous materials policies which apply to development within the project area include requirements for Uniform Building Code compliance and preparation of soil studies. Please refer to Table 4.9-2 of the Land Use section for a detailed analysis of the project's consistency with the City's General Plan hazards/hazardous materials policies.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential hazardous materials associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts

associated with individual development projects, such as the proposed project. According to the General Plan EIR, the following hazardous material impacts were identified:

- Urban development accommodated by the General Plan will increase the amount of hazardous materials used, stored, generated, and transported in and through the City. This would result in increased amounts of hazardous materials entering natural drainage courses and ultimately, the Salinas River. This impact was identified as significant unless mitigated.

Miravale III Specific Plan

Section 5.2.2 of the Miravale III Specific Plan identifies policies and implementation measures to ensure adequate fire protection services to mitigate impacts to emergency response or risk associated with wild land fire.

- New development shall provide fire flow, emergency access, and hydrants consistent with Fire Department Requirements.

Relevant Project Characteristics

The Specific Plan calls for a mixed-use urban development consisting of new roads and infrastructure, single-family and multi-family residential units, retail commercial space, a golf course, school and public safety sites, and open space and recreation areas. Project development would require extensive grading in order to facilitate construction of the proposed uses, in addition to the relocation and demolition of existing structures on-site. More specifically, as detailed in **Section 4.5 Cultural Resources,** the existing Lorentzen home, which is considered a historic structure, would be relocated to avoid impacting a historically significant resource. Several existing outbuildings would be demolished subsequent to the relocation of the Lorentzen home.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;

- create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;

- emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within on-quarter mile of an existing or proposed school;

- be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment;

- for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area; and

- for a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area.

Impacts and Mitigation

The issues of emergency response and wildland fires are addressed in **4.12 Public Services** of this EIR.

Hazardous Material/Waste Sites

The project site has been under active agricultural use, including orchards, vineyards, and row crops, for the past 90 years. Commonly used agricultural chemicals of the past were chlorine or metal based and tend to persist in near-surface soils. In recent years, the western portion of the site has been used as an organic farm and limited quantities of pesticides have been applied. Vineyard operations continue on the eastern portion of the project site and involve applications of sulfur and other fungicides and weed control herbicides. These newer agricultural chemicals tend to be much less persistent in soil and the environment.

In 1995 limited soil sampling was conducted within the eastern portion of the site as part of the Phase 1 Environmental Site Assessment prepared by Terratech, Inc. Soil sampling was conducted in order to determine the presence of any hazardous conditions on-site. No soil samples were taken within the western portion of the project site. Testing was limited to the 'Priority Pollutant' suite of chlorinated pesticides; plus PCBs, which are chemically similar. Seven of the 10 soil samples exhibited no detectable analytes. The other three samples were found to only contain trace amounts of DDE (a breakdown product of DDT), plus a trace of dieldrin in one of the three. The maximum concentrations were 0.066 mg/kg and 0.013 mg/kg, respectively. For relative comparison, the currently applied screening levels for these chemicals in a residential land use are 1.6 mg/kg for DDE and 0.035 for dieldrin (Cal EPA, 2005). Although the limited soil sampling conducted in 1995 did not reveal any significant levels of residual chemicals, additional sampling conducted as part of a Phase II Environmental Site Assessment is warranted per the recommendations contained in the Phase 1 prepared by D&M Consulting Engineers, Inc. See Mitigation Measure 4.7-1 below.

Within the project vicinity, there are no known or listed releases of contaminants (soil or groundwater). A single testing event conducted in 1987 on groundwater from a supply well showed no suspicion of regional groundwater contamination. Nitrates may be high, but that is common for the whole valley. D&M Consulting Engineers, Inc. determined that additional groundwater sampling is not warranted as the project would be provided potable water from municipal sources (See **Section 4.14 Utilities** for further discussion regarding Water Supply). A "closed" landfill, however, is located adjacent to the project site. According to Terratech, Inc. disposal operations at this facility commenced in 1964 and included the disposal of "non-hazardous" waste, including municipal waste, brush, and other vegetative materials. An exploratory investigation conducted in 1977 determined that the site is underlain with non-waterbearing coarse-grained granatic bedrock. It was determined that the underlying geological features would preclude the landfill from degrading the surrounding environment. No records were found of analytical environmental investigations having been performed, just the general exploratory investigation conducted in 1977. A single incidence was reported in 1981 that indicated the site was not in compliance with surface water criterion because the site was not properly maintained to prevent erosion and water from ponding on site. No other violations have been reported on the facility.

Future development of phase four, including areas identified as "Urban-Reserve" may potentially be exposed to hazards associated with the closed landfill. Although the facility is not anticipated to result in exposure of environmental hazards to surrounding uses, this is considered a potentially significant impact. Due to potential human health concerns, the County of Monterey is currently in the process of reviewing a landfill buffer ordinance, which would limit development within 1,000 feet of a closed landfill. Figure 4.7-1 identifies portions of the project site that are within the 1,000 foot landfill buffer zone. Although the

facility is listed as closed and no known environmental concerns have been reported at the facility, the County of Monterey has identified the buffer zone as necessary to ensure the healthy and safety of the public. Upon annexation, however, approval of development within this area would be subject to the approval of the Soledad Planning Department. Mitigation 4.7-1 would insure project impacts would be reduced to less-than-significant.

Based on review of the hazardous materials database report, observations from the site reconnaissance, and results of the owner/operation managers' interviews, it was determined that the following hazardous environmental conditions exist within and near the project site:

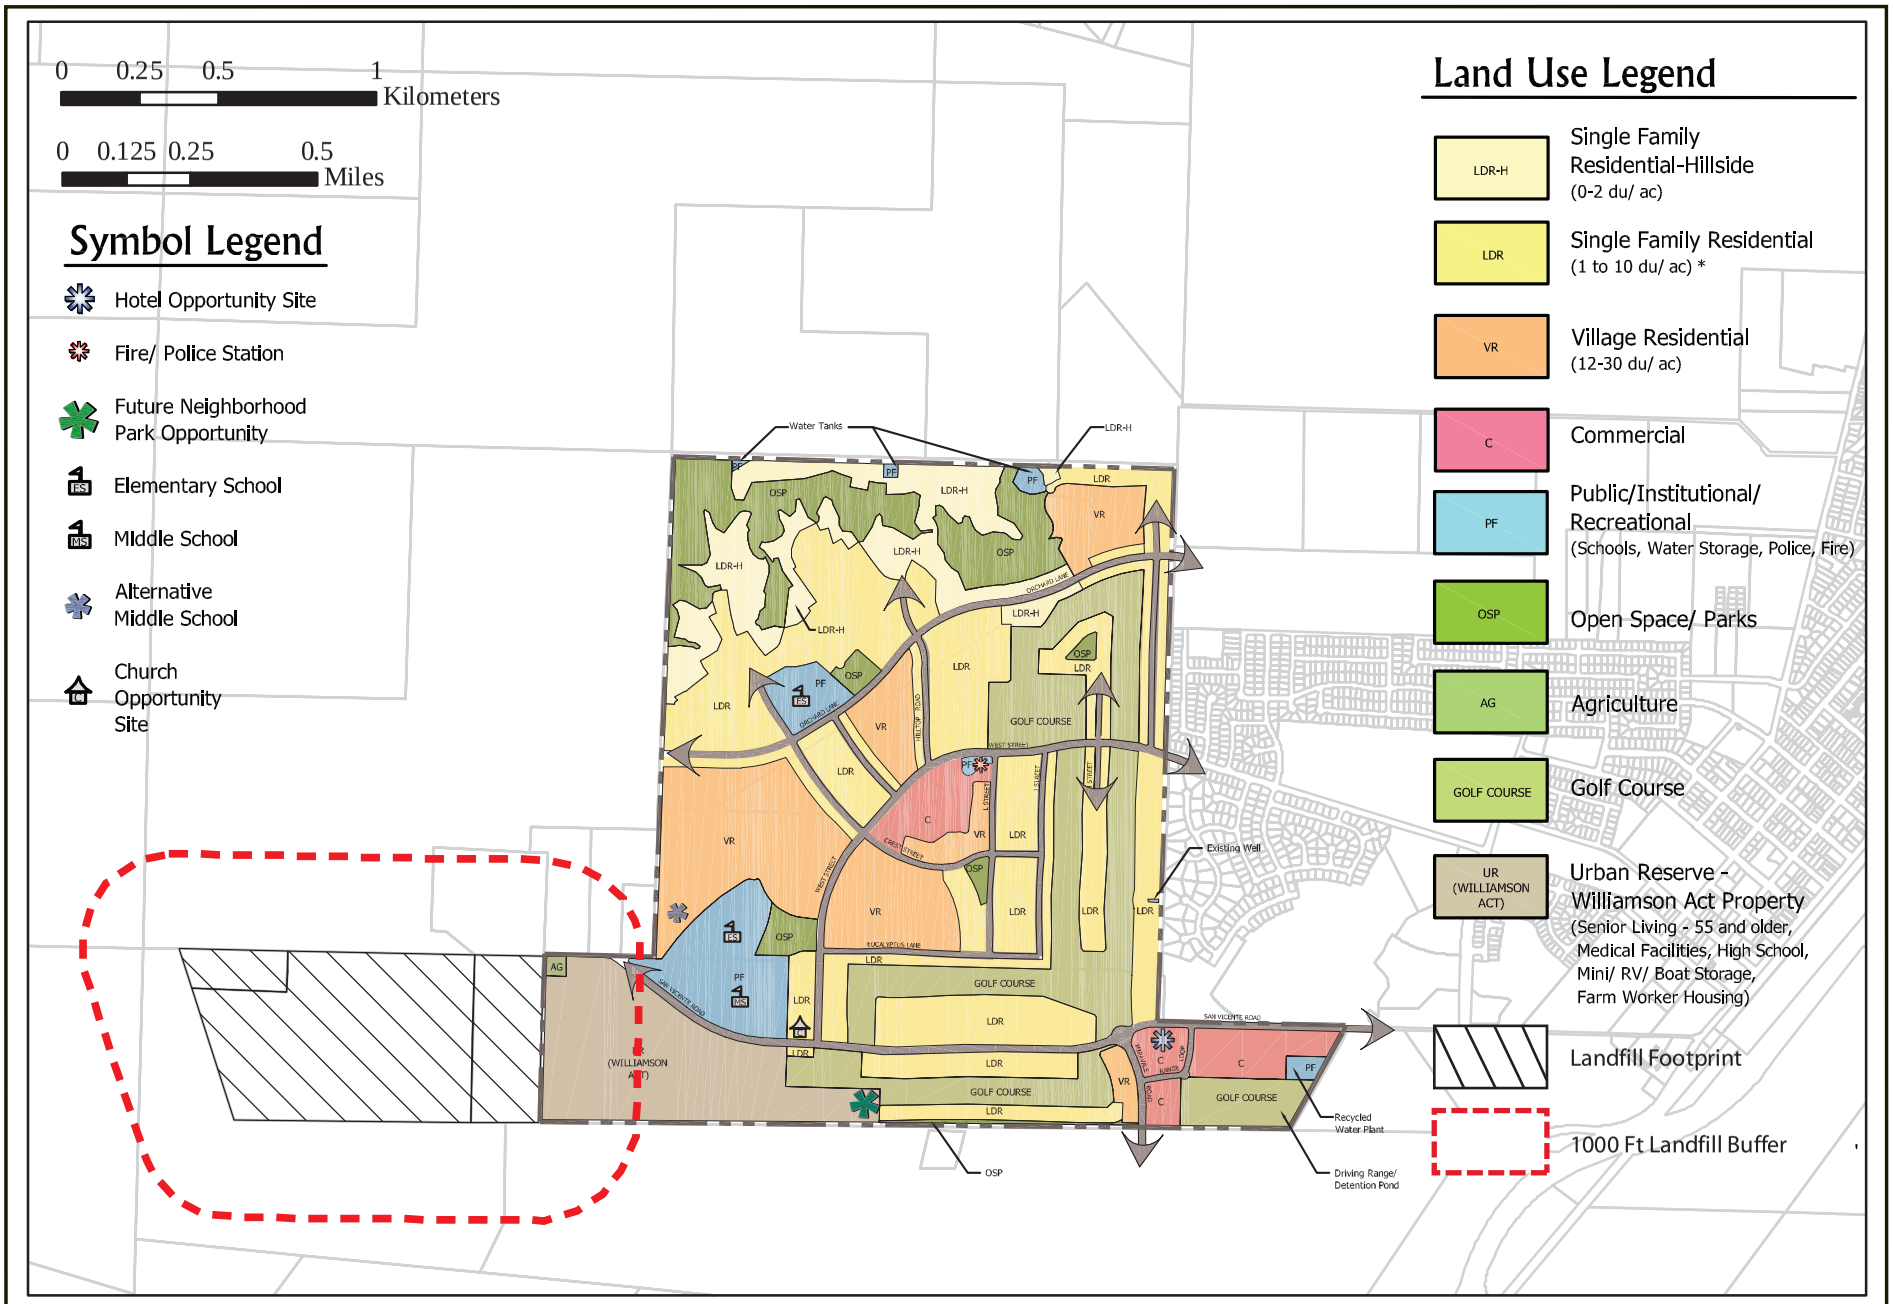
- Pesticide and metal residuals from longtime agricultural use on most of the site;
- Specific areas where agricultural chemicals were stored, and especially mixed;
- Specific areas where burning of grape stakes has occurred;
- Lead-based paint and pesticide residues around structures (both current and former);
- Soil staining in areas such as the various earthen building floors;
- Soil beneath the maintenance pit in the vineyard shop;
- Soil beneath the pole-mounted transformers that apparently malfunctioned;
- Infiltration of possible contaminants at the wash rack drain and shop leachfield; and
- Possible impacts from the closed landfill adjacent to north end of Parcel 26.

These items are in addition to the standard 'closure' processes of removing all hazardous materials, their containers (including any underground tanks, if present) and affiliated equipment, and the standard pre-demolition survey of all structures for hazardous building materials, such as asbestos. Although the existing Lorentzen house would be relocated to avoid impacting a historically significant structure, the demolition of existing on-site structures, such as the barn and various agricultural buildings, could result in the exposure of construction personnel to asbestos-related hazards. According to D&M Consulting Engineers, Inc., asbestos containing material may be present in these structures and affiliated equipment. The incorporation of mitigation requiring asbestos surveys would be warranted in order to minimize potential human health-related impacts (personal communication, Eric Lautenbach, June 2008).

Based on the findings of the Phase I Assessment, the preliminary environmental soil testing conducted in 1995, and the similar developments that have already occurred within the project vicinity, it is not expected that development of the proposed project would be exposed to significant environmental hazards. Implementation of the following mitigation measures, as recommended in the Phase I Assessment, would further ensure that project impacts are reduced to a less-than-significant level. Implementation of the following mitigation measures would not result in any new environmental impacts beyond those identified elsewhere in this EIR.

Impact **The project proposes a variety of uses in an area that may be contaminated with hazardous materials. Release of these contaminants could pose a health risk to construction workers and future users on the site.** ***This is a significant impact that can be reduced to a less-than-significant impact with the following mitigation measures.***

Mitigation



4.7-1 Prior to the recordation of any final map, the applicant shall arrange for a Phase II Environmental Site Assessment to be prepared which assesses the localized environmental conditions described in the Phase I Environmental Site Assessment prepared by D&M Consulting Engineers, Inc. (September 2006) and identifies any required remedial actions for the safe handling, removal and special needs for any identified materials. The Phase II Assessment shall include site-specific soil sampling in order to assess the presence of potential soil contamination and to identify special needs for soil handling during construction/grading activities and possible health risks to construction workers and future users consistent with the recommendations contained in the Phase 1 Environmental Site Assessment prepared by D&M Consulting Engineers, Inc.

If results indicate the presence of such materials in excess of screening levels for residential, educational, or commercial uses, a Remediation Plan shall be prepared and implemented to reduce contamination to acceptable levels, maintain the safety of construction workers and future site users, and assure proper management of contaminated materials in accordance with state and local regulatory requirements. This plan shall be subject to review and approval by the Monterey County Division of Environmental Health. Prior to the issuance of any building and/or grading permit, the project applicant shall submit evidence to the City of Soledad for review and approval demonstrating compliance with this measure.

4.7-2 Prior to commencement of new development, the applicant shall obtain approval of a Soil Management Plan from the Monterey County Division of Environmental Health, which establishes management practices for handling potentially contaminated soil, if encountered, during construction/grading activities.

4.7-3 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to survey all buildings to be demolished for asbestos under the National Emissions Standards for Hazardous Air Pollutants (NESHAP) guidelines prior to demolition activities. If asbestos containing material is documented within existing on-site structures, all potentially friable asbestos shall be removed prior to building demolition in accordance with NESHAP guidelines. Prior to the issuance of a grading permit, the project proponent shall submit written evidence to the City of Soledad Director of Public Work from a qualified consultant demonstrating that all asbestos containing material, if present, has been properly removed and demolition activities may proceed without exposing construction personnel to asbestos related-hazards.

4.7-4 In order to reduce human health risks to construction personnel and future site occupants, the project proponent shall retain a qualified consultant to conduct a lead-based paint survey to evaluate the presence of lead-based paint residues in site soils adjacent to existing structures. If lead contamination is documented on-site, all peeling and flaking lead-based paint shall be removed and properly disposed of separately from building debris, in accordance with current Department of Toxic Substances Control policies. In addition, all existing structures within the Specific Plan area that were constructed prior to 1978 shall be surveyed for lead-based paint prior to any demolition activities. Prior to the issuance of any permit for each phase of development, the project proponent shall submit written evidence from a qualified consultant documenting that all lead-based paint hazards have been appropriately removed and disposed of in accordance with industry standards, subject to the review and approval of the City of Soledad.

N

Soledad Sanitary Landfill Buffer Zone

DENISE DUFFY & ASSOCIATES, INC.

Hazardous Emissions Within One-Quarter Mile of a Proposed School Site

As identified in the Miravale III Specific Plan, several sites have been identified as future school locations, including two elementary schools and one middle school, within the project boundaries. Due to the historical uses associated with the subject property, in addition to the proximity of the Soledad Sanitary Landfill, there is the potential that several of the proposed school sites may be exposed to hazardous materials and/or emissions. More specifically, the proposed middle school and elementary school located along San Vicente Road, in addition to the alternative middle school location, are within approximately 1,500 feet of the Soledad Sanitary Landfill (see Figure 4.7-1).

According to the Phase 1 prepared by D&M Consulting Engineers, Inc., Soledad Sanitary Landfill is listed as closed and the prime waste type disposed of at the facility was identified as "non-hazardous." More specifically, typical wastes disposed of at this facility included municipal waste, brush, and other vegetative materials. Subsurface investigations conducted in the 1970s determined that the facility was underlain by non-waterbearing, coarse-grained granitic bedrock and that the facility, due to the underlying site characteristics, would not degrade the surrounding environment. A single incidence reported in 1981 by the State Solid Waste Management Board indicated that the site was not in compliance with surface water criterion because the site had not been properly maintained to prevent erosion and water from ponding on-site. Further investigations were conducted by Monterey County Environmental Health Division representatives from 1991 through 1994 and no additional incidences were reported.

Due to the proximity of the Soledad Sanitary Landfill to planned school sites and other educational uses within the project area, there is the potential that these sites may be exposed to environmental hazards. Although this facility is located within approximately 1,500 feet of the proposed school sites, preliminary investigations conducted as part of the Phase 1 Environmental Site Assessments determined that the landfill, which is located either downgradient or crossgradient from the project site, would not pose a significant environmental hazard to the proposed development. Additionally, the materials historically disposed of at this facility have been identified as non-hazardous. Although the landfill is not considered a hazardous waste site, the decomposition of organic material and other solid waste may result in the release of gases and/or other harmful emissions. Potential impacts would be minimized through the implementation of Mitigation Measure 4.7-1 identified above. In addition, further project-specific environmental review would be required prior to conveyance of any potential school sites consistent with the California Education Code. If, however, it is determined through the implementation of Mitigation 4.7-1 that the existing landfill would result in the exposure of students to potential environmental hazards the following mitigation measure would ensure that impacts would be reduced to a less-than-significant level. Implementation of the following mitigation measures would not result in any new environmental impacts beyond those identified elsewhere in this EIR.

Impact **Due to the proximity of the Soledad Sanitary Landfill to the proposed school sites, there is the potential for hazardous emissions and/or other environmental hazards to affect the health and safety of students attending new schools within the project area. More specifically, the existing landfill has the potential to expose several of the proposed school sites to environmental hazards. Although the landfill is listed as "closed" and no known hazardous incidents have been reported, releases of emissions may, nevertheless, adversely affect the health of students. *This is a significant impact that can be reduced to a less-than-significant impact with the following mitigation measures.***

Mitigation

4.7-5 If, during the course of the Phase II Environmental Site Assessment, it is determined that the existing Soledad Sanitary Landfill would expose the proposed school sites to an environmental hazard that cannot be reduced to an acceptable level through remediation, the project applicant, in conjunction with the Soledad Unified School District and the City of Soledad, shall identify new school sites within the Miravale III project area that would not be exposed to known environmental hazards, prior to the recordation of any final map. If new school locations are necessary, the applicant shall amend the Specific Plan and submit a revised tentative map demonstrating the new school locations, subject to the review and approval of the City of Soledad, prior to the recordation of any final map. Any new school site shall be coordinated with the Soledad Unified School District.

Hazardous Materials Use

The project proposes new residential, commercial, and recreational uses, including school and public facility sites and a golf course. The golf course will be surrounded by residences and will be located near the proposed school sites. Golf course use could expose residents and students to potentially hazardous chemicals. The public demand for turf grass of high quality and uniform playing surface on golf courses require pest management. Pesticides and other methods are used to control or reduce the adverse effects of harmful insects, unwanted plants, and pathogenic organisms. Pesticide use on golf courses is relatively small compared with agricultural operations. Pesticides are applied selectively and much less frequently than fertilizers, usually no more than once or twice per year. The pesticides and herbicides typically used on golf courses are not highly mobile or persistent and dissipate rapidly as a result of volatilization, photodegradation, microbial action, hydrolysis, and soil absorption. The project will be required to minimize pesticide use by adhering to a chemical application management plan.

The project site is proposed along the City's periphery, where land uses begin to become more rural and agricultural in nature. The project site abuts existing agricultural uses with a majority of the cultivation occurring to the west of the site. It is anticipated that the adjacent agricultural uses will continue during the construction and operation of the project. As in most agricultural production, chemical applications to the crops are necessary to control pests and diseases. The types of chemicals and their frequency of application are driven by the prevalent pest or disease, which often varies. For the types of crops adjacent to the project site, sulfur dust is typically applied via tractor applications. Aerial spraying is not normally required; however, blowers may be used that create plumes of sulfur. Application routines are generally frequent, approximately once every 7 to 21 days. Numerous local, state, and federal regulations and ordinances pertain to the proper transport, use, storage, and disposal of pesticides and herbicides, including training for workers handling and applying these materials and reporting of releases. Permits are required for pesticide and herbicide application through the Monterey County Agricultural Commissioner's Office.

Residential uses are proposed along a portion of the western edge of the project site. The residences will be in proximity to adjacent agriculture operations and residents could be exposed to potential hazardous chemicals. In order to reduce the risk of pesticide exposure, consistent with the mitigation measures identified in **Section 4.2 Agricultural Resources**, the proposed project will be required to incorporate agricultural buffers between residential and agricultural uses to minimize and/or avoid potential impacts to surrounding uses. The incorporation of the following mitigation would further minimize potential project impacts to a level considered less-than-significant. Implementation of the following mitigation measures would not result in any new environmental impacts beyond those identified elsewhere in this EIR.

Impact **Future development could involve the use/storage of hazardous materials and/or be located in proximity to existing agricultural use/storage of hazardous materials. Accidental release of hazardous materials could result in significant impacts on public health and the environment.** ***This is a significant impact that can be reduced to a less-than-significant impact with the following mitigation measures.***

Mitigation

4.7-6 The applicant shall prepare a Chemical Application Management Plan (CHAMP). This plan shall detail the procedures to construct, operate, and maintain the golf course. The CHAMP shall provide technical public disclosure regarding pesticides, fertilizers and other chemicals to be used on the golf course, as well as methods of application and handling. This plan shall be submitted to the Monterey County Environmental Health Division for review and approval. Prior to the issuance of any permit for golf course development, the project applicant shall submit documentation to the City of Soledad demonstrating that a CHAMP has been prepared and approved by the County of Monterey. The following provisions shall be included in the CHAMP:

- Drought, pest, and disease resistant grass species shall be selected.
- Pesticides shall be handled, applied, and disposed of by a licensed (State-certified) spray technician.
- Only approved and legal chemicals shall be used. All county, state, and federal guidelines must be strictly adhered to regarding storage, handling, and application of pesticides.
- Advanced technology/monitoring equipment shall be used to insure minimal application of pesticides, herbicides, and fertilizers. This equipment shall be maintained and in proper calibration.
- A controlled and designated area/facility shall be used for the proper mixing and loading of pesticides into application equipment. The facility shall consist of an impermeable pad with controlled and contained drainage, and should be at least 50 feet from open ditches, ponds, or other water bodies. Rinse water shall be properly stored and hauled for disposal at an approved facility.
- Selection of pesticides shall be based on the ability to achieve treatment goals and criteria to minimize off-site movement. Selection of less toxic, less mobile, and less persistent pesticides shall be a priority management criterion.
- Pesticide applications shall be carefully timed and combined with other pest management practices; pests shall be accurately identified and pesticide applications made only when necessary, using the least amount required for all seasons.
- Pesticides shall not be applied when soil moisture is high during the rainy season. Applications shall be restricted prior to any anticipated late or early season storm events to preclude potential impacts from runoff.
- Irrigation applications shall be consistent with turf grass evapotranspiration requirements. Over-watering shall be avoided.

Airport Hazards

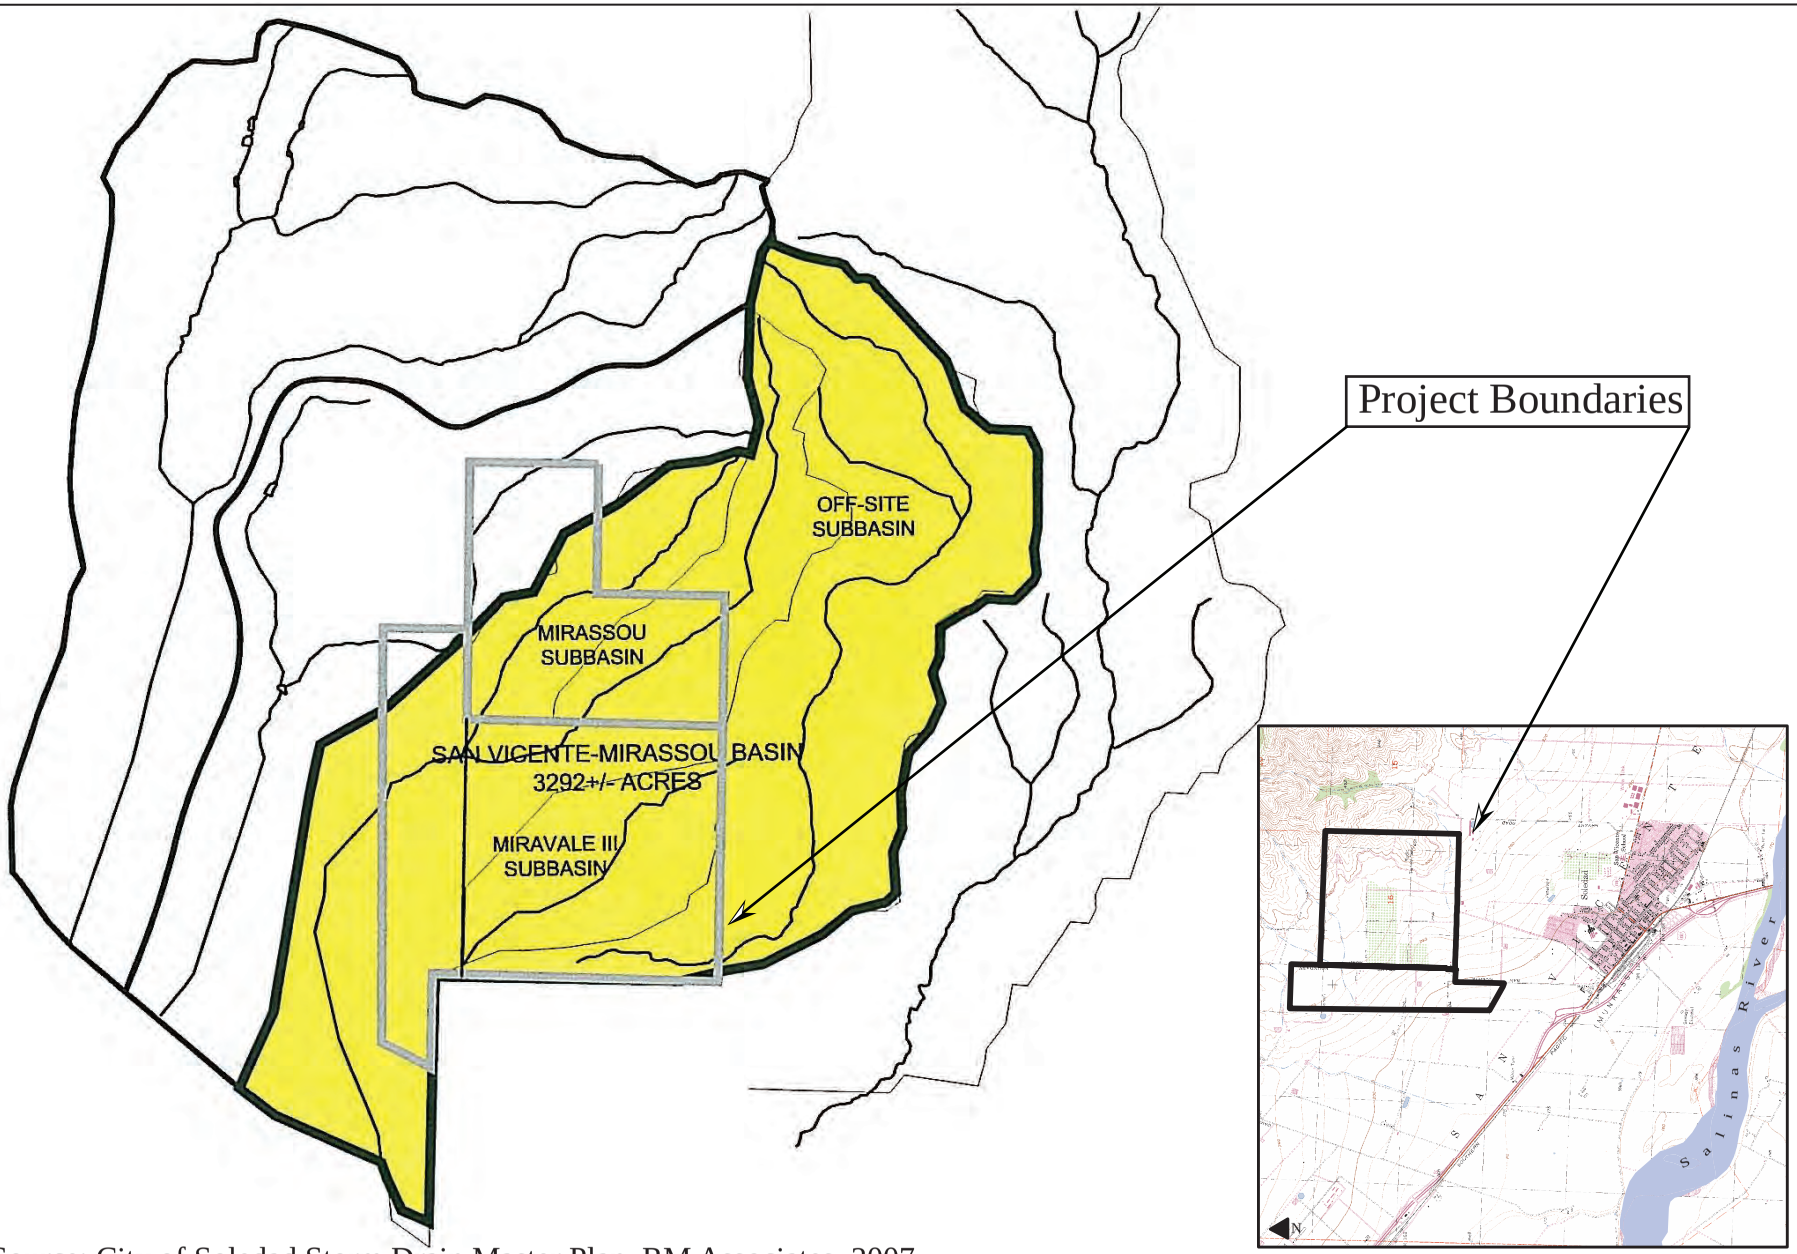
A private airstrip is located approximately 6,000 feet from the project's boundary. The northwest-southeast orientation of the runway does not place the project site in the line of overflight for takeoffs and landings. Except when necessary for takeoff and landing, the minimum altitude for aircraft over populated areas is 1,000 feet above the highest obstacle according to Federal Aviation Administration (FAA) standards. Since the project site would not be subject to takeoffs and landings from the

neighboring airstrip, it is unlikely that aircraft would operate at an altitude less than 1,000 feet over the project site. Therefore, airport hazard risk impacts would be considered less-than-significant. **This represents a less-than-significant impact.**

4.8 HYDROLOGY AND WATER QUALITY

Introduction

This section evaluates the potential impacts of the project to hydrology and water quality based on existing information and data provided in the City of Soledad Urban Water Management Plan (UWMP), the Water Supply Assessment (WSA) prepared for the project (Byron Buck, August 2007), and available drainage and hydrologic information from the City of Soledad Storm Drain Master Plan (SDMP), which was adopted by the City Council in October 2007. As part of the SDMP, RM Associates conducted an analysis of the existing drainage conditions on the project site, in addition to stormwater runoff calculations (Appendix G). Additional information is derived from Nolan Associates, the geologic consultants for the property (Preliminary Hydrogeologic Investigation, August 1995 and Geologic Investigation, 2007 Update). The following section evaluates these items in accordance with the CEQA Guidelines. Impacts related to the availability of water supply and water system infrastructure are addressed in **Section 4.14 Utilities.**



Setting

Surface Water Resources and Water Quality

As previously identified elsewhere in this EIR, the proposed project site is located within three designated expansion areas according to the City of Soledad General Plan. The project site is generally located to the north and northwest of the existing developed portions of the City, which is divided into nine drainage basins. Five of these basins are located entirely within the City limits, three are partially inside the City limits, and one lies entirely outside the City boundaries. The 920-acre project site is part of a large watershed system that has an offsite watershed of ±1,900 acres (refer to Figure 4.8.1).

The land to the east of the site consists of a rugged ridge-and-valley topography that rises rapidly to elevations greater than 2,000 feet. Site elevation ranges between 200 and 600 feet above sea level. Surface slopes on the alluvial portion of the site are approximately 5 to 8 percent gradient. Steep slopes on the eastern portion of the site range up to about 70 percent gradient, but more commonly fall in the range of 30 to 45 percent. Drainage of the surface water in the vicinity of the project generally occurs by overland sheet flow towards shallow ephemeral drainage courses on the site. The drainages on the property typically do not carry surface water except during peak rainfall events (Nolan Associates, 1995). The site's soils have moderate to high infiltration rates and low moisture retention capacity. The natural drainage channels crossing the property show little incision and there is little indication of significant erosion on the property, consistent with the observed infrequent surface flow (Nolan Associates, 1995).

Surface water quality within the Salinas River has been monitored over time in several locations. The results indicate that water quality meets the standards specified in the City's NPDES permit.

Storm Drain Master Plan Watershed Map

Figure 4.8-1

DENISE DUFFY & ASSOCIATES, INC.

Flooding

The General Plan FEIR describes generalized flood hazards within the City of Soledad area. The Salinas River is located approximately 1.25 miles south of the project site and is the primary surface drainage feature that affects the surrounding area. As identified in the General Plan FEIR, the boundaries of the 100-year floodplain generally correspond to the areas surrounding the Salinas River. There are no areas within the project site that are identified within a 100-year flood hazard area on the Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map. The 100-year floodplain defines the boundary of flooding statistically anticipated to occur once every 100 years. Although the City is not located within the 100-year floodplain, flooding has occurred in the downtown portion of the City and a portion of the project site. More specifically, flooding occurred during a 1995 storm event that resulted in the Bryant Canyon Channel overflowing. The City of Soledad has recently completed improvements along the Bryant Canyon Channel to prevent future flooding. According to the City, these improvements are thought to have mitigated potential flooding hazards within the surrounding area (personal communication, Susan Hilinksi, May 2008).

Groundwater Resources

The project site is underlain by the Salinas Valley Groundwater Basin. This groundwater basin extends below the Salinas Valley, from San Ardo to the Monterey coast. In the first comprehensive study of the Salinas Valley aquifer, the California Department of Water Resources (DWR, 1946) separated the aquifer into five sub-areas based on differences in hydrologic character, including the degree of groundwater confinement, the specific capacity of wells, and the source of the groundwater recharge. The five regions are 1) the pressure area, 2) the eastside area, 3) the Arroyo Seco cone, 4) the forebay area, and 5) the upper valley. A more recent comprehensive groundwater study for the basin (Montgomery Watson Engineers, 1994) has modified this division of the groundwater basin by including the Arroyo Seco cone in the Forebay area and by adding the Fort Ord/Toro region as a sub-basin. The subject properties are located within the Forebay area (Nolan Associates, 1995 Hydrogeologic Investigation). According to DWR, the Forebay Aquifer Sub-basin underlies an area of approximately 94,000 acres from Gonzales to just north of Greenfield. Along the southern edge of the sub-basin, the Pancho Rico Formation is water-bearing. The Forebay area is characterized by gravels, sands, and clays of fluvial origin with minor, interfingering alluvial fan deposits occurring along the valley margins. These sediments constitute an unconfined aquifer over 800 feet thick, although local occurrence of clay layers may create partially confined conditions in some areas.

Recharge to groundwater occurs principally by: 1) infiltration from the Salinas River, fed during the dry part of the year by water release from the Nacimiento and San Antonio reservoirs, 2) infiltration and underflow from tributary drainages around the basin, and 3) return flows from agricultural irrigation and percolation of rainfall. On the subject property, principal recharge of aquifers is by rainfall and return flows from irrigation, with recharge occurring due to direct application of irrigation water and precipitation on areas underlain by alluvium. Infiltration also occurs due to runoff from steep slopes underlain by granitic rocks on the alluvial valley fill.

Groundwater flow in the valley is to the northwest, towards the mouth of the Salinas Valley. However, pumping from large agricultural wells can have a significant local impact on groundwater gradient and may locally induce cross valley groundwater flow. Long term groundwater levels in the upper valley and Forebay areas appear to be stable, supported by inflows from the Nacimiento and San Antonio reservoirs (Boyle Engineering, 1986 and Montgomery Watson, 1994). Depth to groundwater in the area is currently about 120 feet (Nolan Associates, 1995 and 2007).

Groundwater pumping for agriculture and urban development in the lower part of the valley (the Pressure Area) has resulted in a decline in groundwater levels, resulting in a serious seawater intrusion problem. An area of significant saltwater intrusion now extends over five miles inland from the Monterey Bay in the shallowest aquifer (the "180-foot" aquifer, Montgomery Watson, 1994). Sensitivity studies on pumping strategies in the valley (Yates, 1987) indicate that the sea water intrusion problem is relatively insensitive to pumping in the upper valley. Studies of the area hydrogeology (Fugro West, 1994) indicate that the portion of the Salinas River south of Soledad (upstream from the project) is a gaining reach where groundwater flows into the river, and the stretch of the river north of Soledad is a losing reach, where water percolates to groundwater from the river.

To address the issue of seawater intrusion, the Monterey County Water Resources Agency (MCWRA) is implementing a program to address overdraft and seawater intrusion in the basin known as the Salinas Valley Water Project (SVWP). The SVWP includes re-operation of the Nacimiento and San Antonio reservoirs and the capture and diversion of water via a seasonal surface diversion structure to provide water for agriculture in lieu of groundwater pumping. A later phase of the SVWP involves supplying surface water to coastal urban water agencies to further reduce pumping in the coastal areas. Detailed information regarding the background and history of the condition of the Salinas Valley Groundwater Basin, including the cause and extent of overdraft and seawater intrusion, current and future water needs and trends, and efficacy of alternative mitigation measures, is contained in the *June 2001 EIR and Environmental Impact Statement for the Salinas Valley Water Project* (http://www.mcwra.co.monterey.ca.us/SVWP/DEIR_EIS_2001/index.htm). Further information is also provided in the project's Water Supply Assessment and Written Verification of Supply (WSA) prepared for this project pursuant to Water Code sections 10910 et seq. Pursuant to Section 15150 of the CEQA Guidelines, the information and analysis in these reports is incorporated by reference in this EIR.

Regulatory Environment

Federal and State Requirements

Federal Clean Water Act. The Federal Clean Water Act is codified in 33 USC 1251-1376 and regulates discharges into U.S. waters through a National Pollutant Discharge Elimination System (NPDES) permit, administered through the State Water Resources Control Board (SWRCB) and the State Regional Water Quality Control Board (RWQCB) in California. The State and Central Coast RWQCB oversee a statewide General Permit regarding management of stormwater runoff from construction sites over one acre in size. The Central Coast RWQCB has authority to use planning, permitting, and enforcement to protect beneficial uses of water resources in the region. The Central Coast RWQCB uses its adopted Water Quality Control Plan for the Central Coast Region (1994), referred to as the Basin Plan, to implement policies and provisions for water quality management in the region. The Basin Plan identifies beneficial uses of major surface waters and their tributaries, in addition to water quality objectives and implementation plans to protect these beneficial uses.

The 1987 Amendments to the Federal Clean Water Act require that storm water discharges to waters of the U.S. be regulated under the NPDES. The SWRCB issued a draft statewide General Permit in July 2002. The Central Coast RWQCB oversees the statewide General Permit regarding management of storm water runoff from construction sites over one acre in size. Provisions of the statewide General Permit indicate that discharges of material other than storm water into waters of the U.S. are prohibited; that storm water discharges shall not cause or threaten to cause pollution, contamination, or nuisance; and that storm water discharges not contain hazardous substances. The statewide General Permit also requires implementation of Best Management Practices (BMPs) to achieve compliance with water quality standards. A BMP is defined as any program, technology, process, siting criteria, operating method, measure, or device that controls, prevents, removes or reduces discharge of pollutants into bodies of

water. Any project that will disturb over one acre (including the proposed project and any future site-specific projects) is required to file a "Notice of Intent" with the RWQCB with submittal of a Storm Water Pollution Prevention Plan (SWPPP) prior to project construction. The SWPPP is the foundation of the required documentation for a NPDES General Storm Water Permit for construction activities.

California Fish and Game Code. The California Fish and Game Code (Sections 1600-1607) authorizes the Department of Fish and Game to enter into streambed alteration agreements with applicants to develop mitigation measures for projects that would obstruct the flow or alter the bed, channel, or bank of a river or stream in which there are fish or wildlife resources, including intermittent and ephemeral streams.

Local Requirements

City of Soledad General Plan.

The City of Soledad General Plan provides policies to protect groundwater resources and provide adequate storm drain systems. Please refer to Table 4.9-2 of the Land Use section for a detailed analysis of the project's consistency with the relevant hydrological, water quality and flood control provisions of the Soledad General Plan. The following policies address utilities and service systems relevant to the proposed project.

Policy S-12 The City shall encourage the use of natural drainage systems where feasible to preserve and enhance natural features.

Policy S-13 The City shall support efforts to acquire land or obtain easements for drainage and other public uses of flood channels where it is desirable to maintain channels in a natural state.

Policy S-14 The City shall strive to improve the quality of urban stormwater runoff and quality of groundwater recharge through the use of appropriate mitigation measures including, but not limited to, infiltration/sedimentation basins, oil/grit separators, and other management practices, including storm water retention.

Policy S-15 The City shall require new development to adequately mitigate increases in stormwater peak flows and/or volume. Mitigation measures shall take into consideration impacts on adjoining properties and impacts on groundwater recharge related to existing and proposed water wells.

Policy S-16 The City shall encourage project designs that minimize drainage concentrations and impervious coverage and maintain, to the extent feasible, natural site drainage conditions. Drainage onto adjacent properties shall be restricted to pre-project levels minus any runoff from the area to be developed.

Policy S-17 The City shall require projects to allocate land as necessary for the purpose of retaining flows and/or for the incorporation of mitigation measures for water quality and supply impacts related to urban runoff.

Policy S-17 The City shall require projects to allocate land as necessary for the purpose of retaining flows and/or for the incorporation of mitigation measures for water quality and supply impacts related to urban runoff.

Policy S-18 The City shall coordinate mitigation measures with responsible agencies (including California Regional Water Quality Control Board, Monterey County Environmental Health Department, and Monterey County Water Resources Department) for the control of storm drains, the monitoring of discharges and the implementation of measures to control pollutant loads in urban storm water runoff.

Policy S-19 Engineered drainage plans shall be required for all development projects. Engineered drainage plans shall incorporate a collection and treatment system for stormwater runoff consistent with applicable federal and State laws.

Flood Hazards

Policy HZ-1 The City shall promote flood control measures that maintain the drainage courses in their natural conditions within the 100-year floodplain.

Policy HZ-2 The City shall prohibit the construction of facilities essential for emergencies and large public assembly in the 100-year floodplain, unless the structure and access to the structure are free from flood inundation.

Policy HZ-3 The City shall require flood control structures, facilities, and improvements to be designed to conserve resources, incorporate and preserve scenic values, and to incorporate opportunities for recreation, where appropriate.

Policy HZ-4 The City shall manage flood prone areas consistent with the requirements of the Federal Emergency Management Agency (FEMA) and the Monterey County Water Resources Agency.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated hydrologic and drainage impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan rather than project-specific impacts associated with individual development projects, such as the Miravale III project. According to the General Plan EIR, the following water quality impacts were identified.

- Buildout of the General Plan would increase the amount of impervious surfaces within the City's Plan area, thereby increasing the volume and velocity of runoff and the potential for erosion and sedimentation in the Salinas River and its tributaries.

- Buildout of the General Plan would increase the amount of heavy metals and other hazardous materials, washed from the surface of parking lots and roadways constructed within the Plan area that could enter natural drainage courses such as the Salinas River during a rainstorm.

- Development and associated construction activities could result in the release of oil, engine fuel, and other toxic substances into the Salinas River or its tributaries, adversely affecting water quality.

- Buildout of the land uses designated by the General Plan have the potential to expose people and property to the periodic effects of flooding.

- The increase in impervious surfaces resulting from the buildout of the General Plan could adversely affect groundwater recharge.

- Development and the proposed change in land use from buildout of the General Plan could affect regional groundwater quality.

Miravale III Specific Plan

Sections 5.0 of the Miravale III Specific Plan identify goals and policies to ensure the adequate provision of public facilities related to hydrology, drainage and water quality.

- Public Services and Facilities Goal PSF-1 states that project development should provide an efficient, self sustaining system of public facilities that accommodate the needs of project build-out.

- Public Services and Facilities Goal PSF- 2 further states that project development should provide adequate and reliable services and utilities to area residents and business while ensuring that adequate maintenance of these facilities is provided.

Specific Plan policies related to stormwater management are identified in Section 5.1.3 of the Specific Plan as follows:

- Ensure provision and sizing of adequate stormwater facilities to accommodate the Plan Area and provide for water retention sufficient to limit peak flows to predevelopment levels.

- Limit the development of impervious surfaces, to the extent practical, in order to reduce post-project runoff volumes.

- Require appropriate runoff control measures as part of development to minimize discharge of urban pollutants, such as oil and grease, into drainage areas.

- Construction and grading activities shall comply with Best Management Practices and Storm Water Pollution Prevention Plan policies per applicable controls, standards, and the Regional Water Quality Control Board.

- Design and construct a stormwater collection and retention system that adequately retains peak storm flows onsite, avoids aggravating or causing offsite flooding downstream from the project site, and ensures separation of stormwater drainage from recycled water generated within the Plan Area.

Relevant Project Characteristics

The majority of the lowland portion of the project site is currently in active agricultural production or fallow. The upland portions of the site associated with the Gabilan foothills are undeveloped. The Specific Plan calls for the replacement of the existing agricultural and grazing uses with a mixed-use urban development consisting of new roads and infrastructure, single-family and multi-family residential units, retail commercial space, a golf course, school and public safety sites, and open space and recreation areas. According to information provided by the applicant's engineer, development of the proposed project would involve approximately 2.05 million cubic yards (CY) of cut/fill.

The project is proposing to retain post-development storm water onsite, according to the plans for the project, to be contained within two percolation/retention ponds located on the existing San Vicente Road (southeast of the proposed middle school) and in the extreme southwest corner of the Plan Area (at the golf practice range). The Specific Plan and VTMs call for stormwater generated by the development to be collected in an underground piping system and directed to two existing retention ponds located within the plan area boundary that would be enlarged and converted into retention basins. Plans for the project state that the enlarged basins would be sized to accept the increase in flow due to the development and would release runoff to the existing facilities at a rate equal to or less than the historic flow prior to development. Erosion Control measures including pre- and post-construction BMPs are proposed as part of the Specific Plan (refer to the analysis below for City requirements for stormwater retention on site, as identified in the Miravale III Storm Drain Analysis prepared by RM Associates).

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- violate any water quality standards or waste discharge requirements;
- substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted);
- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site;
- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
- create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
- otherwise substantially degrade water quality;
- place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map;
- place within a 100-year flood hazard area structures which would impede or redirect flood flows; or
- expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

Impacts and Mitigation

Surface Water/Water Quality

The project site consists of 920 acres; the area identified as offsite watershed is approximately 1,900± acres. According to the City, the project is required to provide flood protection for this project based on a 2,800± acre watershed. An analysis regarding the proposed stormwater system, as proposed by the project engineers in accordance with City requirements per the adopted City Storm Drain Master Plan, was conducted for the City by RM Associates (Miravale III Storm Drain Analysis, included as part of the City of Soledad Storm Drain Master Plan, adopted by the City Council in October 2007). The proposed Miravale III storm drainage piping system consists of three major branches to provide stormwater collection for each of the major sub-basins of the 2,800 acre watershed. The westerly branch provides collection to the offsite storm water northerly of the development, the southerly branch provides collection to the offsite stormwater easterly of development, and the central branch provides collection to a large portion of the onsite stormwater runoff. The RM Associates review of the engineered plans found that the engineering concepts of the proposed storm drainage collection and storage disposal system, drainage pipes, and basins generally address the natural drainage channels and the critical points of natural convergence of runoff. The proposed detention basins for Miravale III are located in areas of natural or manmade storage of runoff from large areas of agriculture fields (RM Associates, 2007).

The project would require extensive grading on the site to facilitate construction of the proposed uses. There is the potential for increased erosion as a result of the proposed development within the foothills of the Gabilan Range. In addition, grading within the foothill area and portions of the project site located above the 400 foot elevation contour would result in landform alterations that would potentially alter the existing drainage pattern on the project site. Impacts related to changes in the existing drainage pattern are discussed in greater detail below. Site preparation and construction activities would also disturb soil and increase its susceptibility to erosion. Removal of soils by wind or water can undermine buildings, roads, and other developments, as well as contribute to siltation of local streams and water bodies. Surface runoff from the proposed development could generate urban pollutants affecting water quality such as oil, grease, and trace metals from vehicles using parking areas and roadways. In addition, fertilizers, pesticides, and herbicides released from the golf course, parks, and other landscaped areas could impact water quality.

The project proposes to utilize BMPs to minimize the release of water pollutants into surface drainages and groundwater. BMPs for the project may include the use of silt fencing, sediment traps, and other measures during construction, as well as long-term facilities, including surface and subsurface filtration systems. The project would be required to conform to the measures set forth in the Specific Plan, as well as the NPDES permit. The project would also be required to pay fees to the City to fund maintenance costs for onsite BMPs.

Mitigation measures 4.6-4 to 4.6-6 contained in this EIR, which include adherence to the specific erosion control regulations in the Hillside Development Standards & Guidelines contained in Appendix C, in addition to requirements that the project applicant submit a Storm Water Pollution Prevention Plan (SWPPP) and associated erosion control measures, would minimize potential project-related impacts. The following mitigation measures are in addition to existing mitigation identified in **Section 4.6 Geology, Soils, Mineral Resources** (see mitigation measures 4.6-4 and 4.6-5). Implementation of the following mitigation measures would not result in any new impacts beyond those identified elsewhere in this EIR.

Impact **Construction and operation of the project could impact water quality through substantial soil erosion during grading activities, loss of topsoil, and surface runoff from the proposed development.** ***This is a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.8-1 In order to ensure that impacts are minimized to the greatest extent feasible, the project shall be designed to meet the BMP standards for operational phase storm water runoff and to maintain the onsite BMPs. The project shall implement BMPs to manage water quality by providing onsite runoff treatment in line with the onsite infiltration system. Prior to the issuance of any grading and/or building permit, the project applicant shall prepare a Construction Management Plan that identifies a designated construction supervisor responsible for the continued implementation of all construction BMPs throughout the duration of project construction. Moreover, the Construction Management Plan shall also identify BMPs to be implemented as part of the project and associated monitoring activities. The Construction Management Plan shall be reviewed by the City of Soledad Public Works Director prior to the issuance of any permit.

4.8-2 In order to prevent excess sediment buildup and ensure that all percolation basins are functioning in accordance with project-level plans, the project applicant and/or his/her successor in interest, shall be responsible for the long-term maintenance of all percolation basins and related private on-site drainage improvements and shall enter into a maintenance agreement with the City to provide for such. Bi-annually a basin maintenance report shall be submitted to the City of Soledad, subject to the review and approval of the Public Works Director, demonstrating that the basins have been properly maintained and cleaned in accordance with City standards. Prior to the issuance of any building and/or grading permit, the project applicant shall enter into a maintenance agreement with the City of Soledad.

Surface Drainage /Flooding

Development of the proposed project would result in substantial physical changes to the existing drainage conditions within the project area as a result of grading activities, the introduction of impervious surface areas, changes in site topography, and other site disturbing activities. The alteration of existing drainage patterns combined with the introduction of impervious surface areas has the potential to result in substantial soil erosion, in addition to flooding. Project-induced impacts related to increased soil erosion and sedimentation are addressed in **Section 4.6 Geology, Soils, and Mineral Resources.** Moreover, mitigation measures were incorporated in order to reduce the extent of potential project-related impacts related to increased soil erosion (see mitigation measures 4.6-4 – 4.6-6). Therefore, the following analysis focuses only on potential project-related impacts associated with drainage and associated flooding. For more information regarding project-related impacts associated with increased erosion and sedimentation, please refer to **Section 4.6 Geology, Soils, and Mineral Resources.**

As identified above, implementation of the Miravale III Specific Plan would significantly increase impervious surfaces and stormwater runoff thereby resulting in potential impacts related to surface runoff and on- and off-site flooding. In order to ensure that project-induced impacts would not result in significant on- or off-site flooding, the proposed project would be required to provide adequate drainage facilities in order to accommodate a 100-year storm event. As currently proposed, however, the drainage

facilities are inadequately sized to accommodate projected stormwater flows associated with a 100-year storm event. This is considered a potentially significant impact.

In order to accommodate projected stormwater flows, the project would need to provide retention facilities with an estimated storage volume of approximately 230 acre feet (RM Associates, Memorandum to City Public Works Director, dated October 27, 2006). As currently proposed, the project would provide storage facilities with an estimated volume of approximately 148 acre feet, which is considered inadequate to accommodate peak stormwater flows. Inadequately sized facilities could result in off-site flooding and associated impacts, such as property damage, disruption of public services, and similarly related impacts.

As part of the SDMP conducted by RM Associates, several storm water models were developed to evaluate on-site conditions, in addition to off-site conditions on an individual project level, and cumulative level. The results of RM Associates' analysis indicated that the preliminary design proposed as part of the Miravale III Specific Plan does not meet the design requirements delineated in the October 2007 SDMP in regards to flood protection from a 100-year storm event. In addition to providing inadequately sized detention facilities, proposed piping in the major branches were not considered adequately sized to convey stormwater associated with a 100-year storm event. Accordingly, the proposed facilities are considered to be inconsistent with the requirements of the City's adopted SDMP. The applicant's engineer, however, has indicated that RM Associates' analysis does not account for the percolation and disposal of stormwater via native soils. According to the review conducted by RM Associates, the project engineer's design assumptions, however, are not supported by technical evidence and additional geotechnical testing would be necessary to support the project engineer's assumptions. The final location, size, and design of the proposed drainage facilities and associated drainage infrastructure would also be required to be built in conformance with a design-level geotechnical evaluation consistent with the City's standards as evidence of suitable percolation rates at the proposed drainage facilities (refer to Section 3.4 of the Storm Drain Master Plan for design requirements of detention basins).

While the proposed project site is not located within a flood hazard area as delineated by FEMA, localized flooding has been known to occur within the project area and surrounding vicinity. Development of the proposed, which would result in substantial grading, changes in topography, and similarly related activities, has the potential to result in on- and off-site flooding due to changes in existing drainage patterns. In order to ensure that these impacts would be minimized to a less-than-significant level, drainage infrastructure would need to be designed and built in accordance with the City's standards as identified in the SDMP. As currently proposed, the preliminary design is considered inadequate and has the potential to result in additional impacts related to flooding. As a result, project-specific mitigation is warranted in order to ensure that final-design level plans are consistent with adopted City standards. Implementation of the following mitigation measure is necessary in order to ensure that impacts would be reduced to a less-than-significant level. Implementation of the following mitigation measure would not result in any new impact beyond those identified elsewhere in this EIR.

Impact **Construction and operation of the project could potentially result in flooding impacts to off-site properties if adequately sized drainage facilities are not provided within the proposed development.** ***This is a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.8-3 In order to ensure that project-induced impacts related to changes in the existing drainage patterns on the project site are minimized, the project applicant shall submit design-level improvement

plans for the project's storm drainage collection and retention system. Final design-level plans shall be supported with appropriate soils and hydrologic data in accordance with City standards. All conveyance system and retention basins shall be sized and designed in accordance with applicable City design standards and shall be appropriately sized to accommodate stormwater runoff from a 100-year storm event. Prior to the recordation of any final map, the project applicant shall submit all design-level plans and supporting details to the City of Soledad Director of Public Works for review and approval. The VTM and Specific Plan shall be revised as necessary to reflect final locations of drainage facilities, subject to the review and approval of the City of Soledad.

Groundwater Resources

The proposed project would be provided municipal water from the City of Soledad. As identified in the WSA prepared for the proposed project, the City's sole source of water is provided from groundwater resources within the Salinas Valley Groundwater Basin, which is divided into four subareas, including the East Side, Pressure, Forebay, and Upper Valley. As previously discussed**,** the Salinas Valley Groundwater Basin is currently in a state of overdraft and saltwater intrusion has been documented along the coastal portions of the Basin. The City withdraws groundwater from the unconfined shallow aquifer zone located in the Forebay subarea. Although overdraft conditions have been identified along the coastal portions of the Basin, overdraft conditions have not be documented within the Forebay subarea. As part of the City's UWMP, anticipated demands associated with new developments, including the Miravale III project, were included as part of long-term groundwater projections, and it was determined that adequate groundwater resources are available to accommodate buildout as envisioned in the UWMP. Moreover, as discussed in greater detail in **Section 4.14 Utilities,** development of the proposed project would result in a net decrease in water usage as compared to historical water usage associated with existing agricultural activities. In addition, recycled water is an integral component of the proposed project and recycled water would be used to irrigate the golf course, in addition to front yards and other landscaped areas within the project area thereby reducing demands on groundwater resources. The proposed project is also located within Zone 2C of the Salinas Valley Water Project (SVWP), which is intended to minimize groundwater overdraft within the Salinas Basin, and would therefore benefit from improvements implemented as part of the SVWP. Finally, according to the 2005 UWMP and the City's WSA for the proposed project, sufficient water exists to meet the anticipated demands generated by the proposed project. Projected water supplies are sufficient to meet the projected annual water demands of existing and previously approved uses and the proposed Miravale III project during normal, single dry and multiple dry years" (Water Supply Assessment and Written Verification of Supply) without impairing the City's ability to meet existing and future demands. For a more detailed discussion regarding water supply please refer to **Section 4.14 Utilities.** ***The project would result in less-than-significant impacts associated with groundwater supplies.***

4.9 LAND USE AND PLANNING

Introduction

The following section analyzes the project's consistency with applicable land use plans including the Soledad General Plan and other relevant planning documents. The analysis presented in this section addresses the project in terms of the project's consistency with applicable land use policies and regulations pertaining to the development of the project site. In addition the analysis includes a review of the project's compatibility and compliance with the LAFCO of Monterey County's Sphere of Influence Policies and Criteria and Section 56668 of the Government Code. The following documents, herein incorporated by reference, were reviewed during the preparation of this section:

- City of Soledad General Plan
- City of Soledad General Plan EIR
- Monterey County General Plan
- California Department of Conservation Farmland Mapping and Monitoring Program, 1994-2000
- City of Soledad Zoning Ordinance
- Miravale III Specific Plan and Vesting Tentative Map

Physical impacts resulting from the change in land uses (e.g., biological resources, transportation, public services, etc) are address in their respective sections in this EIR.

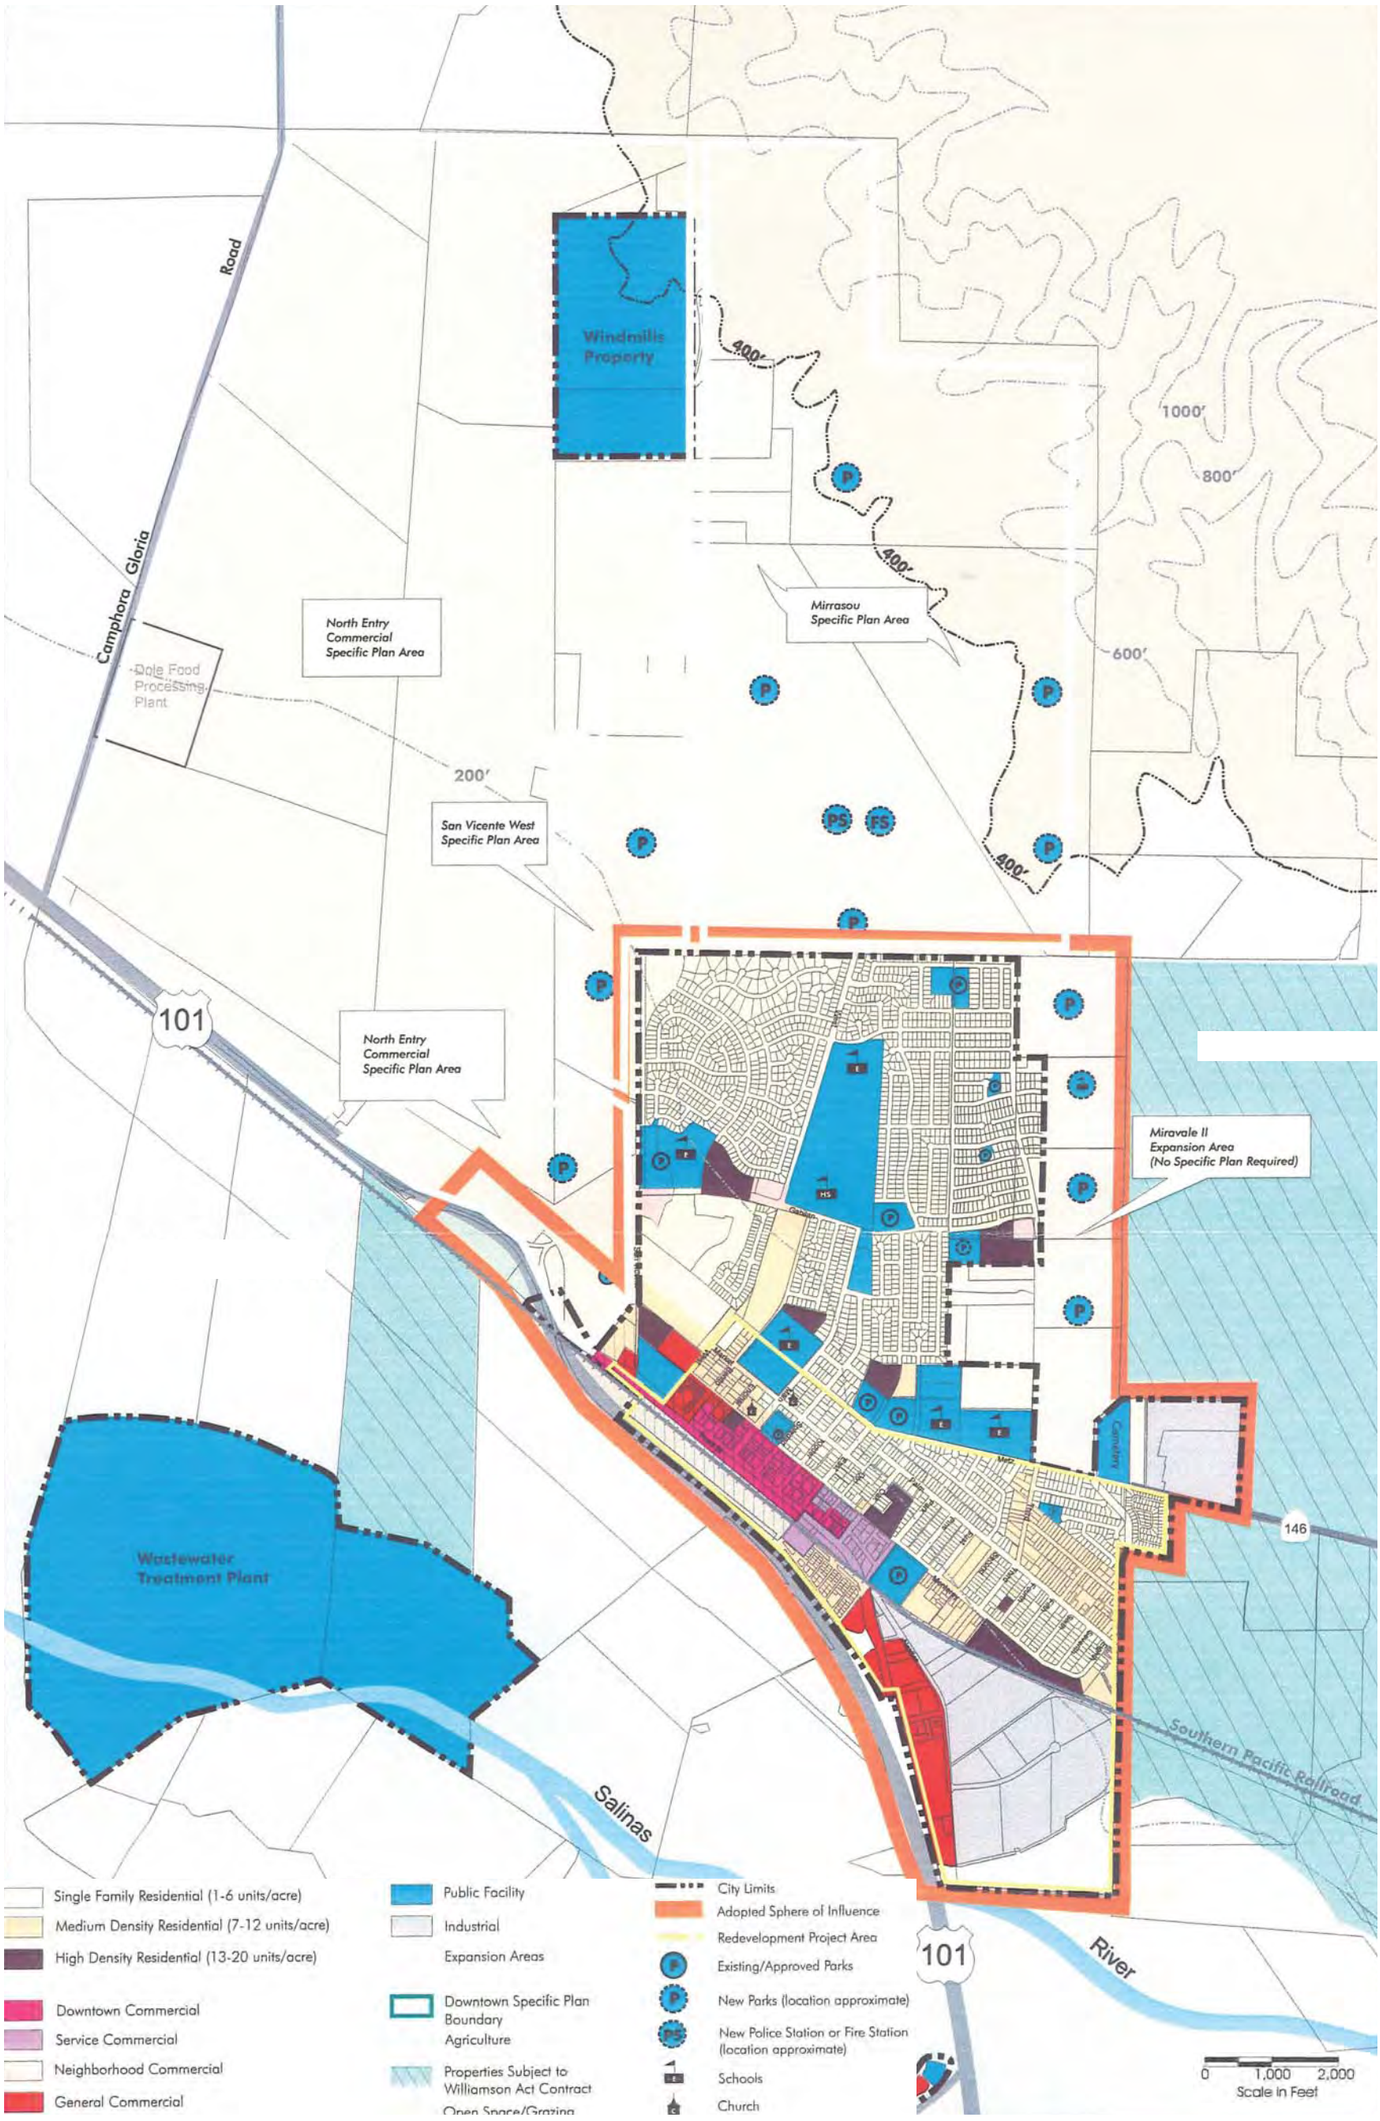
Environmental Setting

The 920-acre project site is located on the northern edge of the City of Soledad outside of the city limits within unincorporated lands of Monterey County. The project site contains approximately 610 acres of farmland currently under agricultural production. The remaining acreage is comprised of fallow lands, non-grazed grasslands, or occupied with agricultural accessory uses such as an equipment storage area and two existing residential units. Within the Project Area approximately 107 acres are under Williamson Act contract, but are currently in non-renewal status with cancellation pending in 2016.

The site is currently zoned by the County for farmland and permanent grazing uses. Land uses surrounding the proposed Project Area are varied. Properties to the north and east are located within unincorporated Monterey County and largely comprise of grazing and fallow lands. Properties to the west are also located within Monterey County and are utilized as irrigated row crop land. Properties to the south are located within the City of Soledad and predominantly residential.

Regulatory Environment

Local Agency Formation Commission. The State Cortese-Knox Act, which was revised by the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (AB 2838), grants the Local Agency Formation Commission (LAFCO) the power and duty to review proposals for changes of organization or reorganization, including adjustments and/or expansions to service district boundaries. Among the purposes of the LAFCO review are the organized and efficient extension of governmental services, protection of open space and prime agricultural lands, and consideration of adequate affordable housing. Moreover, as identified in Government Code Section 56375, LAFCO is required to "review and approve or disapprove, with or without amendment, wholly, partially, or conditionally, proposals for changes of organization or reorganization." As identified in the General Plan EIR, a "change of organization" may include any of the following:



- A city incorporation
- A district formation
- An annexation to, or detachment from, a city or district
- A disincorporation of a city
- A district dissolution
- A consolidation of cities or special districts
- A merger or establishment of a subsidiary district

Development of the proposed project would require that the project site, which is located within unincorporated portions of the County of Monterey, be annexed into the City of Soledad. As the basis for making decisions about organizational changes and annexations, LAFCO must adopt a sphere of influence for each local agency subject to LAFCO regulations. Soledad's current sphere of influence is shown on Figure 4.9-1. The proposed project site is currently located outside of the City's existing sphere of influence. Therefore, future development of the project site would require an amendment to the City's sphere of influence to include the project site. Subsequently, the project area would be annexed into the City. Prior to amending a City's Sphere of Influence, LAFCO must consider and prepare a written determination that adequately addresses the following:

- The present and planned land uses in the area, including agricultural and open space lands;
- The present and probable need for public facilities and services in the area;
- The present capacity of public facilities and the adequacy of public services which the agency provides or is authorized to provide;
- The existence of any social or economic communities of interest in the area if the commission determines they are relevant to the agency;

In July 2006, as required by State law, the LAFCO of Monterey County prepared the Final Municipal Service Review for South/Central Monterey County, which includes the City of Soledad. The service review was prepared consistent with the requirements of Government Code Section 56430, which requires LAFCO to adopt a written statement of determination regarding a number of factors, including, but not limited to, infrastructure needs and deficiencies, population projections, and financing constraints and opportunities. This information has been incorporated into each respective section of this EIR. For more information please refer to **Sections 4.11 Population and Housing, 4.12 Public Services, and 4.14 Utilities.**

Monterey County General Plan. The proposed Miravale III Specific Plan and Vesting Tentative Map are currently located entirely within the unincorporated areas of Monterey County. The Monterey County General Plan, which was adopted in 1982, governs land use within the unincorporated areas of Monterey County, including the project area. While the proposed project site is located within unincorporated Monterey County, the project area is identified within the unincorporated portions of the Soledad General Plan Study Area. As previously identified, the project site, subject to LAFCO review and approval, would be annexed into the City of Soledad. As such, upon annexation, development within the Specific Plan area would be subject to the policies contained within the Soledad General Plan and Miravale III Specific Plan, discussed in further detail below. Additionally, for more information regarding the project's consistency with applicable LAFCO policies please see below.

N

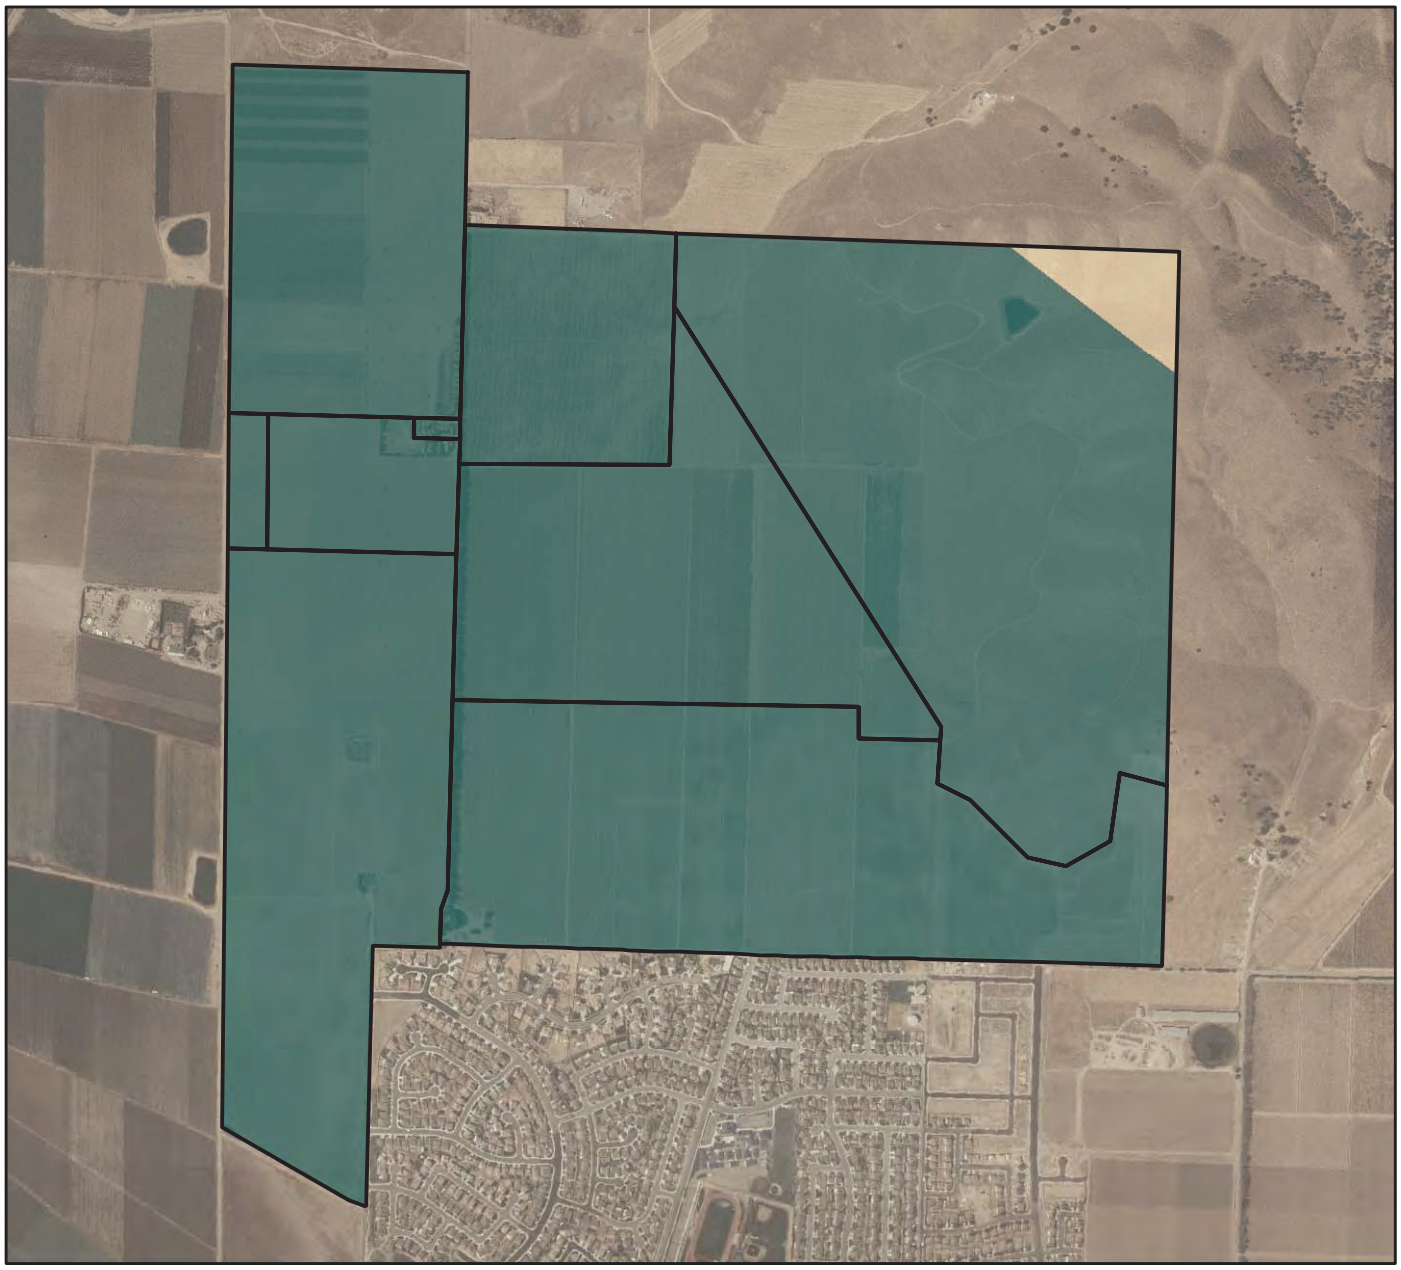
City of Soledad General Plan Land Use Diagram

Figure 4.9-1

This page left intentionally blank.

According to the Monterey County General Plan, portions of the project site are designated as Farmland (F) and Permanent Grazing (PG). The Farmland designation is applied to parcels considered prime, of statewide importance, unique, or of local importance, as defined by the US Department of Agriculture. These areas are designated along the fertile floor of the Salinas Valley and generally surround the City of Soledad. The Permanent Grazing designation is applied to areas with less productive soils and greater slopes which may be less desirable for irrigated agriculture but may still support livestock grazing as a viable agricultural enterprise. Within the City's Study Area, Permanent Grazing areas are located above the valley floor in the foothills of the Gabilan Range east of the City. See Figure 4.9-2 for a graphical representation of the Monterey County land use designations affecting the project site. The expansion of urban development would result in the permanent conversion of land designated Farmland to an urban use. Impacts relating to agriculture are discussed in **Section 4-2 Agricultural Resources**.

Central Salinas Valley Area Plan. The Central Salinas Valley Area Plan (CSVAP) is one of eight planning area components of the Monterey County General Plan. The goals, objectives, and policies of the Area Plan focus on the local issues affecting land uses in the Central Salinas Valley while remaining consistent with the County General Plan. The CSVAP describes and designates various land uses within its planning area and identifies appropriate policies and standards which address local land use issues related to transportation and circulation, water supply, wastewater services, resource management, public services, and housing. Moreover, as identified in the CSVAP, the plan seeks to reconcile the demand for growth with the need to preserve and enhance the attractive qualities of the planning area for its residents and the need to ensure the long-term viability of the area's natural resources. Upon annexation, the proposed project would be subject to the policies contained in the City of Soledad General Plan and the Miravale III Specific Plan.



City of Soledad General Plan

Pursuant to California Government Code Section 65300, each city is required to adopt a comprehensive General Plan to guide the physical development of the Community. The City of Soledad General Plan consists of goals, policies, and implementation plans for the physical development of the City. As identified in the General Plan, several areas adjacent to the City, including the project site, have been identified as future expansion areas. These areas are currently located in the unincorporated portions of Monterey County, but would be annexed into the City. Future development within these areas would be subject to the policies contained in the General Plan, including the preparation of a Specific Plan.

According to the City of Soledad General Plan, the majority of the proposed project site is located within all or a portion of three expansion areas, including the Northwest, San Vicente West, and Mirassou expansion areas (See Figure 4.9-1). These areas, as envisioned by the City, are intended to be primarily residential in nature, but would also provide a range of land uses necessary to support a livable community. The City of Soledad General Plan objectives for the expansion area are as follows:

- New residential projects should be designed to integrate with existing neighborhoods to ensure that they do not destroy the established character. Subdivisions in City expansion areas should be designed so that individual, separately developed projects work together to create true neighborhoods with a sense of identity, instead of disjointed or isolated enclaves.

- Subdivision design should emphasize pedestrian connectivity within each project, and to adjacent neighborhoods, and nearby schools and parks. All streets and walkways should be designed to provide safe and pleasant conditions for pedestrians. Streets within neighborhoods should be no wider than needed to accommodate parking and two low-speed

travel lanes. Sidewalks should be separated from curbs by parkway strips of at least four feet in width; and the parkways should be planted with canopy street trees.

- Specific plans should provide a range of residential housing types affordable to the widest range of income groups, consistent with the goals, policies and programs of the Housing Element of the General Plan.

- Subdivisions should be designed to provide usable public open spaces in the form of parks, linear bicycle and pedestrian trails, squares, and greens, as appropriate.

The Land Use Consistency Table presented in table 4.9-2 of this EIR provides an analysis of the project's consistency with the applicable land use provisions of the City of Soledad General Plan.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential land use and planning impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III project. Rather, the General Plan discussion predominantly focused on the plan's consistency with LAFCO policies, the Monterey County General Plan and other County land use regulations, Monterey Bay Unified Air Pollution Control District regulations, and the Integrated Solid Waste Management Plan.

City of Soledad Zoning Code

The project is located outside of the City of Soledad and will require a General Plan Amendment, Specific Plan, Zone Change (Pre-Zoning), Architectural Review, Sphere of Influence Amendment, Annexation, Tentative Subdivision Map, and Development Agreements to allow the proposed development. The project includes zoning of the entire project site to Specific Plan. The land uses proposed for the project site are classified in the Specific Plan by zoning type, including Low Density Residential (LDR & LDR-H/M3-R-1), Village Residential (M3-VR), Village Commercial (VC), and Gateway Commercial (GC). Development standards for residential and commercial land uses are provided in the Specific Plan. For regulations not covered in the Specific Plan, the City of Soledad Title 17 would apply.

The proposed project would also be subject to Section 17.41 of the Municipal Code, the Inclusionary Housing Ordinance. The proposed project, as mitigated, meets the requirements of the Inclusionary Housing Ordinance. A more thorough evaluation of project compliance with this section of the Municipal Code is provided in **Section 4.11 Population and Housing.**

City of Soledad Housing Element

The City of Soledad Housing Element is one of seven General Plan Elements mandated by California State Law. Housing element law, enacted in 1969, mandates that local governments adequately plan to meet the existing and projected housing needs of all economic segments of the community. The law acknowledges that, in order for the private market to adequately address housing needs and demand, local governments must adopt land use plans and regulatory systems that provide opportunities for, and do not unduly constrain, housing development. The programs presented in the Housing Element must reflect the commitment of the locality to address a range of housing needs, including those for affordable housing. The Housing Element is intended to provide citizens and public officials with an understanding of the housing needs in the community and set forth an integrated set of policies and programs to attain goals. The City of Soledad Housing Element is consistent with California Government Code Section 65581.

The Housing Element is most affected by development policies contained in the Land Use Element of the General Plan. The Land Use Element establishes the location, type, intensity, and distribution of land uses throughout the city. As such, the Land Use Element sets the upper limit of acreage that will be used for housing. The standards set in the Land Use Element determine the density of residential development and sets the upper limit for housing units that can be built in the City. The Land Use Element also addresses the development of other land uses such as industrial, commercial, and professional offices that create demand for housing in the City. Finally, the Land Use Element identifies areas subject to flooding.

According to the City of Soledad Housing Element, the types of housing and units that should be provided include: multi-family housing, affordable housing, units for large families, and single room occupancy units for migrant farm workers. The City of Soledad's holding capacity for residential units is 6,600 to 8,600 units that could be constructed within the City's General Plan area in accordance with the General Plan. Table 4.9-1 below (from the Specific Plan) shows the proposed housing types that would meet the General Plan objectives

Table 4.9-1
Residential Potential For Miravale III Specific Plan Area
(Miravale III Project Site)

Proposed Zone District	Proposed Housing Type	Residential Acreage (Acres)	Average Density (Units/Acre)	Potential Number of Units
LDR (Low Density Residential) *Duplex/Small Lots*	Single-Family Residential	~ 240.88	6.10	~ 1,470 ~ 116
(VR) Village Residential*	Multi-family Residential & High Density Residential	~ 146.88	18.99**	~ 2,614
	TOTAL	~ **387.76**		~ **4,200**
*Assumes 500 Senior Housing Units **This assumes that parks, roads, and parking required for VR is included in the 17.91 du/ac				

City of Soledad Jobs/Housing Balance

The jobs/housing ratio represents the total number of jobs to residential units in a city or region. This number helps to identify the ability of the community to provide a balance of adequate employment and housing for its current and projected population. A lower jobs/housing ratio indicates fewer jobs for residents, and a high number indicates more jobs than housing.[1] A jobs/housing ratio of between 1 and 1.5 is generally considered balanced. Achieving a jobs/housing balance requires controlling the location, intensity, and nature of jobs and housing. Evaluation of the existing and future jobs/housing balance considers employment potential (existing and projected), housing demand, new housing production, and available transportation systems (particularly alternative transportation).

There are currently 3,200 jobs in Soledad (including jobs in the prison) and about 3,192 dwelling units, for a jobs to housing ratio of about 1.0.[2] A ratio of 1.0 means that there are about the same number of

[1] Though useful as a planning tool, it should be noted that the concept of a jobs/housing balance is limited since it does not consider employment wage levels or housing costs.
[2] This information is based on the analysis contained in the City of Soledad's General Plan and data from the California Department of Finance.

jobs as dwelling units, which would seem at first glance to be a positive sign. However, a straight comparison of dwelling units and jobs ignores a number of important factors such as the presence of more than one wage-earner per household, the wage scale in relation to the cost of local housing, and whether or not the jobs are matched by the skill mix of the local workforce. The prison accounts for jobs in Soledad, but the City does not generate property tax or sales tax revenues from the prison, as it would from private industry

The Land Use Element of the City's General Plan calls for phasing construction of residential development with development that will provide primary wage-earner jobs and adjustment of land use designations and new residential project approvals as needed to promote a reasonable balance between employment-generating land uses and housing. This policy is intended to help maintain a jobs-housing balance and contribute to the overall fiscal health of the City.

Miravale III Specific Plan

According to California Government Code Section 65451, cities and counties are required to prepare a general plan which describes what the city or county (and its residents) desire for their community, both now and in the future. General plans are required to address land use, circulation, housing, conservation, open space, noise, and safety. Specific plans provide comprehensive guidelines for a more defined and localized area within a jurisdiction's boundaries. They offer more specific information and guidance than what is available in a general plan. The Miravale III Specific Plan has been prepared consistent with the specific plan content and requirements identified in California Government Code Section 65451 and the criteria identified in Appendix B of the Soledad General Plan, which identifies standards for Specific Plans.

The purpose of the Miravale Specific Plan is to implement the City of Soledad's General Plan land use and development provisions pertaining to the project site. As previously identified above, the 920-acre project site comprises of all or part of three designated expansions areas, specifically the Northwest, San Vicente West, and Mirassou Expansion Areas. The Specific Plan is intended to serve as a comprehensive planning document for the project area that provides a cohesive vision for the buildout of the site.

Section 2.0 of the Miravale III Specific Plan identifies goals and policies to ensure adequate and compatible land uses within the Plan area. In addition, Section 2.0 also establishes development standards, lighting and signage requirements, landscaping, parking lot and driveway standards, as well as residential fencing guidelines. Key Land Use goals are summarized below.

- As indicated in Land Use Goal LU-1, a primary goal of the Specific Plan is to "develop an integrated and cohesive residential and recreation-oriented community centered around a signature golf course, parks, and hillside open spaces."

- Land Use Goal LU-2 states that the Specific Plan is intended to "provide a variety of housing types and densities within low, medium, and high density neighborhoods to serve a range of housing needs and income levels of the broader Soledad community and region."

- Land Use Goal LU-3 identifies that an objective of the Specific Plan is to "provide a range of land uses and facilities that meet the needs of Plan area residents and are economically beneficial to the City."

- Land Use Goal LU-4 is intended to insure that adequate open space, parks and recreational facilities are provided in order to meet the needs of the Plan area residents that are centrally located and linked throughout the plan area.

- Land Use Goal LU- 5 in intended to locate shopping, employment centers, recreation, and parks within walking distance from the homes that use these plan components.

- Land Use Goal LU-6 promotes land uses that provide employment opportunities for residents for the immediate surrounding communities.

- Land Use Goal LU-7 states that development within the project area should "provide public facilities, infrastructure and services commensurate with new development so as to adequately meet the needs of all development and future residents in the planning area in a manner that is financially self-supporting."

- Land Use Goal LU-8 is intended to encourage the development of "new, attractive residential neighborhoods that are in close proximity to parks, open spaces, schools, and neighborhood commercial."

- Land Use Goal LU-9 is intended to ensure that the Specific Plan "provide an integrated storm drainage and open space system that incorporates best management practices to adequately control storm flooding problems and protect water quality."

- Land Use Goal LU-10 is intended to protect the scenic vistas of the hills above Soledad through careful siting and design standards that minimize grading and visibility of new hillside development.

In addition to establishing specific Land Use policies, the Miravale III Specific Plan also establishes land uses designations and corresponding zoning designations on the project site. More specifically, the proposed site consists of residential, commercial, public/institutional, and open space/parks land uses. These land uses are further classified according to zoning type, including Low Density Residential (LDR & LDR-H/M3-R-1), Village Residential (M3-VR), Village Commercial (VC), and Gateway Commercial (GC). Figure 4.9-3 provides a graphical representation of the proposed zoning designations. For more information regarding allowable uses, please refer to section **3.0 Project Description.** Development standards for each of the zoning designations are contained in Appendix H of this document.

Relevant Project Characteristics

The 920-acre Plan Area is located on the northern edge of the City of Soledad generally between San Vicente Road and Orchard Lane, and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east. The project site is contiguous to existing development in Soledad.

The Miravale III Specific Plan proposes to develop a predominantly residential and commercial development on a currently undeveloped site designated for future build-out by the City of Soledad 2005 General Plan. The proposed land uses include approximately 1,470 single-family residential units, 2,230 multi-family residential units, 500 senior housing units, 120 hotel rooms, 250,000 square feet of retail commercial space and an 18-hole golf course. Conceptual plans include a variety of residential types, including apartments, townhouses, and attached homes on small and large lots. The project also proposes three school sites (2 elementary schools and 1 middle school), a fire and police substation, and approximately 255 acres of open space and recreation areas, including parks, playgrounds, a trail system,

and a public golf course. Additionally, project development also includes several amendments to the General Plan, they are summarized below.

Proposed General Plan Amendments

- Revision of General Plan land use diagrams to reflect Specific Plan's proposed planning area boundary and land use designations—i.e., Figures II-4 (Northwest Expansion Area), II-6 (San Vicente West Specific Plan Area), II-7 (Mirassou Specific Plan area) and Figure II-9-Land Use Diagram and Figure VI-1-Parks and Trails.

- Revision of Figure V-2 , Circulation Diagram, to reflect the circulation system proposed by the VTM/Specific Plan contingent upon demonstration that the proposed circulation achieves the same objectives—connectivity/service levels, etc.—as that shown by the Fig. V-2.

- Revision of the land use descriptions and development potential tables for the affected Expansion Areas—Northwest Expansion Area (pp. II-11 –II-12), San Vicente West (p.II-16), and Mirassou Specific Plan area (p. II-18) to reflect the alternative land use concept of the proposed Specific Plan. Revisions may include deletion of the L-shaped block from the Mirassou Specific Plan Expansion area.

- Modification of Table II-1, General Plan Development Potential, to allow an additional 1,050 - 1,550 units—over and above the maximum development currently allowed (number of additional units varies depending upon the extent to which development is reduced in the NW Expansion area)

- Modification of Land Use Policy L-45 to allow exceptions to the restriction on ridgeline development per the proposed Specific Plan/VTM.

- Modification of Land Use Policy L-5 and Policy S-1 and S-23 to allow exceptions to the requirements that adequate public services, including schools, be provided concurrent with new development (or demonstration that the existing middle school and high school—with or without improvements—can accommodate the majority of students generated by the project.)

- Modification of PR-33 to allow exception to the requirement that new development provide its fair share of public park and recreation opportunities (the minimum standard of 3.0 acres per 1000 residents is being met but this includes approximately 8 acres of trails and park connections; further, the General Plan goal is 5 acres of parkland for each 1,000 persons).

- Amendment of Housing Element Program 4-2 to allow exception to requirement that new "development must be organized into functioning neighborhoods that contain very low, low and moderate-income housing that is fully integrated with market-rate single-family housing." Being "next to" as noted in Section 2.5 of the draft Specific Plan doesn't meet the intent of the Housing Element to achieve "fully integrated" mixed income housing types and affordability.

◀N

Miravale III Proposed Zoning Designations

Figure 4.9-3

DENISE DUFFY & ASSOCIATES, INC.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- physically divide an established community;
- conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or
- conflict with any applicable habitat conservation plan or natural community conservation plan.

Impacts and Mitigation

Physically Divide an Established Community

No established residential or business communities exist within the project site. The issue of division or disruption of the physical arrangement of an established community typically involves actions that would create physical barriers that would substantially separate portions of a built community, such as construction of a new freeway through an established neighborhood. Construction of the proposed project would not divide or disrupt the physical arrangement of an established community, since there are no established residential neighborhoods or business districts located within the project site and the project is not located between any established communities. **There will be no impact and no mitigation measures are necessary.**

Conflict with Any Applicable Land Use Plan, Policy, or Regulation

The project would result in potential land use impacts associated with increased traffic, air pollution emissions, noise, and visual changes. These impacts are addressed within their respective sections of this EIR. The following section addresses the conformance of the project with applicable land use policies and regulations, as well as policies and regulations intended to avoid or mitigated an adverse environmental impact.[3]

Project development, which includes several General Plan amendments, as discussed above, is generally consistent with applicable land uses policies and regulations, as amended, pertaining to the development of the project site with the exception of several policies primarily relating to biological and aesthetic resources. The project would result in potential conflicts with adopted land uses policies and regulations that are intended to avoid and/or mitigate an adverse environmental impact. As identified in the City of Soledad General Plan EIR prepared by Crawford Multari & Clark Associates, several policies, including, but not limited to, *Policy C/OS-7*, *C/OS-8*, and *C/OS-9*, are intended to avoid and/or mitigate aesthetic, biological, geological, and agricultural impacts associated with buildout of the General Plan.

[3] It is important to note that the General Plan EIR made the distinction between the General Plan's consistency with other planning and regulatory requirements and potential environmental impacts. Moreover, "the fact that a comprehensive amendment of a city's general plan might be inconsistent with goals, policies and programs currently set forth does not in itself constitute a significant impact (Baldwin v. City of Los Angeles (1999) 70 Cal. App 4th 819,842-843)."

Pursuant to CEQA a significant environmental effect must involve an adverse change in the existing physical condition of the site. As proposed, project development would result in substantial changes in the physical environmental such that development has the potential to conflict with adopted policies intended to avoid and/or mitigate an environmental impact. For instance, project development would result in substantial changes in the physical conditions of the project site by allowing development to occur on and/or above the 400 foot elevation contour. As identified in **Section 4.1 Aesthetics** this is considered a significant unavoidable impact. Additionally, project development would also conflict with General Plan policies intended on avoiding and/or mitigating biological impacts. As indicated in **Section 4.4 Biological Resources**, project development would result in significant and unavoidable impacts to a variety of special-status wildlife species that cannot be mitigated to a less-than-significant level. As previously indicated, project development would result in substantial changes to the physical conditions of the project site that were previously restricted to avoid and/or mitigated aesthetic, biological, geological, and agricultural impacts. Although mitigation measures have been identified in previous sections of this EIR, project-related impacts cannot be mitigated to a less-than-significant level. See Table 4.9-2 for more information regarding the project's consistency with applicable General Plan policies and regulations pertaining to the development of the project site.

Impact **Since the proposed project would conflict with several policies intended to avoid and/or mitigate environmental impacts and these impacts cannot be mitigated to a less-than-significant level, this impact is considered significant and unavoidable. Mitigation measures have been identified in this EIR to reduce the extent of project-induced impacts, but these impacts cannot be minimized to a less-than-significant level. *This represents a significant and unavoidable impact.***

The following discussion examines the proposed project's consistency with adopted planning documents and its conformance with land use plans, policies, or regulations. Relevant land use documents, including the City of Soledad General Plan, General Plan EIR, Zoning Code, and Housing Element were reviewed to address the project's consistency with the land use policies and regulations discussed below.

Compatibility with LAFCO Policies

As previously identified above, the proposed Miravale III project site is located within unincorporated Monterey County. The project site, which is located adjacent to existing residential development within the City of Soledad, is identified in the General Plan as a future expansion area. Consistent with Government Code Section 65859, the site was "pre-zoned" to indicate the City's intention to annex the project site. In order to accommodate development of the proposed project, the City's existing Sphere of Influence would need to be amended to include the project site; subsequently the project site would need to be annexed into the City. The City, as required by LAFCO, will request approval to amend the City's Sphere of Influence, as well as, the annexation of the project site. As discussed in **Section 4.12 Public Services** and **4.14 Utilities and Service Systems**, adequate public services are available to accommodate project development. Accordingly, the proposed sphere amendment and annexation will not result in any new or more significant impacts than already analyzed in this EIR. As identified in Appendix I, development of the proposed project would be compatible with applicable LAFCO of Monterey County policies, including the "factors to be considered in review of proposal" for LAFCO, the adopted LAFCO of Monterey County's "Sphere of Influence Policies and Criteria," and the draft Sphere of Influence policies currently under consideration.

Consistency with City of Soledad General Plan

As previously identified, the proposed project includes several General Plan amendments in order to ensure that project development would be consistent with the City's General Plan. The General Plan

amendments include revisions to several land use and circulation diagrams, land use descriptions of the expansion areas, modification of various tables to demonstrate increased project density, policy modifications/revisions, and amendments to the housing element. Although project approval, including the adoption of the identified General Plan amendments would ensure project consistency with a number of General Plan provisions, development of the project would still conflict with several General Plan policies. Table 4.9-2 summarizes the project consistency with applicable City of Soledad land use policies. As identified above, this is considered a significant impact.

Consistency with City of Soledad Zoning Code

A primary function of the Specific Plan is to establish the zoning districts and development standards by which development within the Plan Area would be regulated. To accomplish this, zoning districts consistent with Soledad Municipal Code Title 17 have been utilized. The zoning districts used within the Plan Area are prefaced with M3, to indicate their specificity with the Miravale III Specific Plan. The Specific Plan's zoning districts are regulated by the design guidelines and development standards contained in the Land Use Section of the Specific Plan. The design guidelines and standards established within the Plan have been adopted by ordinance and provide development regulations that control the subdivision and improvement of land within the Plan Area. The zoning designations identified in the Specific Plan are intended to supplement the existing Zoning Code. However, when the proposed zoning conflict with existing city zoning standards, the standards identified in the Specific Plan will supersede in order to implement the proposed land use designations.

Consistency with City of Soledad Jobs/Housing Balance Goals

Evaluation of the existing and future jobs/housing balance considers employment potential (existing and projected), housing demand, new housing production, and available transportation systems. New residential development will be phased so that the number of new units constructed annually is consistent with the jobs-housing balance provision of the City's General Plan.

The Specific Plan provides a balance of jobs and housing that is consistent with the Housing Element. The Specific Plan includes an industrial, office, and commercial component, which is expected to generate approximately 550 jobs. The housing component of the Specific Plan includes the development of 4,200 dwelling units. This equates to a jobs to housing ratio of approximately .13 new jobs for each new home within the Plan area. The City of Soledad anticipates as many as 22,000 jobs and about 14,000 total dwelling units at buildout of the General Plan, which includes the Miravale III site. Should this development potential be realized, the City's ratio of jobs to dwelling units would be about 1.57, or considerably more jobs than dwelling units. The proposed project has substantially larger residential portion compared to employment generating commercial portion. The ultimate development of the City as envisioned under the General Plan, including development of the proposed project, would provide for a favorable jobs/housing balance.

Consistency with City of Soledad Housing Element

Development of the proposed project, as mitigated, would be consistent with the City of Soledad Housing Element. The Specific Plan provides for a mix of housing types, densities, and lot sizes that are consistent with goals of the Housing Element. In order to ensure consistency with the City of Soledad Housing Element, project-specific mitigation measures were identified in **Section 4.11 Population and Housing**. Mitigation was identified by the City of Soledad as necessary to ensure that affordable housing units are integrated into future development within the project site. For a more detailed discussion please refer to **Section 4.11 Population and Housing.**

Consistency with City Facility Planning Documents

As part of long-range planning, the City has undertaken the preparation of several long-term facility plans, including, but not limited to, the Long-Term Wastewater Management Plan, Stormwater Management Plan, Urban Water Management Plan, and the Water Master Plan. These plans have been prepared in order to ensure that the City has adequate services to accommodate development as envisioned under the 2005 Soledad General Plan. In order to ensure consistency with these documents the City of Soledad Director of Public Works has identified that the following mitigation is necessary.

Impact **As proposed, the Miravale III Specific Plan has the potential to conflict with adopted planning documents pertaining to public services.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measure.***

Mitigation

4.9-1 In order to maintain project consistency with adopted City-wide facility planning documents, the project applicant/developer shall revise Section 5.0 of the Specific Plan to incorporate revisions identified by the City of Soledad Director of Public Works, prior to project approval. The following policy revisions have been identified as necessary. Revisions are underlined.

Revise Wastewater Policy 2 to read as follows, "Design and construct the wastewater treatment system for Miravale III in accordance with applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and the Recycle Water Service Ordinance No. 645.

Revise Water Policy 1 to read as follows, "Design and construct the water supply and distribution system for Miravale III that expands upon and is integrated with the City's water distribution system and which meets the needs of future project developments of the Specific Plan area consistent with the Urban Water Management Plan and the City's 2005 Water Master Plan."

Revise Stormwater Policy 5 to read as follows, "Design and construct a stormwater collection and retention system that adequate retains peak storm flows onsite, avoids aggravating or causing offsite downstream from the project site, and ensures separation of stormwater drainage from Recycled water generated within the Plan area and that is consistent with the 2007 Stormwater Management Plan, Stormwater Master Plan, and Ordinance No. 617"

Add a new policy to the Section 5.2.2 Law Enforcement and Fire Protection/Medical Services. The new policy shall read as follows:

"9. Police and fire services will be maintained with funding from a public safety benefit assessment district or similar district."

Conflict With Any Applicable Habitat or Natural Community Conservation Plan

There are no habitat or natural community conservation plans that apply to the project site. Therefore, the project would not conflict with any applicable Habitat or Natural Community Conservation Plans. An expanded discussion of this issue is provided in **Section 4.4, Biological Resources**. **The project would not adversely impact any habitat or natural community conservation plans.**

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
GENERAL PLAN			
Land Use			
L-2	Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council.		The General Plan anticipated future growth in the Miravale III plan area (Mirassou plan area, Northwest and San Vicente West Plan Expansion Areas). The Plan is providing the City with affordable housing, a golf course, parks, schools, police and fire sites, and trails. The fiscal impact on the City will be reviewed as part of the City Council consideration of the project. The Planning Commission (PC) shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council to determine consistency. Mitigation measures under the Cumulative and Population and Housing Sections of this EIR also incorporate this policy. **With PC determination on above, the project is consistent with this provision.**
L-3	A specific plan shall be required for all annexations and development of properties designated Expansion Area. Specific plans shall be prepared in accordance with the standards provided in Appendix B.		The City will review the Miravale III Specific Plan to ensure compliance with policy and that the Specific Plan has been prepared in accordance with the standards provided in Appendix B of the Soledad General Plan. **The project is consistent with this provision.**
L-4	The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services.		Public services will be provided as described in Section 5 of the Specific Plan and in the Public Services and Utilities section of this EIR. **The project is consistent with this provision.**
L-5	New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development.		**Project consistent.** Development of the proposed project would be required to provide adequate public services in order to accommodate project development. As identified in **Section 4.12 Public Services,** the proposed project, as mitigated, would provide sufficient services to meet project demands.
L-6	New development shall pay its fair share of providing additional public services needed to accommodate such development.		**Project consistent.** As identified in **Section 4.12 Public Services** and **Section 4.14 Utilities,** development of the proposed project would be required to submit payment of its fair share of public services needed to accommodate project development. Moreover, the developer will prepare a Development Agreement and Plan for Services.
L-7	Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City.		Section 5.0 of the Specific Plan provides conceptual public utility plans. Section 4.0 provides a conceptual circulation plan. Final plans will be submitted upon completion of the vesting tentative map. **The project is consistent with this provision.**

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
L-8	The City shall permit only low-intensity land uses in areas where natural conditions such as floodplains and steep hillsides are likely to pose a threat to public safety or produce excessive maintenance costs.		The Specific Plan proposes Low Density Residential in hillside locations, subject to the Hillside Development Standards found in Appendix A of the Specific Plan. **The project is consistent with this provision.**
Land Use - Jobs/Housing Balance			
L-10	The City shall monitor development and adjust land use designations and new residential project approvals as needed to promote a reasonable balance between employment-generating land uses and housing.		The proposed project will provide 4,200 residential units and 550 jobs as part of project development. This equates to a jobs housing ratio of .13 new jobs for each new home within the plan area, considered a reasonable balance for the proposed project considering development potential associated with General Plan buildout. **The project is consistent with this provision.**
L-11	The City shall encourage large residential development projects to be phased or timed with development that will provide primary wage-earner jobs.		Miravale III proposes commercial and office job opportunities in Phases 1 and 2, as well as new schools, police and fire facilities in phases 1-4 to provide sources of employment within the project area. **The project is consistent with this provision.**
Land Use - Residential Development			
L-13	The City shall require that residential projects be designed to reflect and consider the relationship of the project to surrounding uses. Residential densities and lot patterns will be determined by these and other factors. As a result, the maximum density specified by the General Plan land use designations or zoning for a given parcel of land may not be realized.		The project Specific Plan proposes a maximum 4,200 units within the Plan Area including a number of PUD areas that have not been fully designed. Residential siting and design of the residential portion of the project reflect awareness of surrounding land uses as residential and non residential uses abut similar uses in the surrounding project vicinity. **The project is consistent with this provision.**
L-14	The maximum allowable residential density for new residential subdivisions or development projects shall be computed based on the gross area of the lot before dedications for highway setbacks, parks, streets, or other requirements.		The maximum residential density for the proposed project is 30 units per acre. Dedications for parks, streets, etc. have been considered and are part of the proposed project. Moreover, additional project-specific mitigation measures have been identified to ensure that adequate facilities are provided as part of project development. **The project, as mitigated, is consistent with this provision.**
L-15	The City shall require new subdivided lots to be adequate in size and shape for the range of primary and accessory uses designated for the area.		The proposed project provides lots of varying size and shape for the range of primary and accessory uses per new zoning designations as provided in the Specific Plan and Zoning Code. **The project is consistent with this provision.**
L-16	The pace of new residential development should be such that new residents can be absorbed into the fabric of the town and existing residents are not overwhelmed by newcomers. This can be accomplished in part by requiring phasing of larger residential projects and by ensuring that adequate infrastructure and public		The project will be constructed in 4 phases and includes a Plan for Services. As identified elsewhere in this EIR, mitigation measures have been adopted to ensure project development provides adequate public services in accordance with City requirements. In addition, General Plan policies, as well as,

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	improvements are in place concurrently, or in advance of new development.		policies identified in the Specific Plan, ensure that adequate facilities will be in place concurrently with project development. **The project, as mitigated, is consistent with this provision.**
L-17	Major new residential development is appropriate in the areas on the east and north sides of the developed portions of the City.		The Miravale III Specific Plan area lies north of the developed portions of the City in an area planned for expansion. **The project is consistent with this provision.**
L-19	In general, higher densities of residential development shall be located in areas served by the widest range of urban services, and shall be preferred along collector and arterial streets, within walking distance of schools, city parks and transit stops.		The Plan provides 6 Village Residential neighborhoods. Villages 1, 2, 4, and 5 are within a ¼ mile walking distance to schools, commercial uses, parks, and transit. Village 3 is adjacent to commercial, transit, and parks. The sixth village (Village 6) is within walking distance to open space, parks, and transit. All villages are located adjacent to collector roads. **The project, as mitigated, is consistent with this provision.**
L-20	The approval of new residential subdivisions shall incorporate provisions to ensure that an appropriate amount of new multi-family development is constructed concurrently, or in advance of, new single family residences.		Multi-family development is planned in Phases 1-4. The development agreement will provide policies that require the multi-family development be constructed concurrently, or in advance of, new single family residences. **The project, as mitigated, is consistent with this provision.**
Land Use - Commercial Development			
L-21	New commercial development shall be encouraged in Soledad near the freeway interchanges with Highway 101. Limited new neighborhood commercial development will be allowed within areas designated *Expansion Area*, and/or at specified nodes to provide for the everyday needs of the surrounding residential neighborhoods.		The two commercial centers are sited in the southwest corner of the project site, nearest San Vicente road and the highway 101 freeway interchange. In addition, limited neighborhood serving commercial designations are also included as part of the Specific Plan, which is located within a designated expansion area. **The project is consistent with this provision.**
L-23	In general, new retail commercial development should provide a wider range of shopping opportunities for the community.		Two commercial centers; the Gateway Commercial Center, and the Village Commercial Center are planned to contain a variety of shopping opportunities for the community. **The project is consistent with this provision.**
L-24	New commercial development shall be designed to encourage safe and efficient pedestrian circulation within and between commercial sites and nearby residential neighborhoods.		The two commercial sites within the Plan Area contain pedestrian designated walkways through parking lots, wider sidewalks around the building and parcel perimeters, and pedestrian connections to adjacent residential neighborhoods. **The project is consistent with this provision.**
L-25	New commercial development shall be designed to minimize the visibility of parking areas from public roadways.	Section 2.16 – Guideline 1	Design level drawings are not available at this stage. Parking lots visible from public streets should be adequately screened from vehicle view through one or more of the following: rolling earth berms, low screen walls, landscaping, changes in elevation, or combinations of above. In addition, mitigation

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
			measures have been incorporated into this EIR to ensure that aesthetic/visual impacts are reduced to the maximum extent feasible. **The future project design must comply with this provision.**
L-26	The visitor-serving sector of the local economy shall be maintained and expanded. New motels/hotels shall especially be encouraged in areas within walking distance of the downtown. Visitors to the nearby Pinnacles National Monument offers another potential market for visitor-serving land uses.		The project includes an opportunity site for future hotel adjacent to the golf course to expand the visitor-serving sector of the City's economy. **The project is consistent with this provision.**
Land Use - Public-Quasi-Public/Office Development			
L-32	The City shall designate adequate, appropriately located land for the development of City and County facilities and offices, schools, medical facilities, water facilities, and public safety facilities.		**Project consistent.** The proposed project, as mitigated, will provide adequate public facilities, including parks, open space, schools, and a police and fire station.
L-34	When considering plans for large-scale development, the City shall designate adequate, appropriately-located land for the development of quasi-public land uses, such as, hospitals, churches, private schools, cemeteries, and utility uses.		The Plan Area provides a church opportunity site as well as areas for infrastructure/utilities on site. **The project is consistent with this provision.**
L-35	The City shall promote the clustering of public and quasi-public uses such as schools and parks, libraries, child care facilities, and community activity centers. Joint use of public facilities shall be promoted, and agreements for sharing costs and operational responsibilities among public service providers shall be encouraged.		Joint use of the three public schools and adjacent parks is intended to be implemented in the development agreement. Policies have been incorporated into the Specific Plan to promote the joint use of public facilities. **The project is consistent with this provision.**
L-36	The City shall encourage efforts to locate adequate emergency services and other types of health care facilities in Soledad to meet the present and future needs of its residents.		The plan provides a potential site for a joint police/fire station. **The project is consistent with this provision.**
Land Use- Expansion Areas/Specific Plan Areas			
L-42	The City shall use Community Design Guidelines as a decision-making tool to ensure that new development incorporates the qualities and character desired by Soledad residents.		Design Guidelines have been provided for each urban land use within the Miravale III Specific Plan. **The project is consistent with this provision.**
L-43	Specific plans prepared for major expansion areas shall incorporate the standards described in Appendix B – Standards for Specific Plans. In general: a. New residential projects should be designed to integrate with existing neighborhoods to ensure that they do not destroy the established character. Subdivisions in City expansion areas should be designed so that individual, separately developed projects work together to create true neighborhoods with a sense of identity, instead of disjointed or isolated enclaves. b. Subdivision design should emphasize pedestrian connectivity		a. Similar residential product types along the southern portion of the Plan Area and the extension of West Street and San Vicente Road creates neighborhoods that are integrated and linked with existing residential development b. Pedestrian connectivity has been emphasized with the provision of 65 pedestrian park connections and neighborhood connections (refer to section 4.2.7 of the Specific Plan). Local streets have been designed per City direction. Sidewalks are separated from curbs by landscaped parkway strips in all instances except for Hillside Roads which do not require a

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	within each project, and to adjacent neighborhoods, and nearby schools and parks. All streets and walkways should be designed to provide safe and pleasant conditions for pedestrians. Streets within neighborhoods should be no wider than needed to accommodate parking and two low-speed travel lanes. Sidewalks should be separated from curbs by parkway strips of at least four feet in width; and the parkways should be planted with canopy street trees. c. Specific plans should provide a range of residential housing types affordable to the widest range of income groups, consistent with the goals, policies and programs of the Housing Element of the General Plan. d. Subdivisions should be designed to provide usable public open spaces in the form of parks, linear bicycle and pedestrian trails, squares, and greens, as appropriate.		parkway strip. c. A variety of housing types are planned including single family detached, attached duplex, townhouses, and for rent apartments. The provision of affordable housing is consistent with the Housing Element of the City's General Plan. d. Development of the proposed project entails the provision of public open space, parklands, and a semi-private golf course. In addition, mitigation measures have been identified in order to ensure the proposed project provides adequate public facilities to meet project generated demands. **The project, as mitigated, is consistent with this provision.**
L-44	The City shall require that all new development be designed to complement the scale and character of existing development. Views of the surrounding hills and mountains shall be preserved through such means as design review, sign control, undergrounding of utilities, grading and tree removal standards.		**Project inconsistent.** Development of the proposed project, while physically transforming a previously undeveloped project site into a new development, would complement the existing residential character of Soledad. As identified in **Section 4.1 Aesthetics,** development of the proposed project would result in a significant unavoidable impact to a scenic vista. Although measures are incorporated to insure that these impacts would be minimized to the extent feasible, project development would substantially alter the existing visual character of the Hillside portion of the project site. Existing views of the project site as perceived from adjacent uses would consistent predominately of new urban features, such as roads, structures, and other factors. The proposed project, which includes several General Plan amendments pertaining to development within the Hillside would still degrade the existing character of the surrounding hills and mountains. Although these amendments would revise a number of policies prohibiting development above the 400' elevation contour, project impacts would still substantially alter the existing character of these resources.
L-45	The City shall require all new development to be planned and designed in a manner which employs design, construction and maintenance techniques that: a. Avoids locating structures along ridgelines and steep slopes. b. Incorporates design and screening measures to minimize the visibility of structures and graded areas. c. Maintains the character and visual quality of the area.		**Project inconsistent.** As previously identified in **Section 4.1 Aesthetics,** project development would substantially alter the existing visual character of the project site such that project impacts would be significant and unavoidable. Moreover, project development, including development above the 400' elevation contour, would also result in a significant unavoidable impact to a scenic vista. Although the proposed

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
			project includes several amendments to the General Plan to address potential inconsistencies with development within the Hillside portion of the site, project development would nevertheless conflict with the provisions of this policy as these impacts were identified as significant and unavoidable.
L-46	New development on hillsides shall employ design, construction and maintenance techniques that: a. Ensure that development near or on portions of hillsides do not cause or worsen natural hazards such as erosion, sedimentation, or fire hazards. b. Minimize risk to life and property from slope failure, landslides and flooding. c. Include erosion and sediment control measures including temporary vegetation sufficient to stabilize disturbed areas. d. Maintain the character and visual quality of the hillside.	4.1.2.12	**Project inconsistent.** Although the proposed Specific Plan contains numerous policies and guidelines to minimize erosion and potential geological hazards within the Hillside portion of the project site, development within the project area would result in a significant and unavoidable impact to the existing visual quality. As a result, the proposed project is considered inconsistent with this policy.
L-47	The City may, where appropriate, require new development to provide pedestrian amenities along public sidewalks, such as seating and 'pocket parks'.		Public amenities such as benches will be provided around commercial centers and parks. Pocket parks may be included in the ultimate design of the Village Residential areas. **The project is consistent with this provision.**
L-49	The form, scale and character of new residential development shall emulate the best characteristics of the existing residential neighborhoods, such as single and two-story dwellings with adequate off-street parking, landscaped front yards with trees, and sidewalks.		Figure 2-6 of the Specific Plan summarizes the number of floors for each product type. Local residential streets are required to provide street trees separated by a 5' wide planting strip. Single family units are also required to provide adequate off street parking and landscaped front yards. **The project is consistent with this provision.**
L-50	Multi-family development shall include usable open space for each dwelling and shall be designed to be integrated with the surrounding neighborhood.		**Project consistent.** Multi-family development is proposed within six areas designated as Village Residential. Currently, no formal plans have been submitted for development within these areas. Mitigation measures have been incorporated to ensure that adequate open space and improved parkland are provided within the Village Residential areas consistent with the intent of this policy. Moreover, individual applications for multi-family development within the Miravale III Specific Plan area would be required to adhere to the requirements of this policy.
L-51	All exterior lighting in new development shall be located and designed so as to avoid shining directly onto nearby residential properties, and shall minimize offsite glare. Proponents of commercial or industrial projects on property adjacent to residential areas shall submit a lighting plan to the City for review and approval; said plan shall incorporate features such as		City shall review lighting plan prior to approval of commercial projects. Design guidelines and mitigations have also addressed light glare issues. **The project, as mitigated, is consistent with this provision.**

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	low level, downward-directed exterior lights to achieve the intent of this policy.		
L-52	Historically or architecturally significant buildings shall not be demolished or substantially changed in outward appearance in a way that diminishes the historical character, unless doing so is necessary to remove a threat to health and safety and other means to avoid the threat are infeasible.		**Project consistent.** As identified in **Section 4.5 Cultural Resources,** the project applicant will be required to relocate the historically significant Lorentzen house in order to ensure project impacts are less-than-significant. Moreover, the relocation of this building would not diminish the historical character of the house.
Housing			
H-1	The City of Soledad shall promote the expansion of its LAFCO Sphere of Influence and annexation of additional land consistent with its General Plan Land Use Element to accommodate long-term demand for residential development.		The project site includes portions of the San Vicente West, Mirrasou, and Northwest Expansion Areas. These expansion areas combine for residential capacity of 9,012 units on 1,488 acres. **The project is consistent with this provision.**
H-3	The City of Soledad shall require new residential areas to contain a mix of housing types targeted to very low, low, moderate, and above moderate households in approximately the proportion that each of these income categories represent in the AMBAG Fair Share Housing Allocation.		Approximately 340 very low, 318 low, 569 moderate, and 1,047 workforce housing units are proposed within the Plan Area. The City Council (CC) shall review the merits of a development agreement (DA) which will demonstrate project's consistency with the city's affordable housing requirements per the housing element and inclusionary housing ordinance, Mitigation measures under the Population and Housing Sections of this EIR also incorporate this policy. **With PC determination on above, the project is consistent with this provision.**
Housing – Removal of Development Constraints			
H-9	The City of Soledad shall ensure that city site improvement standards, development review procedures, and development fees do not unreasonably constrain the development, conservation, and rehabilitation of housing.		Housing development shall comply with the Specific Plan and all applicable housing policies and will not unreasonably constrain the development, conservation, and rehabilitation of housing. **The project is consistent with this provision.**
H-10	The City of Soledad shall ensure the availability of adequate public facilities for the expected housing need of the city.		The developer will prepare a Development Agreement and Plan for Services. As identified elsewhere in this EIR, the proposed project, as mitigated, would be adequately served by public facilities. **The project, as mitigated, is consistent with this provision.**
Housing – Energy Conservation			
H-11	The City of Soledad shall support and initiate, where feasible, public and private energy conservation programs which will reduce the energy needs of housing in Soledad and so increase housing affordability.	5.1.4.10	The Specific Plan contains goals to maximize energy conservation. In addition, mitigation measures have been incorporated into this EIR to promote the use of solar energy devise and encourage solar orientation of residential and buildings building to reduce the use of fossil fuels. **The project, as mitigated, is consistent with this provision.**

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
Circulation – Traffic Management			
C-1	Level of Service "D" or better shall generally be maintained on all streets and intersections. Lower levels of service may be accepted during peak times or as a temporary condition, if improvements to address the problem are programmed to be developed. To identify potential impacts of new development on traffic service levels, the City shall require the preparation of traffic impact analyses generally at the sole expense of the developer for developments determined to be large enough to have potentially significant traffic impacts.		According to Hexagon's 2006 Traffic Impact Analysis Report, a Level of Service "D" or better shall be maintained upon project build-out. Mitigation measures have been identified in this EIR to ensure that all project-related transportation impacts would be reduced to the greatest extent feasible. **The project, as mitigated, is consistent with this provision.**
C-2	Streets shall be dedicated, widened, extended and constructed in accordance with City standards. Dedication and improvements of full rights-of-way shall not be required in existing developed areas where the City determines such improvements are infeasible or undesirable. New development shall be responsible for improving a minimum one-half street along the outer-boundaries of each subdivision along subdivision property where street extensions are identified. Other deviations from these standards shall be permitted upon a determination by the City Engineer that safe and adequate public access and circulation are preserved by such deviations.		This policy will be implemented by the pending Vesting Tentative Map and the Developer Agreement. **The project is consistent with this provision.**
C-5	The street system in residential neighborhoods shall provide safe and logical connections to the existing street pattern, and connectivity to the range of complementary land uses within neighborhoods (housing, schools, parks, neighborhood shopping, etc.). The use of multiple collector streets shall be favored over the use of arterials in new residential subdivisions.		Connections to the existing street pattern have been provided via the proposed extension of West Street and San Vicente Road. New circulation alignments within the Plan Area have been designed to effectively connect residential neighborhoods to commercial and recreational areas. Sidewalks adjacent to commercial centers and schools will be wider to accommodate higher levels of pedestrian traffic. **The project is consistent with this provision.**
C-8	The City shall manage the street network so that the standards presented in policies C-1 and C-12. are not exceeded. The City will require new development to mitigate the traffic impacts it causes, or the City will limit development along streets where congestion levels are unacceptable		The project, as proposed, provides mitigation for traffic impacts including payment of traffic impact fees to maintain Level of Service "D" or better upon project build-out. **The project, as mitigated, is consistent with this provision.**
C-9	New local streets shall be developed consistent with the goals, policies and programs of the Land Use Element of the General Plan.		Local streets within the Miravale III Plan Area have been designed per City standards. **The project is consistent with this provision.**
C-10	Facilities that promote the use of alternate modes of transportation, including bicycle lanes, pedestrian and hiking trails, park-and-ride lots and facilities for public transit shall be incorporated into new development, and shall be encouraged in		Over 27 miles of trails, sidewalks, and bicycle lanes will be provided to promote alternative modes of transportation. Three transit stops are also planned. **The project is consistent with this provision.**

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	existing development.		
C-13	The City shall ensure through a combination of traffic impact fees and other funding mechanisms that new development pays its fair share of the costs of circulation improvements required by such development.		Site improvements will be constructed by the developer. Off-site improvements will be addressed through the EIR mitigation requirements. **The project, as mitigated, is consistent with this provision.**
C-14	The City shall prohibit the development of private streets in new residential projects, unless approved on a project specific basis where circumstances support such a use and the streets are privately maintained.		No private streets are proposed. **The project is consistent with this provision.**
C-15	New development shall continue the existing street pattern, where logical.		This has been accomplished with the planned extension of West Street and San Vicente Road. **The project is consistent with this provision.**
C-16	Roundabouts will be considered as an alternative to traditional intersection controls.		One roundabout is proposed at project entry. **The project is consistent with this provision.**
Circulation – Parking			
C-17	The City shall require the provision of adequate off-street parking in conjunction with all new development. Parking shall be located convenient to new development and shall be easily accessible from the street. The adequacy and appropriateness of parking requirements in the Zoning Ordinance shall be periodically evaluated.		Parking requirements are consistent with 17.36.020 of the City of Soledad's Municipal Code. All future applications for development within the Specific Plan area will be required to adhere to the parking requirements identified in Section 17.36.020 per the Specific Plan. **The project is consistent with this provision.**
Circulation – Bicycle Circulation			
C-21	Bicycle routes shall emphasize paths separate from vehicle traffic to the maximum extent feasible, but shall also include bicycle lanes within public streets.		Bike lanes are proposed on collector streets. **The project is consistent with this provision.**
C-22	Bike lanes and paths shall be designed and maintained to improve bicycling safety, and convenience, and encourage people to use bicycles to commute to work or school.		Over 4 miles of Class II bike lanes are planned. Bicycles will also be permitted on the Hillside Trail and Linear Park Trail. **The project is consistent with this provision.**
C-25	New development shall provide bike lanes and paths, secure bicycle storage and parking facilities.	Section 2.11 policy j	**Project consistent.** As proposed, the project includes over 4 miles of Class II bike lanes within the project area. Future development within the commercial and village residential areas will be required to provide additional bike facilities, including storage racks, consistent with this requirement
Circulation – Pedestrian Circulation			
C-27	The City shall complete a continuous network of sidewalks and separated pedestrian paths connecting housing areas with major activity centers and with trails leading into City and county open space areas.		Over 15 miles of separated sidewalks are planned. These sidewalks will connect housing areas to major activity centers such as parks, open space, commercial, and civic uses. **The project is consistent with this provision.**
C-28	New commercial development and development in Specific Plan areas shall provide sidewalks and pedestrian paths consistent with applicable State, federal and local plans, programs and		Figure 2-7 of the Miravale III Specific Plan illustrates the location of pedestrian amenities such as sidewalks and pedestrian paths. The Gateway Commercial Center is intended

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	standards.		to provide the same. **The project is consistent with this provision.**
Parks & Recreation – Parks			
PR-1	The City will acquire future park and recreation land and facilities by: a. Requiring park dedications from future residential subdivisions at the rate of one acre per 1,000 population anticipated in the project; b. Requiring payment of a park impact fee, or requiring the dedication of land and improvements in-lieu of fees, from all new development; c. Cooperating with Monterey County to acquire land for a new regional park in the Soledad planning area; d. Acquiring parkland near existing or potential public park or recreation sites, or near quasi- public or private sites that have a good opportunity for a joint use agreement. Acquired parkland should be contiguous to proposed or existing park and recreation facilities or provide a logical connection. e. Pursuing joint use agreements with public and private schools, other public government agencies, private park and recreation providers, and institutions with potential parkland to make existing or proposed park and recreation facilities available to the community on an extended basis.	4.1.2 policy 3	**The project, as mitigated, is consistent with this policy.** The proposed project, consistent with the requirements of this policy, provides park and recreational areas within the project area. a. As currently proposed, the project includes approximately 45.60 acres of parkland, including 24.27 acres of parkland to be provided in conjunction with the development of the multi-family Village Residential areas. In addition, the proposed project also includes an approximately 159 acre golf course, in addition, to approximately 62 acres of open space. b. The proposed project will be required to pay park impact fees, in addition to the dedication of land. c. Not applicable. d. Parks and recreational facilities are located throughout the proposed development and several facilities are planned adjacent to educational facilities. e. A joint use agreement may be established between the City and the School District for shared use of school recreational facilities.
Parks & Recreation – Trails			
PR-10	The City should provide a pedestrian network within the City Limits. The system should: a. Accommodate pedestrians and bicycles. b. Connect residential neighborhoods with: 1) Soledad's downtown, 2) schools, 3) City park and recreation facilities, and 4) regional trails.		The Specific Plan provides both bike lanes and pedestrian sidewalks. All parks within the Plan Area have pedestrian accesses logically located in key areas. Signage may be provided throughout the Plan area to guide bicyclist toward trails, parks and other points of interest. **The project is consistent with this provision.**
Parks & Recreation – Acquisition & Development			
PR-16	Parks shall be designed to be compatible with the neighborhoods in which they are located, and shall provide security and privacy to adjoining properties. Where necessary, buffers shall be provided between park and recreation lands and adjacent development to provide privacy and a physical separation between uses.[4]		Village 1 Park and Z Street Park are planned to be joint use facilities with the adjacent elementary schools. These parks will be lit to ensure security. I Loop Park and Crest St. Park are surrounded by residences which will provide "eyes on the park." Lighting will be provided at parks. **The project is consistent with this provision.**

[4] Buffers may include setbacks, landscaping, fencing, and/or dramatic breaks or changes in topography.

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
Parks & Recreation – Management			
PR-24	New development shall be required to add to proposed or existing park and recreation projects where legally feasible. Public or private development shall provide, as appropriate and legally feasible: 1) a buffer between proposed development and existing park, recreation and/or open space parcels to minimize conflicts between development and existing facilities; and 2) gates, fences, or other deterrents when such facilities are deemed necessary to discourage prohibited or non-compatible uses from entering park, recreation or open space lands.	4.1.2 policy 12	The plan area is not adjacent to existing park and recreation facilities. Where new parks are proposed fencing will be provided as a component of the residential development. A 100' foot buffer will be provided between structures and the hillside open space area. **The project is consistent with this provision.**
PR-25	New development shall not adversely impact adjacent park, recreation or open space lands.	4.1.2 policy 12	There are no park or recreation lands adjacent to the Plan Area. A 100' foot buffer will be provided between structures and the hillside open space area. **The project is consistent with this provision.**
Parks & Recreation – Funding			
PR-33	New development shall be required where legally feasible to provide its fair share of public park and recreation opportunities. New development within the City shall be required to provide park and recreation lands or facilities consistent with this Element. Conditions placed on new development shall be reasonable and consistent with the nature and extent of such development plans. The City shall require the dedication and improvement of park land even in circumstances where the total cost to improve such parkland exceeds the value of the corresponding development impact fee.	4.1.2 policy 2	**Project consistent.** As identified in **Section 4.12 Public Services,** the proposed project, as mitigated, will provide approximately 45.60 acres of improved parkland consistent with existing General Plan policies, as well as provisions contained in the Miravale III Specific Plan. In addition, the proposed project also includes approximately 62 acres of open space and a 159 acre golf course.
Public Services & Facilities – Services & Facilities			
S-1	The City shall ensure through the development review process that adequate public facilities and services are available to serve new development. New development shall not be allowed until adequate public services and facilities to serve such development are provided. Where existing facilities are inadequate, new development may only be approved when the following conditions are met: a. The developer and/or City can demonstrate that all necessary public facilities will be adequately financed and installed in time (through fees or other means); and b. The facilities improvements are consistent with applicable facility plans approved by the City or other agencies in which the City is a participant.		Improvement s for the project infrastructure must be in compliance with the adopted City wide Urban Water Management Plan, Water Master Plan, project Water Supply Assessment and Written Verification of Supply, Long-Term Wastewater Management Plan, and other facility related planning documents. As proposed and with mitigation, adequate public services are available to serve the proposed project. Final design of project infrastructure will be required prior to the recordation of the final map and the City of Soledad will be responsible for insuring that project infrastructure is consistent with applicable City Standards. **The project is consistent with this provision.**
S-2	The City shall plan for the expansion of needed water and sewer infrastructure including, but not limited to, the expansion of		Adequate public services are available to meet project generated demands assuming project mitigation. Final

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	water production, storage and distribution facilities, the expansion of wastewater collection and treatment capacity, and storm drainage facility expansion.		infrastructure plans will be reviewed by the City of Soledad prior to the recordation of the final map to insure that infrastructure sizing adheres to City requirements. For more information regarding project specifics, please refer to **Section 4.14 Utilities and Service Systems.**
S-3	Public facilities, such as wells, pumps, tanks, and yards shall be located and designed so that noise, light, odors, and appearances do not adversely affect nearby land uses.		**Project consistent.** Future development of project infrastructure, including wells, pumps, tanks, and similar public facilities would be required to be built in conformance with this policy.
Public Services & Facilities – Funding			
S-4	Where new development requires the construction of new public facilities, the new development shall pay its fair share of the construction. Where necessary, the City shall require the dedication of land within newly developing areas for public facilities		**Project consistent.** The proposed project, as mitigated, would provide adequate public facilities in order to accommodate project demand. More specifically, a site for fire and police facilities has been integrated into the plan area. School sites have also been integrated and coordinated with the School District. Park sites, open space trails, roads, and the golf course will be developed as a part of this plan.
S-5	The City shall require that new development pay its fair share of the cost of all existing facilities it uses based on the demand for these facilities attributable to the new development; exceptions may be made when new development provides alternative sources of funding or equipment to offset any shortfall in revenues.		**Project consistent.** Development of the proposed project would be required to submit payment of all impact fees consistent with current adopted City provision. Fore more information, please refer to **Section 4.12 Public Services** and **Section 4.14 Utilities and Service Systems.**
Public Services & Facilities – Water			
S-8	The City shall promote the efficient use of water and reduced water demand by: a. Requiring water-conserving design and equipment in new construction; b. Encouraging water-conserving landscaping and other conservation measures; c. Encouraging the retrofitting of existing fixtures with water-conserving fixtures.		**Project consistent.** All project wastewater would be treated at a wastewater treatment plant located on the southwest corner of the project area. Recycled wastewater would subsequently be used for irrigation purposes, including open spaces area, front yards, and golf course areas. Final infrastructure plans will be reviewed by the City of Soledad prior to the recordation of the final map to insure that infrastructure sizing adheres to City requirements. For more information regarding project specifics, please refer to **Section 4.14 Utilities and Service Systems.**
S-10	The City will manage the increase in water demand from new development to help insure groundwater resources are not overdrafted. The City will work with Monterey County and public and private water entities to plan for the efficient, long term management of groundwater resources.		**Project consistent.** As identified in the City Water Master Plan and the Urban Water Management Plan adequate water is available to serve the proposed development. Moreover, the WSA further identifies that adequate water exists to serve the proposed development
S-11	Gravity flow for sewer and water service shall be employed wherever feasible.		**Project consistent.** Gravity flow for sewer and water services will be employed where feasible. Final design of project

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
			infrastructure will be required prior to the recordation of the final map and will be subject to the review and approval of the City.
Public Services & Facilities – Drainage			
S-14	The City shall strive to improve the quality of urban stormwater runoff and quality of groundwater recharge through the use of appropriate mitigation measures including, but not limited to, infiltration/sedimentation basins, oil/grit separators, and other management practices, including storm water retention.		**Project consistent.** As identified in **Section 4. Hydrology and Water Quality** mitigation measures have been incorporated to ensure that project-impacts would be reduced to a less-than-significant level. These measures have been incorporated to ensure that project development is consistent with the City's adopted Storm Drain Master Plan.
S-15	The City shall require new development to adequately mitigate increases in stormwater peak flows and/or volume. Mitigation measures shall take into consideration impacts on adjoining properties and impacts on groundwater recharge related to existing and proposed water wells.		**Project consistent.** As identified in **Section 4. Hydrology and Water Quality** mitigation measures have been incorporated to ensure that project-impacts would be reduced to a less-than-significant level. These measures have been incorporated to ensure that project development is consistent with the City's adopted Storm Drain Master Plan.
S-16	The City shall encourage project designs that minimize drainage concentrations and impervious coverage and maintain, to the extent feasible, natural site drainage conditions. Drainage onto adjacent properties shall be restricted to pre-project levels minus any runoff from the area to be developed.		**Project consistent.** As identified in **Section 4.8 Hydrology and Water Quality** project-specific mitigation measures have been incorporated to ensure that project development is consistent with the City's adopted Storm Drain Master Plan and other relevant facility planning documents.
S-17	The City shall require projects to allocate land as necessary for the purpose of retaining flows and/or for the incorporation of mitigation measures for water quality and supply impacts related to urban runoff.		**Project consistent.** Mitigation measures have been incorporated to address water quality and urban runoff concerns. For more information please refer to **Section 4.8 Hydrology and Water Quality.**
S-19	Engineered drainage plans shall be required for all development projects. Engineered drainage plans shall incorporate a collection and treatment system for stormwater runoff consistent with applicable federal and State laws.		**Project consistent.** As a standard condition of approval the project applicant will be required to submit an engineered drainage plan consistent with the City's adopted Stormwater Drainage Master Plan.
Public Services & Facilities – Schools			
S-20	The City will work cooperatively with the Soledad Unified School District to monitor housing, population and school enrollment trends and in planning for future school facility needs. The City shall assist the District in locating new school sites.		**Project consistent.** The City of Soledad is currently working with the School District to identify a future high school site within the City of Soledad. For more information, please see **Section 4.12 Public Services**.
S-21	The siting of new schools shall be coordinated with the City's Circulation Element to ensure that traffic conflicts are avoided, the safety of students is addressed and roadway function is not reduced, including provisions for off street student drop-off/pick up.		The two elementary schools have been located along collector and local streets in order to provide safe student drop-off/pick up locations. All new school facilities provided in conjunction with the proposed project would be required to adhere to this policy. **The project is consistent with this provision.**
S-22	The City will work closely with the school district to secure		**Project consistent.** As identified in **Section 4.12 Public**

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	adequate funding for new school facilities, and where legally feasible, shall provide a mechanism which requires development projects to mitigate the cost of providing school facilities needed to serve such development, consistent with relevant provisions of State law.		**Services** the project applicant/developer will be required to submit payment of a school impact fee for each type of development within the project area.
S-23	The City, to the extent feasible, shall ensure that new school facilities are constructed and operating prior to the occupation of residences which the schools are intended to serve.		**The project, as mitigated, is consistent with this policy.** The City is currently in the process of coordinating with the School District regarding the timing of new school facilities. In addition, all new facilities provided as part of the proposed project would be required to adhere to this policy.
Public Services & Facilities – Solid Waste			
S-27	The City shall require that all new development complies with applicable provisions of the Monterey County Integrated Waste Management Plan.		**Project consistent.** As requested by the Salinas Valley Solid Waste Authority, project-specific mitigation measures have been identified in order to insure that construction generated waste is recycled to the greatest extent possible. For more information, please see **Section 4.14 Utilities and Service Systems.**
Public Services & Facilities – Police Protection			
S-29	The City shall strive to achieve and maintain a ratio of a minimum of 1 police officer per 1,000 residents.		**Project consistent.** In order to maintain the desired ratio of police officers, development of the proposed project will be required to fund a fully operational police sub-station within the project site through the payment of development impact fees. Please see **Section 4.12 Public Services** for further information.
S-30	The City shall strive to achieve and maintain emergency response time to a maximum of 5 minutes for police emergencies.		**Project consistent.** As identified above, the proposed project includes a site for the future location of a police substation, which the applicant/developer will be responsible for funding. The construction of a substation in this location will insure that response times will be within this timeframe.
S-32	The City shall require new development to pay its fair share of providing or funding facilities that, at a minimum, achieve and maintain the above police protection standards.		**Project consistent.** As identified in **Section 4.12 Public Services** the project applicant/developer will be required to submit payment of all applicable fees in order to maintain the police protection standards enumerated above.
Public Services & Facilities – Fire Protection			
S-36	The City shall strive to achieve and maintain an emergency response time of 5 minutes or less for fire emergencies over 90% of the City.		**Project consistent.** The proposed project, as mitigated, contains measures to in order that adequate public facilities are provided to ensure that emergency response time are within the established target range. More specifically, project development would result in the construction of both a police and fire substation within the project area.
S-37	The City shall require new development to pay its fair share of		**Project consistent.** The project applicant/developer will be

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	providing or funding facilities that, at a minimum, achieve and maintain the fire protection standards identified in Policies S-35 and S-36.		required to submit payment of fees in order to insure that facilities are adequately funded. For more information, please refer to **Section 4.12 Public Services.**
S-38	The City shall ensure that all proposed developments are reviewed for compliance with fire safety standards per the Uniform Fire Code and other City standards and ordinances.		**Project consistent.** All new development will be reviewed by the City for consistency with fire safety standards contained in the Uniform Building Code, as well as, other City standards and ordinances.
S-39	New non-residential development and non-residential additions of over 100 square feet of habitable space shall provide fire sprinklers in accordance with City standards, and as determined by the Fire Marshal. New residential development shall be provided with fire sprinklers unless the developer provides studies that prove the standard identified in Policy S-35 is not negatively affected.		**Project consistent.** Future buildout of the project site will be required to adhere to these standards.
Conservation / Open Space – Agricultural Resources			
C/OS-1	The City shall discourage "leapfrog" development and development in peninsulas extending into agricultural lands to avoid adverse effects on agricultural operations.		The project site is located directly north of existing city limits and the proposed project will not adversely affect surrounding agricultural operations. Project site includes Williamson Act property which will remain in open space/ag use per the contract until cancellation date (approximately 18 years). **The project is consistent with this provision.**
C/OS-2	The City shall retain the agricultural land use designation on lands within its planning area until the land is needed for urban development.		**Project consistent.** The project site is currently located within the County of Monterey and is zoned for agricultural use. The subject site, however, is designated within the City of Soledad General Plan as a future expansion area to accommodate projected growth as envisioned under the 2005 General Plan. Upon annexation, the subject site would be appropriately zoned for commercial and residential uses consistent with the Miravale III Specific Plan.
C/OS-3	The City shall ensure that new development and public infrastructure projects do not encourage expansion of urban uses outside the general plan area into areas designated *Agriculture* by the Monterey County General Plan.		The project site is located within expansion areas as designated in the Land Use Diagram of the General Plan. Williamson Act property will remain in open space/ag use per the contract until cancellation date. **The project is consistent with this provision.**
C/OS-4	The City shall support the agricultural economy by encouraging the location of agricultural support industries in the City, establishing and promoting marketing of local farm products, and providing its regional fair share of adequate housing to meet the needs of agricultural labor.		The proposed project will provide 2,276 units of affordable and workforce housing which will exceed City's regional fair share of adequate housing units (799 units) to meet the needs of agricultural labor. **The project is consistent with this provision.**
C/OS-5	The City shall require a right-to-farm condition to all future subdivision maps adjacent to farmlands.		**Project consistent.** The proposed project, as mitigated, contains right-to-farm measures. Please see **Section 4.2**

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
			Agricultural Resources for further discussion.
C/OS-6	The City shall require development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses.		A 100' wide linear parkway buffer has been provided on the western border of the Plan Area. **The project is consistent with this provision.**
Conservation / Open Space – Scenic Resources			
C/OS-7	The City shall require new public and private development to protect scenic resources by: a. Prohibiting structures along ridgelines, steep slopes (above the 400 foot elevation contour), or in other highly visible locations unless no practical alternative is available, or such a location is necessary to protect public health and safety; b. Utilizing natural landforms and vegetation for screening structures, access roads, building foundations, and cut and fill slopes; c. Requiring landscaping which provides a landscape transition between developed areas and adjacent open space or undeveloped areas; and is compatible with the scenic resource being protected; d. Incorporating sound Soil Conservation Service practices and minimizing land alterations. Land alterations shall be minimized by: keeping cuts and fills to a minimum; limiting grading to the smallest practical area of land; limiting land exposure to the shortest practical amount of time; replanting graded areas to insure establishment of plant cover before the next rainy season; and creating grading contours that blend with the natural contours on site or look like contours that would naturally occur; e. Designing roads, parking, and utilities to minimize visual impacts. If possible, utilities shall be underground. Roadways and parking shall fit the natural terrain; and f. Designing projects to fit the site's scale and character. Structures shall be designed and located so: they do not silhouette against ridgelines, or hilltops; roof lines and vertical architectural features blend with and do not detract from the natural background or ridge outline; residential density and massing is decreased with increased elevation where it would mar the scenic quality of the scenic resource; they fit the natural terrain, and they utilize building materials, colors, and textures that blend with the natural landscape and avoid the creation of high-contrast	4.1.2 policy 12	**Project inconsistent.** Although the proposed project includes several General Plan amendments to facilitate project development, the project, as currently proposed, would result in significant and unavoidable visual impacts due to development above the 400' elevation contour. Therefore, the proposed project is considered to be inconsistent with the provisions of this policy. It is important to note, however, that despite the inconsistencies, the Miravale III Specific Plan identifies specific measures and guidelines for development within areas of visual sensitivity.

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	situations.		
Conservation / Open Space – Hillside Protection			
C/OS-8	The City shall require public or private development to: a. The City shall designate hillside areas above the 400 foot elevation contour as *Open Space/Grazing, Public Facility* (parkland) or *Agricultur*e. b. Locate primary structures, accessory structures, paving, and grading at the base of a hill (generally that are below the 400 foot contour or 15 percent slope) unless: (1) no practicable alternative is available, (2) the location on a greater slope or at a greater elevation provides more aesthetic quality, or (3) the location is necessary to protect public health and safety. c. Utilize design, construction, and maintenance techniques that: (1) preserve and enhance the hillsides; (2) ensure that development near or on portions of a hill do not cause, or make worse natural hazards (such as erosion, sedimentation, fire, or water quality concerns); (3) include erosion and sediment control practices including temporary vegetation sufficient to stabilize disturbed areas; (4) minimize risk to life and property from slope failure, landslides, and flooding; (5) maintain the character and visual quality of the adjacent hillside. d. Incorporate recreation and public access on or near hillsides consistent with this Element.		**Project inconsistent.** As identified above, the project, as proposed, consists of several General Plan amendments pertaining to the development above the 400' elevation contour. Despite the incorporation of General Plan amendments to facilitate development within the project area, the proposed project would nevertheless conflict with this policy as significant and unavoidable visual impacts would occur due to project development. Moreover, as discussed previously, this policy was adopted in order to mitigate potential adverse impacts associated with buildout of the General Plan.
C/OS-9	The City shall support the preservation and enhancement of natural land forms, natural vegetation, and natural resources to the maximum extent feasible.		**Project Consistent.** The Hillside Development Standards Section II in Appendix A of the Miravale III Specific Plan states that the project development will: • Maintain the existing open rural character, • Be in harmony with the natural setting, • Conserve land forms and other features of the natural landscape, • Preserve wildlife habitat and movement corridors, • Protect and preserve viewsheds of the mountains, and • Promote the establishment of native trees and shrubs.
Conservation / Open Space – Plant, Animal & Related Habitat Protection			
C/OS-10	The City shall support State and federal laws and policies to preserve populations of rare, threatened, and endangered species		**Project consistent.** As identified in **Section 4.14 Biological Resources** the project will provide mitigation to limit adverse

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	by ensuring development does not adversely affect such species in a significant way or by fully mitigating adverse effects.		impacts to rare, threatened, and endangered species. In addition, project development will be required to adhere to all applicable State and Federal requirements pertaining to biological resources within the project area. Compliance with existing laws, in addition to the incorporation of project specific mitigation insures that the proposed project is consistent with this provision.
C/OS-11	The City shall require that significant natural, open space, and cultural resources be identified in advance of development and incorporated into site-specific development project design to the extent feasible.		**The project, as mitigated, is consistent with this policy.** In addition to providing 45.60 acres of improved parkland, the proposed project also entails 62 acres of natural open space. The project, as mitigated, also includes provisions to insure that impacts to historically significant structures within the project area are minimized to the extent feasible. For more information, please refer to **Section 45 Cultural Resources** and **Section 4.12 Public Services.**
C/OS-12	The City shall require developers to use native and compatible non-native species, especially drought-tolerant species, to the extent possible in fulfilling landscaping requirements imposed as conditions of project approvals or project mitigations.		Plant palettes will be developed in conjunction with the vesting tentative map. **The project is consistent with this provision.**
Conservation / Open Space – Air Quality			
C/OS-13	The City will encourage the improvement of air quality in Soledad and in the region by implementing the measures described in the Monterey County Air Quality Management Plan. Such measures include, but are not limited to, measures to reduce dependence on the automobile and encourage the use of alternate modes of transportation such as buses, bicycles and walking.		The Specific Plan Area contributes to improving air quality by providing non motorized amenities such as pedestrian and bicycle trails, bicycle lanes, and transit stops. **The project is consistent with this provision.**
C/OS-14	The City shall, to the extent feasible, separate sensitive land uses from significant sources of air pollution.		No significant sources of air pollution are proposed as part of this project or in the project vicinity. **The project is consistent with this provision.**
C/OS-16	The City shall promote and encourage the use of alternate modes of transportation by incorporating public transit, bicycle, and pedestrian modes in City transportation planning and by requiring new development to provide adequate pedestrian and bikeway facilities.		The Miravale III Specific Plan provides 3 transit stops, 4 + miles of bicycle lanes, and over 20 miles of pedestrian amenities such as separated sidewalks and trails. **The project is consistent with this provision.**
Conservation / Open Space – Tree Preservation/Landscaping			
C/OS-17	When considering the approval of activities that result in the removal of mature trees, the following factors shall be considered: a. The size, age, health and species of tree(s) to be removed. b. Whether or not the removal of the tree(s) is necessary for the reasonable development and use of the site.		**The project, as mitigated, is consistent with this policy.** As identified in **Section 4.4 Biological Resources** development of the proposed project would result in the removal of existing mature trees in order to accommodate project development. Mitigation has been incorporated in order to ensure consistency with this policy, in addition to minimizing potential impacts

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	c. Whether the tree(s) to be removed is (are) a native or introduced species.		associated with tree removal.
C/OS-18	The City shall institute and promote a vigorous program of tree planting in new development areas and in older portions of the City to increase the number and density of tree cover.	See Section 2.13 Landscaping.	**Project consistent.** Final landscaping plans will be required for development within the specific plan area. As identified in the Specific Plan, numerous policies have been identified regarding the use of street trees and accent trees.
C/OS-19	When mature trees are removed to accommodate new development, they shall be replaced at a ratio of at least two new trees for every one tree removed, or such additional number and size of trees as considered appropriate by the reviewing body at the time of approval of such development.	See Section 2.13 Landscaping.	**The project, as mitigated, is consistent with this policy.** Development of the proposed project would result in the removal of several mature trees. As identified in **Section 4.4 Biological Resources,** the project applicant/developer will be responsible for preparing a Forest Management Plan that identifies replanting ratios consistent with the requires identified in this policy.
C/OS-21	Landscaping plans for new development incorporate water conservation methods and shall employ native varieties of plants that are drought tolerant.	See Section 2.13 Landscaping.	**Project consistent.** To the extent feasible all front yards and landscaped areas will be irrigated using recycled water.
Conservation / Open Space – Archaeological & Cultural Resources			
C/OS-23	If development of a site uncovers cultural resources, the recommendations of Appendix K of the Guidelines for Implementation of the California Environmental Quality Act (Public Resources Code Section 15000 et seq.) shall be followed for identification, documentation, and preservation of the resource.		This policy is included as mitigation during project construction. **The project is consistent with this provision.**
C/OS-24	The City shall document and record data or information relevant to prehistoric and historic cultural resources which may be impacted by proposed development. The accumulation of such data shall act as a tool to assist decision-makers in determinations of the potential development effects to prehistoric and historical resources located within the City.		A single historic structure is located on the site and mitigation measures are identified in the EIR. The historic structure will be relocated from its current location. **The project, as mitigated, is consistent with this provision.**
Conservation / Open Space – Mineral Resources			
C/OS-26	The City and County shall discourage urban uses adjacent to State-designated regional resource deposits if such uses would be incompatible with mining operations, or would restrict future extraction of significant mineral resources.		The project site is not located adjacent to State-designated regional resource deposits. **The project is consistent with this provision.**
Safety – Flood Hazards			
HZ-2	The City shall prohibit the construction of facilities essential for emergencies and large public assembly in the 100-year floodplain, unless the structure and access to the structure are free from flood inundation.		**Project consistent.** No emergency facilities are located within the 100-year floodplain.
HZ-4	The City shall manage flood prone areas consistent with the		**Project consistent.** The proposed project is not located with an

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	requirements of the Federal Emergency Management Agency (FEMA) and the Monterey County Water Resources Agency.		area that is prone to flooding as defined by the Federal Emergency Management Agency of the Monterey County Water Resources Agency.
Safety – Seismic Safety			
HZ-5	All new development shall satisfy the applicable requirements of the Uniform Building Code.		**Project consistent.** All new development within the Specific Plan will be required to adhere to all applicable requirements contained in the Uniform Building Code.
HZ-6	The City shall require the preparation of a soils engineering and geologic-seismic analysis prior to permitting development in areas prone to geologic or seismic hazards (ie, groundshaking, landslides, liquefaction, expansive soils).		**The project, as mitigated, is consistent with this policy.** A soils engineering and geological/seismic analysis was prepared for the project. Specific geological and geotechnical constraints were identified in these reports and incorporated as part of this EIR. In addition, mitigation has been incorporated requiring that final-design level plans be developed in accordance with individual project-specific geotechnical evaluations.
HZ-7	The City shall limit development in areas of steep or unstable slopes to minimize hazards by landslides or liquefaction.		**Project consistent.** The proposed project includes development above the 400 foot elevation contour. Due to the underlying geological unit, these areas have been identified as not being prone to liquefaction and/or landslide potential. Nevertheless, the proposed project includes specific Hillside Development Standards to insure that development within these areas would not be prone to geological hazards.
HZ-8	In landslide hazard areas, the City shall prohibit alteration of land in a manner that could increase the hazard, including concentration of water through drainage or irrigation systems; removal of vegetative cover; and steepening of slopes and undercutting the bases of slopes.		**Project consistent.** See response above.
Safety – Emergency Preparedness			
HZ-9	New development shall provide fire flow, emergency access and hydrants consistent with Fire Department requirements	Policy 5.2 - 7	All new development shall provide fire flow, emergency access and hydrants consistent with Fire Department Requirements. . **The project is consistent with this provision.**
HZ-12	The City will encourage site planning which helps reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department.	Policy 5.2 - 8	All new development shall help to reduce crime potential through appropriate lighting, access, ease of surveillance, and other features such as alarms and security systems as may be required by the police department. . **The project is consistent with this provision.**
Noise			
N-1	The City shall not allow development of new noise-sensitive land uses where existing or ambient noise levels exceed those shown on Figure X-1, as measured immediately within the property line of the new development, unless effective noise mitigation measures have been incorporated into the development design to		As identified is **Section 4.10 Noise**, effective noise mitigation measures have been incorporated to achieve standards in Table 4.10-1 of the City's Noise Element.

Table 4.9-2
Project Consistency with Relevant City of Soledad General Plan Land Use Policies

Policy Number	Policy Summary	Applicable Specific Plan Policy Number	Consistency
	achieve the standards set by Figure X-1.		
N-2	Where non-residential land uses are likely to generate noise levels exceeding those shown on Figure X-1 on adjacent or nearby existing or planned noise-sensitive uses, the City shall require preparation of an acoustical analysis as part of the environmental review process so that noise mitigation may be included in the project design.		**The project, as mitigated, is consistent with this policy.** An acoustical analysis has been prepared by Illingworth & Rodkin, Inc. and the mitigation measures identified in their report have been incorporated into this EIR. See **Section 4.10 Noise** for more information.
N-3	New residential development shall comply with State Noise Insulation Standards.		**Project consistent.** Development of the proposed project will be required to comply with all applicable State Noise Insulation Standards.
N-4	New commercial and industrial development shall incorporate design elements to minimize the noise impact when residential neighborhoods are nearby.		A conceptual site plan has been prepared for Village 4. Noise reduction techniques include providing parking lots interior to the center and the provision of a landscaped sound wall where adjacent to residential uses. The City should consider limiting delivery times to mid-day and restrict truck idling times.
N-5	Where noise mitigation measures are required to achieve the standards described in Figure X-2, the emphasis of such measures shall be placed on site planning and project design. The use of noise barriers shall be considered as a means of achieving the noise standards only after all other practical design-related mitigation measures have been integrated into the project.		**Project consistent.** As identified in **Section 4.10 Noise** mitigation measures have been identified in order to insure project-related noise impacts are reduced to the extent feasible. While some noise sensitive land uses would be expose to noise in excess of applicable standards, mitigation measures emphasize site planning and project design principles, including the use of building materials to minimize noise related impacts.

This page left intentionally blank.

4.10 NOISE

Introduction

A *Environmental Noise Assessment* was prepared for this project by Illingworth & Rodkin, Inc. (March 14, 2007), and the following discussion incorporated that analysis. This report (herein referred to as "Noise Assessment") is included as Technical Appendix T-7 in Volume II of the DEIR. This section assesses the potential noise impacts from project operations (long-term) and construction equipment (short-term) on nearby sensitive receptors.

Setting

Noise is defined as unwanted or objectionable sound. State and local regulations and ordinances define objectionable noise levels and identify land use compatibility standards. Sound is comprised of three variables: magnitude, frequency, and duration. The magnitude of variations in air pressure associated with sound waves results in the quality commonly referred to as "loudness." Variations in loudness are measured on the decibel (dB) scale. The dB scale is logarithmic; noise at zero decibels is barely audible, while noise at 120-140 decibels is painful and may cause hearing damage.

The second characteristic of sound is frequency. The human ear responds to sounds whose frequencies are in the range from 20 hertz (HZ) to 20,000 HZ. Within the audible range, subjective response to noise varies. People generally find that they are more sensitive to higher pitched sound than lower pitched sounds. Noise is typically characterized using the A-weighted sound level or dBA. This scale gives greater weight to the frequencies that the human ear is most sensitive. The third characteristic of noise is duration. Annoyance due to noise is often associated with how long noise persists.

For evaluating noise over extended periods, the "Day-Night Noise Level" scale (L_{dn}) and the "Community Noise Equivalent Level" (CNEL) are used to express the average sound level (L_{eq}) during a 24-hour period. The L_{eq} can be thought of as the steady sound level that, in a stated period of time, would contain the same acoustic energy as the time-varying sound level during the same period. These measures of noise account for greater sensitivity of noise receptors at night by averaging in weighted sound levels during hours of greater noise sensitivity (evenings and nights).

As described in the Noise Assessment, sensitivity to noise increases during the evening and at night; therefore, twenty-four hour descriptors have been developed that incorporate artificial noise penalties for quiet-time noise events. The Community Noise Equivalent Level, CNEL, is a measure of the cumulative noise exposure in a community, with a 5 dB penalty added to evening (7:00 pm - 10:00 pm) and a 10 dB addition to nighttime (10:00 pm - 7:00 am) noise levels.

Another method of accounting for nighttime noise levels is the day/night average level (L_{dn}), which usually measures at approximately the same dBA level as the CNEL scale. The day/night average level, or L_{dn}, is an average sound level that occurs between the hours of 10:00 p.m. and 7:00 a.m. Levels during these hours are treated as though they are 10 dBA higher than they actually are because sensitivity to noise is greater during nighttime hours. The State of California requires either the L_{dn} scale or the CNEL scale to be incorporated into city and county general plan noise elements. The City of Soledad uses the CNEL scale as its noise element measure of scale. The L_{dn} has been adopted by the Environmental Protection Agency (EPA) and is used by the County of Monterey.

Sensitive Noise Receptors

The City of Soledad General Plan contains guidelines for determining noise and land use compatibility. Based on these guidelines, noise-sensitive uses are identified as residential neighborhoods, schools, churches, hospitals, and playgrounds. Sensitive receptors in the project area include existing residences surrounding the project site, several schools, the Soledad Branch Library, and several medical facilities. See Figure 4.10-1 for a map of nearby sensitive noise receptors. The figure also depicts the potential sensitive receptors along the southern border of the project site that may be affected by construction activities. The project proposes a large residential development in an area that is currently vacant or in agricultural production. Proposed residential, commercial, office, and school uses would increase the traffic generated to the site, as well as activity levels, thereby affecting existing noise levels.

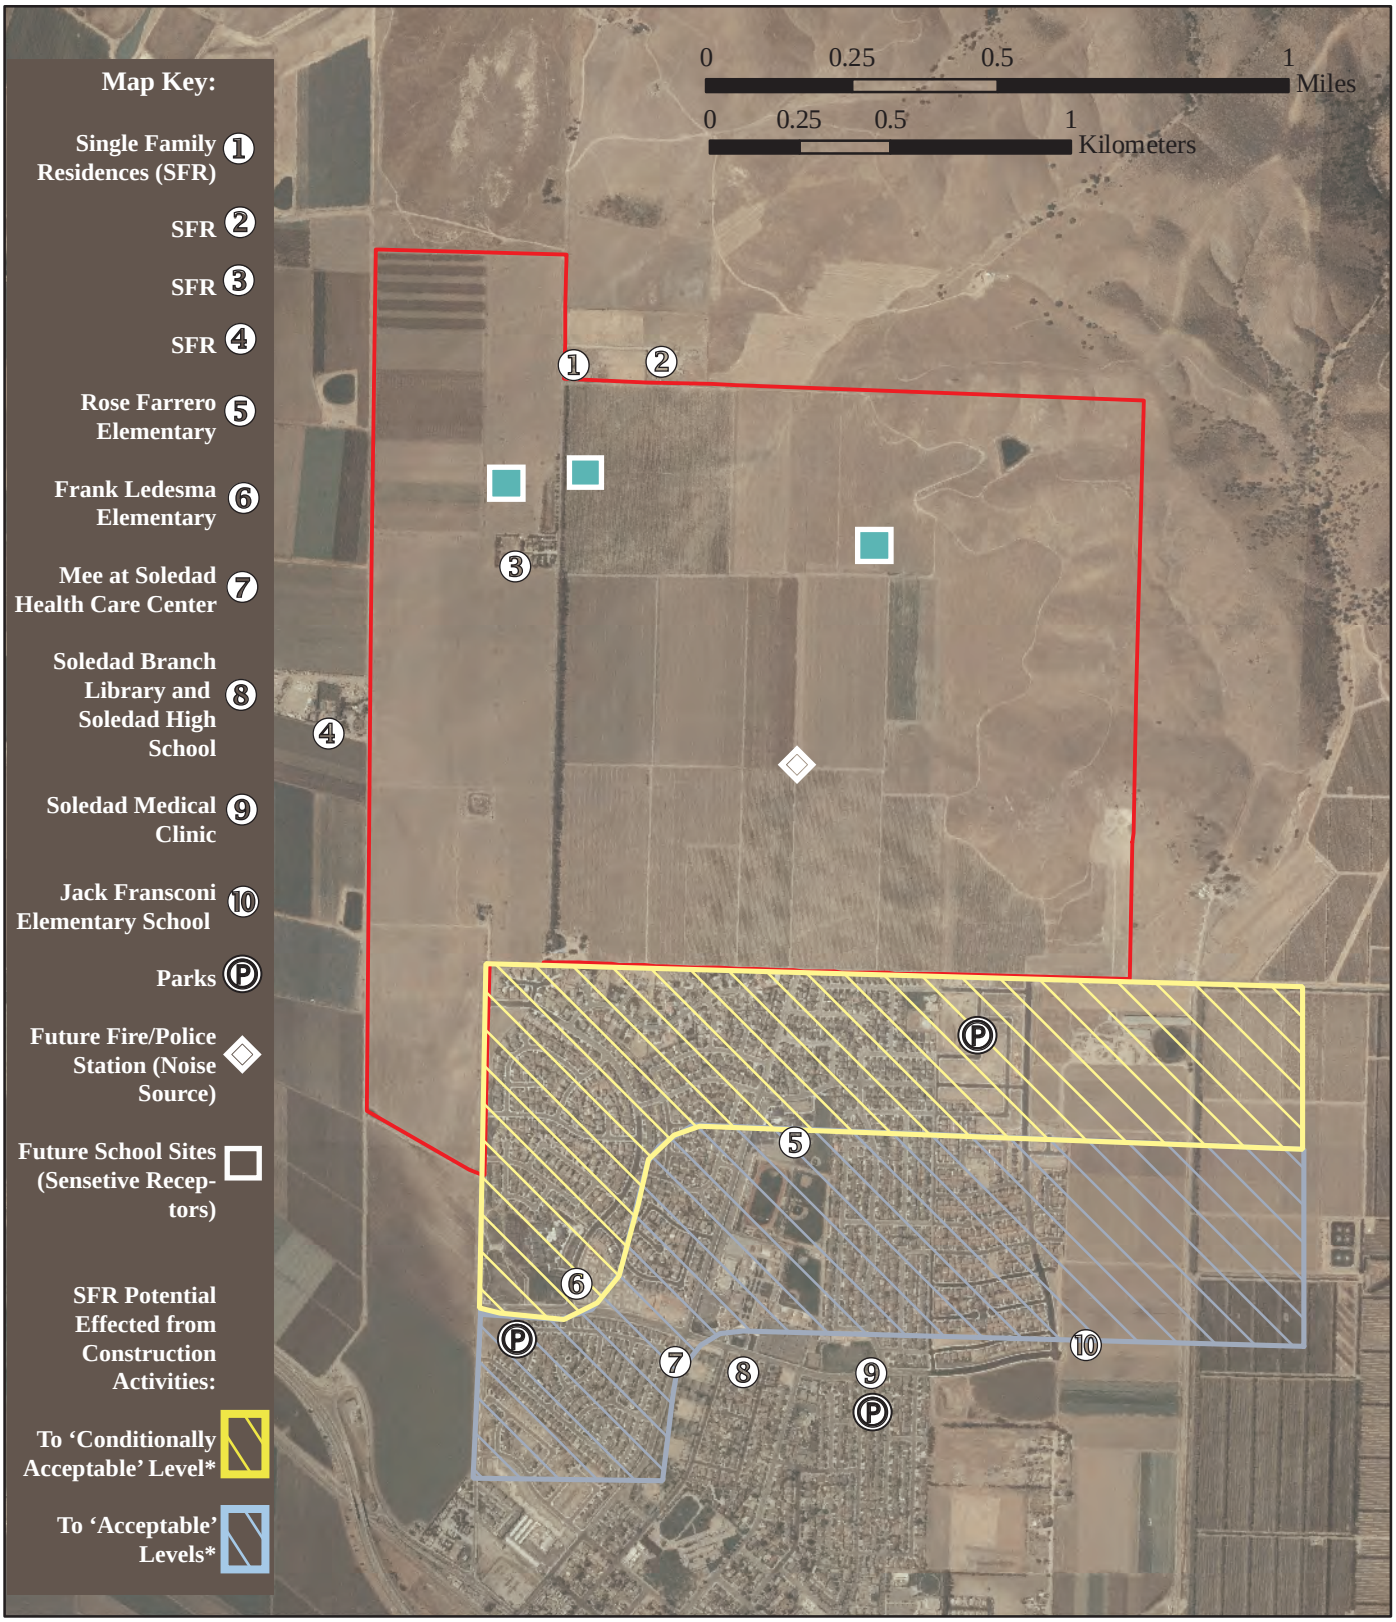
Regulatory Environment

The State of California and the City of Soledad have regulations, plans and policies to limit noise exposure at existing and proposed noise sensitive uses. These are established in the following documents: 1) the California Building Code, 2) the City of Soledad Noise Element of the General Plan, and 3) the City of Soledad Municipal Code, as described below.

California Building Code

The California Building Code regulates environmental noise intrusion into new multi-family housing. Interior noise levels attributable to exterior sources cannot exceed 45 L_{dn}. Residential structures proposed where exterior noise levels exceed 60 L_{dn} shall require an acoustical analysis demonstrating that the proposed design will maintain interior noise levels at or below 45 L_{dn}.

City of Soledad General Plan



The City of Soledad has established policies in the Noise Element of the General Plan to guide the development of new land uses with respect to noise exposure. The following policies are applicable to the proposed project.

Policy N-1 The City shall not allow development of new noise-sensitive land uses where existing or ambient noise levels exceed those shown on Table 4.10-1, as measured immediately within the property line of the new development, unless effective noise mitigation measures have been incorporated into the development design to achieve the standards set by Table 4.10-1.

Policy N-2 Where non-residential land uses are likely to generate noise levels exceeding those shown on Table 4.10-1 on adjacent or nearby existing or planned noise-sensitive uses, the City shall require preparation of an acoustical analysis as part of the environmental review process so that noise mitigation may be included in the project design.

Policy N-3 New residential development shall comply with State Noise Insulation Standards.

Policy N-4 New commercial and industrial development shall incorporate design elements to minimize the noise impact when residential neighborhoods are nearby.

* Calculations based on Construction noise estimates from Table 4

N	Sensitive Noise Receptors	Figure 4.10-1

Policy N-5 Where noise mitigation measures are required to achieve the standards described in Table 4.10-1, the emphasis of such measures shall be placed on site planning and project design. The use of noise barriers shall be considered as a means of achieving the noise standard sonly after all other practical design-related mitigation measures have been integrated into the project.

Policies and implementation programs outlined in the Noise Element focus on establishing noise projections for proper planning and reducing the noise impacts at sensitive receptor locations. They include: 1) identifying noise structures and determining noise exposure levels; 2) adopting acceptable levels of noise for land use categories; 3) adopting a comprehensive noise ordinance; 4) promoting effective enforcement of existing federal and state noise standards; 5) requiring proper acoustical site planning and acoustical construction; and 6) evaluating noise analyses which have been required for new development projects.

Table 4.10-1
Allowable Noise Standards Measured in CNEL (dBA)

Land Use Category	Maximum Exterior		Maximum Interior*
	Acceptable	Conditionally Acceptable**	
Residential: Low-Density Single Family, Duplex, Mobile Homes	60	65	45
Residential: Multiple Family	65	70	45
Transient Lodging: Hotels, Motels	65	70	45
Schools, Libraries, Churches, Hospitals, Nursing Homes	70	70	45
Auditoriums, Concert Halls, Amphitheaters	NA	70	45
Sports Arena, Outdoor Spectator Sports	NA	75	NA
Playgrounds, Neighborhood Parks	70	NA	NA
Golf Courses, Riding Stables, Water Recreation, Cemeteries	70	NA	NA
Office Buildings, Business Commercial and Professional	70	75	50
Industrial, Manufacturing, Utilities, Agriculture	75	80	65

*It is preferred that the interior noise standards be attained with open windows. However, where the interior noise standard is attainable only with closed windows and doors, mechanical ventilation shall be required.
**Requires analysis of noise reduction requirements and insulation measures

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential noise impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III Specific Plan project. According to the General Plan EIR, the following noise impacts were identified:

- Noise associated with construction activities may adversely impact nearby noise-sensitive uses. This impact was considered significant unless mitigated.

- Noise associated with motor vehicle traffic generated by the development of land uses accommodated by the General Plan will increase, which may result in the exceedances of the applicable standards. This impact was considered significant unless mitigated.

- Buildout of land uses accommodated under the General Plan will increase the exposure of people to new and existing stationary sources of noise. This impact was considered adverse but not significant.

- Noise from ongoing agricultural operations could periodically exceed the City's noise standards for adjacent residences. This impact was considered adverse but not significant**.**

City of Soledad Municipal Code

The City of Soledad has also established noise regulations in Chapters 9.09 and 17.38.240 of the Municipal Code. Chapter 9.09 addresses general noise regulations and prohibits excessive or loud noises that result in a public nuisance. Chapter 17.38.240 establishes exterior noise limits that apply to residential, commercial, and industrial land uses measured at the property line of the receiving land use. Specifically, noise impacts are limited to 55 dBA at the adjacent residential property lines, 65 dBA at adjacent commercial property lines, and 68 dBA at adjacent industrial property lines. Limit adjustments for temporary, non-continuous noise are given based on the following criteria:

Table 4.10-2
Type or Location of Operation Correction in Decibels

Character of Noise	**Decibels**
1. Daytime operation only	Plus 5
2. Noise source operated less than: (Apply only one subcategory only)	
a. 20% of any 1-hour period	Plus 5
b. 5% of any 1-hour period	Plus 10
3. Noise of impulsive character such as hammering	Minus 5
4. Noise of periodic character such as hammering or screeching	Minus 5

Miravale III Specific Plan

Section 2.0 (Land Use) and Section 4.0 (Parks, Recreation, and Open Space) of the Miravale III Specific Plan contain policies concerning noise impacts. Section 2.0 identifies land use goals and policies regarding the physical development for each respective land use category (i.e. residential, commercial, etc.). Section 4.0 identifies goals and policies in regard to the uses and development in open space and recreational areas. The following policies are applicable regarding noise impacts.

Policy 2.8.k New commercial developments should incorporate design elements to minimize the visual and noise impact when adjacent to residential neighborhoods.

Policy 4.1.2.10 Parks should be designated and located to minimize noise and activity conflicts with residential areas.

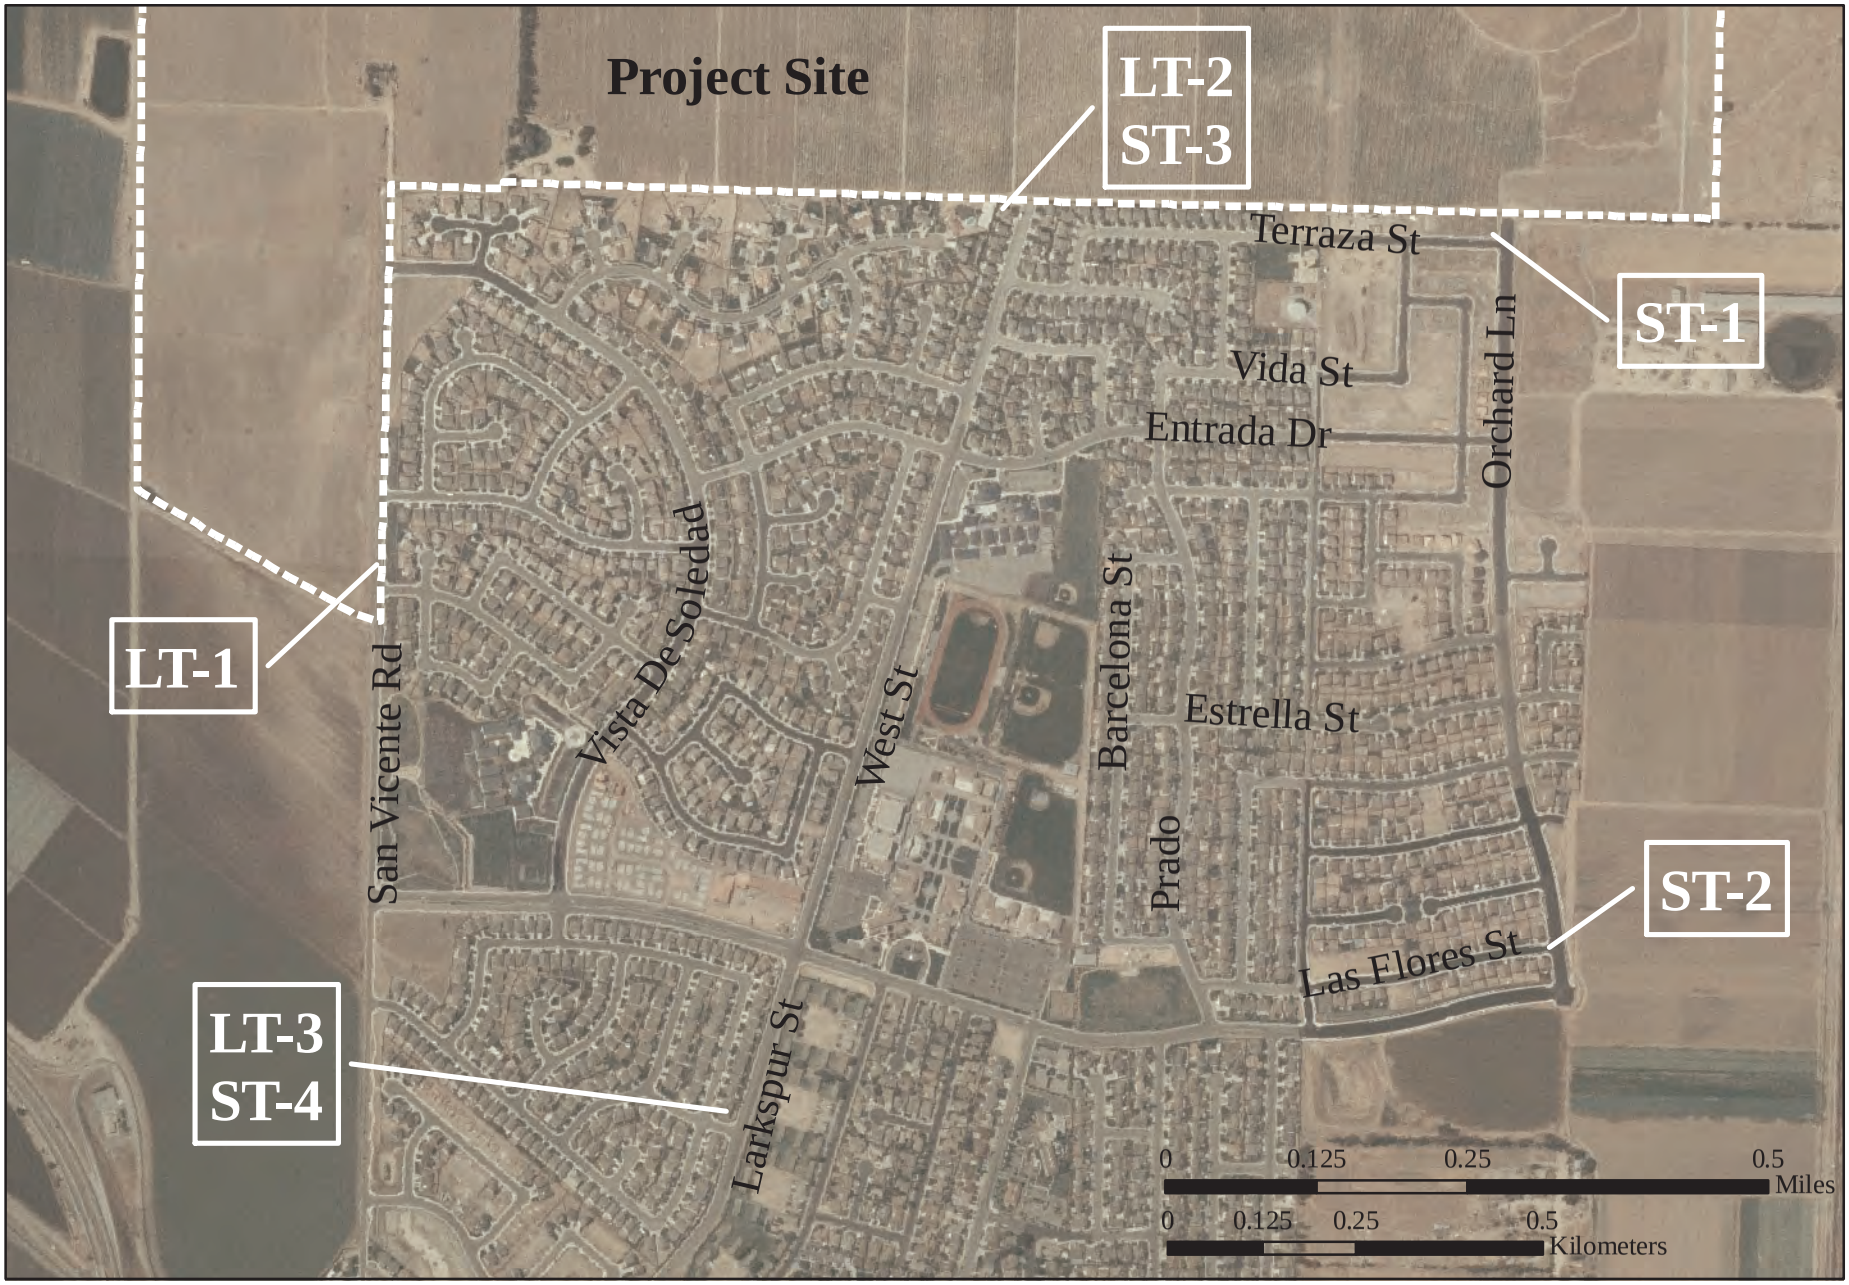
The following analysis evaluates potential noise impacts from the project consistent with the General Plan EIR mitigation.

Existing Noise Environment

Farmland borders the project site to the west, north, and east. Single family residences exist along the northern border of the project site. The major noise source in Soledad, as well as at the project site, is vehicular traffic. Railroads, aircraft, farming activities, quarry activities, and industrial and food packaging facilities also contribute to local ambient noise levels.

Several sites along the project site border and within the neighboring residential development were assessed for noise conditions. Three long-term noise measurements were analyzed to determine daily trends in noise levels along roadways leading to the project site, and four short-term sites were analyzed to measure levels at specific noise sources, including roadways leading to the proposed site. Noise measurement locations are shown on Figure 4.10-2. Further, Table 4.10-3 shows the noise assessment levels from the Noise Assessment Report for long-term sites (LT) and short-term sites (ST).

Table 4.10-3
Summary of Short-Term Noise Measurement Data (dBA)



Site Location	Noise Measurement Location	Average CNEL
LT-1	20 feet from the center of San Vincente Road near Saavedra Street*	71
LT-2	North end of West Street near existing residential receptors	53-55
LT-3	25 feet from the center of West Street near Sundew Street	69
ST-1	North end of Orchard Lane near Terraza Street.	53-55
ST-2	45 feet from the center of Orchard Lane near Las Flores Street	61
ST-3	North end of West Street	53-55
ST-4	65 feet from the center of West Street near Sundew Street.	65
*Data reported resulted additionally from wind noise.		

The ambient noise environment in the project vicinity results primarily from local and distant vehicular traffic. Intermittent sources of environmental noise include railroad trains along the Union Pacific Railroad and agricultural related activities. The noise monitoring survey included three long-term noise measurements to quantify the daily trend in noise levels along roadways serving the site and four short-term noise measurements to identify specific noise sources and associated noise levels at representative locations in adjoining neighborhoods.

The daily trend in noise levels along San Vincente Road was measured at Site LT-1 from September 6 to 7, 2006, according to the Noise Assessment prepared by Illingworth and Rodkin, Inc. Noise measurement location LT-1 was approximately 20 feet from the center of San Vincente Road near Saavedra Street. Noise levels at this location resulted primarily from local vehicular traffic. During periods of the noise measurement, wind noise also contributed to the measured levels. Daytime hourly average noise levels typically ranged from 62 to 73 dBA L_{eq}. At night, hourly average noise levels ranged from 52 to 70 dBA L_{eq}. The day-night average noise level at LT-1 was 71 dBA CNEL.

A second long-term noise measurement position (LT-2) was selected at the north end of West Street to quantify noise levels near existing residential receivers. Noise levels at this location resulted primarily from local neighborhood activities and periods of wind. Daytime hourly average noise levels at Site LT-2 typically ranged from 50 to 55 dBA L_{eq} excluding atypical high noise level events occurring close to the sound level meter. Hourly average noise levels were relatively low at night ranging from about 33 to 47 dBA L_{eq}. The day-night average noise level calculated at LT-2 was 61 dBA CNEL. The estimated CNEL at this location, excluding periods of wind and the atypical noise events occurring near the sound level meter is approximately 53 to 55 dBA CNEL.

A third long-term noise measurement was made approximately 25 feet from the center of West Street near Sundew Street. Noise levels at this location resulted primarily from local vehicular traffic. Daytime hourly average noise levels at Site LT-3 typically ranged from 61 to 70 dBA L_{eq} and from 49 to 67 dBA L_{eq} at night. The day-night average noise level at LT-3 was 69 dBA CNEL.

Noise Assessment Site Locations

Figure 4.10-2

DENISE DUFFY & ASSOCIATES, INC.

Four short-term noise measurements were made to complete the noise monitoring survey. These measurements were made near noise sensitive receptors that could be affected by increased traffic resulting from the proposed project. Refer to Table 4.10-3

Relevant Project Characteristics

The Miravale III Specific Plan proposes a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space, and an 18-hole golf course. Construction of the project is anticipated to begin in 2008 and be completed no later than 2028.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- expose persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- expose persons to or generation of excessive groundborne vibration or groundborne noise levels;
- have substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- have a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;
- expose people residing or working in the project area to excessive noise levels for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport; or
- expose people residing or working in the project area to excessive noise levels for a project within the vicinity of a private airstrip.

The following criteria were used to evaluate the significance of noise impacts associated with the proposed project.

Noise and Land Use Compatibility. A noise impact would occur where noise-sensitive land uses are proposed in exterior noise environments exceeding 60 dBA L_{dn}. A noise impact would also be identified if the project creates noise levels in excess of the General Plan noise standards or the noise level limits established in the City's Municipal Code

Vibration Compatibility. A noise/vibration impact would be identified where noise-sensitive land uses are exposed to excessive vibration levels. Although there are no local standards that control the allowable vibration in a new residential development, Caltrans has developed vibration impact assessment criteria to address vibration associated with transit projects. The Federal Transit Administration has proposed vibration impact criteria, based on maximum overall levels for a single event. The criterion for "infrequent" vibration events is 80 VdB.

Substantial Increase in Noise Levels. A noise impact would be identified where the project results in a noise level increase of 3 dBA L_{dn} or more in noise environments of 60 L_{dn} or greater or 5 dBA L_{dn} in noise environments where noise levels would remain below 60 dBA L_{dn}. These thresholds represent the point at which the change in noise levels become perceptible within the respective various noise environments.

Construction Noise. Since noise generated by construction would be short-term and vary considerably day-to-day, construction noise is evaluated somewhat differently than operational noise. When construction activities are predicted to cause prolonged interference with normal activities at noise-sensitive receiver locations, generate noise levels in excess of 60 dBA L_{eq}, and exceed ambient noise levels by five dBA or more, the impact is considered significant. Prolonged interference is defined as a substantial noise level increase that occurs for one or more years.

Impacts and Mitigation

Noise and Land Use Compatibility

The Noise Assessment determined that future residential development at the project site would be exposed to elevated exterior noise levels in excess of the 65 dBA CNEL limit allowed by the 2005 City of Soledad's General Plan. Interior noise levels also have the potential to be in excess of the allowed 45 dBA CNEL limit without the incorporation of noise insulation features in the project design.

Exterior Noise Levels – Vehicular Traffic

Several proposed noise-sensitive land uses are in the vicinity of Highway US 101 and collector roadways, which have the potential to expose those land uses to exterior noise levels greater than the allowed 65 dBA CNEL. Further, California Building Code insulation standards require that noise levels exceeding 60 dBA CNEL need additional noise analysis for noise reduction measures.

Traffic noise increases were calculated using traffic noise models to determine the worst-case projection of noise contours and where additional noise analyses are required. According to the model, the southernmost portion of the planning area would most likely be affected by US 101 traffic. The project is located at a distance sufficient to allow US 101 traffic noise to dissipate before exceeding the required 65 dBA CNEL noise standard. However, the section of multi-family residences on the proposed project's southern boundary would expect to have ambient noise levels increase to 60 dBA, which requires additional noise analysis for internal levels.

The Noise Assessment identified several roadways within the project area would generate traffic noise levels greater than the allowed 65 dBA CNEL with the addition of the project buildout. Those roadways include San Vincente Road, West Street, and Orchard Lane, identified in Table 4.10-4. Exterior noise levels would exceed 65 dBA CNEL within 90 feet of the center of San Vincente Road and West Street, and within 50 feet of the center of Orchard Lane. Where exterior noise levels exceed the City's noise level goal of 65 dBA CNEL, mitigation is required to provide a compatible exterior noise environment.

Table 4.10-4 Future Noise Contours for Roadways in Project Vicinity				
		Distance from Roadway Center (feet)		
Roadway	**Segment**	**70 dBA CNEL**	**65 dBA CNEL**	**60 dBA CNEL**
Highway 1	Camphora-Gloria Road to North Soledad	620’	1330’	2860’
San Vincente Road	North of Project Entrance	*	90’	200’
West Street	North of Project Entrance	*	90’	200’
Orchard Lane	North of Project Entrance	*	50’	100’
*Data not reported within 50 feet or less of the roadway center, since no development would occur in these areas. Source: *Miravale III Specific Plan Environmental Noise Assessment*. Illingworth & Rodkin, Inc. 2007.				

Interior Noise Levels – Vehicular Traffic

As mentioned previously, US 101, San Vincente Road, West Street, and Orchard Lane would have the potential to generate Community Noise Equivalent Levels greater than 60 dBA CNEL. Typically, interior noise levels are 15 dBA less than exterior noise levels with windows open. Per California Building Code, interior noise levels must be maintained at or below 45 dBA CNEL. If those levels are not achieved with standard construction practices, forced air ventilation systems with closed windows would decrease interior noise levels. Incorporating this measure would typically reduce noise levels from 65 dBA to 60 dBA. Other methods that would provide additional noise impact reduction would be limiting window size facing noise source or sound-rate construction methods.

Exterior Noise Levels – Commercial Uses

With the development of approximately 275,000 square feet of retail commercial space, several noise-generating factors would be created, including loading docks, heating and ventilation systems, cooling equipment, emergency generators, trash compactors, parking lots, and other mechanical equipment. The Noise Assessment estimated that loading docks and parking lots would generate approximately 50 to 60 dBA $L_{eq.}$ The total L_{eq} for proposed loading docks would be dependent on the number of trucks accessing the loading dock, the frequency of truck trips, and use of other equipment on the loading dock, such as forklifts. Temperature control systems typically generate from 50 to 70 dBA L_{eq}, which is also dependent on use factors. Noise generated from trash compactors ranges to a maximum of 40 to 50 dBA. Parking lot noise impacts were identified as deriving from vehicle circulation, car alarms, squealing tires, door slams, and human voices. These factors generate approximately 35 to 45 dBA L_{eq}. According to the City of Soledad Zoning Code, these uses have the potential to exceed allowed noise limits for the area depending on the configuration of the final land use plan parcels designated for commercial development.

Exterior Noise Levels – Educational and Public Parks

Several educational and recreational facilities are proposed adjacent to residential land uses, including the development of two elementary schools, and one middle school. The noise generated from student arrival and departures would raise noise levels. Further, several parks and outdoor recreational facilities are proposed, such as active parks, ball fields, and sports complexes. Outdoor activities and spectators at these facilities have the potential to increase community noise levels, especially during evenings and weekends. In some cases, noise levels can exceed 80 dBA L_{max}. Outdoor activities, including soccer games, baseball games, and dog walking activities, average at 55 to 60 dBA L_{eq}. These activities would

have the potential to exceed acceptable noise levels, thereby requiring site specific analysis, as identified in the mitigation below.

In addition to outdoor recreation facilities, several passive parks, or neighborhood parks with playgrounds, picnic areas, walking paths, and open turf areas, have been proposed. These areas create minimal noise level increases. Per the Noise Assessment, these activities are not anticipated to adversely impact noise levels of existing or future noise-sensitive receptors in the project vicinity.

Police and Fire Sub-Stations
