The proposed project includes the addition and of a police/fire sub-station at the northwest corner of West Street and J Street. The emergency response facility has the potential to produce elevated noise levels associated with the operation of a police station and fire station. Police station noise generation typically includes vehicle circulation, testing, and maintenance, as well as emergency mechanical equipment. With the combination of the police and fire sub-station, the proposed project would also include noise generation from fire station activities, such as sirens sounding, engine testing, horns, training exercises, and emergency generator checks. During equipment checks, noise levels have the potential to reach 80 to 85 dBA L_{max}. With the added vehicular traffic noise from nearby roadways, impacts to neighboring sensitive receptors may exceed City Noise Ordinance standards triggering additional study.

In order to ensure that project-induced impacts are reduced to a less-than-significant impact, the Noise Assessment identified the following mitigation measures as necessary. Implementation of the following mitigation measures would not result in any new environmental impacts beyond those identified in this EIR.

Impact **Future residential uses developed at the project site would be exposed to exterior noise levels greater than 65 dBA CNEL, which exceeds the noise and land use compatibility standards presented in the City of Soledad's General Plan. Interior noise levels would be expected to exceed 45 dBA CNEL without the incorporation of noise insulation features into the project's design.** ***This is a significant impact that can be reduced to a less-than-significant level with the mitigation below.***

Mitigation

4.10-1 Maintain a sufficient buffer distance between transportation noise sources and future sensitive land uses, or alternatively, construct noise barriers or create acoustically shielded outdoor use areas utilizing buildings to achieve noise exposures of 65 dBA CNEL or less. The specific determination of necessary mitigation measures will occur during project level environmental review and design. Results of the analysis shall be submitted to the City prior to issuance of a building permit.

4.10-2 Retain a qualified Acoustical Specialist to prepare for City review and approval a detailed acoustical analysis of interior noise reduction requirements and specifications for all projects proposed within the 60 dBA CNEL contours of area roadways, in accordance with State and City standards. Interior noise levels must be maintained at or below 45 dBA CNEL. Building sound insulation requirements will include forced air mechanical ventilation in noise environments exceeding 60 dBA CNEL. Special building construction techniques (e.g., sound-rated windows and building facade treatments) may be required where exterior noise levels exceed 65 dBA CNEL. These treatments include, but are not limited to, sound rated windows and doors, sound rated exterior wall assemblies, and acoustical caulking. The specific determination of required treatments will be made on a unit-by-unit basis during project design. Results of the analysis,

including the description of the necessary noise control treatments, will be submitted to the City along with the building plans prior to issuance of a building permit. Feasible construction techniques such as these would adequately reduce interior noise levels to 45 L_{dn} or lower.

4.10-3 Non-residential development will comply with the noise standards established in the Zoning Code at existing or planned residential properties in the vicinity. Further, efforts will be made to reduce noise impacts through the following planning and equipment requirements:

- Development site planning will be utilized in a fashion that reduces noise impacts for nearby sensitive receptors, such as by not locating loading docks near residences.
- Equipment screens, fan silencers, and engine mufflers will be used to mitigate noise from mechanical equipment.
- Noise barriers will be used to control noise from parking and vehicle circulation.
- For recreational uses, proposed development must consider impacts upon the adjacent residential development in terms of the location of active sports areas, their orientation on the site, whether or not lights are included, and speech amplification systems.

Project Generated Traffic Noise

The *Miravale III Mixed-Use Development Draft Transportation Impact Analysis*, prepared by Hexagon Transportation Consultants, Inc., was reviewed to calculate the relative change in traffic noise levels resulting from project-generated traffic. The study was incorporated into the Noise Assessment prepared for the proposed project. The project area contains a variety of land uses with varying sensitivities to noise. Residential land uses would be most affected by noise generated by additional traffic. Office and commercial uses are not typically affected by traffic noise increases along the local roadway network. However, existing noise levels would noticeably increase along some roadway segments with the implementation of the project, as described below.

A comparison of existing, background, and project traffic volumes was evaluated, and the relative change in traffic noise along identified roadway segments was calculated as part of the noise study. Roadway segments experiencing a traffic noise level increase of less than three dBA L_{dn} were excluded from further analysis, as the noise level increase would not be noticeable. Table 4.10-5 shows the roadway links that are calculated to experience a substantial noise increase (three dBA or more) as a result of the project.

Table 4.10-5
Traffic Noise Level Increases Above Existing Levels Resulting from Project

Roadway	Segment	CNEL Noise Levels (dBA)at 75 feet from Roadway Center			
		Existing	Background	Project	Project Increase
San Vincente Road	Gabilan Dr. to Project Entrance	57	57	64	+7
West Street	Market St. to Gabilan Dr.	60	60	65	+5
West Street	Gabilan Dr. to Project Entrance	59	59	66	+7
Main Street	Market St. to Gabilan Dr.	57	57	63	+6

Source: *Miravale III Specific Plan Environmental Noise Assessment*. Illingworth & Rodkin, Inc. 2007.

Traffic noise levels would be substantially increased at noise-sensitive residential receivers along San Vincente Road, north of Gabilan Drive, along West Street, north of Market Street, and along Main Street between Market Street and Gabilan Drive. Exterior noise levels would exceed 65 dBA CNEL at a distance of 75 feet from the roadway center along West Street north of Gabilan Drive. Noise levels along the remaining roadway segments would be 65 dBA CNEL or less and would be considered acceptable for residential development.

In order to minimize potential project-related impacts to the greatest extent feasible, the following mitigation measure was identified as necessary. Implementation of this mitigation measure would not result in any new environmental impacts beyond those identified in this EIR.

Impact **Traffic volume increases from the project would increase traffic noise along the local roadway network. In some locations, there would be a substantial, permanent increase in noise levels at sensitive receptors. Measures available to reduce the project noise level increases would not likely be feasible in all areas.** ***The impact, therefore, is considered significant and unavoidable.***

Mitigation

4.10-4 The project shall incorporate noise reduction methods, subject to the review and approval of the City of Soledad. Methods to reduce noise on the project site may include the following measures:

- Pave and re-pave streets with "quieter" pavement types, such as Open-Grade Rubberized Asphaltic Concrete, that would reduce noise levels by 2 to 3 dBA depending on the existing pavement type, traffic speed, traffic volumes, and other factors. All new and improved streets within the project area shall use quieter pavement types.

- Implement new or larger noise barriers that may reduce noise levels by 5 dBA CNEL in areas that would not impair access requirements. Final design of such barriers, including an assessment of their feasibility and reasonableness, must be approved by the City during project-specific development applications. An increase in barrier height per foot equates to approximately 1 dBA noise reduction. However, noise barriers must be considered as a last resort to alternative noise reduction methods per the City of Soledad General Plan.

- Install traffic calming measures to slow traffic and provide qualitative improvement by smoothing out the rise and fall in noise levels caused by speeding vehicles. For each 5 mph reduction in average speed, noise generation is reduced by approximately 1 dBA.

- Provide affected residences with building sound insulation, such as sound rated windows and doors on a case-by-case basis to reduce interior noise levels to below the 45 dBA CNEL noise standard.

A combination of mitigation measures such as the repaving of area roadways, the replacement or construction of noise barriers, traffic calming, and sound insulation could be implemented to reduce the effects of project generated traffic noise at affected residences along identified segments of as San Vincente Road, West Street, and Main Street .

Case studies have shown that the replacement of dense grade asphalt (standard type) with open-grade or rubberized asphalt can reduce traffic noise levels along residential-type streets by 2 to 3 dBA. A possible noise reduction of 2 dBA would be expected using conservative engineering assumptions. Table 4.10-6 shows the expected project noise level increases assuming the replacement of existing pavement with open-grade or rubberized asphalt. Project-generated traffic noise increases along West Street, between Market Street and Gabilan Drive could be mitigated to a less-than-significant level as the mitigated traffic noise increase would be 3 dBA CNEL and the resulting noise level would be less than 65 dBA CNEL. In order to provide permanent mitigation, subsequent repaving would also have to be “quieter” pavements.

Table 4.10-6 Traffic Noise Level Increases Assuming Re-pavement of Affected Roadways with "Quieter" Pavement		
Roadway	**Segment**	**Noise Level Increase after Mitigation (dBA, CNEL)**
San Vincente Road	Gabilan Dr. to Project Entrance	+5
West Street	Market St. to Gabilan Dr.	+3
West Street	Gabilan Dr. to Project Entrance	+5
Main Street	Market St. to Gabilan Dr.	+4
Source: *Miravale III Specific Plan Environmental Noise Assessment*. Illingworth & Rodkin, Inc. 2007.		

As identified in the Noise Assessment, newer residential land uses constructed in the vicinity of San Vincente Road have existing noise barriers that would provide additional shielding in rear yard areas. Exterior noise levels, although substantially increased over existing conditions, would be less than 65 dBA CNEL in the rear yards of these homes. It is likely that these recently constructed residences were planned and constructed recognizing the future development at Miravale III. Existing noise barriers in older developments may also be sufficient to reduce exterior noise levels in rear yard areas to 65 dBA CNEL or less. Even with mitigation, noise levels might still be substantially and permanently increased in nearby residential areas. Some noise reduction levels require individual homeowner cooperation; therefore, they cannot be guaranteed. The noise impact, therefore, is considered significant and unavoidable.

Construction Noise

Future construction within the plan area would generate temporary noise level increases for adjacent residential land uses to the south of the project site. Construction noise would also affect the noise environment of noise-sensitive land uses developed during the first phases of the project as later phases are developed. Noise impacts resulting from construction depend on the equipment used, timing and duration of activities, and the distance between construction noise sources and noise sensitive receptors. Where noise from construction activities exceeds 60 dBA L_{eq} and exceeds the ambient noise environment by at least five dBA at noise-sensitive uses in the project vicinity, the impact would be considered significant. Additional significant impacts include extended noise level increases for a duration exceeding one year.

Construction activities generate considerable noise, especially during the construction of project infrastructure when heavy equipment is used. Typical hourly average construction generated noise levels are about 81 to 88 dBA at 50 feet from the center of the site during busy construction periods (e.g., earth moving equipment, use of impact tools). The highest maximum noise levels generated by project construction would typically range from about 90 to 98 dBA at a distance of 50 feet from the noise source. Construction-generated noise levels drop off at a rate of about six dBA per doubling of distance between the source and receptor. Additionally, construction-related noise levels are normally less during building framing, finishing, and landscaping phases. There would be variations in construction noise levels on a day-to-day basis depending on the specific activities occurring at the site. Table 4.10-7 identifies the distance needed from the noise source to reduce the construction noise to "Conditionally Acceptable" and "Acceptable" Noise Levels. Figure 4.10-1 identifies sensitive noise receptors in the project vicinity that may be affected during periods of maximum noise-generating construction.

Table 4.10-7 Noise Contour Calculations for Construction Sources	
CNEL Noise Levels (dBA)	**Distance from Construction Source (ft.)**
90 – 98	50
84 – 92	100
78 – 86	200
72 – 80	400
66 – 74	800
60 – 68*	**1600**
54 – 62*	**3200**
Notes: * Denotes "Acceptable" and "Conditionally Acceptable" ranges as defined by the City of Soledad General Plan - Calculations are based on the assumption that noise levels will decrease by 6 dBA per distance doubled, as mentioned above. - Calculations do not take into account noise barrier structures, such as buildings and landscaping.	

The build out of the plan area would increase the ambient noise environment at existing homes bordering the project site, as well as residential units built within the plan area during the earlier construction phases. Construction noise levels are anticipated to exceed 60 dBA L_{eq} and exceed ambient levels by five dBA or more over extended periods of time. It is conceivable that a particular receiver or group of receivers would be subject to construction noise levels in excess of 60 dBA L_{eq} and in excess of the ambient noise level by five dBA for durations exceeding one construction season (one year). Construction of the project would result in a significant temporary noise level increase at neighboring noise-sensitive properties and would exceed the City's ordinance regarding construction noise.

In order to ensure that project-induced impacts are reduced to the greatest extent feasible, the Noise Assessment identified the following mitigation measures as necessary. Implementation of these mitigation measures would not result in any new environmental impacts beyond those identified in this EIR.

Impact **Existing and proposed noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one construction season. Although mitigation measures would reduce noise generated by construction, the impact would remain significant and unavoidable as a result of the extended period of time that adjacent receivers would be exposed to construction noise.** ***This is a significant and unavoidable impact.***

Mitigation

4.10-5 Noise-generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturdays, unless otherwise approved by the City. No construction activities should occur on Sundays or holidays, including New Years and 4th of July.

4.10-6 Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.

4.10-7 Locate stationary noise generating equipment (e.g., portable concrete crusher) as far as possible from sensitive receptors. Construct temporary noise barriers to screen stationary noise generating equipment when located near adjoining sensitive land uses.

4.10-8 Utilize "quiet" air compressors and other stationery noise sources where technology exists.

4.10-9 Route all construction traffic to and from the project site via designated truck routes where possible. Prohibit construction related heavy truck traffic in residential areas where feasible.

4.10-10 Control noise from construction workers' radios to a point that they are not audible at existing residences bordering the project site.

4.10-11 Consider the use of multiple-pile drivers to expedite construction where pile driving is required. (Although noise levels generated by multiple pile drivers would be higher than the noise generated by a single pile driver, the total duration of pile driving activities would be reduced.)

4.10-12 Use temporary noise control blanket barriers to shroud pile drivers or erect in a manner to shield the adjacent land uses. Such noise control blanket barriers can be rented and quickly erected.

4.10-13 Pre-drill foundation pile holes to minimize the number of impacts required to seat the pile. Pre-drilling reduces the number of blows required to seat the pile and is a standard construction noise control technique.

4.10-14 The contractor shall prepare a detailed construction management plan identifying the schedule for major noise-generating construction activities. The construction management plan shall identify a procedure for coordination with the adjacent noise sensitive facilities so that construction activities can be scheduled to minimize noise disturbance. Prior to the issuance of any grading and/or building permit, the project applicant shall submit a detailed construction management plan to the City of Soledad for review and approval.

4.10-15 The project applicant shall designate a "disturbance coordinator" who shall be responsible for responding to any local complaints about construction noise. The disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall require that reasonable measures warranted to correct the problem are implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule. Prior to the issuance of any grading and/or building permit, the project proponent shall provide the City of Soledad with the contact information for the designated "disturbance coordinator."

Although the above measures would reduce noise generated by the construction of the project, the impact would remain significant and unavoidable as a result of the extended period of time that receivers would be exposed to construction noise.

4.11 POPULATION AND HOUSING

Introduction

This section describes the population and housing issues related to the proposed project, including background and documentation to support the growth inducement analysis contained within Section 5.0 of this EIR. The key sources of information for this analysis include the 2000 Census, the 2004 Association of Monterey Bay Area Governments (AMBAG) Projections, the California Department of Finance (DOF), and the City of Soledad.

Setting

Based on 2008 data from DOF, Monterey County had a population of approximately 428,549 people. The County's population has grown at an overall rate of 1.1 percent annually since 2000. While communities along the Salinas Valley have experienced an increase in population, the majority of communities along the Monterey Peninsula have experienced a decrease in population as a result of the closure of the Fort Ord military base. According to data published by the DOF, Soledad, Greenfield, King City, and Gonzales were all among the fastest growing cities in the State in 1999. Approximately 25 percent of the population of Monterey County resides in the unincorporated areas, with the remaining 75 percent residing in the county's 12 cities. Salinas is the largest city, followed by Seaside, Monterey, and Marina.

The population of Soledad includes residents within the incorporated limits of the City, as well as inmates at the Soledad Valley State Prison and Correctional Training Facility, which was annexed to the City in 1992. In 1997, the prison was expanded, bringing its total inmate population to 11,200 and a total full-time workforce to 2,700. The current prison population is 11,929, and the state has no immediate plans for expansion.

Table 4.11-1 presents projected population growth along the Salinas Valley through 2020, based on the current population and historic trends. These projections suggest that all the cities will experience growth between 2000 and 2020. The population of the City of Soledad is projected to increase by 63 percent during this time period.

Table 4.11-1
Current and Projected Population Summary By Jurisdiction

Place of Residence	2000 Census Population	2015 Projected Population	2020 Projected Population
City of Gonzales	7,525	14,627	16,791
City of Greenfield	12,583	21,570	24,512
City of King City	11,094	32,465	34,362
City of Salinas	143,776	174,787	184,434
City of Soledad	22,634	35,938	39,463
Unincorporated Monterey County	100,252	114,776	124,067
Monterey County Total	401,762	495,961	527,069

Sources: 2000 Population and Household data from the U.S. Census Bureau. *DP-1. Profile of General Demographic Characteristics: 2000.* Summary File 1; and population projections from AMBAG, *2004 AMBAG Regional Population and Employment Forecasts.*

Monterey County's total population resides in approximately 121,236 households (Census 2000). The average number of persons per household is 3.06, although this is far from uniform throughout the County. The average household size is about 4.0 persons per dwelling for single-family dwelling units and 4.52 persons per dwelling for multi-family dwelling units in the City of Soledad (Census 2000).

Cities along the Salinas Valley also tend to have larger household sizes possibly due to the seasonal influx of field workers and the absence of farm labor housing. Families often pool their resources and share housing in Soledad. Table 4.12-2 shows the distribution of housing stock among the cities and the unincorporated parts of the County.

Table 4.11-2
Housing Stock In Monterey County (Dwelling Units)

Jurisdiction	Total Housing Units
Carmel	3,331
Del Rey Oaks	727
Gonzales	1,738
Greenfield	2,727
King City	2,855
Marina	8,543
Monterey	13,420
Pacific Grove	7,998
Salinas	39,612
Sand City	92
Seaside	11,005
Soledad	2,543
Unincorporated	37,579
Total	**132,170**
Source: U.S. Census, 2000.	

Based on current conditions and trends, growth is projected to continue throughout the county. Estimated growth projections are higher in southern Monterey County while the majority of occupied and unoccupied housing units are located in northern Monterey County. As a result, southern Monterey County communities are expanding their city limits to provide areas in which to grow. According to the City of Soledad General Plan, 28 percent of housing to be added to the City over the next two or three decades will be in the designated expansion areas, which are outside of the City's Sphere of Influence. According to the 2000 Census, the City had about 2,472 dwelling units, not counting dwellings approved or under construction. Since then, about 600 additional units have been constructed, which brings the total in the City to about 3,072. This leaves a remaining development potential of 6,600 to 8,600 units that could be constructed within the City's general plan area. The proposed project site includes areas in the Mirrasou, Northwest, and San Vicente West expansion areas, which are identified in the General Plan and located outside the City's Sphere of Influence. Housing capacity projections do not account for these areas. Sphere of Influence expansion and annexation of these areas are required for development of the project site. The General Plan carrying capacity for these areas combined is 1,806 single family units, 357 medium density residential units, and 488 units of high density residential on 553 acres.

AMBAG assigns each community within its jurisdiction a "fair share" of the regional housing needs, and the communities are required to show how they will meet these needs. Based on the 2002 AMBAG Regional Housing Needs Allocation (RHNA), the total number of new housing units that need to be constructed in Soledad between 2000 and 2007, in order to meet Soledad's "fair share" of the regional housing need, is 1,283. This includes very low, low, moderate, and above moderate households. 525 building permits at above-moderate income level and 2 building permits at the moderate income level were issued between January 2000 and August 2002 according to Soledad's Housing Element. A remaining 799 units affordable at very low, low, and moderate income levels should be filled in order to meet AMBAG's fair share allocation. According to the recently updated RHNA, the city of Soledad has been allocated a "fair share" of 897 new units for the 2008-2014 planning period to meet regional housing

needs. Jurisdictions are required to meet previous planning period allocations of affordable housing if they have not been met in addition to current planning period allocations. The Specific Plan will ultimately provide approximately 4,200 attached and detached residential units, of which 1,229± will be affordable (including 500 senior housing units) and another 1,047± workforce housing units. Table 4.11-3 shows the residential potential for the Miravale III project site according to the Specific Plan. The Housing Element allows for variations to the residential portion as long as the housing objectives are met pursuant to the goals identified in the City of Soledad General Plan.

Table 4.11-3
Residential Potential For Miravale III Specific Plan Area
(Miravale III Project Site)

Proposed Zone District	Proposed Housing Type	Residential Acreage (Acres)	Average Density (Units/Acre)	Potential Number of Units
LDR (Low Density Residential) *Duplex/Small Lots*	Single-Family Residential	~ 240.88	6.10	~ 1,470 *~ 116*
(VR) Village Residential*	Multi-family Residential & High Density Residential	~ 146.88	18.99**	~ 2,614
	TOTAL	~ **387.76**		~ **4,200**

*Assumes 500 Senior Housing Units
**This assumes that parks, roads, and parking required for VR is included in the 17.91 du/ac

City of Soledad General Plan

The Housing Element of the General Plan demonstrates the existing condition and projected needs of the City. It also contains goals, policies, programs, and quantified objectives to ensure the City will be able to provide for the residential need of the community. The following housing and population policies apply to development within the project area.

Policy H-1 The City of Soledad shall promote the expansion of its LAFCO Sphere of Influence and annexation of additional land consistent with its General Plan Land Use Element to accommodate long-term demand for residential development.

Policy H-3 The City of Soledad shall require new residential areas to contain a mix of housing types targeted to very low, low, moderate, and above moderate households in approximately the proportion that each of these income categories represent in the AMBAG Fair Share Housing Allocation.

Policy H-5 The City shall provide incentives to housing developers that provide housing opportunities for large families in new residential development areas.

Policy H-6 The City shall require housing developers to offer an optional design to homebuyers whose household has one or more disabled person.

Policy H-9 The City of Soledad shall ensure that city site improvement standards, development review procedures, and development fees do not unreasonably constraint the development, conservation, and rehabilitation of housing.

Policy H-10 The City of Soledad shall ensure the availability of adequate public facilities for the expected housing need of the city.

Policy H-11 The City of Soledad shall support and initiate, where feasible, public and private energy conservation programs which will reduce the energy needs of housing in Soledad and so increase housing affordability.

Additional land use policies from the City General Plan would also apply to this project.

Policy L-10 The City shall monitor development and adjust land use designations and new residential project approvals as needed to promote a reasonable balance between employment-generating land uses and housing.

Policy L-11 The City shall encourage large residential development projects to be phased or timed with development that will provide primary wage-earner jobs.

Policy L-12 The City shall maintain an adequate supply of land in appropriate designations to accommodate projected household growth, maintain affordability to moderate and below moderate income groups, and maintain acceptable vacancy rates.

Inclusionary Housing Ordinance

On July 6, 2005, the City Council adopted Section 17.42, Inclusionary Housing Ordinance (IHO), with the intent of increasing the production and affordability of affordable housing units. The IHO requires that 20 percent of the proposed affordable units be restricted affordable units pursuant to execution of an Affordable Housing Agreement between the Developer and City. Inclusionary units must be affordable to the target income categories in the following proportions: 8 percent moderate income, 6 percent low income, and 6 percent very low income. The ordinance establishes several development principles for development of inclusionary units:

> 17.41.050 A-5: "Inclusionary units should be similar in size and design to market rate units within the development;"
>
> 17.41.140 "(1) The development shall provide for the dispersal of inclusionary units to the maximum extent feasible. (2) Multi-family buildings may contain any proportion of inclusionary units, but no inclusionary units should be located to or in the immediate vicinity of another inclusionary housing development."

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential effects on population and housing associated with the adoption and implementation of the Soledad General Plan, including future development within the Miravale III project site. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III project. According to the General Plan EIR, the following Housing and Population impacts were identified:

- Continued development of the City as contemplated in the General Plan will result in considerable additional housing and population growth, which in turn could affect the supply of affordable housing and the relationship between jobs and housing. This impact is considered adverse but not significant.

Miravale III Specific Plan

One of the primary goals of the Miravale III project is to provide the City of Soledad with workforce and affordable housing that is integrated in neighborhoods with market rate housing. This includes housing in the "very low," "low," and "moderate" categories. It is also includes workforce housing, which is comprised of smaller detached and attached units that are more affordable by design.

The Specific Plan would ultimately provide approximately 4,200 attached and detached residential units, of which 54 percent would be affordable per the Housing Element requirements. To assure development of affordable housing, Section 2.5 of the Specific Plan contains the following policies and implementation measures:

- All six of the Village Residential (VR) areas are located next to single family residential neighborhoods. The VR residential areas should arrange units/lots that abut or face onto adjacent single family residential (LDR) neighborhoods to face the street. This will create neighborhood streets lined with lots and homes and not segregate the affordable units by separating them with parking areas.

- Sprinkle affordable lots throughout the single family neighborhoods.

    - Locate smaller lots adjacent to the mid-block pedestrian parkway connections. The pedestrian parkway will give the appearance of a larger lot.

    - Locate duets or duplexes on key corner lots. This will keep the building massing consistent within the neighborhood and allow for one garage door to be accessed off of one street and the other off the intersecting street (avoiding double garage doors on one elevation).

Relevant Project Characteristics

The project's proposed development would protect and enhance the quality of the City's existing housing stock and allow for future economic growth that would help maintain a local jobs/housing balance. Implementation of the project includes the development of approximately 4,200 residential units on approximately 388 acres within the 920-acre planning area and the creation of 550 jobs. Development of the project would occur over a 15- to 20-year time period, with buildout occurring between 2023 and 2028.

The overall gross density at buildout would average 10.8 units per acre. The residential neighborhoods would contain a variety of housing types and lot sizes enhanced by open space and recreational amenities. The types of housing may include custom homes, production detached homes, cluster homes—attached and detached, and garden apartments.

The lowest density neighborhoods with the largest lots are located on the eastern hillsides. Typical lot sizes range from 7,000 sf to 55,000 sf (0-2 du/ac). Approximately 983 single-family units are planned for the first two phases of the project, while another 487 single-family homes would be built in Phases 3 and 4 for a total of 1,470 units. There are approximately 118 smaller affordable lots "sprinkled" throughout the single family neighborhoods. Medium density neighborhoods (6.1 - 12 units per net acre) occur within the Village Residential designated areas. Typical lot sizes range from 2,500 square feet to 5,000 square feet. This designation is intended to provide for detached and attached single-family homes, duplex homes, and triplex homes on smaller lots within walking distance to neighborhood parks. Higher

residential density neighborhoods are generally found in proximity to the neighborhood commercial center in areas designated for Village Residential. Allowable density ranges from 12.1 to 25 units per acre with an average density of 18.5 dwelling units per acre. Housing products range from attached single-family homes (townhomes) to garden apartments and larger apartment complexes.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- induce substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension or expansion of infrastructure);
- displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere; or
- displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

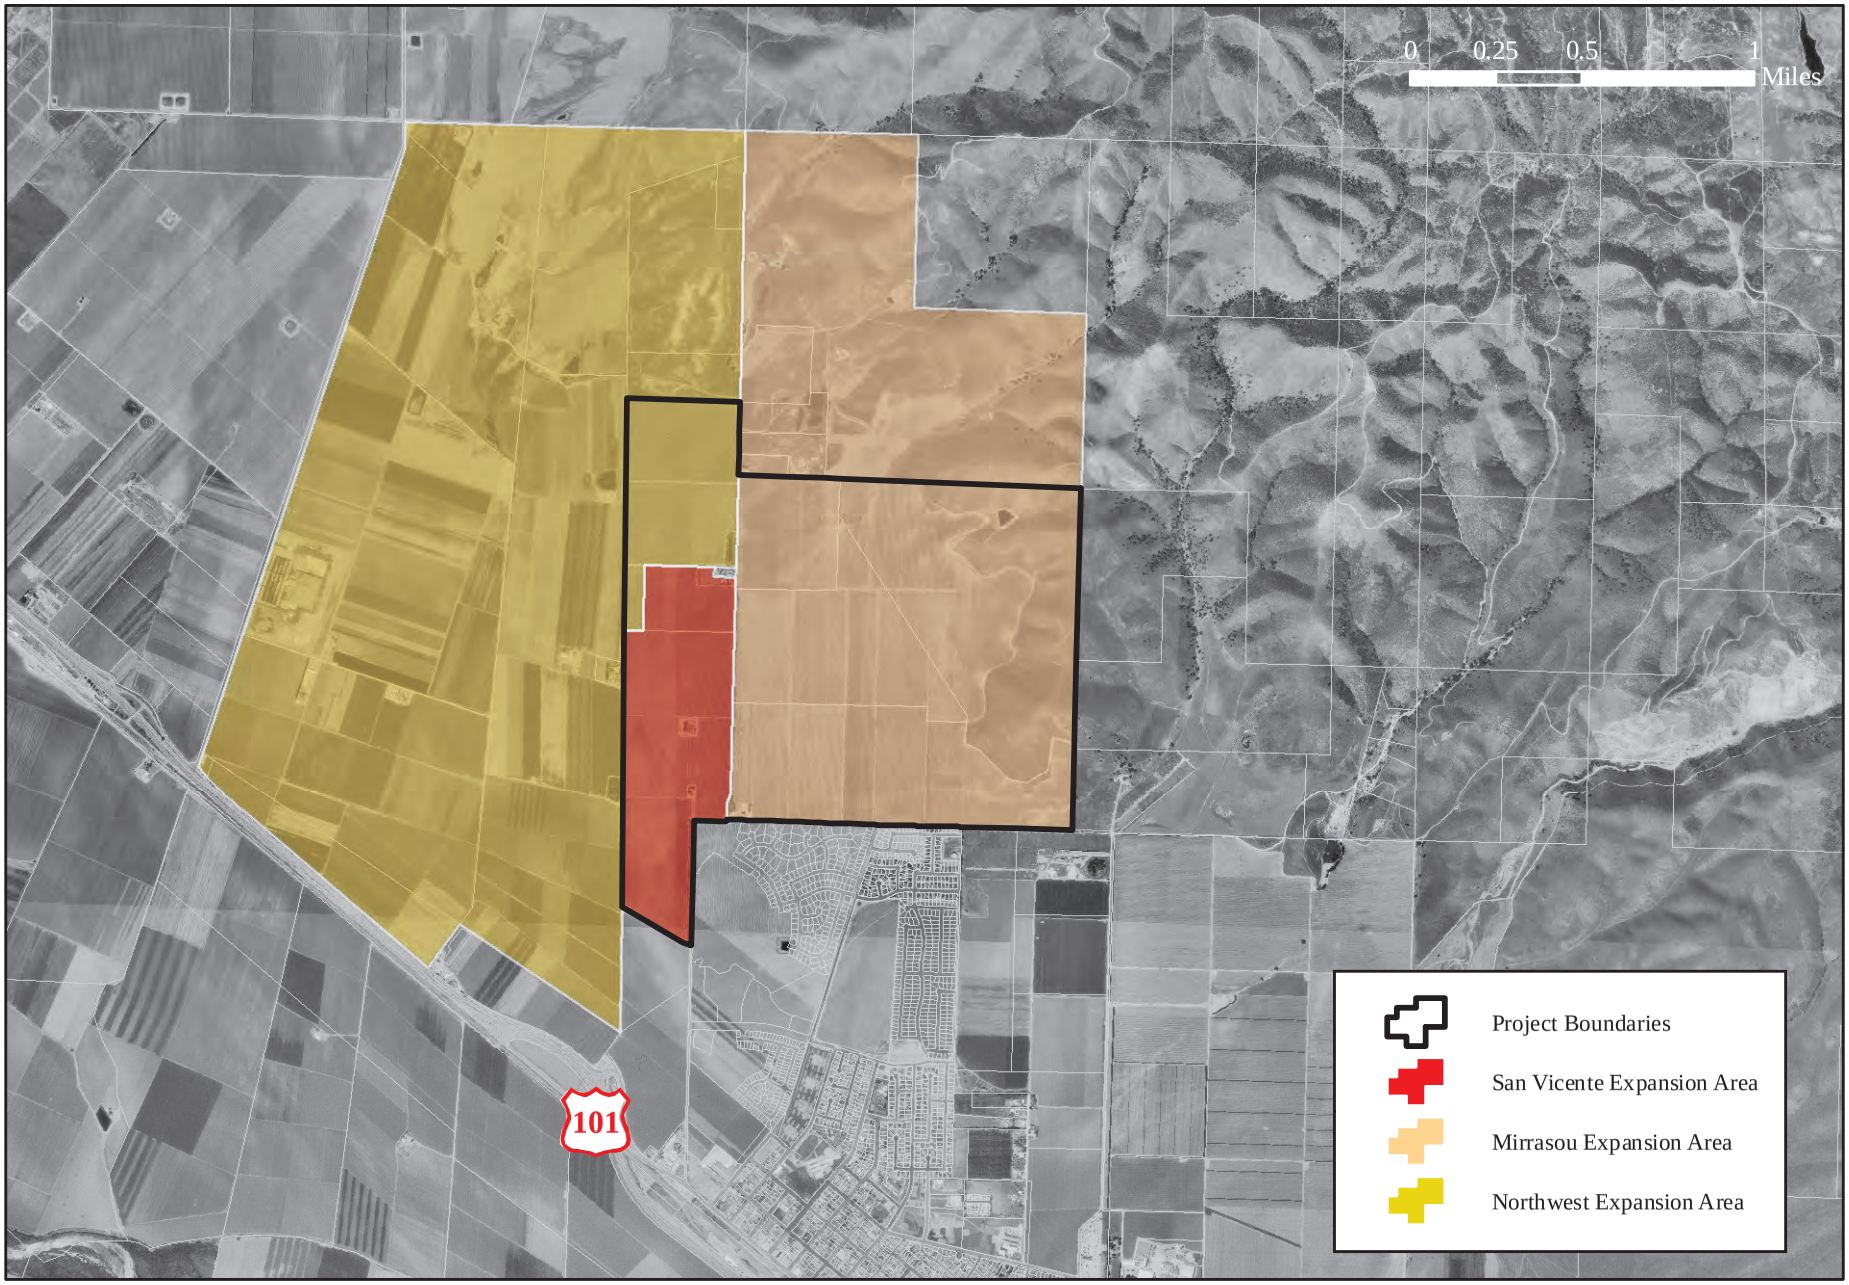
The only threshold that would apply to the project is the inducement of population growth, since the project would not displace existing housing or people.

Impacts and Mitigation

Displacement

The Specific Plan area is composed of eight separate but contiguous parcels totaling approximately 920 acres of rolling grasslands and agricultural lands. The project site is currently used for grazing and agricultural uses. There are two single family homes, the only existing structures on the site, and a row of eucalyptus trees that line one side of San Vicente Road, which will be removed as part of this project. There are an additional 10 existing residential units which are not part of the project but are centrally located within the project area. They are located on a 3.58 acre parcel (APN # 257-081-32). Removal of these existing houses is not proposed as part of this project. **The project would have no significant impact associated with displacement of housing or people.**

Population Growth



The project would increase population in the area from Soledad's existing population (2008) of 27,905 which includes the prison population. The housing component of the Specific Plan includes the development of 4,200 residential units, including 1,470 single family units and 2,730 multi-family units. Based on assumptions for persons per housing type developed by City staff, the number of persons per dwelling unit is assumed to be 4.5 for three bedroom multi-family residential, 4 for two bedroom multi-family residential and single-family residential, and 1.75 for senior and studio/one bedroom multi-family residential.[1] Using these factors, the 4,200 new units proposed by the project could result in an additional 15,201 people. Table 4.11-4 shows the persons per household factor by residential type and estimated population from project residential development. This additional population represents about 54 percent of Soledad's existing (2008) population, 42 % of its projected population in 2015 (35,938) and 39% of its projected population in 2020 (39,463).

2 bedroom	1,338	4	5,352
3 bedroom	558	4.5	2,509
TOTAL	**4,200**		**15,201**
Source: Miravale III Specific Plan, Table 4-1, June 2007			

The project site is however, in an area planned and designated for future expansion and the General Plan anticipated a significant population growth associated with the development of the future expansion areas, including the project site. The EIR estimated the population holding capacity for the project site, as shown below in Table 4-11.5 under the expansion areas for Mirassou, San Vincente and Northwest Expansion Area. The following holding capacity and population projections for each expansion area estimate a total population in these expansion areas of 36,052 persons and approximately 9,012 additional dwelling units out of a total population at full buildout of 57,000. The Miravale III project site contains only a portion of the Northwest Expansion area (approximately 8%) and Mirrasou expansion area (approximately 75%) and the entire San Vicente West expansion area (see figure 4.11-1). Using these approximations, the project site, comprised of portions of three identified expansion areas, has a holding capacity of 3,110 units.

Table 4.11-5 Holding Capacity and Population Projections from City 2005 General Plan EIR			
Portion of Planning Area	**Holding Capacity**		
	Total Res. Acres	**Dwelling Units (80% of Maximum)**	**Population[1]**

N

Soledad General Plan Expansion Areas

Figure 4.11-1

DENISE DUFFY & ASSOCIATES, INC.

The General Plan identified a non-prison population of about 28,000 residents by 2020 and 57,000 residents at full buildout. Assuming 3,192 existing dwelling units (2005 General Plan EIR), the remaining residential development potential of the General Plan was estimated at about 11,000 units that could be constructed within the City's Planning area.

This growth in population in the expansion areas including the project site would increase demands on existing community facilities, requiring construction of new facilities as well as the extension of infrastructure to the site. According to the adopted General Plan, the site is within an area of planned growth and expansion although outside of the current City limits and sphere of influence for the City. The City will be requesting approval from the Monterey County Local Agency Formation Commission to amend the City's Sphere of Influence to include the acreage for the property and to annex the properties into the City of Soledad. The General Plan and EIR anticipates that "subsequent to adoption of the draft General Plan, and to carry out its objectives, the City will apply to [LAFCO] for a revision to its sphere of influence to denote areas into which the City will extend public services for urban development." *See also, General Plan*, Program 2.1 on p. II-32 ("The City will pursue an application to [LAFCO] for an amendment of its sphere of influence consistent with this General Plan").

The City has identified holding capacities for individual major properties within these expansion areas. The proposed Specific Plan for Miravale III proposes an increase in the applied density for the project site, approximately 1,500 units above the estimated holding capacity for the Miravale III site, according to City Planning staff (Susan Hilinski, email communication, September 2006). Estimation for the purposes of this EIR found a holding capacity for the project site to be 3,110 dwelling units. Based on these estimations, development of the proposed project is anticipated to exceed the projected holding capacity of the project site by approximately 1,090 units. Although the 2005 General Plan EIR identified population estimates in the Planning Areas (table 4.11-5), these figures don't account for types of housing units which can influence population projections. Moreover, the General Plan and EIR anticipate and analyze the impacts of the development of property within the City limits and the expansion areas based on the entire Planning Area's aggregate estimated development potential at buildout. Proposed density associated with project development exceeds development anticipated in the 2005 General Plan and therefore could impact planned services and city wide infrastructure and could be considered growth inducing.

Impact **The project would represent an increase in overall residential holding capacity identified in the 2005 General Plan EIR for portions of the Mirassou, San Vincente and Northwest Expansion Areas within the project area and could be considered growth inducing if annexations and development in the remaining expansion areas exceed development potential addressed in the General Plan EIR. *This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4-11.1 Phase approval of development applications and annexations in the Mirassou, San Vincente and Northwest Expansion Areas to maintain holding capacity and population projections in Table 4.11-5 of the General Plan EIR. Monitor development approvals in these expansion areas to limit overall density and population growth to the holding capacity identified to ensure consistency with projections in approved City planning documents.

4-11.2 Implement General Plan policies L-2 to L-7 and other applicable policies for phased development and population growth in the project and expansion areas. General Plan policies L-

2 to L-7, (below) identify expansion area requirements and applicable policies for annexation of these areas:

L-2 Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council.

L-3 A specific plan shall be required for all annexations and development of properties designated *Expansion Area*. Specific plans shall be prepared in accordance with the standards provided in Appendix B of the General Plan.

L-4 The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services.

L-5 New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development.

L-6 New development shall pay its fair share of providing additional public services needed to accommodate such development.

L-7 Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City.

The additional population increase (15,201) associated with buildout of the project site over the projected 15-20 years of project development represents approximately 54 percent of Soledad's existing (2008) population. Depending upon the timing of project development, this additional population represents a major portion of the projected City wide population of 28,000 by year 2020. This growth in population would increase demands on existing community facilities, requiring construction of new facilities that could cause significant environmental effects. The project also proposes office and commercial uses that would have a direct, economic growth-inducing impact by providing new employment. The project would generate an estimated 550 jobs at the project site. Residential development and residential-serving commercial development is included in the Land Use Plan to meet the needs of new employees.

Impact **Although the project site is located in an area that has been identified for future population growth in City's General Plan, based on the above discussion, the project would result in a significant growth-inducing impact through the introduction of new sources of employment and a significant portion of the City's projected population growth, which would result in additional demands on existing facilities. *This represents a significant and unavoidable impact that cannot be reduced to less-than-significant level with mitigation.***

Housing Element

The Housing Element requires that specific plan areas provide, at a minimum, 15 percent of housing affordable to very low-income households, 14 percent affordable to low-income households, and 25 percent affordable to moderate-income households. The Specific Plan will ultimately provide approximately 4,200 attached and detached residential units of which 1,229± will be affordable (including 500 senior housing units) and another 1,047± workforce housing units. The Housing Element does not contain a definition of workforce housing, therefore units proposed as workforce housing may or may not be restricted in price or rent and at this time cannot be considered affordable. Program 4.3 of the Housing Element requires each subdivision in a Specific Plan area to have a development agreement with the City of Soledad that prescribes the proportion of very low, low, and moderate income housing to be built in the project, the location of these units within the subdivision, and the qualifying incomes of families to which the sale and resale of the units shall be limited. Each Planned Development area will require an affordable housing development agreement which will ensure the project's consistency with the City's Housing Element. Table 4.11-6 outlines both the Housing Element and Inclusionary Housing Ordinance affordability requirements and the affordable units proposed by the Specific Plan.

Table 4.11-6
Proposed Affordable Housing Units for Miravale III Specific Plan Area

City Requirements				Proposed			
Affordability Target Group	**GP Housing Element Affordability Requirement (54%)**	**Inclusionary Ordinance Requirement (20%)**	**Minimum Density Required by GP**	**Proposed General Plan Affordable Units**	**Proposed Percentage/Number of Inclusionary Units**	**Development Location**	**Proposed Construction Phases**
Very Low Income	15%	6%	18 du's/net acre	15% 341± GP Units	6% 136± Inclusionary Units	PD-1,2,3,4,5,6	1 to 4
Low Income	14%	6%	18 du's/net acre	14% 318± GP Units	6% 136± Inclusionary Units	PD-1,2,3,4,5,6	1 to 4
Moderate Income	25%	8%	12 du's /net min.	25% 569± GP Units	8% 182± Inclusionary Units	PD-1,2,3,4,5,6	1 to 4
Workforce housing	N/A		N/A	1047± Workforce Units		PD-1,2,3,4,5,6	1 to 4
				2276 Units	454 Units		
TOTAL	**54%**	**20%**		**54%**	**20%**		

NOTE: Workforce housing / entry level is defined for the Miravale III Specific Plan as housing units/ lots that are smaller in size, therefore more affordable by design. It is the intent of this Plan to provide workforce housing which will be affordable by design, but not restricted in price or rent. The Housing Element requirement of 54% is also a requirement to be affordable by design.

Source: Miravale III Specific Plan, June 2007

The Specific Plan does not, however, meet the Housing Element's requirement for "integrated" neighborhoods where higher density and more affordable housing are integrated with market-rate housing. Figure 2-4 from the Miravale III Specific Plan depicts 59 affordable housing unit lots in the Low Density Residential (LDR) neighborhoods. Development of two units on each of these lots would result in 118 affordable housing units in the LDR neighborhoods, representing only 8% of the 1,470 total single family units. Village Residential areas which contain a majority of the Specific Plan's affordable housing are located "next to" single family neighborhoods. Therefore, affordable housing units are not "integrated" as the Housing Element Program 4-2 stipulates.

Impact **The Miravale III Specific Plan is inconsistent with the Housing Element, which requires affordable housing to be fully integrated with market rate housing.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

4.11.3 The applicant shall enter into a Development Agreement per Program 4.3 of the City's Housing Element with the City that prescribes the parameters of the development of affordable housing consistent with the City's Housing Element, Inclusionary Housing Ordinance, and the revised Specific Plan. The Development Agreement shall be reviewed and approved by the City of Soledad prior to or concurrent with project approval.

Inclusionary Housing

The Miravale III Specific Plan proposes 454 units restricted affordable pursuant to the City of Soledad's Inclusionary Housing Ordinance. Of these 454 units, 6 percent would be deed restricted for very low-income households, 6 percent to low-income households, and 8 percent to moderate-income households. 454 affordable units represent only 11% of the total 4,200 units proposed. These units would be affordable to target income categories according to income limits established by State Department of Housing and Community Development for Monterey County. As proposed, the Specific Plan does not meet the 20 percent requirement and therefore the project would not be consistent with the City's Inclusionary Housing Ordinance.

Impact **The Miravale III Specific Plan is inconsistent with affordable housing requirements of the City's Inclusionary Housing Ordinance.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

4.11.4 Prior to project approval, the Specific Plan shall be revised to provide 20% of the units proposed in each Planned Development area and the Low Density Residential area to be affordable housing units. Alternatively, the project applicant shall dedicate real property for affordable housing or submit payment of in-lieu fees in order to ensure project consistency with the requirements of the City of Soledad's Inclusionary Housing Ordinance, subject to the approval of the City of Soledad. The project's consistency with the City's Inclusionary Housing Ordinance shall be evidenced in the Development Agreement (DA) prepared for the project, subject to the approval of the City of Soledad. The DA shall be reviewed concurrently with the project's General Plan amendments, Specific Plan and the Vesting Tentative Map.

4.12 PUBLIC SERVICES AND RECREATION

Introduction

This section assesses the proposed project's potential impacts on public services and recreation. To obtain information from public service providers, DD&A contacted the City of Soledad Police and Fire Departments in order to gather information on existing fire and police facilities, staffing for the project area, and current, as well as, target response times. The Soledad Unified School District was contacted to obtain information on student enrollment capacity.

Setting

Police and Fire

Fire protection services within the City of Soledad are provided by the City of Soledad Fire Department. The closest fire station is located on 525 Monterey Street in Soledad. Mission Rural Fire Protection District also contracts with the City of Soledad to provide fire department services to the rural areas surrounding the City. According to the City of Soledad General Plan EIR, the Soledad district is approximately 42,000 acres and is bounded by the foothills of the Gabilan Range and the Santa Lucia Mountains.

In May of 2006, a fire analysis, prepared by Citigate and Associates regarding fire services within the City of Soledad, found that existing fire personnel levels and responses times were inadequate to meet the needs of a small, but growing city. The report further concluded that the City should adopt a target response time of seven (7) minutes. In response to this analysis, the City of Soledad Fire Department hired additional staff to insure that adequate fire personnel were available to meet current demands. Currently, the City maintains a full-time staff consisting of ten full time personnel, a part-time staff consisting of 12 individuals and 14 Volunteers. The Fire Department is equipped with two fire engines, an aerial ladder, a wildland fire engine, water tender, a utility pick-up, a staff vehicle and a new Type I fire engine on order. In 2007, the fire department responded to 1300 alarms, of which 795 were located within the City of Soledad. The Fire Department also provides emergency response services to area residents.

The Soledad Police Department, which is located at 236 Main Street, provides police protection services within the City of Soledad. The City currently has 23 sworn officers and six non-sworn officers (pers. comm. Police Chief Richard Cox, September 20, 2006). This is equivalent to approximately 1.1 officers per 1,000 residents. Currently, there are five shifts per day with approximately 2-3 sworn officers on duty per shift. In 2005, the Police department responded to 16,303 calls, with the majority of calls being related to burglary attempts. Average response times are approximately three minutes. In order to augment its services, the Police Department has a mutual aid agreement with the cities of Greenfield and Gonzales and the Monterey County Sheriff's Department.

Schools

The Soledad Unified School District (SUSD) provides educational services to the City, which includes San Vicente School, Gabilan School, Rose Ferrero Elementary School, Frank Ledesma Elementary School, Jack Franscioni Elementary School, Main Street School, and Soledad High School. SUSD has five (5) elementary schools serving grades K through 6, one middle school serving grades 7-8, and one High School for grades 9 through 12. Currently, adequate capacity exists to accommodate additional students, although several of the SUSD's schools are approaching full capacity. Table 4.12-1 depicts current student enrollment and student capacity. There are also two continuing education facilities

(Shalom High School and Pinnacles High School) within the City that provide opportunity for students to complete their high school diploma or GED, as well as, providing practical work experience and English language training. While there are no community colleges located within the City, Hartnell community college is located approximately 30 miles north in the city of Salinas. Currently, new school facilities are being proposed throughout the community, including three elementary schools. Construction of these facilities is dependent on future development and will be constructed as the City continues to expand.

Table 4.12-1
Current Student Enrollment

School	Grade Level	Student Enrollment	Capacity	Enrollment Capacity (%)
San Vicente	K-6	557	650	85.6%
Gabilan	K-6	400	650	61.5%
Rose Ferrero	K-6	401	650	61.6%
Frank Ledesma	K-6	589	650	90.6%
Jack Franscioni	K-6	447	650	68.7%
Main Street	7-8	630	652	96.6%
Soledad High	9-12	1,093	1,400	78.0%
Source: City of Soledad General Plan and Soledad Unified School District 2007.				

Libraries

The Monterey County Free Libraries network supports Soledad residents with a branch at 401 Gabilan Drive. The County also operates two bookmobiles, a books by mail program, deposits collections in local schools, and a number of special programs, including a literacy program that operates a literacy outreach vehicle focused on family literacy and kindergarten readiness. Funding for the Soledad Library comes primarily from a share of the property tax collected within its service area.

Recreation

According to the City of Soledad General Plan, approximately 27 acres of land are dedicated to recreational uses within Soledad. These facilities include a little league field, an indoor swimming pool, and public parks. Table 4.12-2 depicts recreational facilities within the City and classifies each park type based on the type of recreational usage (i.e., passive or active). Active recreational facilities include a mix of recreational uses and may include athletic fields, hard courts, children's play areas, and structures for recreational activities. Passive recreational facilities are generally undeveloped or minimally improved lands that include landscaped areas, non-landscaped open space, trail systems, and other similar uses. Parkland is further classified according to type and size. According to the General Plan, parkland within the City of Soledad is classified as the following:

- **Linear Parks**: A linear park is often developed along natural or human made corridors, such as creeks, drainage facilities, or roads. The size of a linear park may vary but should be of sufficient width to protect sensitive resources and to accommodate a pedestrian and/or bicycle trail. Facilities provided with linear parks are usually limited to seating, picnic tables, and in some instances, a tot-lot and par course.

- **Pocket Park/Mini Parks**: A pocket park is a small facility designed to serve a limited population or group (such as seniors or small children) within about a one quarter mile radius. Such parks are typically between 0.25 to 2 acres in size and provide limited amenities that may include play equipment, seating, picnic areas, and landscaping.

- **Neighborhood Park**s: Neighborhood parks serve primarily one neighborhood and provide active and passive facilities for all age groups. Such parks may range in size from 2 to 15 acres and generally provide open turf areas, picnic areas, play equipment, multiuse game courts, drinking fountains, restrooms, parking, and landscaping. Neighborhood parks typically serve an area within one quarter to one half mile of the park.

- **Community Parks**: A community park serves multiple neighborhoods or an entire community. These parks are usually developed on large sites (15 to 30 acres) and provide a wide range of facilities and activities, such as larger play areas for children, picnic areas, play fields and courts (tennis, basketball, baseball, etc.), and open turf areas, as well as parking, lighting, landscaping and restrooms.

- **Regional Parks**: Regional parks serve multiple communities, provide larger facilities and amenities on sites, and range in size from 100 to 200 acres. Regional parks may provide large open areas, group picnic facilities, trails, campgrounds, sports fields, a golf course, courts for tennis and volleyball, and other amenities, such as parking, landscaping, and restrooms. The communities served by a regional park should be within one hour driving distance and may be subject to user fees. The Draft Monterey County General Plan proposes to locate a regional park near Soledad between the existing city limits and the Los Coches Adobe near the confluence of the Salinas and Arroyo Seco Rivers.

As identified in Table 4.12-2, in addition to active recreational opportunities, there are three (3) passive park facilities located within Soledad, totaling approximately 36.35 acres. There are also several regional parks and open space areas within the vicinity of the City, including the Mission Nuestra Senora de la Soledad, Pinnacles National Monument, and the Arroyo Seco area that are available to area residents. According to the City of Soledad's General Plan, a regional park is planned north of the project-site on the Windmill property. Additionally, there are three parks totaling approximately 6.52 acres that are planned within the City.

Table 4.12-2
Park and Recreation Facilities

Park Name	Size (acres)	Recreational Type
Vosti Park	6.4	Active
Ramirez Park	1.25	Active
Bill Ramos Park	1.25	Passive
Front Street Park (Old Town Park)	0.6	Passive
Chester Aaroe Park	2.8	Active
Indoor Swimming Pool	4.0	Active
Lum Park	2.5	Active
Gallardo Park	4.0	Active
Los Coches Adobe	-	-
Veterans Park	4.0	Active
Santana Park	4.2	Active
Rotary Park	4.0	Active
Salinas River Open Space	50	Passive
TOTAL:	+/- 89.0

Regulatory Environment

City of Soledad General Plan

The Public Services/Facilities and the Park/Recreation Elements of the General Plan contain numerous goals and policies to enhance the level of recreational amenities and public services provided to the City and surrounding areas. Please refer to Table 4.9-2 of the Land Use section for a detailed analysis of the project's consistency with the relevant provisions of the Soledad General Plan. The following recreational and public services policies apply to development within the project area:

Policy PR-1 The City will acquire future park and recreation land and facilities by:

a. Requiring park dedications from future residential subdivision at the rate of three acres per 1,000 population anticipated in the project;
b. Requiring payment of a park impact fee, or requiring the dedication of land and improvements in-lieu of fees, from all new development;
c. Cooperating with Monterey County to acquire land for a new regional park in the Soledad planning area;
d. Acquiring parkland near existing or potential public park and recreation sites, or near quasi-public or private sites that have a good opportunity for a joint use agreement. Acquired parkland should be contiguous to proposed or existing park and recreation facilities or provide a logical connection.
e. Pursuing joint use agreement with public and private schools, other public government agencies, private park and recreation providers, and institutions with potential parkland to make existing or proposed park and recreation facilities to the community on an extended basis.

Policy PR-10 The City should provide a pedestrian network within the City Limits. The system should:

a. Accommodate pedestrians and bicycles.
b. Connect residential neighborhoods with: 1) Soledad's downtown, 2) schools, 3) City park and recreation facilities, and 4) regional trails.

Policy PR-16 Parks shall be designed to be compatible with the neighborhoods in which they are located, and shall provide security and privacy to adjoining properties. Where necessary, buffers shall be provided between park and recreation lands and adjacent development to provide privacy and a physical separation between uses.[1]

Policy PR-24 New development shall be required to add to proposed or existing park and recreation projects where legally feasible. Public or private development shall provide, as appropriate and legally feasible: 1) a buffer between proposed development and existing park, recreation and/or open space parcels to minimize conflicts between development and existing facilities; and 2) gates, fences, or other deterrents when such facilities are deemed necessary to discourage prohibited or non-compatible uses from entering park, recreation or open space lands.

Policy PR-25 New development shall not adversely impact adjacent park, recreation, or open space lands.

[1] Buffers may include setbacks, landscaping, fencing, and/or dramatic breaks or changes in topography.

Policy S-20 The City will work cooperatively with the Soledad Unified School District to monitor housing, population, and school enrollment trends and in planning for future school facility needs. The City shall assist the District in locating new school sites.

Policy S-21 The siting of new schools shall be coordinated with the City's Circulation Element to ensure that traffic conflicts are avoided, the safety of students is addressed and roadway function is not reduced, including provisions for off street student drop-off/pick up.

Policy S-22 The City will work closely with the school district to secure adequate funding for new school facilities and where legally feasible, shall provide a mechanism which requires development projects to mitigate the cost of providing school facilities needed to serve such development, consistent with relevant provisions of State law.

Policy S-23 The City, to the extent feasible, shall ensure that new school facilities are constructed and operating prior to the occupation of residences which the schools are intended to serve.

Policy S-29 The City shall strive to achieve and maintain a ratio of a minimum of 1 police officer per 1,000 residents.

Policy S-30 The City shall strive to achieve and maintain emergency response time to a maximum of 5 minutes for police emergencies.

Policy S-32 The City shall require new development to pay its fair share of providing or funding facilities that, at a minimum, achieve and maintain the above police protection standards.

Policy S-36 The City shall strive to achieve and maintain an emergency response time of 5 minutes or less for fire emergencies over 90 percent of the City.

Policy S-37 The City shall require new development to pay its fair share of providing or funding facilities that, at a minimum, achieve and maintain the fire protection standards identified in Policies S-35 and S-36.

Police S-38 The City shall ensure that all proposed developments are reviewed for compliance with fire safety standards per the Uniform Fire Code and other City standards and ordinances.

Policy S-39 New non-residential development and non-residential additions of over 100 square feet of habitable space shall provide fire sprinklers in accordance with City standards, and as determined by the Fire Marshal. New residential development shall be provided with fire sprinklers unless the developer provides studies that prove the standard identified in Policy S-35 is not negatively affected.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential recreational and service systems impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III project. According to the General Plan EIR, the following recreational and service systems impacts were identified:

- Buildout of the General Plan would significantly increase the City's population and demand for parkland. This impact was identified as significant, unless mitigated.

- Buildout of the General Plan would increase the need for fire fighting personnel and equipment. This impact was considered significant, unless mitigated.

- Buildout would require additional fire protection facilities and equipment to maintain an acceptable response time. This impact was considered significant, unless mitigated.

- Buildout would increase the need for police protection personnel and equipment. This impact was considered significant, unless mitigated.

- Buildout would generate additional school aged children. The number of new households and associated students would significantly increase the demand for school facilities. This impact was considered significant and adverse.

Soledad Municipal Code

The following discussion provides a general overview of applicable provisions of the City of Soledad Municipal Code, in addition to associated Ordinances and City Council Resolutions, as they pertain to development impact fees for various public facilities. This information is intended to provide a contextual background of various City requirements pertaining to the payment of public facilities impact fees. Moreover, as discussed below, the City of Soledad annually updates the various development impact fees to reflect the percentage change in the construction index for San Francisco. As a result, the proposed project will be subject to the requirements of the adopted impact fee in effect at the time of building permit issuance.

Ordinance No. 637

On October 18, 2006 the City Council adopted Ordinance No. 637, which added Chapter 14.06 to Title 14 of the Soledad Municipal Code. The purpose of Ordinance No. 637 was to identify impact fees for public facilities in order to mitigate potential impacts to public facilities associated with new developments. As required pursuant to Section 14.06 of the Soledad Municipal Code, all public impact fees are required to be annually adjusted to reflect the annual percentage change in the construction index for San Francisco as reported in the Engineering News-Record. In order to mitigate potential project-induced impacts to public facilities, the project applicant would be required to submit payment of public facilities impact fees consistent with the requirements of Ordinance No. 637 and the corresponding impact fee in effect at the time of building permit issuance.

Miravale III Specific Plan.

Sections 4.0 and 5.0 of the Miravale III Specific Plan identify goals and policies to ensure the adequate provision of public services and recreational space. Applicable goals are summarized as follows:

- Parks, Recreation, and Open Space Goal P-1 states that adequate park, open space, and recreational facilities shall be provided in order to meet project demands. Numerous policies are contained in the Specific Plan to insure that adequate facilities are provided to meet anticipated demands.

- Public Services and Facilities Goal PSF-1 states that project development should provide an efficient, self sustaining system of public facilities that accommodate the needs of project build-out.

- Goal PSF- 2 further states that project development should provide adequate and reliable services and utilities to area residents and business while ensuring that adequate maintenance of these facilities is provided.

Relevant Project Characteristics

The Specific Plan calls for a mixed-use urban development consisting of new roads and infrastructure, single-family and multi-family residential units, retail commercial space, a golf course, school and public safety sites, a 120-unit hotel, and open space and recreation areas.

As identified in Section 6.3.4 of the Miravale III Specific Plan, a centrally located site along West Street has been designated for the future location of a fire station substation and a remote police station in order to meet project generated demands for police and fire protection services (See Figure 3-3). Moreover, according to Section 5.2.1 of the Specific Plan, three school sites have been identified within the Specific Plan area. Specifically, the proposed project would provide two elementary school sites located on the southeast corner of Orchard Lane and Crest Street and north of West Street between San Vicente Road and Crest Street. A junior high site is also planned east of San Vicente Road and north of West Street. However, the proposed junior high site is located within lands contracted by the Williamson Act. If the proposed junior high school must be constructed prior to the expiration of the Williamson Act contract, an alternative location has been identified east of San Vicente Road and north of the elementary school proposed between San Vicente Road and Crest Street. The proposed project also includes a site for the future location of a Community Education Center/Continuation school within the northwest portion of the project site.

As previously identified, the proposed project would also provide recreational opportunities to area residents. Specifically, in addition to providing an approximately 159-acre semi-private golf course and driving range, development of the proposed project would result in the construction of four pocket parks totaling approximately 11.52 acres. The four pocket parks would be distributed throughout the proposed development to provide active recreational uses to area residents. Moreover, according to the Specific Plan, approximately 24.27 acres of additional parkland would be provided in the six Village Residential areas. Although no formal plans have been prepared for these areas, future development of these sites would be required to provide improved parkland consistent with the Specific Plan and General Plan requirements. Table 4.12-3 provides an estimated parkland requirement according to maximum allowable density for each of the proposed Village areas per the Village Residential standards contained in the Specific Plan.[2] The Specific Plan also identifies approximately 5.96 acres of pedestrian trails within the planning area, 1.90 acres of park connections, and a 1.95 acre linear park. In addition to active recreational uses, the Specific Plan has identified approximately 61.90 acres of open space for passive recreational use. In addition to the 5.96 acres of pedestrian trails, the proposed project also includes an additional 4.22 miles of Class II bike lanes, as well as, another 4.04 miles of trails within the golf course alignment.

[2] It is important to note, however, that parkland requirements may vary depending on project-specific plans. The calculations in Table 4.12-3 assume maximum buildout per the Village Residential standards contained in the Specific Plan. Future development of the proposed Villages may be subject to variation.

Table 4.12-3 Parkland Requirements for Proposed Village Areas	
Village Area	**Required Parkland**
Village 1	9.27 Acres
Village 2	6.0 Acres
Village 3	1.0 Acres
Village 4	1.0 Acres
Village 5	3.5 Acres
Village 6	3.5 Acres
Source: Miravale III Specific Plan	

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any public services:
  - fire protection;
  - police protection;
  - schools;
  - parks;
  - other public facilities;

- impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;

- expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands;

- increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; or

- include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

Impacts and Mitigation

Police and Fire

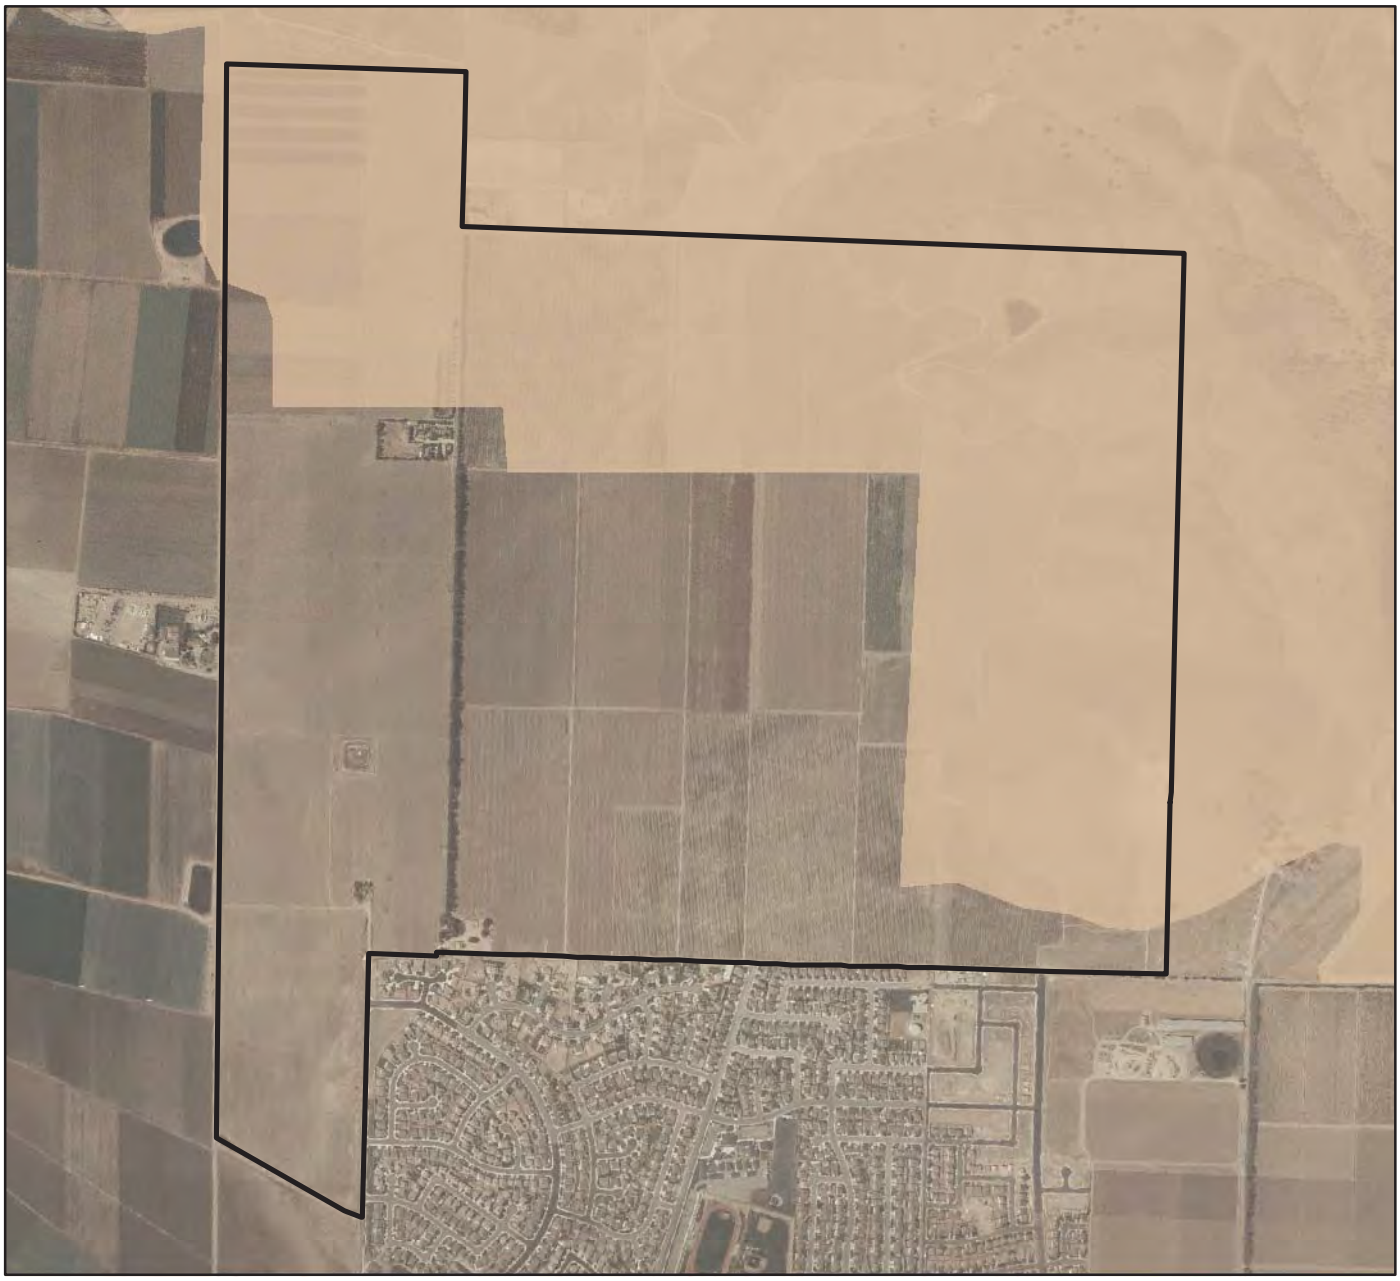
Implementation of the proposed project would create an increased demand for police and fire services due to the increase in the square footage of commercial space and the development of new residential units. Project development would result in the introduction of 15,201 persons within the City, effectively increasing the response area for both police and fire services. The increased demand for police services would be generated by potential crimes that could occur within the proposed project site. The increased

demand for fire protection services would be generated by the expansion of the service area and the potential for fire hazards, including but not limited to, structural fires, medical emergencies, and hazardous conditions associated with project buildout.

According to the City of Soledad Fire Department, average response times to the main entrances of the project site vary between five and seven minutes (Interim Fire Chief Steven Negro, personal communication, September 2006, and Fire Chief Richard Foster, personal communication, June 2007). According to a fire analysis prepared by Citigate, which was adopted by the City Council in April 2006, the first fire engine should arrive on scene within seven minutes, 90 percent of the time. As indicated by the City of Soledad Fire Department, project development would impact existing response times for fire protection services due to the expansion of coverage area. As a result, the Fire Department would not be capable of achieving the identified target response time of seven minutes due to project development (Interim Fire Chief Steven Negro, personal communication, September 2006, and Fire Chief Richard Foster, personal communication, June 2007).

As previously identified above, a site has been designated along West Street to ensure that average responses times would be within acceptable levels. According to the City of Soledad Fire Chief, the proposed location of the fire substation would be adequate to provide fire protection services to the project area (Fire Chief Richard Foster, personal communication, January 2008). Project-specific mitigation, however, would be warranted to ensure that the proposed facility is operational prior to the initiation of construction activities associated with Phase 2 of the proposed development. More specifically, the Fire Department has indicated that average response times outside of Phase 1 would be in excess of established standards. Therefore, the Department has determined that it is necessary that the fire substation be constructed and operational prior to additional construction in subsequent phases of the proposed project to minimize potential fire-related hazards. Implementation of Mitigation Measure 4.12-1 would reduce project-related impacts to a level considered less-than-significant.

In addition to adversely affecting target response times, development of the proposed project would expose people and/or structures to wildland fire hazards. More specifically, the foothill portions of the project site are identified as being subject to wildland fires and are identified as a "State Responsibility Area" by the State of California. According to the State of California, these areas are subject to fire hazards and typically consist of "timber, brush, undergrowth or grass…which protects the soil from erosion, retards runoff of water, or accelerates percolation, and lands principally used for range of forest purposes." Figure 4.12-1 identifies portions of the project site that are located within the State Responsibility Area. Vegetation within these areas is consistent with the State's definition. Currently, fire protection services within these areas are provided by the California Department of Forestry; however, upon annexation, these areas will be under the jurisdiction of the Soledad Fire Department. Although fire services would be provided by the City, homesites within these areas would be required to adhere to fire safety standards, including setbacks in the form of defensible spaces from areas designated as Open Space. While agricultural/urbanized areas are considered to have a relatively low fire hazard compared to wildlands, wildland fire hazards, due to prevailing wind patterns in the Salinas Valley, are considered significant. To minimize these hazards, the City Fire Chief implements the fire prevention regulations of the Uniform Fire Code. These regulations specify minimum safety standards for water flow, water pressure, street width and access, and turning radius for fire equipment. The proposed development would be required to be constructed in accordance with all applicable fire and building safety codes, including both the Uniform Building Code and Uniform Fire Code. In addition to adhering to the requirements of applicable fire and building safety codes, implementation of project-specific mitigation requiring a 100-foot defensible space for structures constructed within the foothill areas would ensure that fire hazards are reduced to the extent feasible. Project-related impacts are further reduced to a less-than-significant level through the incorporation of mitigation requiring that a fully operational fire station at the designated West Street location be constructed prior to the issuance of any building permits for Phase 2 of the



proposed project. As a result, project-related impacts associated with the exposure of people and/or structures to fire hazards are considered less-than-significant.

Development of the proposed project would also result in potentially significant impacts in terms of police protection services. More specifically, development of the proposed project has the potential to adversely affect average response times and generate additional demands for services beyond current levels. Additionally, development of the proposed project would also conflict with several General Plan policies pertaining to police staffing and target response times.

According to the City of Soledad Police Department, current responses times within the City average approximately three minutes. The annexation and subsequent buildout of the project site would effectively increase the response area for police protection services. Consequently, project development has the potential to adversely affect emergency response times. According to General Plan Policy S-30, the "City shall strive to achieve and maintain emergency response time to a maximum of five minutes for police emergencies." Development of the proposed project, without mitigation, would exceed this threshold and would have a significant adverse impact on existing police protection services. As identified in Section 6.3.4 of the Specific Plan, a centrally located site has been designated for the future siting of a remote police station and a fire station. Implementation of the mitigation identified below requiring that the police substation be constructed in proposed location prior to the issuance of any building permit for Phase 2 would ensure that average response times are within the identified target range. As a result, project-related impacts would be reduced to a level considered less-than-significant.

Development of the proposed project would also generate additional demands for police protection services associated with the expansion of service area and corresponding increase in population. In 2005, according to the Monterey County Emergency Communication Department, the City of Soledad Police Department responded to 16,303 calls, which included traffic violations, thefts, burglary, peace disturbances, and medical emergencies. The introduction of 15,201 persons would substantially increase the population of Soledad and thereby increase demands for police services. As identified in the City of Soledad General Plan, the desired police officer to resident ratio is one officer per 1,000 residents (General Plan Policy S-29). At current staffing levels, development of the proposed project would result in an officer to resident ratio of 0.5 officers per 1,000 residents. Therefore, existing staff levels are insufficient to maintain the identified officer to resident ratio. In order to maintain the established ratio, development of the proposed project would require an additional 15 police officers. This represents a significant impact that can be reduced to a less-than-significant level through the incorporation of mitigation identified below. More specifically, the mitigation measures identified below ensure that adequate funding and facilities would be available to hire additional staffing as necessary and thereby accommodate project development.

The project would result in an increase in the number of calls for police protection and emergency response. Access to the main entrances of the project site is within range of the average response times, however, additional staffing, equipment, and infrastructure (substation) would be necessary in order to serve the proposed development and maintain average response times (Interim Fire Chief Steven Negro, personal communication, September 2006, and Police Chief Richard Cox, personal communication, September 2006). While the proposed development would substantially increase the demand for police and fire protection services within the City of Soledad, the proposed development can effectively mitigate project-related impacts to a less-than-significant level. Additionally, the project would not interfere with an adopted emergency response/evacuation plan since the project site is currently undeveloped and located east of existing urban areas. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

0 0.25 0.5 Kilometers

Project Boundaries

State Responsibility Area

N

State Responsibility Areas

Figure 4.12-1

Impact **The project would result in an increased demand for police and fire services. *This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.12-1 Prior to the initiation of construction for Phase 2 of the proposed development, the proposed fire and police facilities located on West Street shall be constructed and operational. Prior to the issuance of any building permit for new residential and commercial development in Phase 2, the project applicant shall obtain written documentation from the Soledad Fire and Police Departments indicating that the fire and police substations are operational, subject to the review and approval of the City of Soledad.

4.12-2 Prior to the issuance of building permits, the applicant/developer shall pay a City Public Facilities Development Impact Fee for each type of new development in accordance with the adjusted impact fee in effect at the time of building permit issuance. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.

4.12-3 Prior to the recordation of each final map for development within areas currently designated as "State Responsibility Areas," the applicant shall submit evidence, subject to the review and approval of the City of Soledad Fire Department, demonstrating that a minimum 100-foot defensible space will be provided around any structure constructed within the foothill area. The defensible space shall be cleared of and maintained free of brush and combustible debris, and any landscaping placed within the defensible space shall be irrigated.

Schools

Within the Soledad planning area, the SUSD currently operates five (5) elementary schools (grades K-6), one middle school (grades 7-8), one high school (grade 9-12), and two continuation/alternative high schools. Development of the proposed residential uses would generate additional students, associated with the increase in population. The SUSD has prepared student generation rates for residential uses. Using these rates, project buildout is anticipated to generate 4,291 school-aged children, as presented in Table 4.12-4 below.

Table 4.12-4
Projected Student Generation

Grade Level	Generation Rate/Unit	No. Units[1]	No. New Students
K-6	0.662	3,700	2,449
7-8	0.169	3,700	625
9-12	0.329	3,700	1,217
		Total:	4,291

1. Senior units are excluded from total number of units as these units are not anticipated to generate additional students.
Source: Soledad Unified School District 2008.

Project development would result in an increase in student population thereby exceeding existing enrollment capacity of the SUSD. In order to accommodate anticipated student capacity, the project proposes to provide three school sites, including two elementary schools and one middle school. The proposed middle school is currently located on a portion of the site under Williamson Act contract. An alternative middle school location has been proposed in the event that the middle school, depending on

future capacity and enrollment figures, requires construction prior to the expiration of the Williamson Act contract. Figure 3-3 shows the proposed school locations, including the alternative middle school location.

The project, as currently proposed, however, does not provide adequate school sites to accommodate projected students associated with project development. More specifically, according to the SUSD additional school sites are necessary in order to accommodate project demand. In a September 2007 correspondence regarding the potential impacts of the proposed development on school facilities, SUSD indicated that two additional elementary and one high school site would need to be provided to meet project demands. At the time, SUSD projected that project development would result in approximately 4,872 school aged children. These estimates have subsequently been revised based on additional information regarding the number of senior units proposed as part of the proposed project. As indicated in recent correspondence from SUSD (March 2008), senior units are not anticipated to generate additional students. Table 4.12-4, above, reflects the revised student projections, which take into account the number of senior units. Based on the revised student projections and existing school capacity, at least two additional elementary sites and a high school site would be necessary to meet project demands. As a result, the proposed project does not provide adequate school facilities. This is considered a potentially significant impact.

While overcrowding itself does not constitute a significant effect on the environment, previous court rulings have determined that overcrowding would constitute a significant impact if the overcrowding would ultimately require physical changes in the environment, such as construction of new school facilities. As previously discussed, project development would necessitate the construction of at least three additional facilities beyond those currently identified in the Specific Plan. According to the SUSD, an additional 40-acre high school location would be warranted to accommodate projected students. Based on current enrollment projections, as well as anticipated student growth associated with previously approved projects, the additional High School site would need to be operational to accommodate Phase II of the proposed project. Moreover, based on the projected student population figures contained in Table 4.12-4, an additional two elementary schools would also be warranted. At least one of the additional elementary sites would also need to be operational at the time of Phase II of the proposed project to ensure adequate facilities are available to meet project demands associated with Phase I and II of the proposed project. Based on the preceding discussion, the project, as currently proposed, provides inadequate school facilities to accommodate projected students. This is considered a potentially significant impact that can be reduced to a less-than-significant level through the incorporation of mitigation. To further minimize project impacts, the City of Soledad requires that school impact fees be paid to the school district to mitigate project-related impacts. California State law (Government Code Section 65995) specifies the payment of a school impact fee for each type of new development as an acceptable method of offsetting the effect of new development on the adequacy of school facilities.

Based on current enrollment figures and project generated student population, project development, as currently proposed, would exceed the capacity of existing schools within the SUSD (Jorge Guzman, SUSD, personal communication, August, September, November 2007, February, and March 2008). Project adherence to the General Plan and Specific Plan education policies requiring that new school facilities are constructed and operational prior to the occupation of residences that require the facilities, as well as implementation of the mitigation identified below would ensure that project-related impacts are reduced to a less-than-significant level. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR. If, however, the additional school sites are not provided within the project boundaries, development of these facilities may result in additional environmental impacts beyond those identified in this EIR and additional environmental review would be warranted.

Impact **The project would result in an increased demand for educational services.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.12-4 Prior to project approval, the project applicant shall submit evidence, including a revised Specific Plan and tentative map, demonstrating that an additional two elementary school sites of sufficient size and a 40-acre high school site will be designated within the project boundaries to meet project demands, subject to the review and approval of the City of Soledad and the Soledad Unified School District. The 40-acre high school site shall be operational prior to the issuance of any certificate of occupancy for Phase II of the proposed project, unless otherwise approved by the City of Soledad and the Soledad Unified School District[3]

4.12-5 The applicant/developer shall pay a school impact fee for each type of development pursuant to the criteria set forth within California Government Code Section 65995. Prior to the issuance of building permits, the applicant shall pay required school mitigation fees. As indicated above, the fees set forth in Government Code Section 65996 constitute the exclusive means of both "considering" and "mitigating" school facilities impacts of projects [Government Code Section 65996(a)]. They are "deemed to provide full and complete school facilities mitigation" [Government Code Section 65996(b)].

Parks and Recreation

The project proposes to provide public park lands to serve the recreational needs of the proposed development and surrounding community. As identified in the Miravale III Specific Plan, an array of active and passive recreational opportunities would be provided in conjunction with project development, including an approximately 159-acre golf course, four pocket parks totaling 11.52 acres, 61.90 acres of open space, and approximately 4.22 miles of class II Bike Lanes within the Specific Plan area. Moreover, project development includes 1.90 acres of park connections, 5.96 acres of trails, and a 1.95-acre linear park located along the western boundary of the project site. The proposed linear park also serves as an agricultural buffer.

According to General Plan Policy PR-1, new residential subdivisions are required to provide parkland at a ratio of three (3) acres per 1,000 residents anticipated as part of new development. Buildout of the proposed Specific Plan is anticipated to provide housing for approximately 15,201 new persons within the City of Soledad. As such, project development would be required to provide a minimum of 45 acres of improved parkland. As proposed, the project consists of 11.52 acres of improved parks, 1.90 acres of park connections, 5.96 acres of trails, and a 1.95 linear park/agricultural buffer totaling 21.33 acres of improved parkland. For the purpose of this analysis, the golf course is not included as parkland because access would be restricted to persons with scheduled tee times and, therefore, would not be immediately available to area residents. Figure 4.12-2 provides a graphical representation of open space and parkland to be provided as part of project development.

[3] Alternatively, if additional school sites will not be provided in conjunction with project development, the project applicant shall obtain written documentation from the Soledad Unified School District demonstrating that adequate school facilities, including a 40-acre high school and two appropriately sized middle schools, will be available within the City of Soledad to accommodate anticipated project demands. If, however, adequate capacity does not exist, development shall be restricted until such time that additional capacity is available to accommodate subsequent phases of development.

According to the projected population figure identified in **4.11 Population and Housing**, which includes estimates for the buildout of the six Village areas, project development does not meet the minimum required parkland contribution. More specifically, the Specific Plan identifies that future park sites would be provided in conjunction with the development of the six Village areas. As no formal plans have been submitted for these areas, no formal park sites have been officially delineated within these areas of the project site. Therefore, additional park sites would be required as part of development of the Village areas consistent with the requirements of the Specific Plan. As these additional sites have not been officially designated at this time, the project does not meet the minimum required parkland contribution pursuant to the General Plan. This is considered a significant impact. As identified in Table 4.12-3 above, it is estimated that a minimum 24.27 acres of parkland would be necessary in order to achieve the minimum required parkland contribution pursuant to General Plan requirements. Implementation of project-specific mitigation identified below would ensure that future residents have adequate access to parkland consistent with City standards. Because all of the parks and recreation facilities necessitated by the project would be provided on the project site, the environmental impacts of constructing the parks and recreation facilities (e.g., dust and noise emitted during grading) are addressed in the relevant chapters of this EIR. Implementation of the following mitigation measure would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **As proposed, the project does not meet the minimum required parkland ratio of three acres per 1,000 residents.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measure.***

Mitigation

4.12-6 In order to ensure adequate improved parkland is provided as part of project development, the applicant shall submit detailed plans, including a revised Specific Plan and Tentative Map, demonstrating that adequate parkland (3 acres/1,000 residents) is designated within the project boundaries consistent with the requirements of the General Plan and Miravale III Specific Plan dated June 2007, prior to project approval, subject to the review and approval of the City of Soledad.

In addition, anticipated population growth of future residents of the project would also create additional demands on existing park and recreational facilities throughout the City such that physical deterioration of these facilities would occur. This is a potentially significant impact that can be reduced to a less-than-significant level through the incorporation of mitigation measure 4.12-7 identified below, in addition to adhering to applicable Miravale III Specific Plan and City of Soledad General Plan policies. These impacts are, therefore, reduced to a less-than-significant level. Implementation of the following mitigation measure would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **Population growth anticipated under the Miravale III Specific Plan would create additional demands on park and recreational facilities.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measure.***

4.12-7 Prior to the issuance of any building permit, the applicant/developer shall submit payment of a Park Facilities Impact Fee in accordance with the adjusted impact fee in effect at the time of building permit issuance, if determined to be applicable. All fees shall be subject to the review and approval of the City of Soledad Community Development Director.

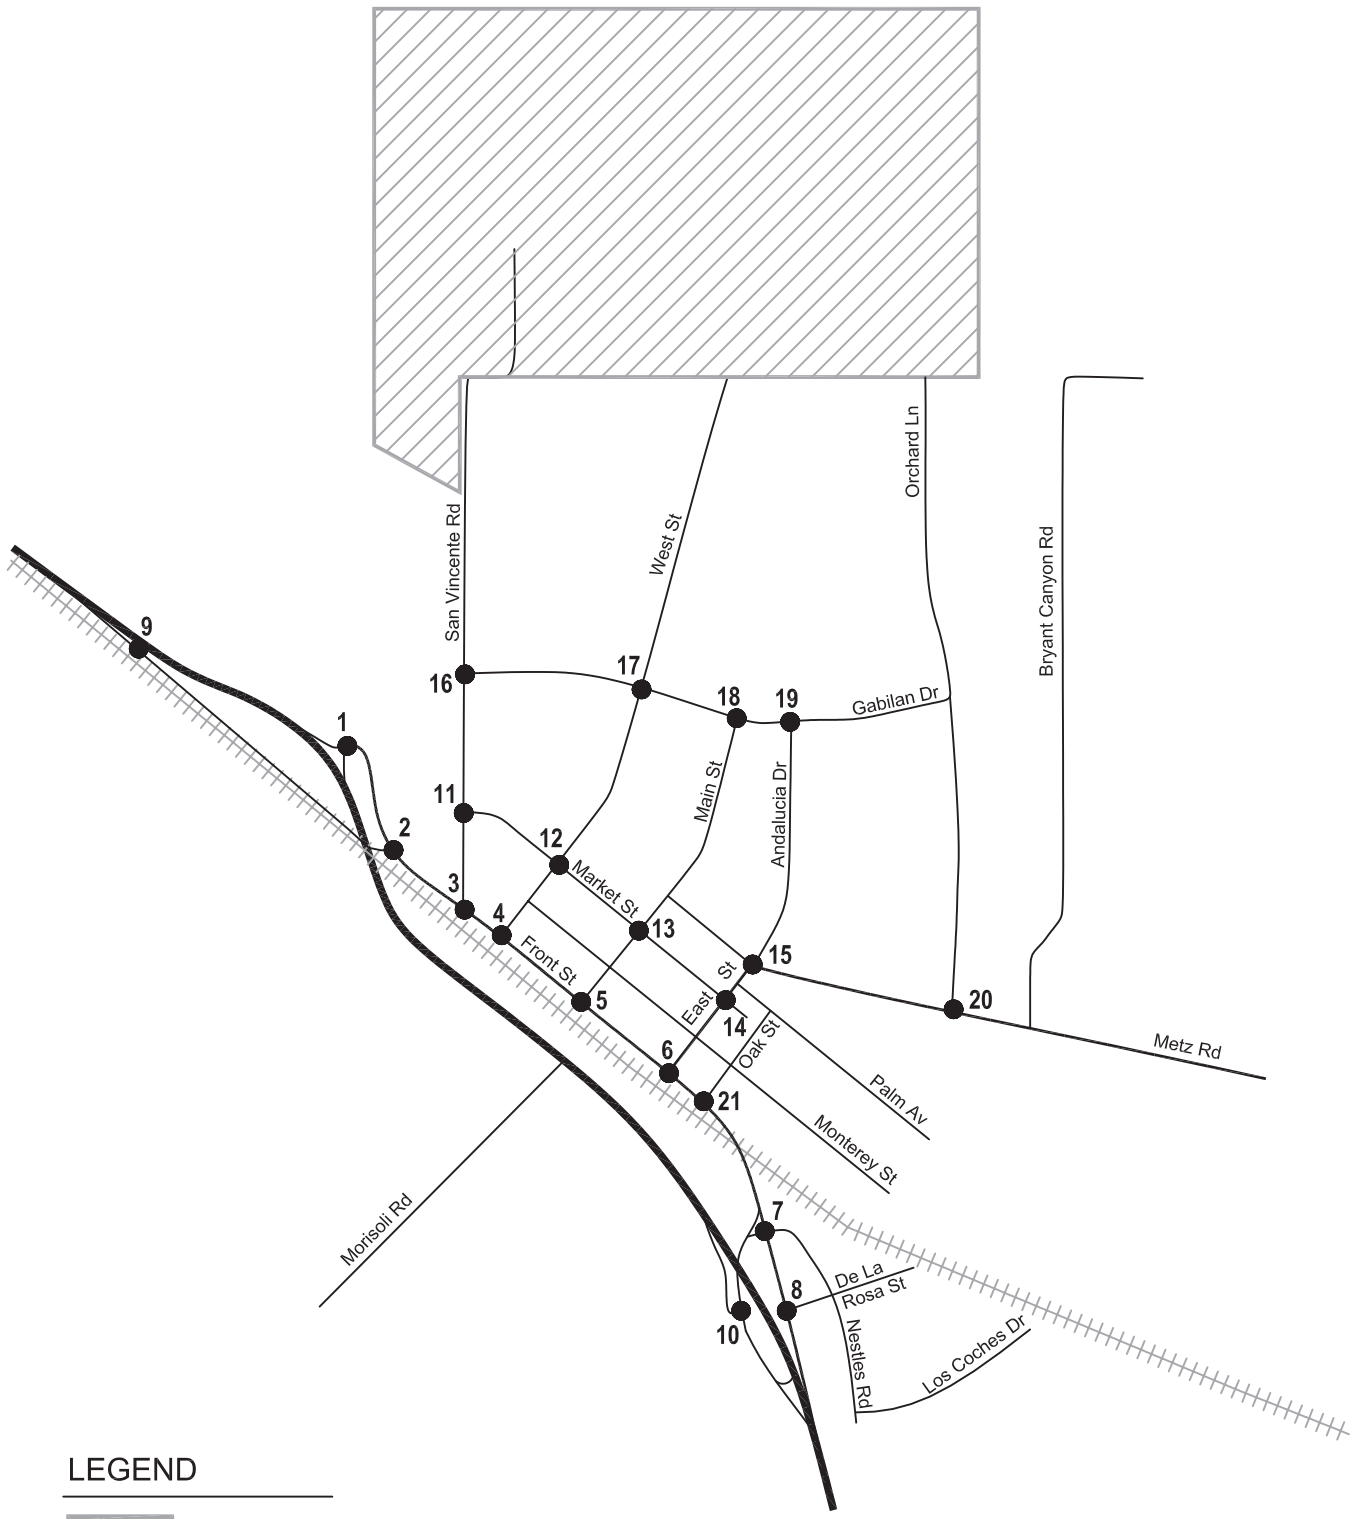
4.13 TRAFFIC AND CIRCULATION

Introduction

A *Transportation Impact Analysis* was prepared for this project by Hexagon Transportation Consultants (August 15, 2007), and the following discussion incorporates that analysis. A copy of this analysis (excluding appendices) is included as Technical Appendix T-8 in Volume II of this EIR. A complete copy of this analysis, including appendices, is available for review at the City of Soledad.[1] Additionally, all key figures and tables of the report are included in Appendix J of this EIR. This section identifies the potential traffic impacts related to the proposed development in accordance with the requirements of the City of Soledad and CEQA.

Setting

The project site is located in the northern outskirts of the City of Soledad between San Vicente Road and Orchard Lane. Soledad is located in the southern Salinas Valley along Highway 101, one of the three main north-south traffic arteries serving central California. Regional access to the project site is provided solely via US 101. Local access to the site is provided by Moranda Road, Front Street, San Vicente Road, West Street, Orchard Lane, and Gabilan Drive.



Traffic Study and Methodology

A traffic analysis was prepared for the project by Hexagon Transportation Consultants, August 15, 2007. This study was conducted for the purpose of identifying the potential traffic impacts related to the proposed development. The project as proposed will consist of 1,470 single-family homes, 2,230 multi-family units, 500 senior housing units, 120 hotel rooms, and up to 275,000 square feet of supporting retail. A golf course, schools, and parks will also be part of the 920-acre site. The traffic analysis is based on peak-hour levels of service for unsignalized intersections. The traffic study also includes an evaluation of peak-hour signal warrant and roadway and freeway level of service analysis. In summary, the study includes an analysis of 21 unsignalized intersections, 11 roadway segments, and 11 freeway segments in the vicinity of the project site. Study intersection and roadway and freeway segments are identified in Figure 4.13-1. Traffic conditions at the intersections were analyzed for the weekday AM and PM peak hours of traffic. The AM peak hour of traffic is generally between 7:00 and 9:00 AM, and the PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that the most congested traffic conditions occur on an average day. The following intersections, freeway segments, and roadway segments were analyzed as part of the traffic analysis prepared by Hexagon Transportation Consultants:

Study Intersections

1. Moranda Road and US 101 Northbound Ramps
2. Moranda Road and Front Street
3. San Vicente Road and Front Street
4. West Street and Front Street
5. Main Street and Front Street
6. East Street and Front Street
7. Front Street and Nestles Road
8. Front Street and US 101 Northbound Ramps

[1] Appendices A through G of this report are not included as part of Technical Appendix T-8 due to the size of the appendices. These appendices are available for public review during regular business hours at the City of Soledad Community Development Department, 248 Main Street, Soledad, CA, (831) 223-5000.

11. West Street, North of Gabilan Drive

The traffic analysis also includes an evaluation of peak-hour signal warrant and roadway and freeway level of service analysis (LOS). LOS is a measure of roadway quality of service. LOS describes traffic conditions on a scale of A to F, with LOS A indicating free flow conditions with minimum delay, and LOS F representing severe congestion with major delay. Table 1 shows the LOS criteria at unsignalized intersections in terms of delay per vehicle. The traffic study analyzed traffic conditions under the following scenarios:

Scenario 1: *Existing Conditions.* Existing conditions were represented by existing peak-hour traffic volumes on the existing roadway network. Existing traffic volumes were obtained from July 2006 traffic counts.

Table 4.13-1
Unsignalized Intersection Level of Service Criteria Based on Delay

Level of Service	Average Control Delay Per Vehicle (sec.)
A	0 – 10
B	> 10 – 15
C	> 15 – 25
D	> 25 – 35
E	> 35 – 50
F	> 50

Source: Transportation Research Board, Highway Capacity Manual (Washington, D.C., 2000) pp. 17-2.

Scenario 2: *Background Conditions.* Background conditions were represented by future background traffic volumes on the near-term roadway network. Background traffic volumes were estimated by adding to existing peak-hour volumes the projected volumes from approved but not yet completed developments. The latter component was developed based on a list of approved projects provided by the City of Soledad.

Scenario 3: *Project Conditions.* Project conditions were represented by future traffic volumes, with the project, on the near-term future roadway network. Future traffic volumes with the project (hereafter called *project traffic volumes*) were estimated by adding to background traffic volumes the additional traffic generated by the project. Project conditions were evaluated relative to background conditions with improvements in order to determine potential project impacts.

Scenario 4: *Cumulative Growth No Project Conditions.* Traffic volumes for cumulative conditions without the project were estimated by adding traffic associated with pending developments in the City of Soledad to background traffic volumes. The analysis of cumulative growth conditions was conducted at the request of the City of Soledad and is in conformance with CEQA.

Scenario 5: *Cumulative Growth with Project Conditions.* Cumulative traffic volumes with the project were estimated by adding to cumulative no project traffic volumes the additional traffic generated by the project.

Scenario 6: *Year 2030 Conditions.* Year 2030 conditions were represented by forecasted Year 2030 traffic volumes. The traffic forecasts for Year 2030 were produced using the Association of Monterey Bay Area Governments (AMBAG) Regional Traffic Model. The 2030 model includes land use growth and transportation improvements associated with build-out of all General Plans within the AMBAG region and 30 year through-traffic growth on major regional facilities.

Existing Conditions

Existing Roadway Network

US 101 is a four-lane freeway within the City of Soledad. It extends north through Salinas and south through King City. Access to the site is provided via its interchanges with Moranda Road and Front Street within the City of Soledad.

Moranda Road is a north/south roadway that runs from Front Street to US 101. Moranda Road serves as the access road to and from the US 101 northbound ramps in the northern part of the city. The roadway is one lane in each direction with a 35-mph speed limit.

Front Street is an arterial that runs parallel to and along the east side of US 101 and the Union Pacific Railroad tracks, between Moranda Road and Oak Street. South of Oak Street, Front Street crosses under the tracks and terminates at the US 101 northbound off ramp at Hector De La Rosa Sr. Street. The roadway varies in width between its north and south termination points at US 101. Between the US 101 northbound off-ramps in the southern part of Soledad and West Street, Front Street is two lanes. Between West Street and Moranda Road, the roadway widens to four lanes prior to narrowing once again to two lanes at its intersection with Moranda Road. The roadway has a 25-mph speed limit through downtown and increases to 35-mph north and south of downtown.

San Vicente Road is a north/south collector roadway that extends north from Front Street to the project boundary. The roadway is one lane in each direction with a 25-mph speed limit. The project includes the extension of San Vicente Road into the site, providing direct access to the project area from northern Soledad.

West Street is a north/south collector roadway that runs from Front Street to the project boundary and will extend from the project boundary to Metz Road, as part of the Miravale II development. The roadway is four lanes wide with speed limits ranging from 25 to 35 mph. The project includes the extension of West Street into the site providing direct access to the project area from central Soledad.

Orchard Lane is a north/south roadway that runs from Gabilan Drive to the project boundary. As part of the Miravale II development, Orchard Lane will be extended from the project boundary to Metz Road. The roadway is one lane in each direction with a 25-mph speed limit. The project includes the extension of Orchard Lane into the site, providing direct access to the project area from southern Soledad.

Gabilan Drive is an east/west arterial roadway that extends from Orchard Lane to San Vicente Road. The roadway is four lanes wide with a 25-mph speed limit between San Vicente Road and Prado Drive. Gabilan Drive narrows to one lane in each direction from Toledo Street to its terminus as a cul-de-sac just west of Bryant Canyon Road.

Existing Transit Service

Soledad is currently not served by regularly scheduled intra-city public transit. However, the Monterey-Salinas Transit system, which is the largest single public transit provider in Monterey County, provides regularly scheduled service between King City and Salinas with a stop in Soledad. In addition taxi, service is provided on-demand within the City. Greyhound Bus Lines provides intercity transportation to locations north and south; the bus stops in Soledad four times per day.

Existing Bicycle and Pedestrian Facilities

There is an existing network of Class II bikeways throughout the City. Bike lanes are provided along Front Street between East Street and Nestles Road, and along Gabilan Drive from San Vicente Road to West Street and from Toledo Street to Orchard Lane; and along Orchard Lane from the projects south boundary to Gabilan Drive with future extension of Orchard Lane to Metz Road. In addition, a City Bike Plan that identifies proposed future bicycle facilities was adopted in May 2007.

Pedestrian facilities in the study area consist primarily of sidewalks and crosswalks at intersections. Sidewalks are found along all previously described local roadways in the study area and along the local residential streets and collectors surrounding the project area.

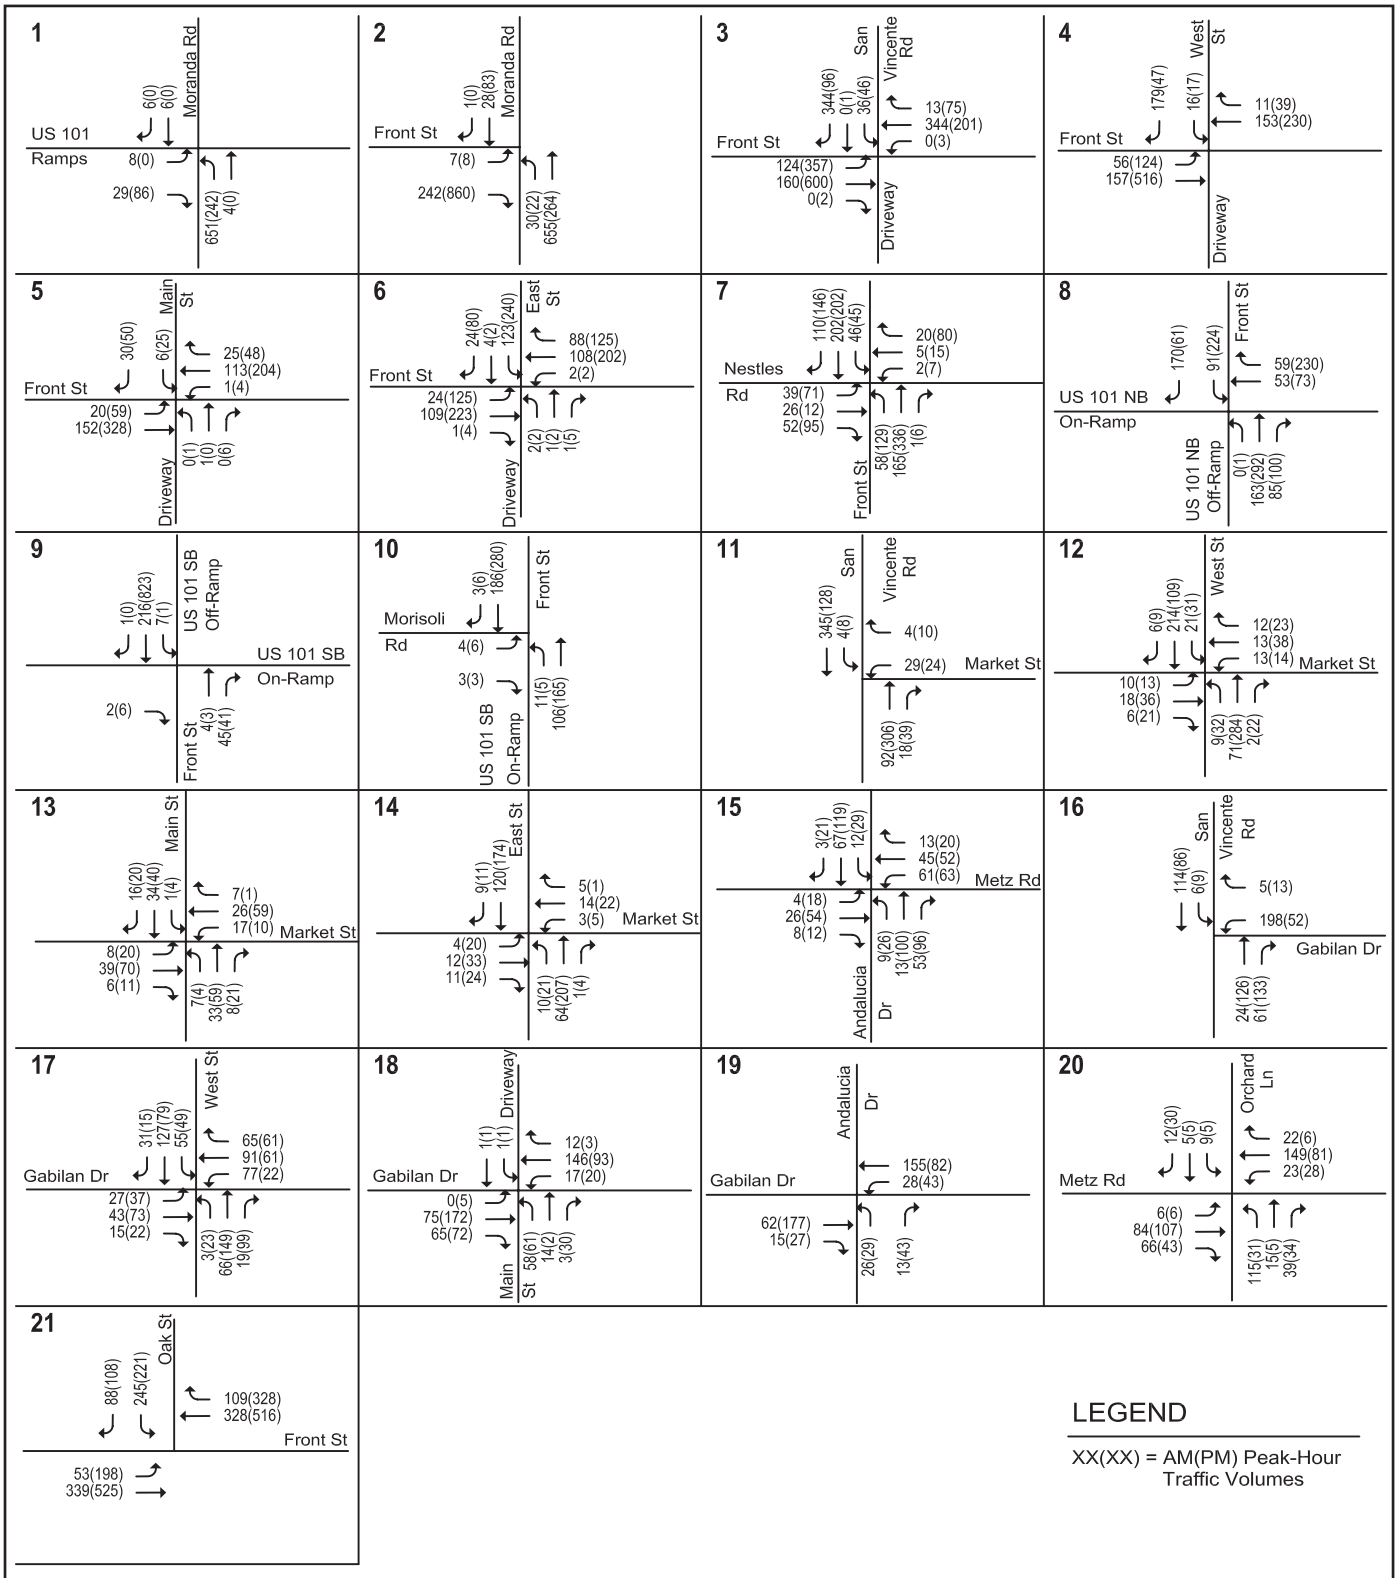
Existing Traffic Conditions

Existing peak-hour traffic volumes were obtained from new manual intersection turn-movement counts conducted in July 2006. The existing peak-hour intersection volumes are shown on Figure 4.13-2. The traffic count data can be found in Appendix A of the Transportation Impact Analysis (Technical Appendix T-8).

Intersection Operations

Measured against the City of Soledad LOS standards, all but one of the study intersections currently operates at an acceptable LOS D or better. The intersection of Oak Street and Front Street currently operates at an LOS F during both peak hours. A summary of the existing intersection LOS analysis can be found in Figure 4.13-3.

In addition, peak-hour signal warrant checks were completed for all study intersections to determine whether signalization would be justified on the basis peak-hour volumes. A summary of the signal warrant checks can be found in Appendix D of the Transportation Impact Analysis. The analysis showed that the Caltrans peak-hour volume warrant is met during at least one peak hour at the following four intersections under existing conditions:



2. Moranda Road and Front Street
3. San Vicente Road and Front Street
6. East Street and Front Street
21. Oak Street and Front Street

Roadway Segment Operations

Twenty-four hour roadway segment tube counts were conducted on all major roadways serving the selected study intersections. The collected counts provide peak hour as well as daily volumes along some of the major roadways within the City of Soledad. The collected segment volumes were used to evaluate roadway segment operations. Since there is no evaluation criteria for roadway segments, the roadway segment analysis is presented for informative purposes only. The roadway segment analysis indicates that all studied roadway segments currently operate at LOS A during both peak hours. Figure 4.13-4 presents the results of the roadway segment analysis.

Freeway Segment Operations

Traffic volumes for the studied freeway segments were obtained from 2005 data collected by the Traffic and Vehicle Data Systems Unit for Caltrans District 5. The collected data provides average annual daily and peak hour volumes along each freeway segment for both directions of travel. Peak hour splits for each segment were developed using directional peak-hour volume data collected by Caltrans. The directional peak hour volume provides a percentage of total peak hour traffic by direction. The freeway segment analysis indicates that all freeway segments analyzed currently operate at LOS C or better. Freeway segment analysis is presented in Figure 4.13-5.

/b/ Data provided by Caltrans Data System Unit 2005, Route 101 District 5.

Freeway Segment Analysis

Figure 4.13-5

DENISE DUFFY & ASSOCIATES, INC.

Freeway Ramp Analysis

Traffic volumes for the studied freeway ramps were obtained from the traffic counts collected at each of the interchange intersections. The collected counts were compared to historical Caltrans ramp counts and found to be greater than Caltrans counts. The freeway ramp analysis indicates that all freeway ramps analyzed currently operate at LOS B or better. Freeway ramp analysis is presented in Figure 4.13-6. Though LOS analysis does not indicate deficient operations on the ramps based on the ramps' capacities, there are existing operational deficiencies due to inadequate ramp configurations to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were not designed to accommodate existing traffic volumes. The existing ramp alignments inadequately accommodate increasing ramp volumes onto the mainline.

Regulatory Environment

City of Soledad General Plan

The City of Soledad General Plan includes a Transportation and Circulation Element adopted in 2005 that provides goals and policies aimed at meeting the transportation needs of the City, including the provision and maintenance of transportation infrastructure. The Circulation Element identifies specific roadway deficiencies, as well as improvements necessary to achieve and maintain an acceptable level of service (LOS) on the transportation system through buildout of the City.

The following transportation and circulation policies apply to development within the project area.

Policy C/T-1 Level of Service "D" or better shall generally be maintained on all streets and intersections. Lower levels of service may be accepted during peak times or as a temporary condition, if improvements to address the problem are programmed to be developed. To identify potential impacts of new development on traffic service levels, the City shall require the preparation of traffic impact analyses generally at the sole expense of the developer for developments determined to be large enough to have potentially significant traffic impacts.

Policy C/T-2 Streets shall be dedicated, widened, extended and constructed in accordance with City standards. Dedication and improvements of full rights-of-way shall not be required in existing developed areas where the City determines such improvements are infeasible or undesirable. New development shall be responsible for improving a minimum one-half street along the outer-boundaries of each subdivision along subdivision property where street extensions are identified. Other deviations from these standards shall be permitted upon a determination by the City Engineer that safe and adequate public access and circulation are preserved by such deviations.

Policy C/T-4 On arterial roadways, intersection spacing shall be maximized. New driveways along collector and arterial roadways shall be minimized or prohibited completely.

Policy C/T-5 The street system in residential neighborhoods shall provide safe and logical connections to the existing street pattern, and connectivity to the range of complementary land uses within neighborhoods (housing, schools, parks, neighborhood shopping, etc.). The use of multiple collector streets shall be favored over the use of arterials in new residential subdivisions.

DENISE DUFFY & ASSOCIATES, INC.

Policy C/T-8 The City shall manage the street network so that the standards presented in policies C-1 and C-12 are not exceeded. The City will require new development to mitigate the traffic impacts it causes, or the City will limit development along streets where congestion levels are unacceptable.

Policy C/T-9 New local streets shall be developed consistent with the goals, policies and programs of the Land Use Element of the General Plan.

Policy C/T-10 Facilities that promote the use of alternate modes of transportation, including bicycle lanes, pedestrian and hiking trails, park-and-ride lots and facilities for public transit shall be incorporated into new development, and shall be encouraged in existing development.

Policy C/T-13 The City shall ensure through a combination of traffic impact fees and other funding mechanisms that new development pays its fair share of the costs of circulation improvements required by such development.

Policy C/T-14 The City shall prohibit the development of private streets in new residential projects, unless approved on a project specific basis where circumstances support such a use and the streets are privately maintained.

Policy C/T-15 New development shall continue the existing street pattern, where logical.

Policy C/T-17 The City shall require the provision of adequate off-street parking in conjunction with all new development. Parking shall be located convenient to new development and shall be easily accessible from the street. The adequacy and appropriateness of parking requirements in the Zoning Ordinance shall be periodically evaluated.

Policy C/T-25 New development shall provide bike lanes and paths, secure bicycle storage and parking facilities.

Policy C/T-28 New commercial development and development in Specific Plan areas shall provide sidewalks and pedestrian paths consistent with applicable State, federal and local plans, programs and standards.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential circulation impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III Specific Plan project.

- Development of the various land uses contemplated in the General Plan would significantly increase traffic generation with a corresponding cumulative impact on the LOS of regional roadways, streets, and intersections serving the City. This impact was identified as significant and unavoidable.

- Buildout of the General Plan would adversely affect the operation and LOS of the two freeway interchanges serving the City. This impact was considered significant.

- Buildout of the General Plan could result in traffic hazards on city streets and intersections. This impact was not identified as significant.

- Buildout of the General Plan would increase demand for bicycle and pedestrian facilities in the City's planning area. This impact was not identified as significant.

- Buildout of the General Plan would contribute to the demand for public transit serving the City's planning area. This impact was not identified as significant.

Miravale III Specific Plan

Section 3.0 of the Miravale III Specific Plan identifies circulation goals and policies which establish the implementation framework for the Plan's Circulation Diagram (see Figure 4.13-7). The Plan's circulation system is designed to provide a functional and efficient transportation network for automobiles, bicyclists, and pedestrians. The street system is comprised of a network of arterial, collector, and local residential streets designed to accommodate traffic generated by Plan Area residents. All streets are public with the exception of the private driveways that serve hillside lots and some roads within Village Residential areas. The following summarizes the Plan's primary Circulation goal.

- Circulation Goal C-1 states that the project shall provide the necessary circulation system and infrastructure to create a safe and efficient circulation network for motor vehicle, pedestrian, and alternative forms of transportation with an emphasis on creating a pedestrian friendly, walkable community.

In addition to the Miravale III Specific Plan identifies specific policies and guidelines regarding the development of the Plan area's circulation system, including roadway design standards, traffic calming devices, village access, funding for ongoing maintenance, bus stop design standards, and bike facility and sidewalk requirements.

Traffic Impact Fees. The City's traffic impact fee (TIF) program was adopted in October 2007 by the City Council. The City TIF identifies fees per single-family unit and multi-family unit to be collected from proposed development and used towards identified improvements to the roadway system within and serving the City of Soledad.

Regional improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway widening, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The TAMC fee is levied against new developments within local member jurisdictions of TAMC, including the City of Soledad. At this time, however, the City of Soledad has not committed to collecting the TAMC fee. In order to address regional improvement, the City of Soledad has incorporated local TAMC improvements projects into their adopted TIF program. Therefore, the collection of impact fees as part of the City's TIF program will include regional improvements and will be in-lieu of payment of an independent TAMC fees.

Proposed Circulation Plan

Figure 4.13-7

DENISE DUFFY & ASSOCIATES, INC.

Significance Criteria

Intersection and Roadway Capacity

The project has the potential to impact both the local (City of Soledad) and regional roadway network (California Department of Transportation (Caltrans). Each agency establishes acceptable level of service standards for roadway facilities within its jurisdiction. These standards are described below.

- The City of Soledad has established LOS D or better as the general threshold for acceptable overall traffic operations for both signalized and un-signalized intersections. Table 4.13-2 (below) shows the LOS criteria at signalized and un-signalized intersections in terms of vehicle delay.

- Levels of service for freeway segments were calculated based on a volume-to-capacity ratio (V/C). Caltrans level of service standard for freeway segments is LOS C. Table 4.13-3 shows the Caltrans LOS.

Table 4.13-2
Signalized Intersection Level of Service Definitions Based on Delay

Level of Service	Description	Average Control Delay Per Vehicle (seconds)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	10.0 or less
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.1 to 80.0
F	Operation with delays unacceptable to most drivers occurring due to oversaturation, poor progression, or very long cycle lengths.	Greater than 80.0

Source: Transportation Research Board, Highway Capacity Manual 2000, Exhibit 16-2.

Table 4.13-3
Freeway Segment Levels of Service based on Volume to Capacity Ratio

Level of Service	Description	V/C Ratio
A	Primarily free-flow operations. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	Less than 0.36
B	Reasonably free-flow conditions. The ability to maneuver within the traffic traffic stream is only slightly restricted.	0.36 - 0.54
C	Provides for stable operation, however flows approach the range in which small increases will cause a substantial deterioration in service. Freedom to maneuver within the traffic is noticeably restricted.	0.55 - 0.77
D	Borders on unstable flow. Small increases in flow cause substantial deterioration in service. Freedom to maneuver within the traffic stream is severely limited. Minor incidents can be expected to create substantial queuing, as the traffic stream has little space to absorb disruptions.	0.78 - 0.93
E	Operations are extremely unstable. Any incident can be expected to produce a serious breakdown with extensive queuing. Maneuverability within the traffic stream is extremely limited.	0.94 - 1.00
F	Forced or breakdown conditions. Such conditions generally exist within queues forming behind breakdown points.	Greater than 1.00

Source: 1985 Highway Capacity Manual for freeway sections with a 70 mph design speed.

The un-signalized study intersections are analyzed with the TRAFFIX LOS software, which uses the *Highway Capacity Manual* (HCM) 2000 methodology for un-signalized intersections. This method is applicable for both two-way stop-controlled (TWSC) and all-way stop-controlled (AWSC) intersections. Two-way stop-controlled intersections have stop signs on the minor street approaches and no control on the major street approaches. The TWSC intersection LOS is determined from average control delay for the most congested approach at the intersection. AWSC intersection LOS is determined from average control delay time for all approaches at the intersection.

Un-signalized intersections were also assessed for the need of signalization. This assessment is made on the basis of the Peak-hour Volume Signal Warrant, Warrant #11, described in the Caltrans *Traffic Manual*. This method makes no evaluation of intersection level of service, but simply provides an indication whether peak-hour traffic volumes are, or would be, sufficient to justify installation of a traffic signal.

When found that study intersections meet signal warrants and/or require signalization, the intersections were analyzed with standard signalized intersection methodology. Signalized intersection area analyzed using TRAFFIX, which is based on the *Highway Capacity Manual* (HCM) 2000 method for signalized intersections. TRAFFIX evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection.

Freeway Segment Analysis

Freeway segments that serve the Soledad area were also analyzed as part of the study. Similar to the selected study intersections, freeway segments were analyzed for the weekday AM and PM peak hours of

traffic. LOS for freeway segments were calculated based on a volume-to-capacity ratio (V/C). Table 3 shows Caltrans LOS standard for freeway segments is LOS C.

Parking

Parking impacts would be considered to be significant if project parking does not meet the minimum parking requirements set forth in the City of Soledad Municipal Code

Internal Site Circulation

Impacts regarding internal site circulation are considered significant if the project would significantly increase hazards due to a design feature or incompatible uses.

Emergency Access

Impacts regarding emergency access would occur if the project did not provide adequate space and/or access for emergency vehicles to serve the project.

Alternative Transportation

Impacts to alternative transportation would occur if the project would conflict with adopted policies, plans or programs supporting alternative transportation (i.e. bus routes, bicycle paths).

Consistency with Applicable Regulations

Impacts would occur if the project would conflict with the goals and polices in the City's adopted General Plan for the purposes of avoiding or mitigating an impact to the transportation system.

Background Conditions

Background conditions are defined as conditions just prior to the completion of the proposed development. Traffic volumes for background conditions are comprised of traffic volumes from existing traffic counts plus traffic generated by other approved developments in the vicinity of the site. For the purpose of this analysis, it is assumed in this analysis that the transportation network under background conditions would be the same as the existing transportation network.

Background peak-hour traffic volumes were estimated by adding to existing volumes the estimated traffic from approved, but not yet constructed, developments. City staff provided a list of five approved developments within the City of Soledad.

- *Miravale II* – 453 single-family homes and 323 Townhomes/Apartments, the site will be bound by Bryant Canyon Road , Orchard Lane, Santa Clara Street and Metz Road.

- *Gabilan Square* – 9,960 s.f. of commercial space and 183 Townhomes/Apartments, located south of Gabilan Drive at Orchard Lane.

- *Orchard Villas* – 172 single-family homes, located along the west side of Orchard Lane north of Metz Road.

- *Monterey Street Public Housing Facility* – 52 multi-family units, located along the north side of Monterey Street between First and Second Streets.

- *Benito Street Public Housing* – 143 units, located between West and Benito Streets, and Gabilan and North Street.

The added traffic associated with the approved projects was developed based on trip generation estimates and assignments produced by Hexagon Transportation Consultants, Inc.. The magnitude of traffic added to the roadway system by each of the approved developments is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled *Trip Generation*, seventh edition, 2003, were used for this analysis. On the basis of these rates, it is estimated that the approved projects would generate a combined total of 10,774 daily trips, with 810 trips occurring during the AM peak hour and 1,051 occurring during the PM peak hour.

Background Intersection Operations

The traffic that will be generated by the approved projects was combined with existing traffic to provide background traffic volumes. LOS under background conditions at the study intersections can be found in Table 10 of the Transportation Impact Analysis. The results show that, measured against the City of Soledad LOS standards, five of the study intersections are projected to operate at an unacceptable LOS E or worse during at least one peak hour under background conditions. The impacted intersections are identified below.

2. Moranda Road and Front Street
3. San Vicente Road and Front Street
6. East Street and Front Street
7. Front Street and Nestles Road
21. Oak Street and Front Street

Peak-hour signal warrant checks were completed for all study intersections to determine whether signalization would be justified on the basis of background peak-hour volumes. A summary of the signal warrant checks are provided in the Transportation Impact Analysis. The analysis showed that the Caltrans peak-hour volume warrant is projected to be met during at least one peak hour at the following seven intersections under background conditions:

2. Moranda Road and Front Street
3. San Vicente Road and Front Street
6. East Street and Front Street
7. Front Street and Nestles Road
8. Front Street and US 101 NB Ramps
15. East Street and North Street/Metz Road
21. Oak Street and Front Street

Roadway Segment Operations

Traffic volumes for background conditions on each of the studied roadway segments were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the roadway system in the same manner as with intersections. The roadway

segment analysis indicates that all studied roadway segments are projected to operate at LOS B or better during both peak hours under background conditions.

Freeway Segment Operations

Traffic volumes for background conditions on each of the studied freeway segments were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the freeway system in the same manner as with intersections. The freeway segment analysis indicates that all freeway segments analyzed are projected to operate at LOS C or better under background conditions.

Freeway Ramp Operations

Traffic volumes for background conditions on each of the studied freeway ramps were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the freeway ramps in the same manner as with intersections. The freeway ramp analysis indicates that all freeway ramps analyzed are projected to operate at LOS C or better under background conditions. As stated under existing conditions, the existing ramp configurations are inadequate to serve existing traffic volumes. The traffic associated with the approved projects will worsen conditions on each of the ramps.

Background Conditions Improvements

Based on the results of the background conditions analysis, necessary improvements to support approved traffic were determined for the study intersections projected to operate at LOS D or worse and/or that meet signal warrants. The background conditions with improvements identified below will serve as the basis for determining impacts attributable to the Miravale III development. Without the improvements in place, LOS conditions with the Miravale III development will not accurately reflect impacts due to project traffic, but rather show problem areas under background conditions compounded by the Miravale III project. Described below are the necessary improvements to improve background conditions LOS to acceptable levels.

2. *Moranda Road and Front Street:* Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second eastbound right-turn lane. Intersection operation levels would improve to LOS C with implementation of these improvements.

3. *San Vicente Road and Front Street:* Necessary Improvements: The intersection is projected to operate at LOS E during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street. Intersection operation levels would improve to LOS B with implementation of these improvements.

6. *East Street and Front Street:* Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second southbound left-turn lane and exclusive

westbound right-turn lane. Intersection operation levels would improve to LOS C with implementation of these improvements.

7. *Front Street and Nestles Road:* Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection. Intersection operation levels would improve to LOS B with the installation of a signal.

8. *Front Street and US 101 NB Ramps:* Necessary Improvements: The intersection is projected to meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection.

15. *East Street and North Street/Metz Road:* Necessary Improvements: The intersection is projected to meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Metz Road.

21. *Oak Street and Front Street:* Necessary Improvements: The intersection is projected to operate at LOS F during the both peak hours and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection and the addition of a separate westbound right-turn lane. Intersection operation levels would improve to LOS B during both peak hours with implementation of these improvements.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections);
- exceed, either individually or cumulatively, a LOS standard established by the county congestion/management agency for designated roads or highways;
- result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks;
- substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
- result in inadequate emergency access;
- result in inadequate parking capacity; or
- conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks).

As per the City of Soledad LOS standards, the project is said to create a significant adverse impact on traffic conditions at an intersection if for either peak hour:

- The LOS at the intersection degrades from an acceptable LOS D or better under background conditions to an unacceptable LOS E or worse under project conditions. A significant intersection impact is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to LOS D conditions or better.

Impacts and Mitigation

Project Conditions

Future traffic volumes with the project were estimated by adding to background traffic volumes the additional traffic generated by the project. Project conditions were evaluated relative to background conditions with improvements in order to determine potential project impacts. It is assumed in this analysis that the roadway network and intersection configurations under project conditions would be the same as described under background with improvements conditions.

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections.

Project Trip Generation

The trip generation estimates for the project are shown in Figure 4.13-8, and are based on trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled *Trip Generation*, seventh edition, 2003.

The trip generation estimates do not include estimates for the proposed schools, parks, and golf course. Trip estimates for the proposed residential uses of the project account for trips made to schools and other types of complimentary land uses. Therefore, it is assumed that trips to the schools, parks, and golf course would originate from within the project area and the proposed residential units.

Similarly, the trip estimates for residential land uses associated with the project were reduced to account for internalization, or interaction, between the retail and residential land uses. The project is proposing up to 275,000 s.f. of retail space. A portion of the retail space will be located centrally within the project area and proposed residential units. The remaining retail space will be located in the southeastern portion of the project site. The retail land uses are intended to be neighborhood serving retail, not major retail establishments. As such, it is assumed that the majority of trips generated by the retail space will originate from within the project area. The residential uses of the project were reduced by a magnitude equal to 90 percent of the estimated trips for the centrally located retail space and 50 percent of the retail space located in the southeastern portion of the site. The difference in reduction percentages for the retail is due to the expectation that the southeastern retail space will attract some trips from outside the project area since it is located near existing neighborhoods and other land uses, while nearly all trips to the centrally located retail would originate from surrounding neighborhoods within the project area.

				AM Peak Hour						PM Peak Hour						
		Daily	Daily	Pk-Hr	Splits		Trips			Pk-Hr	Splits		Pass-By			
Land Use	Size	Trip Rates	Trips	Rate	In	Out	In	Out	Total	Rate	In	Out	Red. /e/	In	Out	Total

Source:
ITE Trip Generation, 7th Edition

Notes:
/a/ Single-Family Detached Housing (210) average rates used for proposed single-family units
/b/ Apartment (220) average rates used for proposed multi-family units
/c/ Senior Adult Housing-Attached (252) average rates used for proposed senior housing units
/d/ Hotel (310) average rates used for proposed hotel units
/e/ Specialty Retail Center (814) average rates used for proposed retail space. No AM peak hour rates are available for Specialty Retail, therefore half of the PM peak hour rates were assumed for the AM peak hour.
/f/ A reduction of of residential trips equal to 90% of Retail "A" and 50% of Retail "B" was applied for internalization of retail/residential uses.
/e/ A reduction of 25% to account for pass-by trips was applied to retail use during the PM peak hour

Trip Generation Estimates

Figure
4.13-8

Based on the trip generation calculations, the project, at buildout, would generate 34,856 daily trips, with 2,451 trips occurring during the AM peak hour and 3,143 occurring during the PM peak hour. Using the specified inbound/outbound splits, the project would produce 619 inbound trips and 1,833 outbound trips during the AM peak hour and 1,969 inbound and 1,174 outbound trips during the PM peak hour.

Project Trip Distribution and Assignment

The trip distribution pattern and trip assignment for the proposed project was estimated based on existing travel patterns in the area and the locations of complementary land uses. Two separate trip distributions were used for the residential and non-residential land uses of the site. Generally, the non-residential trip distribution contains trips produced by the project within city limits. On the other hand, it is expected that the majority of residential trips will leave the City limits for employment zones north and south of Soledad.

Project Access and Circulation

Regional access to the project site is provided from US 101. Access to the site is provided via its interchanges with Moranda Road and Front Street within the City of Soledad. Local access to the project site would be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Each of the roadways would be extended into the project area with connections to a completely new roadway system of collectors and local roads that would serve each of the residential and commercial areas of the project. Future access also would be provided by the extension of Miravale Road to Camphora/Gloria Road and the Orchard Lane extensions north and west of the project, eventually connecting via other planned routes to Camphora/Gloria Road when other development is completed.

All new streets would be designed to meet all applicable City of Soledad standards. In addition, as part of the planned golf course, there would be a need to provide golf cart crossings along project roadways. Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings should not be proposed along streets classified as collectors or arterials.

Project Transit System – "Improvements"

The Miravale-III Specific Plan includes a policy to include bus stops in logical locations, providing for alternative modes of transportation. MST currently operates in Monterey County, with two routes servicing the City of Soledad. One route travels north-south from Salinas to King City. The other extends from King City to the southern tip of the Monterey Peninsula. The City of Soledad currently operates one local door-to-door transit service on an on-call basis that provides a flexible and alternative mode of transportation. It is anticipated that up to 3% of project trips could be made by transit.

Project Bicycle and Pedestrian Facilities

There are three types of bicycle facilities classified in the City of Soledad General Plan. Each type is described below:

- Bike path (Class I) - A completely separate right-of-way designed for the exclusive use of cyclists and pedestrians, with minimal crossings for motorists. These paths should have a minimum width of nine feet when two-way travel is required and six feet in width to accommodate one-way movement.

- Bike lane (Class II) - A lane on a regular roadway, separated from the motorized vehicle right-of-way by paint striping, designated for the exclusive or semi-exclusive use of bicycles. Bike lanes allow one-way bike travel. A minimum width of five feet should be provided and adjacent curbside parking avoided where feasible; where curbside parking is allowed adjoining a bike lane, the combined width of the parking and adjacent bike lane should be not less than 13 feet.

- Bike route (Class III) - Provides shared use of the roadway, designated by signs or permanent markings and shared with motorists.

The General Plan also specifies that pedestrian circulation is an important component of the transportation network because it helps reduce traffic and improve air quality. Specifically the General Plan requires that:

- Pedestrian circulation provides logical connections between residential neighborhoods and neighborhood-serving shopping centers.

- Pedestrian trails are used to connect open space/recreational areas with residential neighborhoods, motels and the downtown.

A primary goal of the Miravale-III Specific Plan is to provide the necessary infrastructure to create a safe and efficient circulation network with an emphasis on creating a pedestrian friendly, walkable community. As noted within the Specific Plan, pedestrian sidewalks provide excellent opportunities for leisure and recreation as well as an alternative means of transportation. Pedestrian sidewalks are proposed on all public streets. Plan area sidewalks consist of a 5 foot wide solid surface area separated by a 5 foot wide landscaped planting strip.

Class II Bike lanes are to be provided on all collector and arterial streets within the Plan Area. Bike lanes will be a minimum 4 feet wide and will be separated from the vehicle travel lane by a solid stripe. Signage may be provided throughout the Plan Area to guide bicyclists toward trails, parks, and other points of interest.

There are no existing bicycle facilities that can be extended into the project area. Existing and proposed residential uses will justify the need for a continuous bicycle facility system throughout the City of Soledad. The project will be subject to the City's Bike Plan which identifies future bicycle facilities. The plan was adopted in 2007. All pedestrian and bicycle lanes of the project should provide for future connection to existing sidewalks and streets.

Project Roadway Network

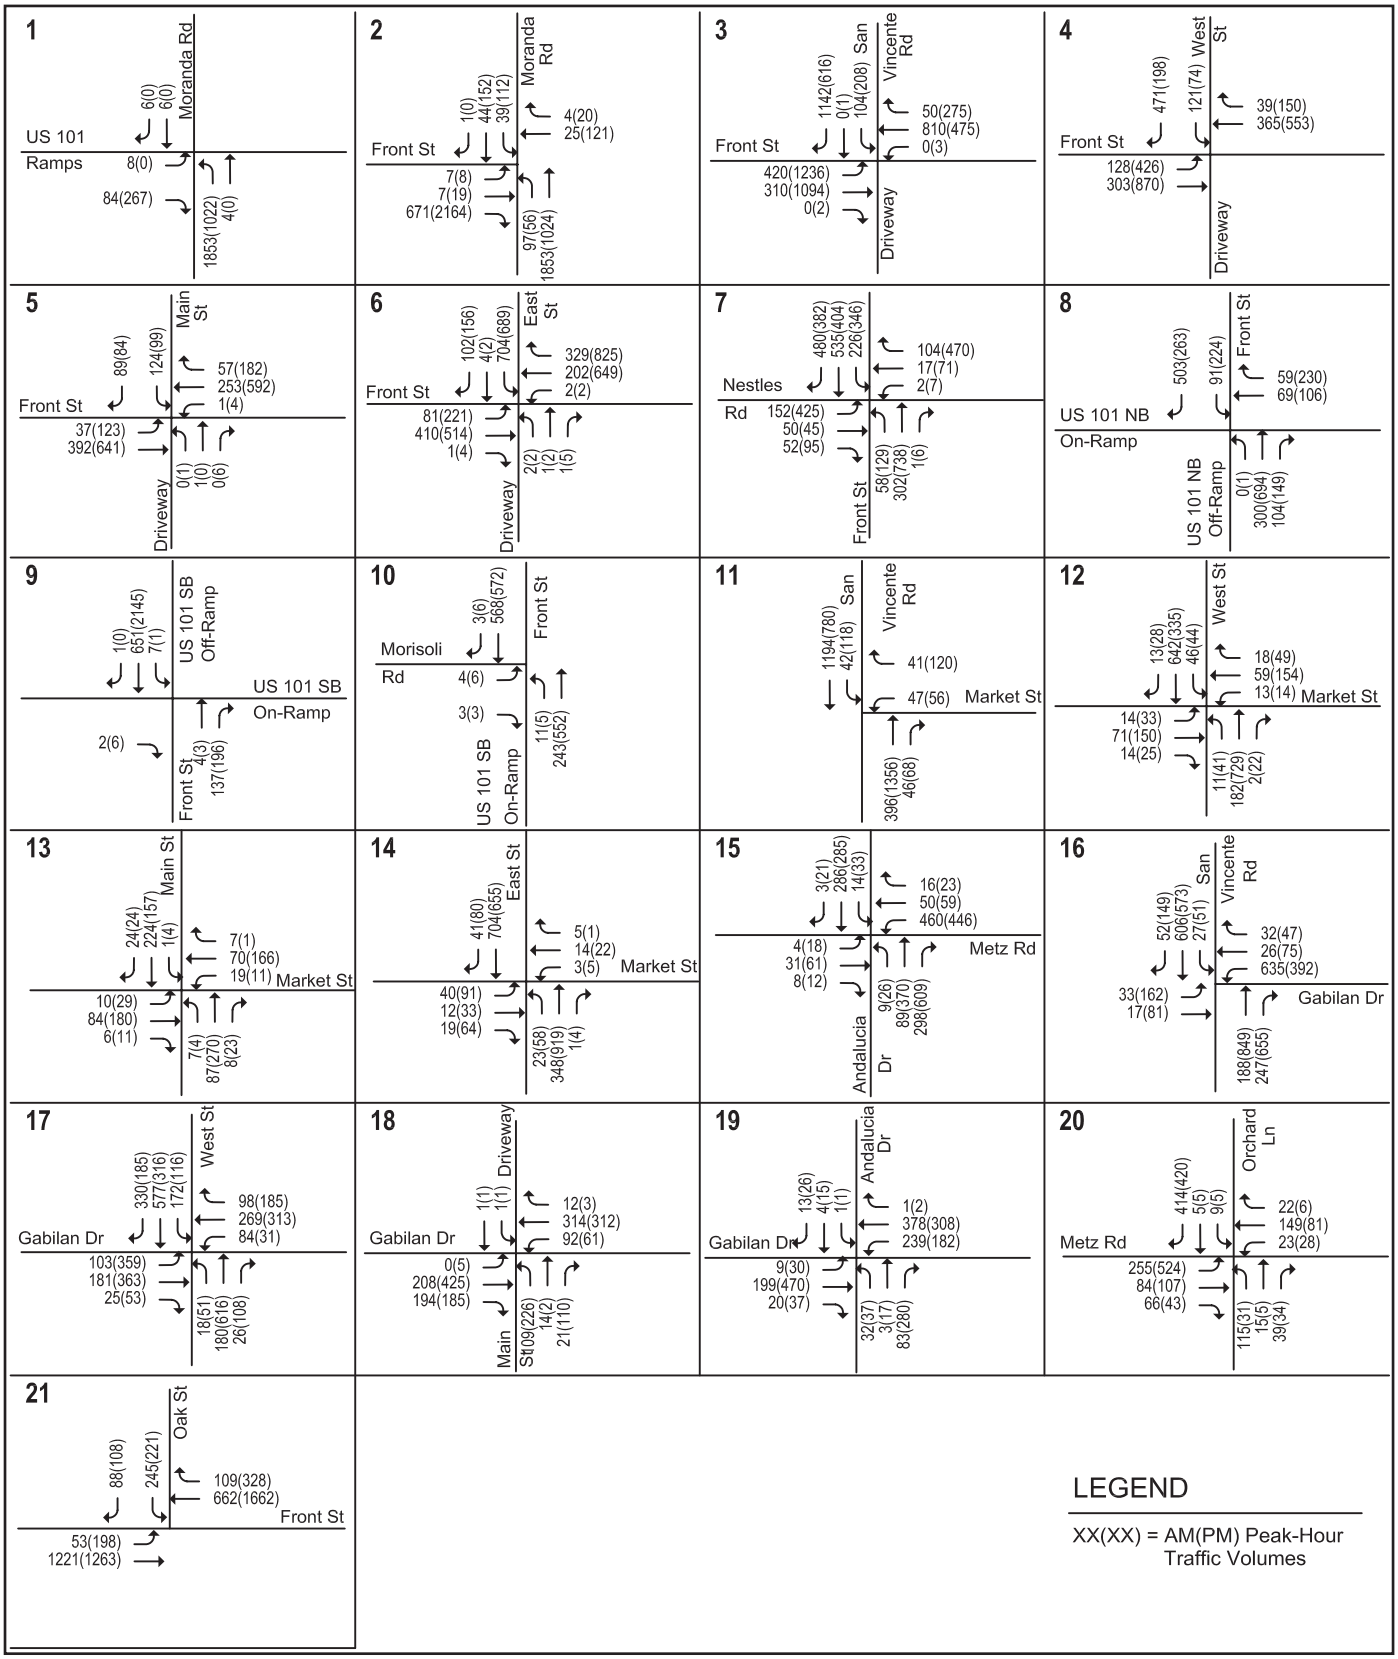
Projected daily volumes and the City's criteria for roadway designation were used to design each of the new major roadways. Projected volumes are based on the same trip generation estimates and assignment methodology described above. Traffic associated with other pending non-residential projects was also included in the projected volumes.

Traffic projections indicate that only West Street, between the project boundary and H Street, will meet the arterial criteria. San Vicente Road and Orchard Lane will meet collector road criteria. All other roadways will meet criteria for classification as local roadways. Figure 4.13-9 illustrates the project roadway classifications.

With implementation of the future roadways described above, several new intersections will be created. Peak hour signal warrant checks were completed for each of the new intersections. Results indicate that only the intersection of West Street and H Street will meet signal warrants. Projected peak hour volumes at all other intersections within the project area will not be large enough to require signalization.

Project Intersection Level of Service Analysis

The results of the intersection level of service analysis under project conditions are summarized in Figure 4.13-3. The results show that 11 of the study intersections would operate at an unacceptable LOS E or worse during at least one of the peak hours analyzed under project conditions:



1 Moranda Road and US 101 Northbound Ramps
2 Moranda Road and Front Street
3 San Vicente Road and Front Street
4 West Street and Front Street
9 Front Street and US 101 Southbound Ramps
11 San Vicente Road and Market Street
14 East Street and Market Street
16 San Vicente Road and Gabilan Drive
17 West Street and Gabilan Drive
20 Orchard Lane and Metz Road
21 Oak Street and Front Street

Each of these intersections would be impacted by the project according to City of Soledad standards. The remaining 10 intersections would continue to operate at acceptable levels of service.

Project Intersection Signal Warrant Analysis

The peak-hour signal warrants were checked for the existing unsignalized intersections to determine whether signalization would be justified on the basis of peak-hour volumes. A summary of the signal warrant checks is shown in Figure 4.13-10. The analysis showed that the Caltrans peak-hour volume warrant would be satisfied at nine intersections under project conditions.

4 West Street and Front Street
5 Main Street and Front Street
12 West Street and Market Street

Signal Warrant Checks

Figure 4.13-10

DENISE DUFFY & ASSOCIATES, INC.

Project Roadway Segment Analysis

Traffic volumes for project conditions on each of the studied roadway segments were developed by adding to background condition volumes the project trips. The project trips were assigned to the roadway system in the same manner as with intersections. The roadway segment analysis indicates that the addition of project traffic will cause three studied roadway segments to operate at LOS E or worse during at least one peak hour under project conditions.

Front Street, between Moranda Road and San Vicente Road (Eastbound PM)
Front Street, between East Street and Nestles Road (Eastbound AM/Westbound PM)
San Vicente Road, between Market Street and Gabilan Drive (Southbound AM/Northbound PM)

The degradation of roadway segment LOS indicates the need for roadway widening. Since there is no evaluation criterion for roadway segments, the roadway segment analysis is presented for informative purposes only. All other studied roadway segments will operate at LOS C or better conditions.

Project Freeway Segment Analysis

The results of the freeway segment analysis showed that four freeway segments are projected to operate at LOS D under project conditions.

US 101 – Northbound North of Gonzales-5th Street (AM Peak Hour)
US 101 – Northbound between Gonzales-5th Street to Gloria Road (AM Peak Hour)
US 101 – Northbound between Camphora Road and North Soledad (AM Peak Hour)
US 101 – Southbound between North Soledad and Camphora Road (PM Peak Hour)

The remaining segments are projected to operate at LOS C or better. The addition of project traffic would worsen conditions on each of the segments projected to operate at LOS D.

Project Freeway Ramp Analysis

Traffic volumes for project conditions on each of the studied freeway ramps were developed by adding to background condition volumes the project trips. The project trips were assigned to the freeway ramps in the same manner as with intersections. The freeway ramp analysis indicates that two of the studied freeway ramps are projected to operate at LOS F under project conditions.

Moranda Road Interchange – Southbound US 101 off-ramp to Moranda Road (PM Peak Hour)
Moranda Road Interchange – Northbound US 101 on-ramp from Moranda Road (AM Peak Hour)

As stated under existing conditions, the existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 are not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes. The project traffic would worsen conditions on each of the ramps.

Project Impacts and Mitigation Measures

Described below are the project impacts and recommended mitigation measures. Figure 4.13-3 shows the resulting LOS for project conditions with the recommended mitigation measures.

Several of the identified impacts involve significant physical improvements to not only intersection configurations, but also roadway widening. In some cases, the improvements identified below will be undesirable due to the need for right-of-way acquisition and/or create inconsistency with the City's General Plan. The evaluation of necessary mitigation measures revealed that several of the project impacts could be mitigated with the construction of an extension of Gabilan Drive that would provide an alternate route to US 101. The City's General Plan calls for the extension of Gabilan Drive to US 101 as a four-lane divided arterial. The Gabilan Drive extension would provide for a more direct route to the project area and alleviate identified impacts at several intersections. Figure 4.13.3 and Figure 4.13.11 show the change in level of service and travel patterns of the project that would result with the extension of Gabilan Drive. Project traffic would be significantly reduced through several of the intersections to be impacted. Therefore, it is recommended that rather than implementing undesirable roadway widening, the project contribute its fair-share towards the construction costs of the extension of Gabilan Drive to US 101 and widening of San Vicente Road from the project south to the Gabilan Drive extension.

The following analysis identifies potential project-induced transportation impacts and necessary mitigation measures to reduce project-related impacts to a less-than-significant level. When impacts cannot be reduced to a less-than-significant, feasible mitigation has been identified to reduce the extent of project impacts. Implementation of the following mitigation measures are necessary to minimize potential project impacts related to transportation/traffic.

Internal Site Circulation

Impact **Based on the significance criteria, the project has the potential to increase hazards due to a design feature or incompatible uses.** ***This significant impact would be reduced to a less-than-significant level with the following mitigation.***

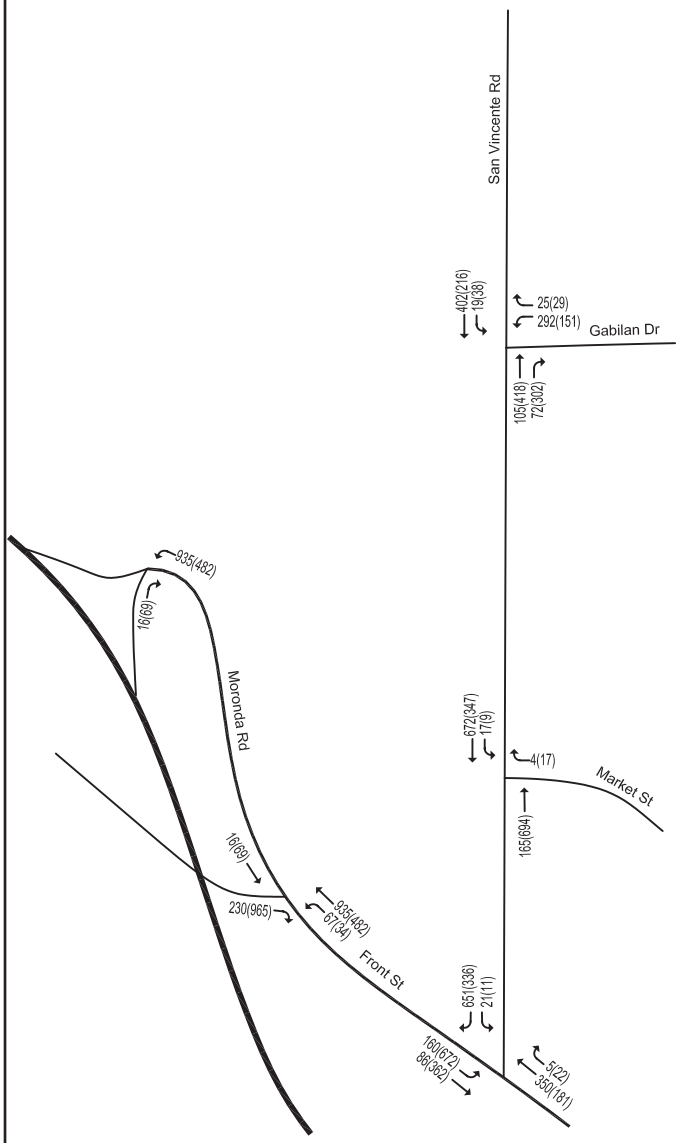
4.13-1 Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings shall not be permitted along streets classified as collectors or arterials. Prior to the issuance of any building and/or grading permit for development associated with the golf course facility, the project applicant shall submit detailed design-level plans demonstrating compliance with this measure, subject to the review and approval of the Director of Public Works. Improvements shall be constructed in accordance with this measure prior to the issuance of any certificate of occupancy or final permit for development associated with the golf course.

Local Intersection Impacts

Impact **Based on the significance criteria, the project will have a significant impact on eleven study intersections, five roadway segments, and signal warrants would be met on nine intersections under project conditions.** ***These significant impacts would be reduced to a less-than-significant level with the following mitigations.***

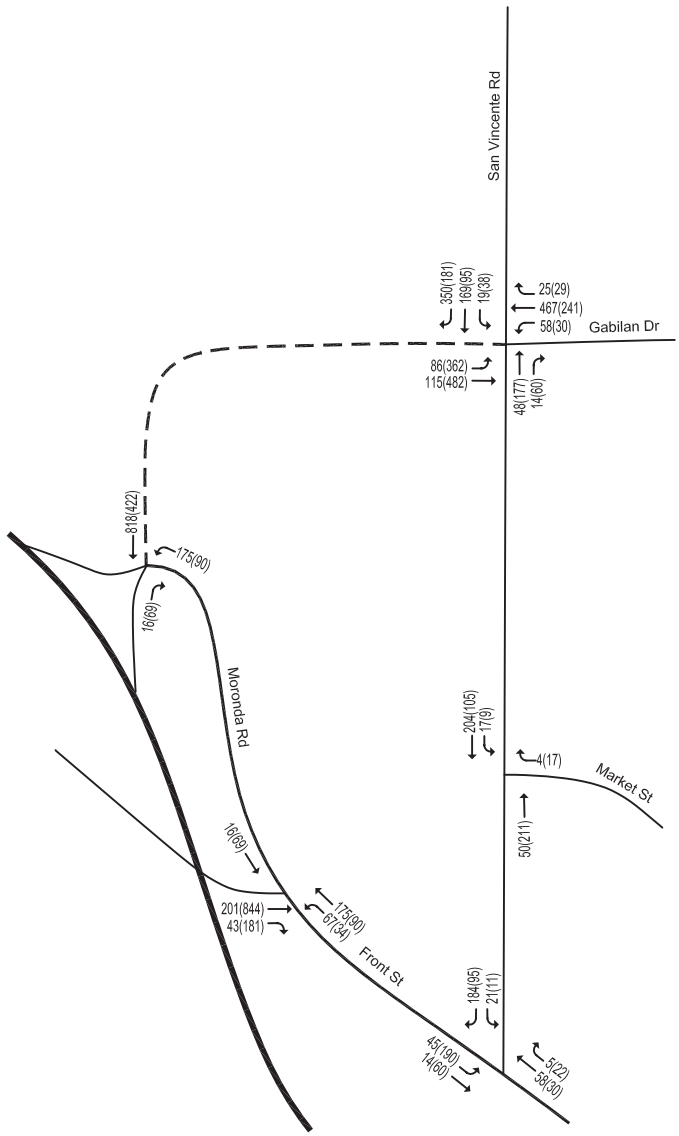
Mitigation

4.13-2 *Moranda Road and Front Street:* Widen NB Front Street to two lanes, add a second NB through lane, EB free-right-turn lane and widen Front Street between Moranda road and San Vicente Road. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can



contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-3 *San Vicente Road and Front Street:* Widen NB Front Street to two lanes, NB San Vicente Road to three lanes, add two EB left-turn lands and a SB free-right-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.



4.13-4 *San Vicente and Gabilan Drive:* Signalize this intersection and add a second westbound left-turn land, exclusive northbound right-turn lane, and southbound left-turn land. SB San Vicente Road will need to be widened to accommodate the dual left-turn lanes from Gabilan. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. If this alternative is selected the project applicant shall submit payment of the projects fair share towards the construction of this improvement in accordance with the traffic impact fee in effect at the time of building permit issuance for each phase of the project. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-5 *West Street and Gabilan Drive:* Signalize the intersection and add exclusive left-turn lanes with protected phasing on all approaches. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

Change of Travel Patterns with Extension of Gabilan

Figure 4.13-11

4.13-6 *Main Street and Gabilan Dive:* Signalize the intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored annually to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-7 *Andalucia Drive and Gabilan Drive:* Signalize this intersection with protected left-turn phasing along Gabilan Drive. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.

4.13-8 *Orchard Land and Metz Road:* Signalize this intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect that the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.

4.13-9 *Oak Street and Front Street:* Widen Front Street to four lanes between Nestles Road and Oak Street and add a second EB left-turn lane at the intersection of Nestles Road and Oak Street. Alternatively, the construction of the US 101/SR 146 bypass would alleviate impacts at this intersection. The project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance. All fees shall be paid prior to the issuance of any building permits for each phase of development and shall be subject to the approval of the Director of Public Works. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad.

Traffic Mitigation Triggers and Impact Fees

The large size of the proposed project would require that construction of the project be phased over the next ten years. As such, mitigation costs/fees must be phased along with the development of the project in

order to ensure the financial feasibility of the initial development activities. The two major roadway improvements, Gabilan Extension and reconstruction of the US 101/Moranda Road interchange, proposed as mitigation measures for the proposed project would require substantial funding that cannot be provided at the initial stages of this development nor by the proposed development alone. Therefore, triggers were determined as part of the traffic analysis for the two major roadway improvement projects. Traffic monitoring is included in the mitigation to assure that improvements are phased with development. The traffic monitoring shall be established and maintained by the city and funded by the developer.

Gabilan Extension Development Level Trigger

Analysis was conducted at intersections and roadway segments along San Vicente Road to determine at what development level the extension of Gabilan Drive needed to be implemented to support project traffic. The traffic analysis indicated that the most critical point of constraint is the intersection of San Vicente Road and Front Street. The capacity of the eastbound left-turn movement, Front Street to San Vicente, during the PM peak hour is the critical movement at the intersection. Under background conditions, the intersection was shown to meet traffic signal warrants. Analysis indicates that with the installation of a signal at the intersection, LOS D will be maintained at the intersection with up to 50 percent of the project development traffic.[2]

Based on roadway segment analysis conducted along San Vicente Road, LOS D operations along the roadway can be maintained with up to 75 percent of the project traffic added to the roadway system. However, as previously discussed, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and would create spill over onto adjacent streets, such as West Street, that provide an alternate access to San Vicente Road.

US 101 and Moranda Road Interchange Improvement Development Level Trigger

As described previously, the existing freeway ramps at Moranda Road and US 101 are not designed to accommodate existing traffic volumes. The addition of project traffic, as well as background traffic, would compound the need for improvement of the ramps. The US 101 southbound off-ramp to Moranda Road will be the constraint on any further development. Analysis of ramp capacities indicate that LOS D operations can be maintained on the ramps with up to 25 percent of the project traffic added to the roadway system.

Intersection LOS analysis indicates that with signalization of the ramp termini intersections, up to 50 percent of the project development traffic can be accommodated; however, even with the signalization of the intersections, the ramps would be inadequate to serve this level of development.

Traffic Impact Fees

Funding for the mitigation measures, will be obtained via traffic impact fees imposed upon the project by both the City of Soledad and The Transportation Agency for Monterey County (TAMC). Mitigation of the project impacts would be in the form of payment of traffic impact fees estimated for the project.

[2] It should be noted, that though intersection LOS may be acceptable, the number of left-turning vehicles under background conditions (545 during the PM peak hour) indicates the need for a second left-turn lane and subsequent widening of San Vicente Road to receive the two left-turn lanes. With 50 percent of the project development traffic added to the roadway system, an additional 350 trips would be added to the left-turn movement during the PM peak hour.

Local Intersection Impacts

The above significant impacts will be reduced to a less-than-significant level through the implementation of one or more of the following actions:

a. The applicant shall construct circulation improvements as specified by the city and outlined above;

b. The applicant shall pay traffic impact fees per the city traffic impact fee ordinance in effect at the time the applicant requests building permits;

c. For any improvement that will not be constructed by the applicant or mitigated through payment of impact fees per city impact fee ordinance, the applicant shall pay a fair share of the improvement.

The City's traffic impact fee (TIF) program mentioned in item b above was adopted in October 2007. The City TIF identifies a fee per single-family unit and multi-family unit to be collected from proposed development and used towards identified improvements to the roadway system within and serving the City of Soledad. Mitigation of the project impacts would be in the form of payment of City of Soledad's traffic impact fees estimated for the project.

Regional Transportation Impacts

The identified freeway segment and interchange ramp improvements described below cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway widening, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The payment of fees is considered mitigation for impacts to freeway facilities. At this time, however, the City of Soledad has not committed to collecting the TAMC fee. In order to address regional improvement, the City of Soledad has incorporated local regional improvement projects into their adopted TIF program. Therefore, the collection of impact fees as part of the City's TIF program will include regional improvements and will be in-lieu of payment of an independent TAMC fees. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact would be considered significant and unavoidable.

Regional Impacts

Impact **Based on the significance impact criteria, the project will have a significant impact on two freeway ramps and four freeway segments. Therefore, the project will have a significant impact on regional roadways.** ***With implementation of the mitigation identified below these significant impacts will be reduced to a less-than-significant level. However, should the proposed improvements be deemed infeasible or not part of the TAMC fee program, the impacts will be considered significant and unavoidable.***

Mitigation

4.13-10 *Moranda Road and US 101 NB Ramps:* Signalize the intersection and widen the NB US 101 on ramp to add a second NB left-turn lane. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic

impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. No certificate of occupancy shall be issued for new residential or commercial buildings requiring the implementation of these improvements until said improvements have been fully constructed, subject to the review and approval of the City of Soledad. Alternatively the project can contribute its fair share towards the construction of the extension of Gabilan Drive to US 101. If this alternative is chosen local roadways shall be monitored to ensure that LOS levels are maintained in accordance with the City of Soledad's adopted standards until the extension is complete. In addition the US 101 interchange at Moranda Road/Front Street will require reconfiguration/reconstruction to provide more efficient access to the project site and north Soledad in general. As this is a regional improvement, funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee, which includes regional improvements, would mitigate the project's regional impact at this location. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-11 *Front Street and US 101 SB Ramps:* Signalize this intersection, widen southbound Front Street to two lanes and add a second lane on the off-ramp. In addition, the volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general. As this is a regional improvement, funding of at least part of the mitigation should be the responsibility of TAMC, and TAMC should include the improvement within its traffic impact fee. In this case, the project's payment of the City's adopted TIF fee would mitigate the project's impact at this location. However, should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works.

4.13-12 The project applicant shall be required to pay towards the City's TIF program, which includes regional improvements. Prior to the issuance of any building permit for each phase of development, the project applicant shall submit payment of the City of Soledad traffic impact fee in effect at the time of building permit issuance in order to mitigate the impact at this location. The payment of fees is considered mitigation for project impacts to freeway facilities. All fees shall be paid prior to the issuance of any building permit for each phase of development and shall be subject to the approval of the Director of Public Works. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable.

Impacts from Mitigation Measures

The environmental impacts from implementation of intersection improvements directly associated with construction of the project are included within the analysis in this EIR. Intersection, roadway, and freeway improvements identified as mitigation that are not the direct responsibility of the project could result in environmental impacts beyond those presented herein. The evaluation of environmental impacts for these improvements is the responsibility of the agency and/or individual with jurisdiction over these

facilities. All transportation improvements would be subject to environmental review in accordance with CEQA at the time that design plans for these improvements are developed.

Cumulative Impacts

This section describes the results of the traffic analysis under cumulative conditions. The traffic analysis evaluated two cumulative conditions: 1) baseline cumulative conditions without the project, and 2) cumulative conditions with the project. A 2030 cumulative condition is included in the Cumulative section of this EIR.

Cumulative Trip Generation

Cumulative traffic volumes include trips associated with three pending developments located within the City of Soledad. City staff provided the list of cumulative developments. The projects are described below.

- *The Village at Soledad* – 139,730 s.f. shopping center, an 84-room hotel, and 1,329 seat cinema located along the eastside of Nestles Road south of Los Coches Drive.

- *Soledad Plaza* – 415,000 s.f. shopping center, located along the west side of San Vicente Road between Moranda Road and Gabilan Road.

- *263Front Street* – 12,200 s.f. retail center and 152 apartments/condominiums, located along the north side of Front Street between West Street and Benito Street.

Traffic volumes for cumulative conditions were estimated by adding traffic associated with pending developments to background traffic volumes for the cumulative without project scenario and the proposed project for the cumulative with project scenario. The added traffic associated with the pending projects was developed based on trip generation estimates and assignments produced by Hexagon. The magnitude of traffic added to the roadway system by each of the pending developments is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled *Trip Generation*, seventh edition, 2003, were used for this analysis. On the basis of these rates, it is estimated that the pending projects would generate a combined total of 25,938 daily trips, with 702 trips occurring during the AM peak hour and 2,348 occurring during the PM peak hour. The type of land use, size, and trip estimates of each development is presented in Table 4.13-4. Cumulative Growth traffic volumes with the project are shown on Figure 4.13-12.

Cumulative Roadway Network

It is assumed in this analysis that the roadway network and intersection configurations under cumulative no project conditions would be the same as described under background conditions with improvements, also known as "cumulative baseline conditions" with the exception of the following two intersections:

Moranda Road and Front Street - The improvement consists of the addition of an east leg to the intersection to serve the Soledad Plaza project site.

San Vicente Road and Gabilan Drive - The necessary improvement consists of the addition of a west leg to the intersection to serve the Soledad Plaza project site.

It is assumed that the project mitigation measures described above are included under the cumulative with project conditions analysis. The cumulative with project analysis includes evaluation of intersection levels of service with and without the extension of Gabilan Drive to US 101 as described above.

Cumulative Intersection Levels of Service Operations

The results of the intersection LOS analysis under cumulative conditions are summarized in Figure 4.13-12. The results show that all of the study intersections would operate at an acceptable LOS D or better under cumulative conditions with and without the project.

Cumulative Signal Warrant Operations

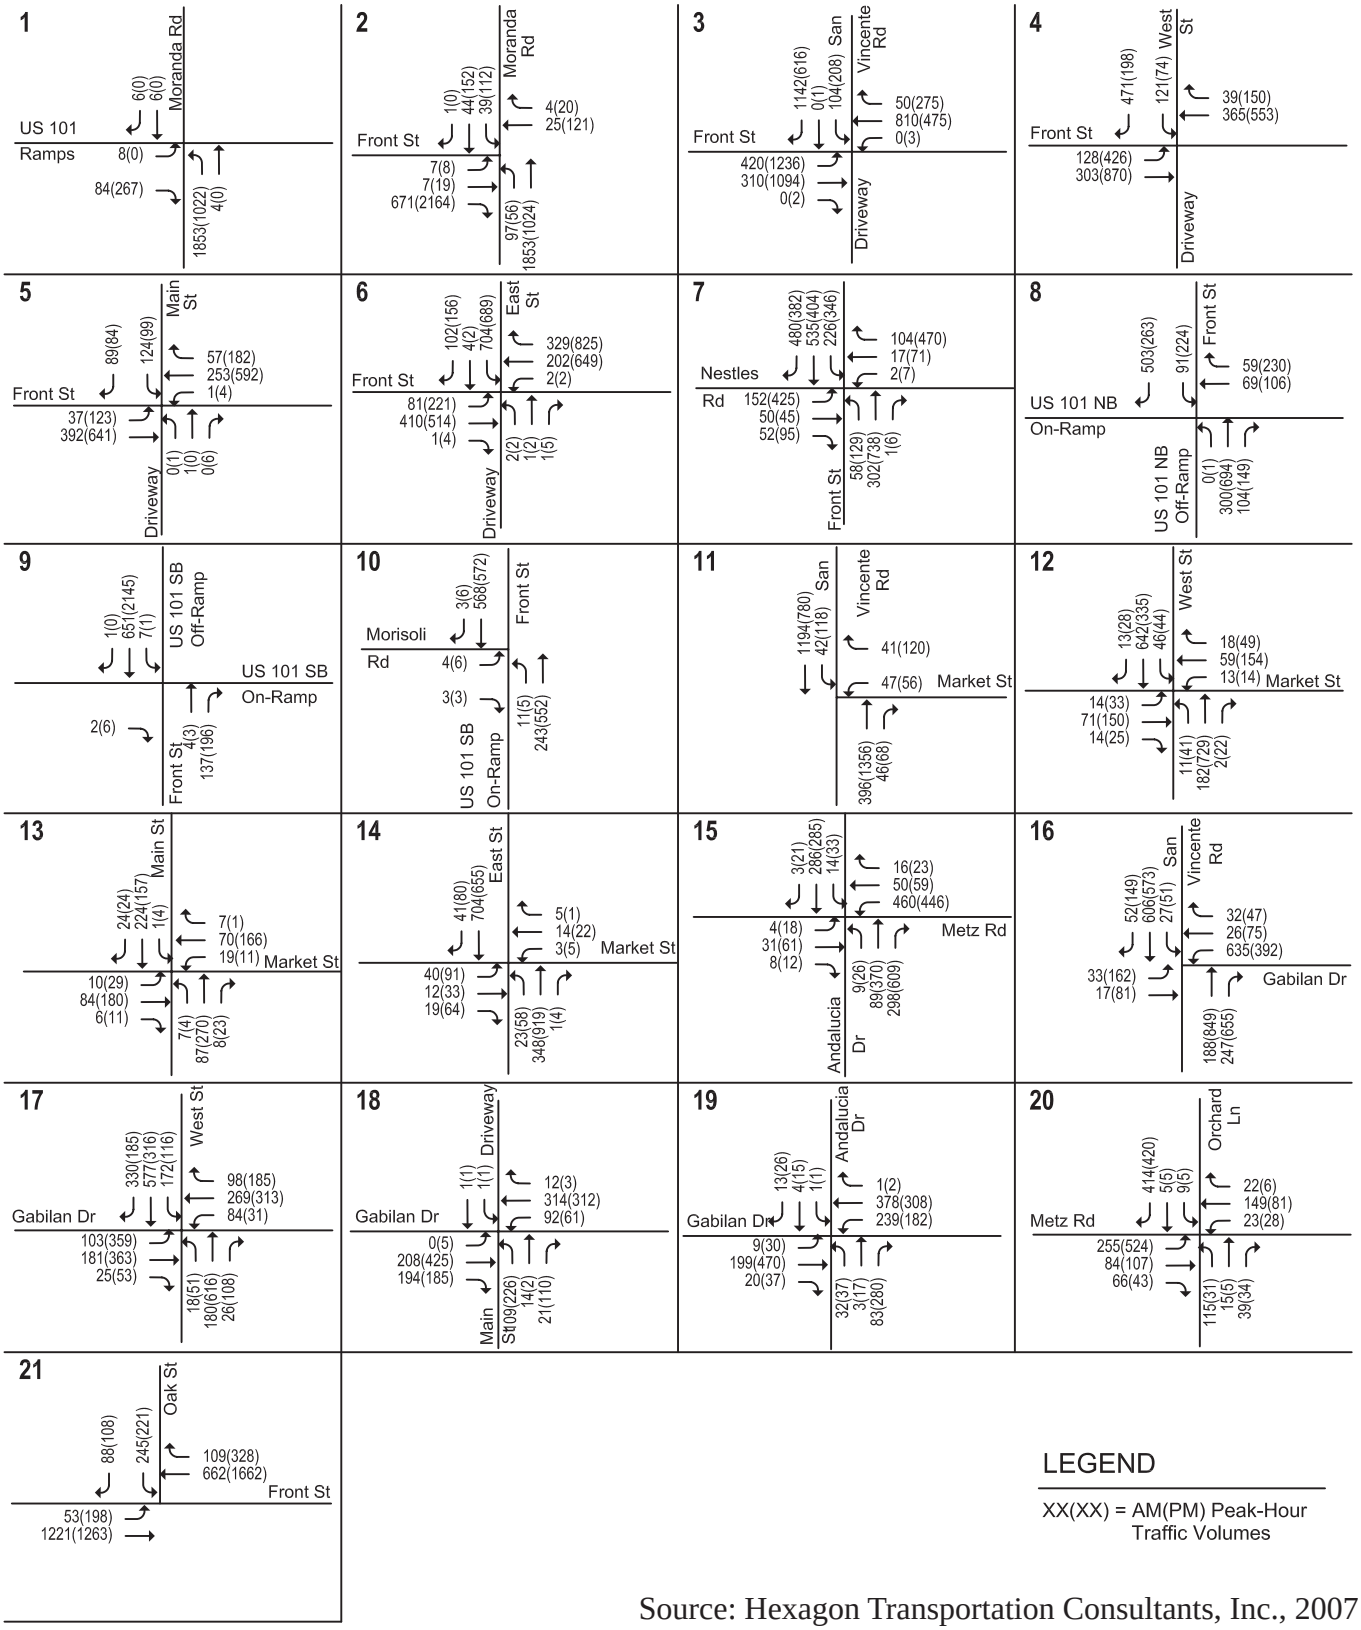
The peak-hour signal warrant analysis for cumulative conditions showed that the Caltrans peak-hour volume warrant would not be satisfied at any further study intersections than those identified under project conditions. The results of the signal warrant analysis can be found in the Transportation Impact Analysis contained in Technical Appendix T-8 in Volume II of this EIR.

Cumulative Roadway Segment Analysis

Traffic volumes for cumulative conditions on each of the studied roadway segments were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The roadway segment analysis indicates that all but one of the studied roadway segments are projected to operate at LOS D or better during both peak hours under cumulative no project conditions at:

Front Street - between East St and Nestles Rd (westbound)

The roadway segment analysis indicates that the addition of project traffic would cause four additional studied roadway segments to deteriorate to LOS E or worse during at least one peak hour under cumulative with project conditions at:



Front Street - between Moranda Rd and San Vicente Rd (eastbound)
Front Street - between East St and Nestles Rd (eastbound)
San Vicente -between Market St. and Gabilan Dr. (northbound & southbound)

The degradation of roadway segment levels of service indicates the need for roadway widening.

Cumulative Freeway Segment Analysis

Traffic volumes for cumulative conditions on each of the studied freeway segments were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the freeway system in the same manner as with the proposed project. The freeway segment analysis indicates that all but one of the studied roadway segments are projected to operate at LOS C or better during both peak hours under cumulative no project conditions. The freeway segment analysis indicates that one additional study segment than those identified under project conditions would deteriorate to LOS D or worse during at least one peak hour under cumulative with project conditions. Freeway segment analysis is presented in Tables 28 and 29 of the Transportation Impact Analysis.

Cumulative Freeway Ramp Analysis

Traffic volumes for cumulative conditions on each of the studied freeway ramps were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the freeway ramps in the same manner as with the proposed project. The freeway ramp analysis indicates that no further study ramps than those identified under project conditions would deteriorate in levels of service under cumulative no project and with project conditions. Freeway ramp analysis is presented in Tables 30 and 31 of the Transportation Impact Analysis.

Cumulative Impacts and Mitigation Measures

Impact **Based on the significance impact criteria, the project together with the cumulative developments will have a significant impact on two intersections.** ***The traffic impacts would be reduced to a less-than-significant level with implementation of mitigation identified below.***

Mitigation

4.13-13 *Moranda Road and Front Street:* Addition of an east leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.

4.13-14 *San Vicente Road and Gabilan Drive:* Addition of a west leg to the intersection to serve the Soledad Plaza project site. In order to mitigate potential impacts at this intersection, the project applicant shall submit payment of the City's adopted traffic impact fee in effect at the time of building permit issuance for each phase of development, subject to the review and approval of the City of Soledad Director of Public Works. All fees shall be paid prior to the issuance of any building permit for each phase of development.

4.14 UTILITIES AND SERVICE SYSTEMS

Introduction

This section evaluates the impacts of the project on water distribution systems and facilities, wastewater collection, treatment and disposal systems and facilities, solid waste disposal facilities, and energy (specifically electricity) supply and infrastructure. Impacts related to the quality of water supply and stormwater/drainage infrastructure are addressed in **Section 4.8 Hydrology and Water Quality.**

To obtain information from public utility providers, DD&A contacted the sewer, water, and landfill operators. Additionally, a Water Supply Assessment and Written Verification of Supply (WSA) was prepared for this project by Byron Buck & Associates. A copy of the WSA is contained in Appendix K and the following section was prepared using information contained in that report. Further, information received from public providers is used to evaluate existing capacity, projected capacity, and existing and projected future use of that capacity.

Setting

Water Supply

The municipal water purveyor for the proposed project is the City of Soledad, which currently operates a series of wells, tanks, and distribution lines within the City's boundaries. As an urban water supplier of more than 3,000 customers, the City is required, under the Urban Water Management Planning Act, as amended, to prepare and periodically update an urban water management plan that describes and projects estimated past, present, and future water sources, supply and demand for at least 20 years into the future. The City's most recent urban water management plan (UWMP) was adopted in December 2005. A portion of the projected water demand associated with the project was included in the UWMP. Under Water Code § 10910(c)(2), and Public Resources Code § 21151.9, when an individual land use project's water demand was accounted for in the most recently adopted urban water management plan, the urban water management plan's information and analysis may be incorporated in the water supply and demand assessment. Accordingly, the information and analysis in the UWMP, including the overall water planning projections and supply projections, is incorporated into this EIR.

The water supply analysis in this section is based on a number of sources in addition to the UWMP, including the following: the June 2001 EIR/EIS for the Salinas Valley Water Project, information developed by the City, the City's 2005 Water Supply Assessment and Written Verification of Supply (WSA) prepared for this project by Byron Buck & Associates, and the City's 2005 Water Master Plan prepared by Schaaf & Wheeler.

As identified in the above referenced documents, the City's sole source of water is groundwater from the Salinas Valley Groundwater Basin (herein referred to as "Basin"), which follows the Salinas River throughout Monterey County. Due to significant groundwater overdraft, the Basin, which consists of four subareas (East Side, Pressure, Forebay, and Upper Valley), has historically experienced saltwater intrusion of varying magnitude along its northern terminus. More specifically, overdraft has caused saltwater intrusion in areas closer to the coast. The City of Soledad, however, is located within the Forebay Subarea, which has a total surface area of 94,000 acres. Soledad draws its water from the unconfined shallow aquifer zone, and overdraft has not historically been a problem in the Forebay Subarea.

Existing groundwater production is shown in Table 4.14-1. According to the 2005 UWMP, the City anticipates pumping up to 8,458 acre feet per year (AFY). This projection, however, is considered

conservative as it does not represent all new demands on the Basin, as existing agricultural uses will gradually be retired, mitigating much of the impacts on the Basin. Table 4.14-2 depicts projected water demand in comparison with available water supply.

Table 4.14-1
City of Soledad's Groundwater Production (AFY)
2000 – 2004

Year	City of Soledad Service Area
2000	1,716
2001	1,749
2002	1,878
2003	2,322
2004	2,363

Table 4.14-2
City of Soledad Water Supply Demand & Supply Comparisons (AFY)

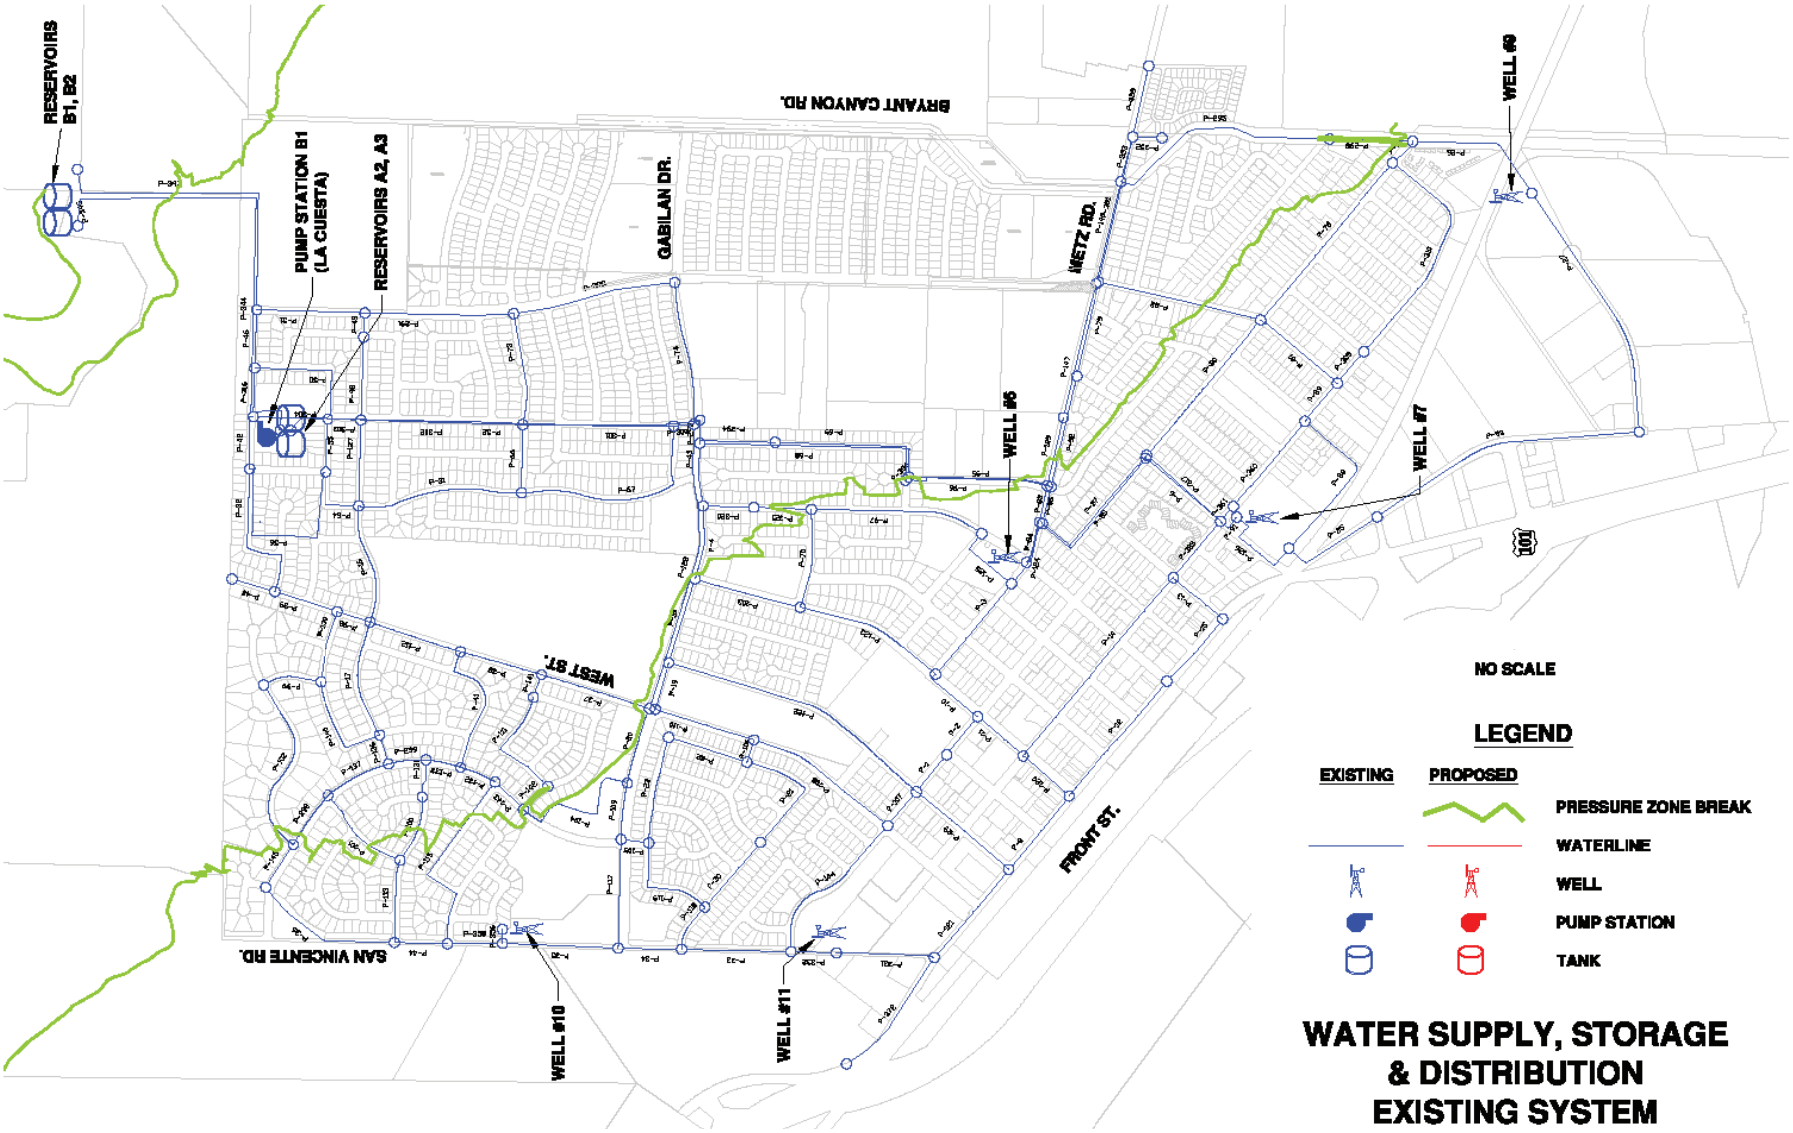
Year	Available Supply	Projected Demand	Proportion of Available Supply
2005	1,500,000	2,337	0.16%
2010	1,500,000	5,592	0.37%
2015	1,500,000	6,531	0.43%
2020	1,500,000	7,506	0.50%
2025	1,500,000	8,458	0.56%

Source: City of Soledad Urban Water Management Plan, Harris & Associates, December 2005.

Infiltration in the Salinas River channel is the principal source of groundwater for the Basin. Flows from the Salinas River channel and its tributaries percolate through alluvial materials and porous geological structures, recharging the local aquifers. While seawater intrusion does not directly affect the City of Soledad, it is an issue for the Monterey County Water Resources Agency (MCWRA), which manages water resources throughout the County. MCWRA is currently in the process of implementing a long-term program to address and ultimately eliminate overdraft and seawater intrusion in the basin known as the Salinas Valley Water Project (SVWP). The objectives of the SVWP, as delineated in the June 2001 EIR/EIS (SVWP EIR) for the project, include halting seawater intrusion, continuing conservation of winter flows for recharge of the Salinas Valley basin through summer releases, improving long-term hydrologic balance between recharge and withdrawal, and providing a sufficient water supply to meet water needs through the year 2030.

According to the 2005 UWMP and the City's WSA for the proposed project, sufficient water exists to meet the anticipated demands generated by the proposed project. Additionally, the project site is located in Zone 2C of the SVWP and would subsequently benefit from the implementation of the measures previously identified above. Furthermore, projected water supplies are sufficient to meet the projected annual water demands of existing and previously approved uses and the proposed Miravale III project during normal, single dry and multiple dry years" (Water Supply Assessment and Written Verification of Supply).

Water System



According to the 2005 Soledad Water Master Plan prepared by Schaaf & Wheeler, the existing City operated system consists of production wells, storage tanks, one booster pump station, and approximately 40 miles of water distribution pipelines ranging in size between 2" to 16" in diameter. The existing system provides approximately 3,900 metered connections and is classified as a large water system according to the State of California Department of Health Services. Figure 4.14-1 provides a graphical representation of the City's water distribution system. The following section provides an overview of the City's existing water distribution system as described in the 2005 Soledad Water Master Plan.

The existing system, which is defined as two pressure zones, Zone A and Zone B, five production supply wells, four reservoirs (i.e. storage tanks), and one booster pump. Due to elevation changes, the City has been defined as two pressure zones in order to ensure that adequate pressure and services are provided to area residents. More specifically, the service elevation for Zone A ranges between 180 and 215 feet above sea level and Zone B ranges between 215 and 340 feet above sea level. There are two existing storage tanks, including a 100,000 gallon tank located in Vosti Park, and a one million gallon tank located near the La Cuesta Views subdivision, in Zone A. All the production wells are also located within Zone A. After water has been pumped from the wells it is subsequently treated with a Chlorine solution to provide for residual disinfection. Two of the existing wells are emergency/standby production wells that have historically tested high for nitrates and low levels of bromobenzene. These wells have not been used and they will be abandoned as new wells are added to the system. Two additional one million gallon storage tanks are located in Zone B. Since all the production wells are currently located within Zone A, a booster pump station, consisting of three pumps, is located at the La Cuesta site and provides water from Zone A to the storage facilities in Zone B. The total storage capacity for the entire system is approximately 3.1 million gallons or approximately 9.5 acre-feet (AF). Existing supply capacity from the five groundwater wells is estimated at 7.5 million gallons per day (MGD) or approximately 8,400 acre-feet per year (AFY).

As identified in the Soledad Water Master Plan, a number of Capital Improvement Program (CIP) projects have been identified as requiring immediate attention in order to address system deficiencies. These projects include the provision of permits and land acquisition for additional supply wells, installing an additional reservoir at the La Cuesta location, and discontinuing the use of the Vosti Park tank. In summary, the existing systems requires infrastructure upgrades in order to meet existing demands and further upgrades are warranted to accommodate both "Near Future Development," which includes the proposed project, and ultimate buildout of the City as envisioned in the General Plan.

Wastewater

In 2005, the City of Soledad, due to the urgent need for wastewater infrastructure to accommodate planned growth, undertook the preparation of a comprehensive Long Term Wastewater Management Plan (LTWMP) for upgrading, operating, maintaining, and expanding the City's sewer system. In May 2006, the City Council adopted Resolution No. 3783 adopting the LTWMP prepared by Black & Veatch. The following discussion provides an overview of the City's wastewater system as described in the Black & Veatch report.

Source: Shcaaf and Wheeler, 2007

◀ N

Existing Water Distribution System

Figure 14.4-1

DENISE DUFFY & ASSOCIATES, INC.

As identified in the LTWMP, wastewater and sanitary sewer services are provided by the City of Soledad. The City operates two wastewater treatment plants, including a plant owned by the California Department of Corrections and Rehabilitation (CDCR), located southwest of the City. The City Plant is owned by the City, and the Prison Plant is leased from CDCR. Currently, the City is in process of purchasing the Prison Plant from the State. The two plants treat wastewater from the City, two prison facilities (CDCR's Salinas State Prison and Correctional Training Facility), and several industrial dischargers.

In November 2001, due to capacity concerns, Carollo Engineers conducted a capacity evaluation and re-rated the capacity of the City Plant at 3.6 million gallons per day (mgd). This re-rating allowed the City to continue approving new development while planning for plant expansion. In 2004, however, the City council adopted Urgency Ordinance No. 612 "Establishing a Moratorium on the Issuance of Building Permits Requiring Sewer Connections and Making Findings Related Thereto" due to treatment capacity concerns. More specifically, in September of 2004 flow rates were measured at 2.9 mgd, exceeding percolation pond capacity. As a result, the City determined that the only viable alternative was to prohibit additional inflow until such time that additional capacity could be provided. Subsequently, the council also adopted Resolution No. 3557 "Declaring an Emergency Pursuant to Section 20168 of the Public Contract Code and Authorizing Contracting Without Compliance With Mandatory Contract Bidding Procedures" in order to expedite design and construction efforts necessary to resolve the treatment and disposal emergency created by the conditions at the facility.

The City's existing wastewater collection system includes more than 100,000 feet of gravity wastewater pipelines, ranging in diameter from 6 to 15 inches, and one small temporary sewage pump station. Currently, the City Plant utilizes both biological and physical treatments, which consist of headworks, aeration ponds, secondary ponds, and effluent disposal. See Figure 4.14-2. After disposal, additional biological and physical treatment occurs within the soil column, but is limited due to high groundwater conditions. The City, however, has committed to phasing in tertiary treatment by 2010 in order to mitigate groundwater quality concerns and allow for the future use of recycled water.

The 2006 LTWMP, which provides for funding, upgrading, operating, maintaining, and expanding the City's wastewater infrastructure, has an emphasis on use of recycled water. The recommended improvements include process improvements and capacity expansion (5.5 MGD) to the City's Wastewater Treatment Plant and implementation of a 1.3 MGD Scalping Plant within the City's collection system. This scalping plant would provide Title 22 water for irrigation of golf courses, parks and other landscape areas. The estimated cost of the capital improvements required to meet the City's projected growth at the year 2028 is approximately $42.8 million. Currently, the City is in the process of soliciting proposals for the expansion of plant capacity. These upgrades are scheduled to be in service by 2010.

Solid Waste

The project area is within the jurisdiction of the Salinas Valley Solid Waste Authority (SVSWA), which provides solid waste services to the cities of Gonzales, Greenfield, King City, Salinas, Soledad, and the unincorporated areas of Monterey County in the Salinas Valley Region. Currently, the SVSWA owns three landfills and a transfer station, and oversees the contract operation of these facilities. The SVSWA is also responsible for overseeing future landfill siting or expansion to meet the area's long-term solid waste disposal needs. Solid waste collection is provided by Tri-Cities, a private hauler.

Existing Wastewater Distribution System

Figure 4.14-2

DENISE DUFFY & ASSOCIATES, INC.

In 1999, the SVSWA developed a Regional Plan to provide the Salinas Valley with additional landfill capacity. As a result of this process, the SVSWA Board of Directors adopted a program that provided for the expansion of Crazy Horse, Johnson Canyon and Jolon Road Landfills, as well as a good faith effort to find a new landfill site to supplement the capacity of the existing landfills in the Salinas Valley for at least 35 years. In 2002, the SVSWA undertook the preparation of an EIR for the Regional Solid Waste Facilities Project in order to procure additional landfill capacity for the SVSWA's member jurisdictions. On November 14, 2002, the SVSWA Board of Directors adopted the Regional Solid Waste Facilities Project, which would maximize the capacity of existing facilities within the SVSWA's jurisdiction.

In addition to disposing of waste at the above referenced landfills, the SVSWA also disposes of waste at Foothill Sanitary Landfill and the Monterey Regional Waste Management District Marina Landfill. As identified in the City of Soledad General Plan EIR, solid waste is primarily disposed of at the Johnson Canyon facility. According to the California Integrated Waste Management Board, the Johnson Canyon facility has an estimated capacity of approximately 6,601,100 cubic yards. Approximately 5,936,250 cubic yards of capacity is available for disposal.

Energy

Pacific Gas & Electric Co. (PG&E) provides gas and electric service to the project site. Natural gas is measured in British thermal units (Btu), which is the quantity of heat necessary to raise the temperature of one pound of water one degree Fahrenheit. Electricity is measured in kilowatt hours (kwh). A kilowatt (kw) is a measure of power produced through sources of generation at 3,413 Btu/kw-hour. Most electricity is produced by converting other primary energy sources into electricity. PG&E operates a grid distribution system that transmits electricity with a vast network of transmission and distribution lines throughout the service area to the users. Most of the electricity that PG&E distributes throughout Monterey County is obtained from the Duke Energy Moss Landing Plant. The Moss Landing Plant generates over 1,500 megawatts, which is adequate to supply the Monterey region (Jose Rios, PG&E, personal communication, August 2007).

Regulatory Environment

City of Soledad General Plan

The City of Soledad General Plan provides policies for adequate utilities and service systems. Please refer to Table 4.9-2 of the Land Use section for a detailed analysis of the project's consistency with the relevant utilities and service systems provisions of the Soledad General Plan. The following policies address utilities and service systems relevant to the proposed project.

Policy S-1 The City shall ensure through the development review process that adequate public facilities and services are available to serve new development. New development shall not be allowed until adequate public services and facilities to serve such development are provided. Where existing facilities are inadequate, new development may only be approved when the following conditions are met:

a. The development and/or City can demonstrate that all necessary public facilities will be adequately finance and installed in time (through fees or other means); and
b. The facilities improvements are consistent with applicable facility plans approved by the City or other agencies in which the City is a participant.

Policy S-2 The City shall plan for the expansion of needed water and sewer infrastructure including, but not limited to, the expansion of water production, storage and distribution facilities,

the expansion of wastewater collection and treatment capacity, and storm drainage facility expansion.

Policy S-3 Public facilities, such as wells, pumps, tanks, and yards shall be located and designed so that noise, light, odors, and appearances do not adversely affect nearby land uses.

Policy S-4 Where new development requires the construction of new public facilities, the new development shall pay its fair share of the construction. Where necessary, the City shall require the dedication of land within newly developing areas for public facilities.

Policy S-5 The City shall require that new development pay its fair share of the cost of all existing facilities it uses based on the demand for these facilities attributable to the new development; exceptions may be made when new development provides alternative sources of funding or equipment to offset any shortfall in revenues.

Policy S-8 The City shall promote the efficient use of water and reduce water demand by:
a. Requiring water-conserving design and equipment in new construction;
b. Encouraging water-conserving landscaping and other conservation measures;
c. Encouraging the retrofitting of existing fixtures with water-conserving fixtures.

Policy S-10 The City will manage the increase in water demand from new development to help insure groundwater resources are not overdrafted. The City will work with Monterey County and public and private water entities to plan for the efficient, long term management of groundwater resources.

Policy S-11 Gravity flow for sewer and water service shall be employed wherever feasible.

Policy S-12 The City shall encourage the use of natural drainage systems where feasible to preserve and enhance natural features.

Policy S-15 The City shall require new development to adequately mitigate increases in stormwater peak flows and/or volume. Mitigation measures shall take into consideration impacts on adjoining properties and impacts on groundwater recharge related to existing and proposed water wells.

Policy S-16 The City shall encourage project designs that minimize drainage concentrations and impervious coverage and maintain, to the extent feasible, natural site drainage conditions. Drainage onto adjacent properties shall be restricted to pre-project levels minus any runoff from the area to be developed.

Policy S-17 The City shall require projects to allocate land as necessary for the purpose of retaining flows and/or for the incorporation of mitigation measures for water quality and supply impacts related to urban runoff.

Policy S-19 Engineered drainage plans shall be required for all development projects. Engineered drainage plans shall incorporate a collection and treatment system for stormwater runoff consistent with applicable federal and state laws.

Environmental Impact Report on the Soledad General Plan. The General Plan EIR evaluated potential utilities and service systems impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. This program-level EIR

focused on general impacts associated with implementation of the General Plan, rather than project-specific impacts associated with individual development projects, such as the Miravale III Specific Plan project. According to the General Plan EIR, the following utilities and service systems impacts were identified:

- Buildout of the General Plan would require considerable expansion of wastewater infrastructure capacity for collection, treatment, and disposal. This impact was identified as significant unless mitigated.

- Buildout of the General Plan would significantly increase the amount of biosolids generated by the wastewater treatment plan, which would impact the capacity of licensed disposal facilities. This impact was identified as adverse, but not significant.

- Buildout would increase additional solid waste generation, which will adversely impact the capacity of landfills serving the City. This impact was considered significant unless mitigated.

- Development accommodated under the General Plan would increase the demand for electricity and therefore additional distribution facilities. This was considered significant unavoidable impact.

Soledad Municipal Code.

The following discussion provides a general overview of applicable provisions of the City of Soledad Municipal Code, in addition to associated Ordinances and City Council Resolutions, as they pertain to the construction of recycled water infrastructure and development impact fees for various public facilities. This information is intended to provide a contextual background of various City requirements pertaining to the payment of public facilities impact fees, as well as infrastructure requirements identified in the City's Municipal Code. Moreover, as discussed below, the City of Soledad annually updates the various development impact fees to reflect the percentage change in the construction index for San Francisco. As a result, the proposed project would be subject to the requirements of the adopted impact fee in effect at the time of building permit issuance.

Chapter 13.11 – Recycled Water Service

On June 6, 2007 the City Council adopted Ordinance No. 645, which amended the City of Soledad Municipal Code to include a new chapter, Chapter 13.11, governing the use of recycled water within the City's service area. More specifically, as identified in Section 13.11.010, the general purpose of Ordinance No. 645 is to "establish procedures, specifications, and limitations for the safe use and operation of recycled water facilities and systems within the City's service area, and adopt rules and regulations controlling such use" in order to achieve conservation of potable water supplies. Development of all recycled water components associated with the proposed project would be required to adhere to the requirements set forth in this Ordinance in order to ensure that project infrastructure adheres to the standards and specifications of the City of Soledad.

Ordinance No. 642

On January 17, 2007 the City Council adopted Ordinance No. 642, which amended Chapter 14.06 of Title 14 of the Soledad Municipal Code to incorporate Water Development Impact Fees (see Section 14.06.111). The general purpose of Ordinance No. 640 was to identify impact fees to mitigate impacts to public facilities associated with new developments. Pursuant to Section 14.06.111, the water development impact fees are required to be annually adjusted to reflect the annual percentage change in

the construction index for San Francisco as reported in the Engineering News-Record. In order to mitigate potential project-induced impacts to water facilities, the project applicant would be required to submit payment of impact fees consistent with the requirements of Ordinance No. 642 and the corresponding impact fee in effect at the time of building permit issuance. Since the proposed project is scheduled to be constructed over a duration of 20 years, the project would be subject to all impacts fees as amended that are in effect at the time of building permit issuance.

Ordinance No. 640

On December 6, 2006 the City Council adopted Ordinance No. 640, which amended Chapter 14.06 to Title 14 of the Soledad Municipal Code to incorporate Wastewater Development Impact Fees (see Section 14.06.110). The general purpose of Ordinance No. 640 was to identify wastewater impact fees to mitigate impacts to public facilities associated with new developments. Pursuant to Section 14.06.110, the wastewater development impact fees are required to be annually adjusted to reflect the annual percentage change in the construction index for San Francisco as reported in the Engineering News-Record. In order to mitigate potential project-induced impacts to wastewater facilities, the project applicant would be required to submit payment of impact fees consistent with the requirements of Ordinance No. 640 and the corresponding impact fee in effect at the time of building permit issuance.

Miravale III Specific Plan

Sections 5.0 of the Miravale III Specific Plan identify goals and policies to ensure the adequate provision of public services. Applicable goals are summarized as follows:

- Public Services and Facilities Goal PSF-1 states that project development should provide an efficient, self sustaining system of public facilities that accommodate the needs of project build-out.

- Goal PSF- 2 further states that project development should provide adequate and reliable services and utilities to area residents and business while ensuring that adequate maintenance of these facilities is provided.

Relevant Project Characteristics

The Miravale III Specific Plan and Vesting Tentative Map would result in the introduction of approximately 15,201 persons within the Specific Plan area, in addition to commercial uses, open space, and public facilities. Project infrastructure, including storm drainage mains, sanitary sewer lines, and water lines, would also be constructed to provide services to the project site.

Thresholds of Significance

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- Have insufficient water supplies available to serve the project from existing entitlements and resources, or require new or expanded entitlements.

- Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction or which could cause significant environmental effects.

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board.

- Result in a determination by the wastewater treatment provider, which serves or may serve the project, that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

- Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

- Be served by a landfill with insufficient permitted capacity to accommodate the project's solid waste disposal needs.

- Not comply with federal, state, and local statutes and regulations related to solid waste.

Impacts and Mitigation

Water Supply

Potable Water Supply and Distribution System

The City of Soledad would provide domestic water service to the Miravale III project. The 2005 UWMP, which includes a portion of the anticipated land uses for the proposed project, states that the City has sufficient water supply to accommodate the development of the proposed project, in addition to, full buildout of the City as envisioned under the 2005 General Plan.

Senate Bills 610 (Water Code Section 10910 *et seq.*) and 221 (Government Code Section 66473.7), require the preparation of a water supply assessment in conjunction with project review under CEQA. The intent of SB 221 and 610 is to assure that certain new developments are provided with a reliable supply of water, and inform decision making regarding water supply implications of development. A Water Supply Assessment (WSA) has been prepared for this project by the City of Soledad and Byron Buck & Associates (August 2007). This EIR section supports the City's fulfillment of its obligation to independently assess and publicly disclose potential water-supply-related impacts of the project under CEQA Guidelines Section 15083.5, Water Code Section 10911(c), and Government Code Section 66473.7. The factual analysis in this EIR draws upon and discusses a range of water supply related information, including information developed by the City, the City of Soledad's 2005 UWMP, and the WSA for this project. The WSA for the project is included as part of this EIR (as required by SB 610) and is attached as Appendix K.

Table 4.14-3 shows the projected average annual water demand from the proposed project as determined in the WSA. This assessment applied accepted water use factors and assumed the use of low flow plumbing devices and other water conservation measures. As identified in Table 4.14-3, project development would result in an annual water demand of approximately 2,521.21 AFY. Net consumptive demand after factoring the use of recycled water is estimated as approximately 1,566.3 AFY. Taking into account historical land uses (i.e. agricultural) on the project site, development of the proposed project would result in an overall net reduction in groundwater extraction by 501.2 AFY. Actual water demands, however, would vary depending on the ultimate mix of specific uses, water use behavior, and landscape development/maintenance practices. In any given year, consumption is expected to vary depending on weather and precipitation. However, as identified in the WSA, the City of Soledad has sufficient water available to accommodate project generated demand during normal, single dry and multiple dry years. Payment of water impact fees as required by the City further insure that project-related impacts are considered less-than-significant. **Therefore, the project would result in a less-than-significant impact on water supply and services.**

Table 4.14-3 Miravale III Annual Water Demand			
Residential Uses	**No. Units**	**Annual Water Demand Factor AF/Y Unit**	**Demand AF/YR**

Recycled Water Distribution and Storage

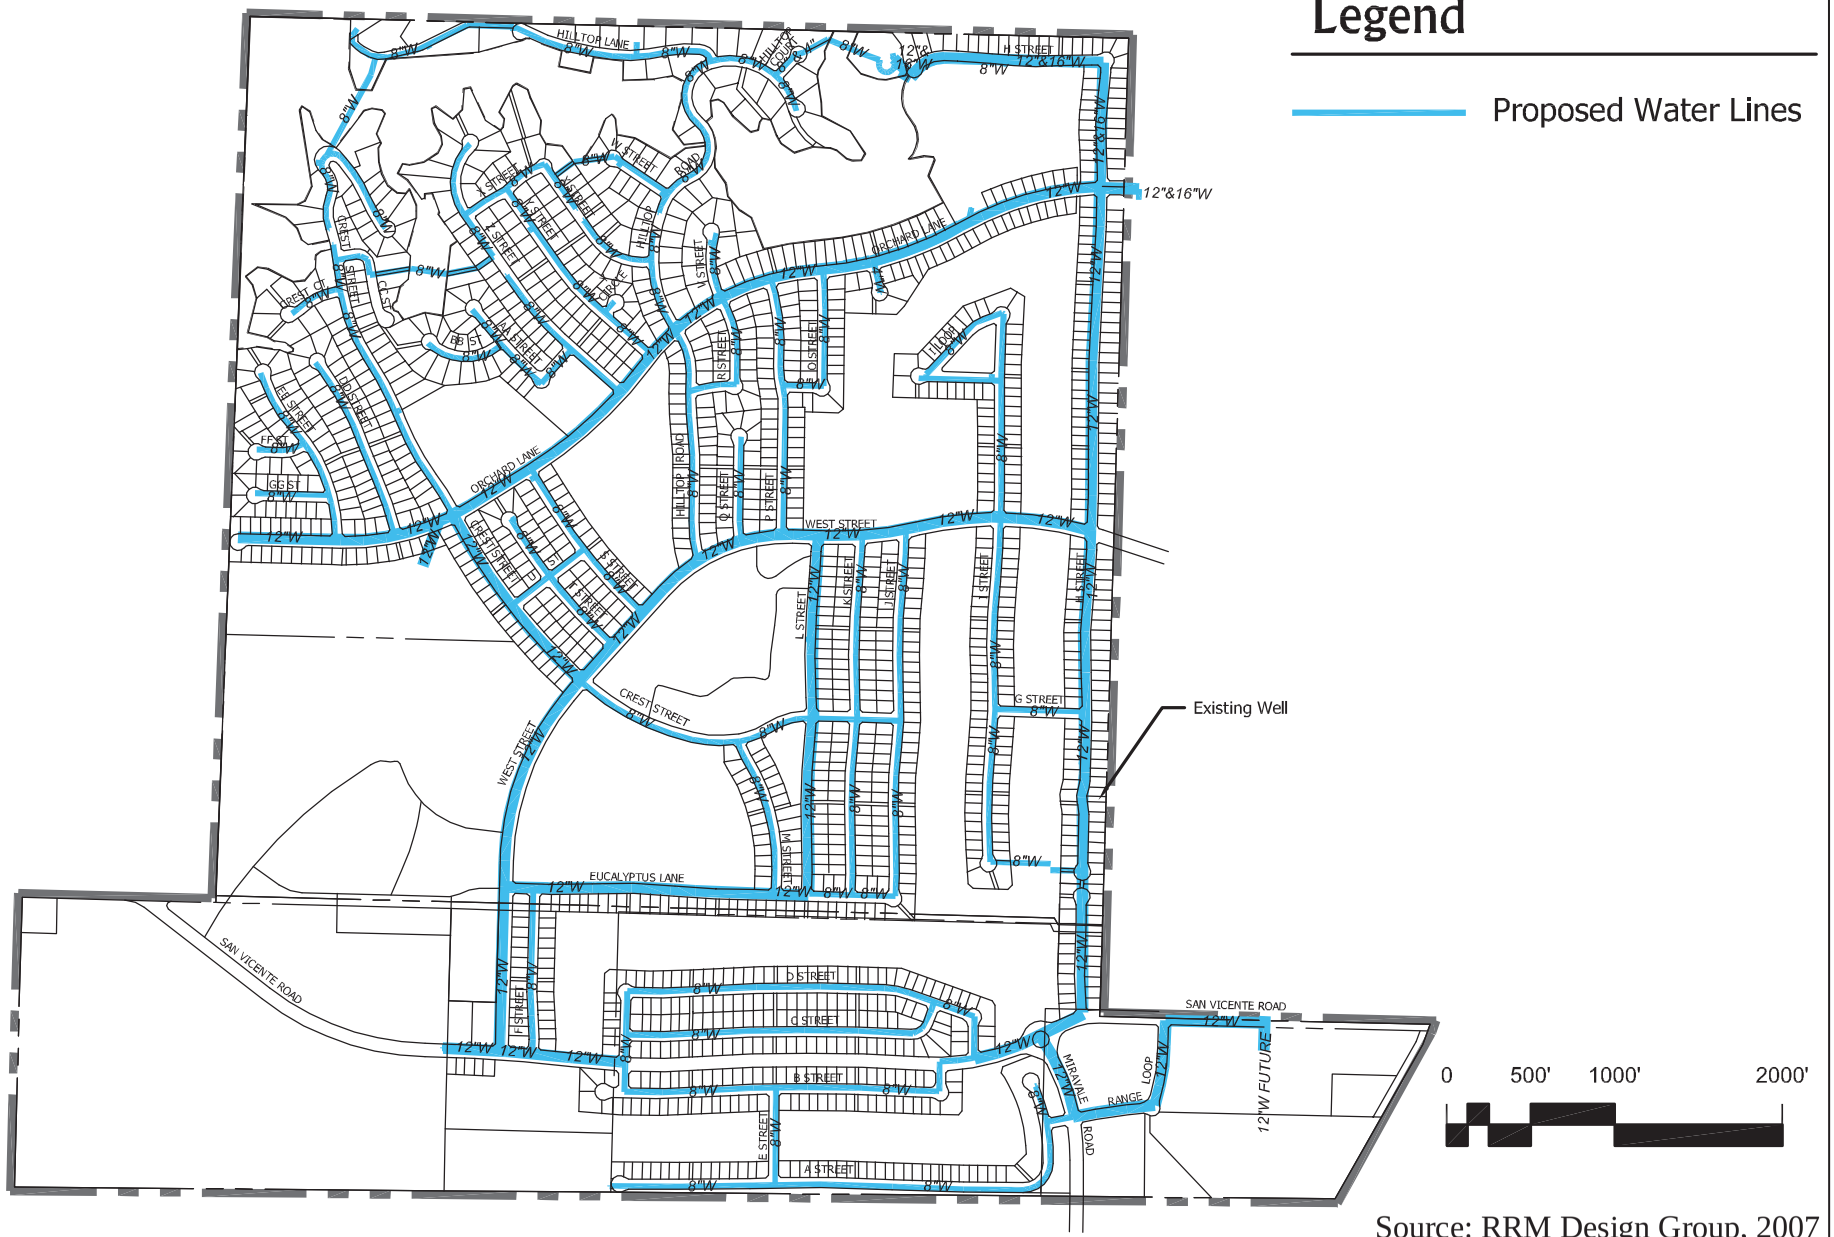
As identified in the WSA prepared for the project, in addition to the City's Urban Water Master Plan, a substantial portion of recycled water would be used to provide irrigation of the golf course and driving range, parks, landscaped parkways, trail areas, front yards, and other landscaped areas within the project site. The recycled water system for the project site would be distributed through a system of 12-inch "purple" pipes (as required for recycled water under Title 22). Mains would be extended to enable access to recycled water at most areas of the site where it can be used for irrigation of the public open space/parks.

The use of recycled water for irrigation purposes would substantially lessen the extent of water demand associated with project development. Installation of project infrastructure would not result in any additional environmental impacts beyond those identified in other sections of this EIR. **This represents a less-than-significant impact.**

Water System

According to the City of Soledad Water Master Plan prepared by Schaaf and Wheeler, the existing City operated water distribution system requires a number of improvements to address current system deficiencies. These improvements have been identified as necessary in order to meet existing system demands. Moreover, buildout of "Near Future Development," which was identified as Miravale III, would necessitate a number of infrastructure improvements to ensure that project generated demands were accommodated. In addition to requiring current improvements, the existing system would need to be extended to provide water services to the project area. As such, additional on-site infrastructure improvements would be warranted. Moreover, development of the proposed project would result in the

introduction of new residences and commercial uses outside of the two existing pressure zones previously described above. In order to accommodate the Miravale III project a new pressure zone, Zone C, would be necessary to accommodate development outside of the existing pressure zones.



As proposed, the project would allow the development of 4,200 units, in addition to, commercial and public uses. Based on the assumed buildout of 3,000 units, the Soledad Water Master Plan determined that the existing water distribution system would be insufficient to meet maximum day demand and at least two additional wells would need to be drilled, permitted, and connected to the existing system. Additionally, new and/or upgraded booster pump stations would also be warranted in Zone B and the new pressure zone, "Zone C." Additional storage tanks would also be necessary to accommodate project development. Preliminary estimates identified in the Soledad Water Master Plan determined that a 1.2 million gallon tank in Zone B would be necessary. A conceptual water distribution map is presented in Figure 4.14-3.

The final design, sizing, and location of system infrastructure would be determined by the City in order to ensure that adequate infrastructure would be provided to meet project demand. Project development would, therefore, require the construction of a number of improvements to expand City services to the project area. The installation of project infrastructure would not result in any new environmental impacts beyond those identified in other sections of this EIR. Furthermore, the City requires applicants to pay all costs associated with extending water mains to provide water service and fire fighting flows to and through the project site. In addition, the applicant would be required to pay impact fees. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **Development of the proposed project would require or result in the construction of new water and recycled water facilities and the expansion of existing facilities. Project development would also require the construction of additional distribution and storage systems, transmission mains and improvements. Potential significant environmental effects could be realized through construction of the facilities if not planned and constructed consistent with Citywide infrastructure improvement plans. *This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

4.14-1 Design and construct the water supply and distribution system for the project that is integrated with the City's water distribution system and consistent with the Urban Water Management Plan and the City's 2005 Water Master Plan. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-2 All water and recycled water facilities and infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.

◀N

Conceptual Water Distribution System

Figure 4.14-3

DENISE DUFFY & ASSOCIATES, INC.

4.14-3 All water and recycled water pipelines shall be placed underground and in the utilities right-of-way and constructed to comply with all applicable state and local standards. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-4 The project shall be required to construct new infrastructure that is of adequate capacity to serve the project's projected water and fire flow demand in addition to the provider's existing commitments. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the approval of the Director of Public Works.

Provided that the applicant makes all water system capacity improvements as required by the City's Public Works Department, project impacts on the City's water system would be mitigated. The proposed project would not result in any potentially significant impacts that cannot be mitigated to a less-than-significant level through implementation of standard conditions of approval and mitigation measures identified above. No additional mitigation measures are required. **This represents a less-than-significant impact.**

Wastewater

The City of Soledad would be responsible for providing sanitary sewer services within the project area and the existing collection system would be extended to provide services to the project site. New wastewater infrastructure (i.e. distribution lines, treatment facility, etc.) would need to be constructed in order to provide services to the project area. According to the City's Long-Term Wastewater Management Plan, the City's total permitted wastewater treatment and disposal capacity is 4.1 mgd and the existing infrastructure would need to be expanded in order to support projected growth. Currently, the City is in the process of expanding its existing treatment capacity to 5.5. mgd with a 4.3 mgd disposal capacity (Clifton Price, personal communication, August 2007). In other words, the City's existing treatment capacity would be expanded to 6,160 AFY with approximately 4,816 AFY of disposal capacity.

Based on the anticipated population of the proposed project and using a wastewater generation rate of 67.5 gpd per person, the proposed project would generate a total of 1.02 mgd of domestic wastewater with an additional 0.08 mgd of commercial flow or a total of approximately 1,232 AFY of residential and non-residential wastewater. Preliminary estimates by the City indicate that projected wastewater generation may be as high as 1.5 mgd or 1,680 AFY. The wastewater generation for the Specific Plan area is greater than that projected in the City's LTWMP due to the difference between the assumed land uses in the LTWMP and the proposed land uses associated with the Miravale III Specific Plan. More specifically, it was originally assumed that buildout of the project site would result in the construction of 2,890 residential units and commercial uses with a projected wastewater flow of 1.0 mgd or 1,120 AFY. Due to an increase in the number of units, projected wastewater flow is now approximately 1.5 mgd or 1,680 AFY.

Based on the preceding analysis, existing treatment capacity is inadequate to accommodate project generated wastewater. Therefore, project buildout would result in an increased generation of wastewater that would cause a need for additional wastewater collection and treatment capacity, including new or expanded facilities. This represents a potentially significant impact. In order to accommodate projected wastewater, a recycled water facility is being planned in the southwest corner of the Specific Plan area as part of the proposed project. All project generated wastewater would be treated at this facility and subsequently used as recycled water for irrigation purposes. According to the City of Soledad, initial

treatment capacity at this facility would be able to accommodate an estimated 1.0 mgd or 1,120 AFY. Full buildout of the project site would, however, exceed the initial treatment capacity at this facility. While the initial capacity is inadequate to support full buildout of the project site, the City has indicated that the facility would be expanded to accommodate a total treatment capacity of over 2.0 mgd or 2,240 AFY. Project impacts can be further reduced to a less-than-significant impact through the incorporation of the following mitigation measures identified below. Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **Development of the proposed project would potentially exceed existing and planned wastewater treatment capacity.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.14-5 In order to ensure that the proposed wastewater treatment system is consistent with the applicable requirements of the Soledad Urban Water Management Plan, Long-Term Wastewater Management Plan, and Chapter 13.11 Recycled Water Service, the project applicant shall submit detailed design-level plans in accordance with these requirements, prior to the issuance of any building and/or grading permit, subject to the review and approval of the City of Soledad Public Works Director.

4.14-6 Prior to the approval of the first final map within the Specific Plan area, all required permits for the on-site recycled water facility, including, but not limited to, a Waste Discharge Permit from the Regional Water Quality Control Board and approval of the system design, shall be obtained. The project applicant shall submit written evidence to the City of Soledad documenting compliance with this measure.

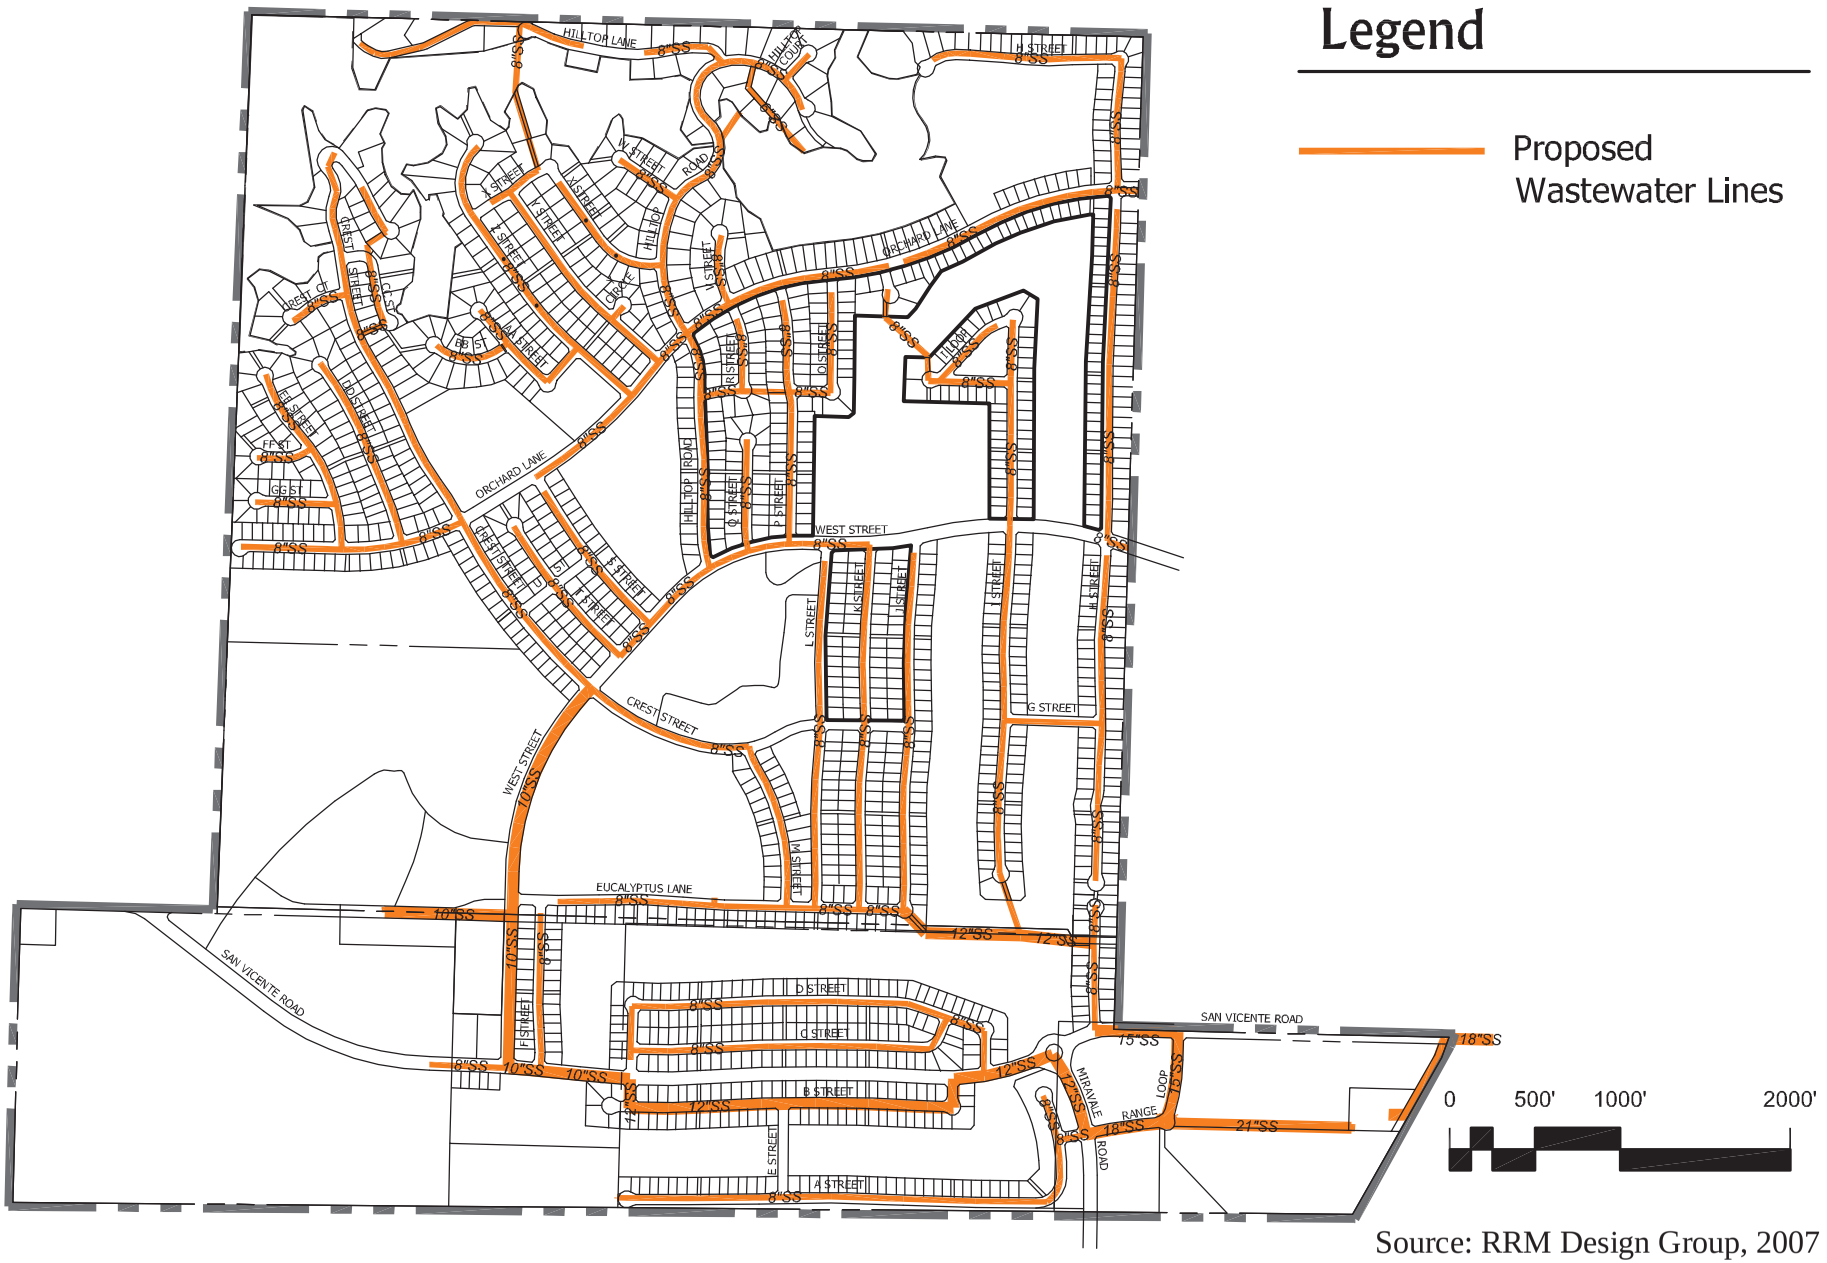
4.14-7 In order to ensure that adequate wastewater treatment is available to accommodate each phase of project development, the treatment capacity for the on-site recycled water facility shall be increased to accommodate each phase of the project prior to the final approval of the first building permit or occupancy permit for each of the respective project phases as appropriate. Subject to the review and approval of the Director of Public Works, excess treatment capacity shall be added to the plant and disposal facilities, as needed, for each phase of the project, to accommodate future increases in wastewater flow rates, based on estimates of future development. In addition, flows shall be metered and records of the flows shall be provided to the RWQCB for review and approval. No building permits shall be issuance unless sufficient capacity exists to accommodate additional phases of development.

4.14-8 Prior to the issuance of any building permit, the applicant/developer shall submit payment of the current City Development Impact Fee for each type of development in accordance with the adjusted impact fee in effect at the time of building permit issuance. Additionally, the applicant/developer shall submit payment of all fees necessary to fund the construction of the expansion of the treatment plant located within the project site, as required by the City of Soledad. All fees shall be subject to the review and approval of the Director of Public Works.

The Miravale III Specific Plan and Vesting Tentative Map have developed a preliminary onsite sanitary sewer plan that addresses the development of the Specific Plan area, as well as its relationship to the existing sewer system. This plan analyzes the sewer system for the Plan area and establishes policies that will help to facilitate the design and construction of a system that would meet the needs of the public. Sanitary sewer lines will be located within the proposed street right-of-ways, and connect to the existing

sanitary sewer lines that serve the City. A conceptual layout of the wastewater plan is presented in Figure 4.14-4.

The City Public Works Director has stated that all wastewater mains must be designed consistent with the requirements set forth by City. All wastewater pipelines would be placed underground and in the utilities right-of-way. The project would be required to construct new infrastructure that is of adequate capacity to serve the project's projected demand in addition to the wastewater provider's existing commitments (Cliff Price, City of Soledad, personal communication, July 2007). Implementation of the following mitigation measures would not result in any new environmental impact beyond those identified elsewhere in this EIR.



Impact **Development of the proposed project would require or result in the construction of new water or wastewater treatment facilities and expansion of existing facilities, including the construction of water and wastewater facilities, transmission mains and improvements which could cause significant environmental effects through construction of the facilities if not planned and constructed consistent with Citywide infrastructure improvement plans.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

4.14-9 All water and wastewater infrastructure shall be designed with sufficient capacity to accommodate the project and be required to adhere to all applicable City standards in terms of infrastructure sizing, design and construction. Prior to the issuance of any building and/or grading plan, the project applicant shall submit detailed evidence, including but not limited to design-level infrastructure plans, consistent with the requirements of this mitigation, subject to the approval of the Director of Public Works.

4.14-10 All wastewater pipelines shall be placed underground and in the utilities right-of-way. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level infrastructure plans in accordance with this measure, subject to the review and approval of the City of Soledad Director of Public Works.

4.14-11 The project would be required to construct new infrastructure that is of adequate capacity to serve the project's projected demand in addition to the wastewater provider's existing commitments. Prior to the issuance of any building permit, the project applicant shall submit detailed design-level documentation, in addition to written documentation from the City of Soledad, documenting that design-level plans are in accordance with City standards, as well as documenting that the City has sufficient capacity to accommodate project demands in addition to existing commitments, subject to the approval of the Director of Public Works.

Construction of wastewater infrastructure has the potential to result in physical environmental impacts such as noise dust, water quality, and potential biological impacts. These issues are addressed within their respective section of this EIR. The proposed project would not result in potentially significant impacts that cannot be mitigated to a less-than-significant level through implementation of standard conditions of approval and mitigation identified elsewhere in this EIR. No additional mitigation measures are required. **This would represent a less-than-significant impact.**

Conceptual Wastewater Distribution System

Figure 4.14-4

DENISE DUFFY & ASSOCIATES, INC.

Solid Waste

Change in solid waste streams generally results from population growth, successful diversion efforts, and substantial fluctuations in demolition and construction activities. The project would result in a population increase as well as new construction activities. As a result, it would increase solid waste generation that could adversely affect local facilities that process or store solid waste.

The project would generate solid waste related to project operations. The solid waste generation rate of 5.4 pounds per person per day is a target rate mandated by the Waste Management Act of 1989 (AB 939) and assumes that solid waste reduction and recycling program would be implemented. According to the Salinas Valley Solid Waste Authority (SVSWA), solid waste generation for each of the six jurisdictions averages approximately 5.0 pounds per capita per resident per day (Jorge Gamboa, SVSWA, personal communication, August 2007). Based on a solid waste generation rate of 5.0 pounds per person per day, upon buildout, the project would generate about 76,005 pounds of solid waste per day, or 13,870 tons per year. According to SVSWA, project generated solid waste would be disposed of primarily at the Johnson Canyon facility, which is permitted to receive 300 tons of solid waste per day. In 2000, the facility received an average of 132 tons of solid waste per day from six jurisdictions. Development of the proposed project would contribute an additional 38 tons of solid waste per day.

The Johnson Canyon landfill has adequate capacity to serve its present service area, including the development of the proposed project site. Moreover, the SVSWA is currently in the process of expanding the capacity of several of its existing facilities, including the Johnson Canyon landfill, which would provide adequate disposal capacity for 70 years. The project's solid waste generation of 13,870 tons per year represents an incremental increase in the yearly receipt of solid waste by the Johnson Canyon facility that can be accommodated by existing landfill facilities (Jose Gamboa, SVSWA, personal communication, August 2007). Further, current efforts to expand capacity would ensure that solid waste generated by the proposed development would be accommodated within existing facilities. As such, no new facilities would need to be constructed in order to accommodate project generated solid waste. Although project-generated solid waste would be accommodated in an existing disposal facility with adequate capacity, project construction would result in significant construction-generated waste. The SVSWA has identified the following mitigation measure as necessary, in order to reduce project construction impacts. Implementation of the following mitigation measure would not result in any new environmental impact beyond those identified elsewhere in this EIR.

Impact **Project construction would result in significant construction-generated waste. The following mitigation has been identified by the Salinas Valley Solid Waste Authority to ensure that all construction-generated waste is recycled to the greatest extent feasible in order to minimize impacts to existing facilities within their jurisdiction.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.***

Mitigation

4.14-12 Prior to the commencement of construction related activities, the applicant/developer shall prepare and submit a Construction and Demolition Diversion Plan consistent with the requirements of the City's adopted Diversion Plan Ordinance, subject to the review and approval of the Salinas Valley Solid Waste Authority and the City of Soledad. This plan shall identify on-going implementation measures for the diversion and separation of construction waste to ensure that all construction-generated solid waste is recycled to the greatest extent possible.

Energy

The project site would be constructed with a variety of commercial, residential, and hospitality-oriented uses that would increase demands on electricity and natural gas supplies. In addition, the proposed project also entails the development of a number of public facilities, including several school sites, a police/fire substation, as well as various parks. Development of the proposed project would result in both direct and indirect energy consumption. Indirect energy consumption includes 1) energy consumed by construction vehicles and energy used for construction materials, such as asphalt, steel, concrete, pipes and manufactured or processed materials such as lumber and metal, and 2) energy consumption related to project land uses (i.e. vehicular traffic). At this time information regarding the type and quantity of building materials is not known. Therefore, only direct energy consumption associated with project operation is considered for this analysis. Anticipated operational energy demand is presented in Table 4.13-4 and 4.13-5 below. Please note that energy and natural gas estimations do not include estimates for institutional uses, such as schools and other public facilities, due to the fact the size of these facilities is currently unknown. Nevertheless, potential energy demands associated with these facilities would not result in the wasteful, inefficient and unnecessary consumption of energy. Although development of the proposed project would result in indirect energy consumption as a result of project construction and operation, these additional demands are not anticipated to result in the need for new facilities such that an adverse environmental impact would occur. PG&E is currently in the process of updating an existing substation and has indicated that this facility, upon completion of the upgrades, would have sufficient capacity to meet project generated demands.

Table 4.13-4 Anticipated Annual Energy Demand

Use	Proposed Dwelling Units	Proposed Floor Area (sq. ft.)	Demand Factor (kiloWatt hour per du/sq)[1]	Approximate Energy Demand (kiloWatt hour/year)
Commercial/Retail/Restaurant	N/A	275,000	13.55	3,726,250
Single Family Residential	1,470	N/A	6,081	8,939,070
Residential - Multifamily	2,230	N/A	6,081	13,560,630
Senior Unit	500	N/A	6,081	3,040,500
Hotel	120	N/A	6,081	729,720
Golf Clubhouse	N/A	15,000	13.55	203,250
			Total:	**30,199,420 kWh**

Source Estimations: Please note that these are rough estimates. Actual energy demand will likely vary depending on commercial uses and other factors. Estimates obtained from Energy Information Administration, California Energy Commission, and SCAQMD CEQA Air Quality Handbook, 1993.
1). Estimates obtained from the Energy Information Administration. Demand factors are provided according to the type of use. Each demand factor either corresponds with total square footage or dwelling units.

According to the California Energy Commission (CEC), total energy consumption in California in 2005 was approximately 272,464 M kWh.[1] Monterey County's average energy consumption in 2005 was

[1] Please note that "M" refers to the International System of Units prefix representing "mega," which denotes one million units or 10^6.

approximately 2,539 M kWh. As identified in Table 4.13-4, development of the proposed project would generate additional demands for energy consumption on the project-site beyond pre-project conditions. Specifically, the proposed project would demand approximately 30.2M kWh. (Note: the figures contained in Table 4.13-4 were converted from kWh to M kWh for consistency.) The additional demands associated with the operation of the proposed project would result in an incremental, albeit insignificant, increase in the demand for electricity consumption. Although the incremental increase in energy demand is relatively insignificant in comparison to energy usage within Monterey County, additional infrastructure would be necessary to provide services to the project site. As identified by PG&E, the capacity of an existing substation would need to be expanded to serve projected demands associated with the proposed project. PG&E has indicated that these improvements would be able to accommodate project demands.

Table 4.13-5 Anticipated Annual Natural Gas Demand

Use	Proposed Dwelling Units	Proposed Floor Area (sq. ft.)	Demand Factor (kBtu/unit of measurement per du/sq. ft.) [1]	Gas Demand (kBtu/unit measurement /year)
Commercial/Retail/Restaurant	N/A	275,000	5.17	1,421,750
Single Family Residential	1,470	N/A	45,900	67,473,000
Residential - Multifamily	2,230	N/A	45,900	1,023,57,000
Senior Unit	500	N/A	45,900	22,950,000
Hotel	120	N/A	45,900	5,508,000
Golf Clubhouse	N/A	15,000	5.17	77,550
			Total:	**97,430,300 kBtu**

Source Estimations: Estimates obtained from the Energy Information Administration & US Environmental Protection Agency. Please note that these are rough estimates of potential natural gas demand associated with the proposed project. Actual demand will likely vary depending on commercial uses and other factors.
1). Demand factors are provided according to the type of use. Each demand factor either corresponds with total square footage or dwelling units.

According to the CEC, total natural gas consumption in California in 2005 was approximately 2,092 T Btu per year.[2] At the time of report preparation, data regarding Monterey County's average natural gas consumption was not readily available. As identified in Table 4.13-5 below project demands would be approximately 0.000094 T Btu per year. (Note: the projected natural gas demand figures contained in Table 4.13-6 were converted from K Btu to T Btu for consistency.) The additional demands associated with the operation of the proposed project would result in an incremental increase in the demand for natural gas. Although project generated demands would result in an insignificant increase in natural gas consumption, services would need to be extended to the project site in order to meet project demands.

As identified above, the project site would be constructed with a variety of residential and commercial uses, increasing demands on electricity and natural gas supplies. It is anticipated that PG&E would extend their services to the project area under a franchise agreement with the City. According to PG&E, the project would not result in any adverse effects on their services, and PG&E has the capacity to provide electric service to the project (Jose Rios, PG&E, personal communication, August 2007).

[2] Please note that "T" refers to the International System of Units prefix representing "tera," which represents one trillion units or 10^{12}.

Existing PG&E-operated gas mains and electrical distribution systems would be extended and new distribution mains installed in a new joint trench adjacent to roadways. In addition, the expansion of existing gas and electrical transmission facilities outside of the project site may be required. The need for these improvements will be determined by PG&E. More specifically, PG&E has indicated that they are currently in the process of upgrading an existing substation within the northern portion of Soledad to ensure that adequate facilities are provided to meet project generated demands, in addition to, full buildout of the General Plan (Jose Rios, PG&E, personal communication, August 2007). As a result, the project would be adequately served by PG&E.

CEQA Guidelines Section 15126.4(a)(1)(c) identifies that energy conservation measures, in addition to mitigation measures intended on reducing energy consumption, should be identified within the context of an EIR. In order to ensure that project impacts related to increased energy consumption are minimized to the extent feasible, the Specific Plan contains policies to reduce energy consumption. In addition, the City of Soledad implements Title 24 requirements as part of their building code to ensure that energy conservation measures are incorporated into project design. While adherence to existing City requirements related to Title 24 compliance would generally reduce project-induced impacts, the increased energy consumption, albeit relatively insignificant from a regional perspective, would still result in the permanent commitment of a non-renewable resource. Development of the proposed project, however, would not result in the wasteful, inefficient and unnecessary consumption of energy. Policies are incorporated into the Specific Plan to minimize the wasteful use of energy and ensure that planning and building efforts are coordinated to maximize energy conservation. In addition, the implementation of additional project-specific mitigation would also ensure that energy use is minimized to the greatest extent feasible and thereby ensure that project-impacts would be considered less-than-significant.

Increased demand for energy and natural gas would also result in additional greenhouse gas emissions as identified in sections **4.3 Air Quality** and **5.0 CEQA Considerations**. While project-induced impacts associated with greenhouse gas emissions are addressed elsewhere in this EIR, it is important to acknowledge the relationship between energy consumption and greenhouse gas emissions. According to the CEC, approximately 20% of greenhouse gas emissions are associated with the energy sector in California. As a result, increased energy demands associated with the construction and operation of the proposed project would contribute towards climate change. In order to ensure project impacts are minimized to the greatest extent feasible, mitigation is warranted. The following mitigation measure is necessary to reduce project demands for electricity and natural gas and is in addition to other mitigation measures identified elsewhere in this EIR to reduce energy consumption and thereby greenhouse gas emissions. Implementation of the following mitigation measure would not result in any new environmental impact beyond those previously identified in this EIR.

Impact **Development of the proposed project would increase demands for electricity and natural gas consumption.** ***This would represent a potentially significant impact that can be reduced to a less-than-significant level with the implementation of the following mitigation measure.***

4.13-1 In order to prevent the wasteful use of energy, all new residential, commercial, and hospitality oriented structures shall incorporate the principles of passive solar design to the maximum extent feasible. Typical passive solar design principles may include the following; 1) large south-facing windows; 2) tile, brick, or other thermal mass material used in flooring or walls to absorb natural heat; 3) improved insulation; 4) building orientation that takes advantage of the sun, shade, and wind; and 5) energy efficient building materials. For new structures that are unable to incorporate these principles, the project applicant shall submit detailed evidence, such as site plans, landscape plans, and similar, to the City of Soledad Public Works Director demonstrating that there are no viable design alternatives to accommodate these principles. Prior to the issuance of each

individual building permit for new structures, the project applicant shall submit evidence, including but not limited to, site plans, proposed building materials, and landscape plans, to the City of Soledad Public Works Director for review and approval.

5.0 CEQA CONSIDERATIONS

5.1 GROWTH INDUCEMENT

CEQA (Section 15126 (d)) requires that any growth inducing aspect of a project be addressed in an EIR. This discussion includes consideration of ways in which the project could directly or indirectly foster economic or population growth, or the construction of additional housing, in the surrounding area. Projects that would remove obstacles to population growth, such as a major public service or utility expansions, are also considered in this discussion.

Under CEQA, growth inducement is not considered necessarily detrimental, beneficial, or of little significance to the environment. Typically, the growth-inducing potential of a project would be considered significant if it encourages growth or a concentration of population in excess of what is assumed in appropriate master plans, land use plans, or in projections made by regional planning agencies such as the Association of Monterey Bay Area Governments (AMBAG). Significant growth impacts could also occur if the project provides infrastructure or service capacity to accommodate growth beyond the levels currently permitted by local or regional plans and policies. In general, growth inducement by a project is considered a significant impact if it directly or indirectly affects the ability of agencies to provide needed public services, or if it can be demonstrated that the potential growth significantly affects the physical environment in some other way, such as through an increase in traffic congestion or deterioration of air quality. In addition, the removal of constraints to growth, such as the extension of services or infrastructure into an area, can be considered growth-inducing.

Soledad's existing population (2007) is 28,361. The project would increase population in the area through the development of 1,470 single family units and 2,730 multi-family units for a total of 4,200 residential units. Based on assumptions for persons per housing type identified in **Section 4.11 Population and Housing**, the 4,200 new units proposed by the project could result in an additional 15,201 people. This additional population represents about 54 percent of Soledad's existing (2007) population. This growth in population would increase demands on existing community facilities, requiring construction of new facilities. The project site is located outside City limits, within an area planned for City expansion. The project would provide new infrastructure to the area, including extensions of water and sanitary sewer lines, as well as roadway improvements.

Based on the above discussion, the project would result in a significant growth-inducing impact.

5.2 CUMULATIVE IMPACTS

Section 15130 of the State CEQA Guidelines requires an EIR to generate impacts that may be individually limited, but could be significant when taken together with other similar projects in the area (cumulative impacts). As defined by Section 15355 of the State CEQA Guidelines, a cumulative impact is an impact that is created as a result of the combination of the proposed project and related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

Approach

This EIR uses the general plan approach and the project list approach for determining potential cumulative impacts. The geographic area considered in this general plan analysis includes the area within

the City of Soledad incorporated limits and general plan area, as defined in the City General Plan. The General Plan and General Plan EIR are incorporated by reference and available for review at the offices of the City of Soledad. The area covered by the General Plan is referred to herein as the City's planning area and includes the incorporated limits as well as "...any land outside its boundaries which in the planning agency's judgment bears a relation to its planning" (Government Code Section 65300). The City's planning area is shown on Figure 4-9.1 and covers an area generally defined by the ridegline of the Gabilan Range to the east and the foothills of the coast range to the west, extending north past the Soledad prison, and to the south about mid-way between Soledad and Greenfield.

City of Soledad General Plan and EIR. The cumulative and growth inducing impacts of continued development of the City of Soledad including the project site were evaluated by the City of Soledad General Plan EIR. As noted in Table 5.2-1, below, the EIR concluded that buildout of the Plan area in forty or more years will have unavoidable adverse impacts related to the permanent loss of prime agricultural land, regional traffic, cumulative air quality, visual resources, biological resources, energy consumption, and water supply. However, potentially significant adverse impacts related to infrastructure, traffic, noise, and others, will be avoided by implementing the policies and programs recommended by the adopted General Plan. Additionally, the following impacts were found to be less-than-significant by the General Plan EIR.

- ✓ Fire protection for industrial development
- ✓ Energy consumption related to motor vehicle fuel
- ✓ Traffic hazards
- ✓ Demand for public transit
- ✓ Increase of population in relation to consistency with the Clean Air Plan
- ✓ Air quality impacts relative to CO hotspots
- ✓ Impacts related to stationary noise sources and agricultural operations
- ✓ Impacts to groundwater recharge
- ✓ Impacts to the beneficial use of groundwater resources
- ✓ Groundwater quality
- ✓ Impacts relating to the movement of animal species across the Valley floor
- ✓ Urbanization impacts (light, glare, and noise) on animal populations
- ✓ The potential for urban development to hasten the cancellation of Land Conservation Act contracts
- ✓ Visual impacts of construction storage
- ✓ Jobs housing balance

Section 15130 of the State CEQA Guidelines requires an EIR to generate impacts that may be individually limited, but could be significant when taken together with other similar projects in the area (cumulative impacts). This EIR addresses the cumulative considerations of this development with the buildout considered in the Soledad General Plan DEIR.

Table 5.2-1
Summary Of Impacts in the 2005 City General Plan EIR

Environmental Issue	Impact	Policy Response/ Mitigation Measures	Residual EFFECT
Class I Impacts -- Significant and unavoidable impacts.			
Public Services	Impact PS-1: Water demand associated with buildout of the draft Plan will contribute to the cumulative demand for water for domestic use from the Salinas Groundwater Basin.	Policies S-1 though S-40, HZ-9 through H-11, Programs 5.11, 7.1 through 7.9, 9.4 through 9.7, 4.1 and 4.2	Significant and adverse.
Energy	Impact PS-14: Development accommodated by the draft will increase the demand for electricity within the Plan area and the need for distribution facilities.	Policy H-11, Program 5.11	Significant and adverse.
Traffic and Circulation	Impact T-1: Buildout of the land uses recommended by the Draft General Plan will significantly increase traffic generation with a corresponding cumulative impact on the level of service of regional roadways, streets and intersections serving the City.	Policies T-1 through T-37, Programs 5.1 through 5.24	Significant and adverse.
Air Quality	Impact AQ-2: Motor vehicle trips associated with buildout of the draft Plan will contribute to a cumulative adverse impact on regional air quality.	Policies T-1 through T-37, C/OS-13 through C/OS – 16 Programs 5.2 through 5.11, Programs 5.15, 8.1 through 8.4	Significant and adverse.
Biological Resources	Impact BIO-4: Development accommodated by the draft Plan will increase groundwater withdrawals, which has the potential to diminish in-stream flow along the Salinas River.	Policies C/OS-7 through C/OS-12; Policies C/OS-17 through C/OS-21 Programs 8.7 and 8.8	Significant and adverse.
	Impact BIO-7: The permanent loss of 3,500 acres of foraging area for special status animal species would contribute to the cumulative loss of such areas within the Salinas Valley.		Significant and adverse.
Agricultural Resources	Impact A-1: Development of land designated for urban development by the draft Plan, and the development of additional disposal ponds for the wastewater treatment plant, will result in the permanent conversion of about 3,500 acres of land classified Prime and Farmland of Statewide Importance.	Policies C/OS-1 through C/OS-8 Programs 8.7 and 8.8	Significant and adverse.

Table 5.2-1
Summary Of Impacts in the 2005 City General Plan EIR

Environmental Issue	Impact	Policy Response/ Mitigation Measures	Residual EFFECT
	Impact A-2:Development of additional rapid infiltration basins as recommended by the draft Wastewater Treatment and Disposal Master Plan will result in the permanent conversion of about 469 acres of land classified Prime and Farmland of Statewide Importance. This is considered an unavoidable and adverse project-specific and cumulative impact (Class I).	Policies C/OS-1 through C/OS-8 Programs 8.7 and 8.8	Significant and adverse.
Visual Resources	Impact V-1 Development of the various land uses contemplated by the Draft Plan will alter the visual character and/or quality of the Plan area.	Policies L-3, L-42 through L-52; Policies C/OS-7 through C/OS-9, C/OS-18 Programs 8.7 through 8.9	Significant and adverse.
Class II Impacts -- Significant impacts that can be mitigated to a less-than-significant level by recommended mitigation measures.			
Public Services	Impact PS-3: Buildout of the area designated for urban development will require the expansion and extension of water storage and distribution infrastructure to accommodate the level of development anticipated.	Policies S-1 though S-40, HZ-9 through H-11, Programs 5.11, 7.1 through 7.9, 9.4 through 9.7, 4.1 and 4.2	Not significant
	Impact PS-4: The draft Plan designates some 2,750 acres for urban expansion beyond the area currently served by the City's wastewater collection and treatment systems. Serving this area will require considerable expansion of infrastructure capacity for collection, treatment and disposal.		Not significant.
	Impact PS-6: Buildout of the City as contemplated by the draft Plan will increase the need for fire fighting personnel and equipment.		Not significant
	Impacts PS-7: Buildout of the draft Plan will require additional fire protection facilities and equipment to maintain an acceptable response time.		Not significant
	Impact PS-9: Buildout of the City as contemplated by the draft Plan will increase the need for police protection personnel and equipment.		Not significant
	Impact PS-10: Buildout of the draft Plan will significantly increase the City's population and the demand for parkland.		Not significant

Table 5.2-1
Summary Of Impacts in the 2005 City General Plan EIR

Environmental Issue	Impact	Policy Response/ Mitigation Measures	Residual EFFECT
	Impact PS-12: Buildout of the draft Plan will accommodate about 11,539 additional dwelling units which in turn are expected to generate additional school aged children. The number of new households and associated students will significantly increase the demand for school facilities.		Not significant
	Impact PS-13: Buildout of the draft Plan will result in the generation of additional solid waste which will adversely impact the capacity of landfills serving the City and surrounding cities.		Not significant
Traffic	Impact T-2: Buildout of the land uses recommended by the Draft General Plan will adversely affect the operation and level of service of the two freeway interchanges serving the City.	Policies T-1 through T-37, Programs 5.1 through 5.24	Not significant
Noise	Impact N-1: Noise associated with construction activities may adversely impact nearby noise-sensitive uses.	Policies N-1 through N-5; Programs10.1 and 10.2	Not significant
	Impact N-2: Noise associated with motor vehicle traffic generated by the development of land uses accommodated by the draft Plan will increase, which may result in the exceedence of the standards described in Table V.4-1 adjacent to the roadway.		Not significant
Geologic Hazards	Impacts GEO-1: A major earthquake on the San Andreas faults could produce ground accelerations of 0.15g to 0.7g within the Plan area, resulting in damage to structures and a potential safety hazard to occupants of such structures.	Policies C/OS-7, C.OS-8, C/OS-9, HZ-5 through 8; S-12 through S-19; Program 9.2	Not significant
	Impact GEO-2: Portions of the Plan area may be subject to landslides and/or slope failure.		Not significant
	Impact GEO-3: Development activities associated with the various land uses contemplated by the draft Plan have the potential to result in soil erosion.		Not significant
	Impact GEO-4: Construction and renovation activities associated with the Wastewater Master plan could result in erosion and sedimentation.		Not significant
Flooding, Drainage and Water Quality	Impact W-1 Buildout of the land uses designated by the draft Plan will increase the amount of impervious surfaces within the City's Plan area, thereby increasing the volume and velocity of runoff, and the potential for erosion and sedimentation in the Salinas River and its tributaries.	Policies S-12 through S-19; HZ-1 through HZ-4; Programs 9.1 and 9.2	Not significant

Table 5.2-1
Summary Of Impacts in the 2005 City General Plan EIR

Environmental Issue	Impact	Policy Response/ Mitigation Measures	Residual EFFECT
	Impact W-2: Heavy metals and other hazardous materials washed from the surface of parking lots and roadways constructed within the Plan area could enter natural drainage courses such as the Salinas River during a rainstorm.		Not significant
	Impact W-3: Construction activities could result in the release of oil, engine fuel and other toxic substances into the Salinas River or its tributaries, adversely affecting water quality.		Not significant
	Impact W-4: Buildout of the land uses designated by the draft Plan may expose people and property to the periodic effects of flooding.		Not significant
Biological Resources	Impact BIO-1: Buildout of the Plan area with urban uses could result in the permanent conversion of 3,500 acres of agricultural land to urban use. This land may provide suitable foraging habitat for certain special status animal species, and uncultivated areas could contain sensitive plant species.	Policies C/OS-7 through C/OS-12; Policies C/OS-17 through C/OS-21 Programs 8.7 and 8.8	Not significant
	Impact BIO-2: Construction activities could result in a number of temporary impacts, including, but not limited to, disturbance of special status plant or animal species (nesting raptors, burrowing owls, etc.), increased erosion potential, and noise, particularly along the Salinas River and its tributaries, and the foothills.		Not significant
	Impact BIO-3: Urban development in the planning area could adversely impact riparian habitat by increasing impervious surfaces, accelerating erosion and input of sediments and pollutants.		Not significant
Agricultural Resources	Impact A-3: The expansion of urban uses contemplated by the draft Plan will increase the potential for incompatibility between urban uses and agricultural operations.	Policies C/OS-1 through C/OS-8 Programs 8.7 and 8.8	Not significant
Visual Resources	Impact V-3: Development of the various land uses accommodated by the draft Plan will result in additional sources of light and glare. These new sources will be visible from adjoining areas and from the 101 Freeway.	Policies C/OS-1 through C/OS-8 Programs 8.7 and 8.8	Not significant
	Impact V-4: New urban development could adversely affect the historic character of the City.		Not significant
Cultural Resources	Impact C-1: Development of the land uses contemplated by the draft Plan could unearth or disturb previously undiscovered resources of cultural or historic significance.	Policies L-49, L-52, C/OS-23, C/OS-24, Programs 8.5, 8.9, 8.10	Not significant

Table 5.2-1
Summary Of Impacts in the 2005 City General Plan EIR

Environmental Issue	Impact	Policy Response/ Mitigation Measures	Residual EFFECT
	Impact C-2: Development in accordance with the draft Plan could alter the historic character of the City.		Not significant
Class III Impacts -- Impacts that are adverse but not significant.			
Public Services	Impact PS-2: The increased demand on groundwater resources required to serve buildout of the City's Plan area could potentially reduce water levels in wells serving agricultural operations in the vicinity of the City.	Policies S-1 though S-40, HZ-9 through H-11, Programs 5.11, 7.1 through 7.9, 9.4 through 9.8, 4.1 and 4.2	Not significant
	Impact PS-5: Buildout of the draft Plan will significantly increase the amount of biosolids generated by the wastewater treatment plant which in turn will impact the capacity of licensed disposal facilities.		
	Impact PS-8: The additional industrial development accommodated by the draft Plan may necessitate specialized fire fighting and hazardous materials equipment to maintain an acceptable level of fire protection.		
	Impact PS-11: Buildout of the draft Plan will significantly increase the City's population and the demand for recreation programs.		Not significant
	Impacts PS-15: Development of the land uses contemplated by the draft Plan will increase motor vehicle use with a corresponding increase in the consumption of motor vehicle fuels.		Not significant
Traffic	Impact T-3: Buildout of the land uses recommended by the Draft General Plan could result in traffic hazards on city streets and intersections.	Policies T-1 through T-37, Programs 5.1 through 5.24	Not significant
	Impact T-4: Buildout of the land uses recommended by the Draft General Plan will significantly contribute to the demand for bicycle and pedestrian facilities in the City's planning area.		Not significant
	Impact T-5: Buildout of the land uses recommended by the Draft General Plan will contribute to the demand for public transit serving the City's planning area.		Not significant
Air Quality	Impact AQ-1: The draft Plan accommodates a considerable increase in the City's population over the next twenty or more years which may hamper efforts to achieve and maintain federal and state air quality standards.	Policies T-1 through T-37, C/OS-13 through C/OS – 16 Programs 5.2 through 5.11, Programs 5.15,	Not significant

Table 5.2-1
Summary Of Impacts in the 2005 City General Plan EIR

Environmental Issue	Impact	Policy Response/ Mitigation Measures	Residual EFFECT
	Impact AQ-3: Buildout of the draft Plan will degrade the operation of intersections within the City's Plan area which may lead to CO 'hotspots' where the state or federal standard may be violated.	8.1 through 8.4	Not significant
	Impact AQ-4: Expansion of the City's wastewater treatment and disposal capacity as contemplated by the draft Wastewater Treatment and Disposal Master Plan could result in the generation of nuisance odors.		Not significant
Noise	Impact N-3: Buildout of land uses accommodated by the draft Plan will increase the exposure of people to new and existing stationary sources of noise.	Policies N-1 through N-5; Programs10.1 and 10.2	Not significant
	Impact N-4: Noise from ongoing agricultural operations could periodically exceed the City's noise standards for adjacent residences.		Not significant
Flooding, Drainage and Water Quality	Impact W-5: The increase in impervious surfaces could adversely affect groundwater recharge.	Policies S-12 through S-19; HZ-1 through HZ-4; Programs 9.1 and 9.2	Not significant
	Impact W-6: Improvements contemplated by the draft Wastewater Treatment and Discharge Master Plan and resulting treatment plant expansions could impair groundwater beneficial uses or quality.		Not significant
	Impact W-7: The proposed change in land use at the project area could affect regional groundwater quality.		Not significant
	Impact W-8: Expanded infiltration basins could result in increased risk of surface water degradation to the Salinas River in the event of a spill.		Not significant
Biological Resources	Impact BIO-5: The conversion of agricultural land to urban uses within the Plan area may restrict the east-west movement of animals from the hills to the west across the Salinas Valley.	Policies C/OS-1 through C/OS-8 Programs 8.7 and 8.8	Not significant
	Impact BIO-6: Buildout of the Plan area with urban uses will result in long-term indirect impacts associated with increased urbanization, including light, noise, pets, traffic, and other effects of increased human presence.		Not significant
Agricultural Resources	Impact A-4: Development of land designated for urban development by the draft Plan may hasten the early cancellation of Land Conservation Act Contracts.	Policies C/OS-1 through C/OS-8 Programs 8.7 and 8.8	Not significant

Table 5.2-1
Summary Of Impacts in the 2005 City General Plan EIR

Environmental Issue	Impact	Policy Response/ Mitigation Measures	Residual EFFECT
	Impact A-5: Development of infiltration basins could hasten the cancellation of LCA contracts on properties surrounding the wastewater treatment plant.		Not significant
Visual Resources	Impact V-2: Grading and construction activities and the storage of construction materials may be visible from public vantage points.	Policies C/OS-1 through C/OS-8 Programs 8.7 and 8.8	Not significant
Housing and Population	Impacts PH-1: Continued development of the City as contemplated by the draft Plan will result in considerable additional housing and population growth which in turn could affect the supply of affordable housing and the relationship between jobs and housing.	Policies L-1 through L-20, L-43, H-1 through H-12, Programs 2.1 through 2.7; 4.1 through 4.23	Not significant

5.2A Viewshed

Setting: The viewshed surrounding the City consists largely of agricultural fields with a backdrop of mountain ranges to the east and west. The outward expansion of the City has established a firm visual edge between urban and rural uses. However, commercial and industrial businesses located along the Highway 101 right-of-way north of the City interrupt this established boundary. The scenic variety of the City's Plan area could hardly be considered 'distinctive' within the context of the Salinas Valley. The fairly uniform rows of crops with the mountain ranges behind is the predominant visual experience when traveling through the Salinas Valley.

When approaching the City from either the north or south on Highway 101, the most prominent view of the City is the commercial businesses along the east side of Front Street which form a nearly solid facade when viewed from the west. The freeway interchanges serving the City are important visual gateways that provide visitors with their first impressions of the form and character of the community and its largely-agricultural setting.

General Plan EIR: The General Plan EIR evaluated potential aesthetic impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. The General Plan EIR identified the following cumulative impacts:

- Development of the various land uses contemplated in the General Plan would alter the visual character and/or quality of the area. This impact was identified as significant and unavoidable.

- Temporary construction related impacts were identified due to buildout according to the General Plan. This impact was identified as adverse, but not significant.

- Buildout of the General Plan would result in additional sources of light and glare, which would be visible from adjoining areas and from Highway 101. This impact was considered significant, unless mitigated.

Cumulative Impact: Implementation of the project in conjunction with cumulative projects associated with General Plan buildout would introduce substantial new development, decreased views of open space, and potential reduction of views of the Gabilan Mountain Range foothills. The proposed Specific Plan adoption amends a key goal of the General Plan that will introduce substantial new development, including structures of various heights and densities, which would result in decreased views of open space, within that portion of the Gabilan Mountain Range foothills located within the project boundaries. Mitigation is presented in this EIR to reduce these impacts as much as feasible at the project level but this project impact remains significant and unavoidable. Similarly, the General Plan includes goals and policies intended to protect the visual character of the City and surrounding scenic resources. This EIR finds that the increased visibility and intensity of development would have a substantial adverse effect on a scenic vista. The cumulative loss of natural open space and introduction of urban development would result in a significant unavoidable impact to the scenic vista. **Based on the above discussion, the cumulative impacts associated with loss of viewshed materials would be cumulatively considerable.**

Cumulative Mitigation: Implementation of the policies and programs contained in the City General Plan (Table 5.2-1 above).

5.2B Agricultural Resources

Setting: Conversion of agricultural land to urban uses continues to be a public policy issue in California. The Farmland Mapping and Monitoring Program (FMMP) has determined that approximately 828,445 acres (approximately 1.8 percent of California's landmass) were converted to urban and built uses between 2000–2002. Of the total acres converted, 397,097 were formerly cropland and 172,857 were formerly grazing land.

Monterey County cities and residential communities continue to grow and in recent years, agricultural land has been converted to residential and other non-agricultural uses. The single most important factor in the decline of agricultural acreage in Monterey County has been the rapid spread of urban development. In the South Monterey County area, significant development pressures have resulted in the conversion of agricultural land to urban uses.

According to a study by the California Department of Conservation, conversions of farmland to urban uses adversely affect the efficiency of remaining farming operations in the area. For example, agricultural production decreases as a result of increased air pollution, livestock predation by pets, crop diseases resulting from inadequate care of off-farm ornamental plants, restriction on pesticide use and burning, and requirements to set aside on-farm buffer zones. Production costs increase because of rising land costs, water scarcity, theft and vandalism of farm equipment, crop pilferage, road congestion, and personal injury liability associated with farm trespass.

Based on data from the FMMP for the years 2000 to 2004 (Table 5.2. 1), it would appear that the majority of residential and commercial development has occurred on prime farmlands (prime and important lands, combined). However, the conversion of prime irrigated lands is not consistently related to the increases in urban land areas. As an example, Table 5.2.2 shows that between 2000 and 2002, approximately 12.5 percent of irrigated farmland loss was due to conversion to urban development. During this period total irrigated agricultural acreage increased by 1,596 acres. The additional prime land is largely attributable to the conversion of non-irrigated grazing and other lands.

Table 5.2.2 Change in Monterey County Prime and Important Farmland Acreage					
Category	**Years Inventoried**			**Net Change (%)**	
	1984	**2000**	**2004**	**1984-2000**	**2000-2004**
Prime Farmland	176,779	169,255	169,368	-4.3	0.1
Farmland of Statewide Importance	37,762	45,877	44,544	21.5	-2.9
Prime Farmland Subtotal	214,541	215,132	213,912	0.2	-0.6
			Acres	591	-1220
Grazing Land	1,081,510	1,060,663	1,066,539	-1.9	0.6
			Acres	-20,847	5876
Agricultural Land Subtotal	1,306,926	1,299,937	1,306,929	-0.5	0.5
			Acres	-6989	6992
Urban and Built-Up Land	42,374	52,486	54,293	23.9	3.4
			Acres	10,112	1807

Source: California Department of Conservation Farmland Mapping and Monitoring Program, 1994-2000

*Due to the incorporation of digital soil survey data (SSURGO) in 2000, acreages for farmland, grazing and other land categories may differ from those published in the 1998-2000 Farmland Conversion Report.

Table 5.2.3 Change in Monterey County Irrigated Farmland Acreage Between 2000 and 2002						
Land converted to irrigated			**Land converted from irrigated**			
Prime	**Statewide and Unique**	**Total**	**Urban**	**Grazing**	**Other**	**Total**
1295	2953	4248	331	1461	860	2652

The proposed project would incrementally contribute to this significant cumulative impact by converting approximately 760 acres of prime cropland to a non-agricultural use and is therefore considered significant and unavoidable.

The draft County General Plan includes a policy where "... impacts to productive farmlands resulting from urban development shall be mitigated through the implementation of agricultural land conservation programs. Mitigation shall be provided at a ratio of 1 acre conserved for each acre impacted. In lieu of conserving land through a conservation easement, another mitigation approach is payment of a fee based upon a one to one replacement for a farmland conservation easement or farmland deed restriction established by the Board of Supervisors by resolution or through an enforceable agreement with the developer. The in lieu fee option must be approved by the Board of Supervisors. The fee shall be equal to or greater than the value of a previous farmland conservation transaction in the planning area plus the estimated cost of legal, appraisal and other costs, including staff time, to acquire property for agricultural mitigation...".

General Plan EIR: The impact to agricultural lands due to the allowable development under the General Plan Land Use Element was identified as an unavoidable significant impact.

Cumulative Impact: Implementation of the project in conjunction with cumulative projects associated with General Plan buildout would introduce substantial new development, decreased agricultural lands and open space, and potential conversion and early cancellation of Williamson Act parcels in the planning area of the City. Due to the conversion of 3500 acres of state-identified prime agricultural land within the planning area of the City, the impacts from loss of agricultural lands due to development accommodated by the General Plan Land Use Element is considered an unavoidable significant impact.

Cumulative Mitigation: Currently there are no formal mitigation fee and/or conservation easement policies in place. There are grant programs provided by the State's Department of Conservation to assist in the acquisition of conservation easements and the Monterey County Agricultural and Historical Conservancy Inc. has successfully acquired easements in the Salinas Valley.

Impact after Mitigation - **No measures are available to fully mitigate the loss of prime agricultural land, therefore even after mitigation the impact will be significant and unavoidable.** This conclusion is consistent with the City of Soledad General Plan EIR, Agricultural Resources section for the eventual phased development of adjacent agricultural land.

5.2C Geologic Hazards

Setting: The City of Soledad is located on the eastern side of the Salinas Valley. The Valley is bordered by the Santa Lucia mountain range to the west, and the Gabilan range to the east and is underlain by alluvial fill to an estimated depth of between 800 and 1,000 feet. The composition of the fill is mainly unconsolidated or loosely consolidated sediments. These sediments were derived through weathering and subsequent movement of this material from upland areas to the valley floor. Most of the City of Soledad overlies recent alluvium although underlying geologic structure can vary considerably due to alternating layers of silt, sand, gravel, cobble, and occasional boulders that have been deposited over the alluvial fans in the valley. Clay layers occur at irregular intervals and depths throughout the area (Soledad General Plan, 2005). The City of Soledad is located in a seismically active region. The alluvial Salinas Valley is bordered both to the east and west by active or potentially active fault zones.

General Plan EIR: Potential geological and geotechnical hazards due to development accommodated by the Land Use Element were identified as potentially significant impacts which would be reduced to less-than-significant with implementation of policies and programs in the General Plan.

Cumulative Impact: The San Andreas Fault lies some thirteen miles east of the City and has produced some of the largest earthquakes in California history. A major seismic event associated with this fault could result in significant damage to structures and public infrastructure within the Plan area. The Plan area includes a portion of the foothills of the Gabilan Range which contain slopes of twenty percent and more. Portions of the Plan area may be subject to landslides and/or slope failure. Development activities associated with the various land uses under cumulative development of the General Plan construction activities will involve grading, excavation, and fill, all of which will expose soils to wind, water and other eroding elements.

Cumulative Mitigation: Implementation of the policies and programs contained in the City General Plan (Table 5.2-1 above) will reduce the potentially significant impacts to a less-than-significant level. **Based on the above, cumulative impacts associated with geologic hazards would be less-than-significant.**

5.2D Hydrology/Drainage

Setting: The project site is located north and northwest of the City of Soledad. The City is divided into nine drainage basins. Five of these lie entirely within the City limits, three are partially inside the City limits, and one lies entirely outside City boundaries. The Salinas River is located approximately 1.25 miles to the south of the site and is the primary surface drainage feature that affects the area. The City is located within the Salinas Valley groundwater Basin within the Forebay area. The Forebay area is characterized by gravels, sands, and clays of fluvial origin with minor, interfingering alluvial fan deposits occurring along the valley margins. These sediments constitute an unconfined aquifer over 800 feet thick, although local occurrence of clay layers may create partially confined conditions in some areas.

Recharge to groundwater occurs principally by 1) infiltration from the Salinas River, fed during the dry part of the year by water release from the Nacimiento and San Antonio reservoirs, 2) infiltration and underflow from tributary drainages around the basin and 3) return flows from agricultural irrigation and percolation of rainfall. Groundwater flow in the valley is to the northwest, towards the mouth of the Salinas Valley. However, pumping from large agricultural wells can have a significant local impact on groundwater gradient, and may locally induce cross valley groundwater flow.

Soledad General Plan EIR. The General Plan EIR evaluated potential hydrologic and drainage impacts associated with the buildout of the Soledad General Plan, including future development within the project area. According to the General Plan EIR, the following potentially significant impacts were identified:

- Buildout of the General Plan would increase the amount of impervious surfaces within the City's Plan area, thereby increasing the volume and velocity of runoff, and the potential for erosion and sedimentation in the Salinas River and its tributaries.

- Buildout of the General Plan would increase the amount of heavy metals and other hazardous materials washed from the surface of parking lots and roadways constructed within the Plan area that could enter natural drainage courses such as the Salinas River during a rainstorm.

- Development and associated construction activities could result in the release of oil, engine fuel and other toxic substances into the Salinas River or its tributaries, adversely affecting water quality.

- Buildout of the land uses designated by the General Plan have to potential to expose people and property to the periodic effects of flooding.

- The increase in impervious surfaces resulting from General Plan buildout could adversely affect groundwater recharge.

- Development and the proposed change in land use from buildout of the General Plan could affect regional groundwater quality.

Impacts to water quality were determined to be significant if project implementation would not comply with surface water quality objectives established by the Regional Water Quality Control Board (RWQCB) in Chapter 3 of the Water Quality Control Plan, Central Coast Region.

Additionally, the General Plan EIR concluded that water demand associated with buildout of the draft Plan will contribute to the cumulative demand for water for domestic use from the Salinas Groundwater Basin.

The remaining impacts were considered to be less-than-significant with mitigation proposed as part of the General Plan.

Cumulative Impact: Implementation of the project in conjunction with cumulative projects associated with General Plan buildout would introduce substantial new development. Cumulative development on undisturbed land within the watershed could increase the amount of impervious surfaces, thereby increasing runoff rates in the area. Future development of the project site as proposed by the Miravale III Specific Plan would include storm drain facilities not currently sized to be consistent with Storm Drain Master Plan requirements. However, with mitigation, the project's storm drain facilities will be in accordance with all local and state regulations, and would not result in significant impacts to hydrology or flooding conditions.

Cumulative development and increases in localized runoff could introduce urban pollutants into the drainage system and receiving water bodies, impacting water quality. The project proposes BMPs, as well as detention basins, to allow infiltration and remove heavy metals and other pollutants from storm water before it enters the groundwater. The onsite drainage system with proposed mitigation in this EIR and BMP measures would avoid offsite, cumulative water quality impacts.

The General Plan EIR concluded that water demand associated with buildout of the draft Plan will contribute to the cumulative demand for water for domestic use from the Salinas Groundwater Basin. The contribution of this project to incremental increase in demand is not considered cumulatively (as evidenced by the UWMP and WSA prepared for this project).

Cumulative Mitigation: Implementation of the policies and programs contained in the City General Plan (Table 5.2-1 above) and this EIR will reduce the potentially significant impacts to a less-than-significant level. The project would have a less-than-significant cumulative impact on hydrology and water quality.

Based on the above discussion, the cumulative impacts associated with hydrology and water quality would be less-than-significant.

5.2E Biological Resources

Setting: The majority of the lowland portion of the project site is currently in active agricultural production or fallow but typically dedicated to agricultural production. Active and fallow agricultural areas represent appropriate foraging and dispersal habitat for a variety of wildlife species and limited habitat for special-status plant species. The grassland portions of the site associated with the Gabilan foothills are relatively undeveloped and are not currently grazed; these areas provide valuable plant and wildlife habitat and habitat connectivity.

General Plan EIR: The General Plan EIR evaluated potential biological impacts associated with the adoption and implementation of the Soledad General Plan, including future development within the project area. According to the General Plan EIR, the following impacts were identified as unavoidable and adverse:

- Development accommodated by the draft Plan will increase groundwater withdrawals, which has the potential to diminish in-stream flow along the Salinas River.

- The permanent loss of 3,500 acres of foraging area for special status animal species would contribute to the cumulative loss of such areas within the Salinas Valley.

Additionally, these impacts were considered significant unless mitigated:

- Buildout of the Plan area with urban uses could result in the permanent conversion of 3,500 acres of agricultural land to urban use. This land may provide suitable foraging habitat for certain special status animal species, and uncultivated areas could contain sensitive plant species.

- Construction activities could result in a number of temporary impacts, including, but not limited to, disturbance of special status plant or animal species (nesting raptors, burrowing owls, etc.), increased erosion potential, and noise, particularly along the Salinas River and its tributaries, and the foothills.

- Urban development in the planning area could adversely impact riparian habitat by increasing impervious surfaces, accelerating erosion and input of sediments and pollutants.

Cumulative Impact: Buildout according to the General Plan in addition to other cumulative developments would potentially result in significant cumulative level impacts to biological resources as a result of habitat loss, fragmentation, and isolation. More specifically, as identified in **Section 4.4 Biological Resources,** the proposed project would result in several significant unavoidable impacts to a number of special status species, in addition to significant impacts due to habitat loss. Moreover, as identified in the General Plan EIR, the permanent loss of foraging habitat would result in a significant cumulative impact to biological resources. To the extent that mitigation has been incorporated into this EIR, project impacts, as well as cumulative impacts, would remain significant and unavoidable. **This represents a significant cumulative level impact.**

Mitigation: Mitigation as proposed in the EIR and General Plan Policies identified in Table 5.2-1 above.

5.2F Utilities/Public Services

General Plan EIR: The impacts to Utilities/Public Services due to development accommodated by the buildout of the General Plan was identified as a potentially significant impact but reduced to less-than-significant with mitigation and planned improvements.

Cumulative Impact: Buildout of the Plan area as contemplated by the General Plan will require the expansion and extension of public utilities and infrastructure. Accordingly, policies and programs of the Plan recommend preparation of capital improvement plans to identify these improvements and funding, and require adequate capacity for services to be in place concurrently or in advance of such new development.

> **Water**: Buildout of the Plan area with urban land uses as contemplated by the draft Plan will result in a net increase in water extracted from the Forebay Sub-basin. An estimate of future water demand under cumulative conditions for all land uses was prepared for the Soledad General Plan EIR. Applying assigned demand factors to buildout yielded the following estimate of future demand under cumulative conditions:

Table 5.2-4
Future Cumulative Water Demand

Future Non-Prison Population	Water Demand Factor	Water Demand At Buildout (AFY)[2]
57,273	128 gallons per day per capita[1]	8,233
Current Demand (Urban plus Ag.)		7,756
Increased Demand At Buildout		**477**

Notes:
1. Water demand from all land uses expressed as a per capita equivalent (Hanna and Brunetti *Water Impact Fee Study*, December, 1999);
2. Based on average daily demand
3. Assumes buildout of the General Plan, 2005 projections
4. Source: Table V.1-4: Future Water Demand At Buildout of the Draft Plan, GPEIR

As Table 5.2-4 suggests, total water demand from the City's Plan area will increase by about 477 AFY at buildout with the uses contemplated by the adopted General Plan. This will occur incrementally over time as more land is annexed to the City and converted from an agricultural to an urban use. It should be noted, however, that this estimate of future water demand makes no assumptions for savings associated with water conservation measures that will implemented in the future as required by State law. For example, new development will be required to incorporate water-conserving plumbing fixtures which will reduce future water use. According to the General Plan EIR, with other more aggressive measures, such as the retrofitting of older toilets and showerheads with more water efficient fixtures, would reduce future demand to near or below current water demand for the Plan area.

Table 5.2-5 from the 2005 General Plan compares present and future water demand with identified withdrawals from the Forebay Sub-basin. The General Plan EIR concluded that water demand associated with buildout of the draft Plan will contribute to the cumulative demand for water for domestic use from the Salinas Groundwater Basin. As identified in the General Plan EIR, withdrawals from the Forebay sub-basin attributable to buildout of the draft Plan will increase by about 0.3 percent over 2004 demand. **The contribution of this project to incremental increase in demand is not considered significant in comparison to withdrawal in the Forebay Sub-Basin.**

Table 5.2-5
Comparison of Present and Future Water Demand In Relation to 2004 Groundwater Withdrawals from the Forebay Sub-Basin

	AFY	Expressed as a Percentage of Total Withdrawals from Forebay Sub-Basin[2]
Current (2004) Demand[1]	7,756	4.8 %
Buildout Demand	8,233	5.1%
Increase	477	0.34%

Sources: CMCA and DWR Bulletin 118, February, 2004
Notes:
1. Urban and agricultural uses within the City's Plan area.
2. February, 2004 withdrawals are estimated at 160,000 AFY by DWR Bulletin 118.
3. Source: Table V.1-5 City of Soledad GPEIR

Both the Urban Water Management Plan and the WSA prepared for the project take into account the salt water intrusion and Salinas Valley Water Project issues; the EIR concludes that adequate water is available to serve the proposed project.

The Salinas Valley Groundwater Basin is experiencing overdraft, with seawater intrusion of about 9,000 acre-feet per year (AF/Y) at its coastal margins affecting portions of the 180-foot and 400-foot aquifer systems. The Monterey County Water Resources Agency (MCWRA) has been pursuing the Salinas Valley Water Project (SVWP) to address the saltwater intrusion in the coastal regions of the basin. Funding for the SVWP under a special property assessment in accordance with Proposition 218 was approved by a vote of property owners in a mailed ballot election in 2003, and the MCWRA has secured federal grants to fund analysis of the second phase of the project, which involves supplying a portion of the available surface water to coastal urban water agencies to further reduce pumping in the coastal areas. Additionally, the State Water Resources Control Board has been monitoring the MCWRA's ongoing efforts to halt seawater intrusion in the basin and has provided $1.4 million in funding to the MCWRA for development of this seawater intrusion solution. As discussed in the SVWP, after reviewing the technical documents analyzing the probable effects of the SVWP on seawater intrusion, the SWRCB concluded "that seawater intrusion can be stopped" (refer to SVWP EIR). However, given the lack of full understanding of the relationship between the Salinas Basin as a whole, and the Pressure Subarea in the vicinity of the former Fort Ord, it is uncertain whether this outcome will be achieved at currently expected levels of pumping increases in the coastal margins of the Pressure Subarea.

The reader is referred to detailed information regarding the background and history of the condition of the Salinas Valley Groundwater Basin, including the cause and extent of overdraft and seawater intrusion, current and future water needs and trends, and efficacy of alternative mitigation measures contained in the EIR/EIS for the Salinas Valley Water Project. (Please refer to http://www.mcwra.co.monterey.ca.us/SVWP/DEIR_EIS_2001/index.htm). The information and analysis in the Salinas Valley Water Project EIR/EIS is expressly incorporated into the Draft EIR. Under Public Resources Code Section 21061, information or data that is relevant to the environmental analysis and is a matter of public record or is generally available to the public need not be repeated in the EIR, but may be specifically cited as the source for conclusions stated in

the EIR. It is sufficient that such information or data is briefly described and that its relationship to the EIR is indicated. As set forth in Guideline Section 15150(a), where all or part of another document is incorporated by reference, the incorporated language is considered to be provided in full as part of the EIR text.

Fire and Police Services: The EIR analyzes the potential impacts of development on fire and police protection services, including the impacts of development within the five Expansion Areas. The EIR concludes that buildout of the City as contemplated by the Plan will increase the need for fire fighting and police protection personnel and equipment. The EIR further concludes that new development to the east and north of the City limits, including within the Expansion Areas, will require additional fire protection facilities to maintain an acceptable response time, and that implementation of mitigation measures will reduce these impacts to a less-than-significant level. Development of the project site and corresponding fire and police protection for such development is anticipated in the General Plan and EIR. Therefore, the proposed project does not create any new or more significant impacts with respect to fire or police protection services.

Wastewater: The General Plan designates some 2,750 acres for urban expansion to be served by the City's wastewater collection and treatment systems. Serving this area assumes expansion of infrastructure capacity for collection, treatment and disposal. This impact was considered significant unless mitigated in the General Plan EIR.

Services Conclusion: Buildout of the Plan area as contemplated by the draft Plan will require the expansion and extension of wastewater collection and treatment facilities, water supply infrastructure, as well as fire and police facilities and services. Accordingly, policies and programs of the Plan recommend preparation of capital improvement plans to identify these improvements and funding, and require adequate capacity for services to be in place concurrently or in advance of such new development. These improvement plans and programs are ongoing under the direction of the City. Thus, the contribution of the project to expansion of public services would not be cumulatively considerable.

Mitigation: Mitigation as proposed in this EIR and General Plan Policies identified in Table 5.2-1 above.

5.2G Air Quality

Regional Air Quality

Setting: The air pollutant emissions resulting from the Miravale III project would contribute to overall increases in regional emissions due to other cumulative development. A determination of consistency with the Air Quality Management Plan is used to define the cumulative impacts of a proposed project on regional air quality.

AMBAG is responsible for determining consistency of the Miravale III project with the Air Quality Management Plan for the Monterey Bay Region (AQMP). The 2008 Regional Population & Employment Forecast is the official population forecast of the AQMP and is the basis for AMBAG's consistency analysis. Consistency of the project with the AQMP was analyzed by comparing the total potential population growth facilitated by the project with the forecasted growth for Monterey County.

Specific plans are evaluated for cumulative impacts both determining the consistency of the proposed project with the applicable regional air quality plan the specific plan's individual impacts to air quality. The MBUAPCD *2008 Air Quality Management Plan for the Monterey Bay Region* (AQMP) addresses

attainment of the State ozone standard. MBUAPCD has included emissions related to population growth in the AQMP using projections adopted by the AMBAG. For this specific plan, consistency with population forecasts is determined by comparing plan build-out population at the year of project completion with the appropriate five-year forecast increment for the jurisdiction that the project is located (i.e. Soledad). Projects or plans that would not cause the estimated cumulative population to exceed forecasts are considered consistent with air quality planning efforts. According to the AMBAG, this project is consistent with the 2008 regional forecasts for Monterey County and the Air Quality Management Plan. A letter from AMBAG documenting the consistency determination is included in the Air Quality Report in Appendix E.

As described in the Air Quality Section of this EIR, individual projects developed could have significant air quality impacts with respect to direct and indirect emissions of ozone precursor pollutants. These impacts are typically identified at the time project-level analyses are conducted. Current modeling indicated the potential for projects to have VOC emissions in excess of the MBUAPCD thresholds. Therefore, this was identified as a potentially significant impact. Mitigation measures to reduce the impacts were suggested to apply to the plan. Because much of the emission from projects would be associated with use of consumer products that cannot be mitigated, the impact could be considered significant and unavoidable. This represents a potentially significant cumulative impact to air quality.

Cumulative Impact: The specific plan consists of mostly residential with commercial retail uses and schools that were found by AMBAG to be consistent with 2008 regional forecasts and the Air Quality Management Plan; therefore, it would not conflict with regional efforts to attain and maintain ambient air quality standards. Projects developed under the specific plan may have individually significant impacts that may not be mitigated to a less-than-significant level**. As a result, the specific plan may contribute significantly to a significant cumulative air quality impact.**

Mitigation: Implementation of the Air Quality mitigations in this EIR and programs and policies in the General Plan identified in Table 5.2-1 above.

Greenhouse Gas and Global Climate Change

Various gases in the Earth's atmosphere, classified as atmospheric greenhouse gases (GHGs), play a critical role in determining the Earth's surface temperature. Solar radiation enters Earth's atmosphere from space, and a portion of the radiation is absorbed by the Earth's surface. The Earth emits this radiation back toward space, but the properties of the radiation change from high-frequency solar radiation to lower-frequency infrared radiation. Greenhouse gases, which are transparent to solar radiation, are effective in absorbing infrared radiation. As a result, this radiation that otherwise would have escaped back into space is now retained, resulting in a warming of the atmosphere. This phenomenon is known as the greenhouse effect.

Among the prominent GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), ozone (O_3), water vapor, nitrous oxide (N_2O), and chlorofluorocarbons (CFCs). Human-caused emissions of these GHGs in excess of natural ambient concentrations are responsible for enhancing the greenhouse effect (Ahrens 2003). Emissions of GHGs contributing to global climate change are attributable in large part to human activities associated with the industrial/manufacturing, utility, transportation, residential, and agricultural sectors (California Energy Commission 2006a). In California, the transportation sector is the largest emitter of GHGs, followed by electricity generation (California Energy Commission 2006a). A byproduct of fossil fuel combustion is CO_2. Methane, a highly potent GHG, results from off-gassing associated with agricultural practices and landfills. Processes that absorb and accumulate CO_2, often called CO_2 "sinks," include uptake by vegetation and dissolution into the ocean.

As the name implies, global climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants, which are pollutants of regional and local concern, respectively. California is the 12th to 16th largest emitter of CO_2 in the world and produced 492 million gross metric tons of carbon dioxide equivalents in 2004 (California Energy Commission 2006a). Carbon dioxide equivalents are a measurement used to account for the fact that different GHGs have different potential to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. This potential, known as the global warming potential of a GHG, is also dependent on the lifetime, or persistence, of the gas molecule in the atmosphere.

Carbon dioxide, the primary man-made greenhouse gas of concern, would be generated by the project from mobile sources and other energy usage. The proposed Specific Plan incorporates the following measures to reduce motor vehicle and other energy use:

- Providing employment opportunities near housing to minimize off-site commuting.
- Linking a mix of land uses with alternative transportation facilities (e.g., bikeways, sidewalks, and trails).
- Promote the use of solar energy devices to encourage solar orientation of residential and business buildings to reduce the use of fossil fuels.

In addition, mitigation is identified in this EIR, including Transportation Demand Measures, to further reduce mobile source emissions.

Regulatory Framework

This section describes recent state regulations that specifically address greenhouse gas emissions and global climate change. At the time of writing, there are no regulations setting ambient air quality standards or emission limits for greenhouse gases.

Assembly Bill 1493. In 2002, then-Governor Gray Davis signed Assembly Bill (AB) 1493. AB 1493 requires that the California Air Resources Board (ARB) develop and adopt, by January 1, 2005, regulations that achieve "the maximum feasible reduction of greenhouse gases emitted by passenger vehicles and light-duty truck and other vehicles determined by the ARB to be vehicles whose primary use is noncommercial personal transportation in the state." For more information see http://www.leginfo.ca.gov/pub/01-02/bill/asm/ab_1451-1500/, http://www.arb.ca.gov/regact/grnhsgas/revfro.pdf and http://www.arb.ca.gov/regact/grnhsgas/revtp.pdf.

Assembly Bill 32, the California Climate Solutions Act of 2006. In September 2006, Governor Schwarzenegger signed AB 32, the California Climate Solutions Act of 2006. AB 32 requires that statewide GHG emissions be reduced to 1990 levels by the year 2020. This reduction will be accomplished through an enforceable statewide cap on GHG emissions that will be phased in starting in 2012. To effectively implement the cap, AB 32 directs ARB to develop and implement regulations to reduce statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then ARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32. AB 32 requires that ARB adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrives at the cap; institute a schedule to meet the emissions cap; and develop tracking, reporting, and enforcement mechanisms to ensure that the state achieves reductions in GHG emissions necessary to meet the cap. AB 32 also includes guidance to institute emissions reductions in an

economically efficient manner and conditions to ensure that businesses and consumers are not unfairly affected by the reductions. For more information see http://www.leginfo.ca.gov/pub/05-06/bill/asm/ab_0001-0050/ab_32_bill_20060927_chaptered.pdf

Senate Bill 1368. SB 1368 is the companion bill of AB 32 and was signed by Governor Schwarzenegger in September 2006. SB 1368 required the California Public Utilities Commission (PUC) to establish a greenhouse gas emission performance standard. Therefore, on January 25, 2007, the PUC adopted an interim GHG Emissions Performance Standard in an effort to help mitigate climate change. The Emissions Performance Standard is a facility-based emissions standard requiring that all new long-term commitments for baseload generation to serve California consumers be with power plants that have emissions no greater than a combined cycle gas turbine plant. That level is established at 1,100 pounds of CO_2 per megawatt-hour. "New long-term commitment" refers to new plant investments (new construction), new or renewal contracts with a term of five years or more, or major investments by the utility in its existing baseload power plants. In addition, the California Energy Commission (CEC) established a similar standard for local publicly owned utilities that cannot exceed the greenhouse gas emission rate from a baseload combined-cycle natural gas fired plant. On July 29, 2007, the Office of Administrative Law disapproved the Energy Commission's proposed Greenhouse Gases Emission Performance Standard rulemaking action and subsequently, the CEC revised the proposed regulations. Those regulations can be found at http://www.energy.ca.gov/ghgstandards/documents/index.html. SB 1368 further requires that all electricity provided to California, including imported electricity, must be generated from plants that meet the standards set by the PUC and CEC.

Executive Order S-3-05. signed by Governor Schwarzenegger in 2005, proclaims that California is vulnerable to the impacts of climate change and declares that increased temperatures could reduce the Sierra's snowpack, further exacerbate California's air quality problems, and potentially cause a rise in sea levels. To combat those concerns, the Executive Order established total greenhouse gas emission targets. Specifically, emissions are to be reduced to the 2000 level by 2010, the 1990 level by 2020, and to 80% below the 1990 level by 2050. The Executive Order directed the Secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multi-agency effort to reduce greenhouse gas emissions to the target levels. The Secretary will also submit biannual reports to the governor and state legislature describing: (1) progress made toward reaching the emission targets; (2) impacts of global warming on California's resources; and (3) mitigation and adaptation plans to combat these impacts. To comply with the Executive Order, the Secretary of the CalEPA created a Climate Act Team (CAT) made up of members from various state agencies and commission. CAT released its first report in March 2006. The report proposed to achieve the targets by building on voluntary actions of California businesses, local government and community actions, as well as through state incentive and regulatory programs. For more information see http://gov.ca.gov/index.php?/executive-order/1861/.

In addition to S-3-05, the following executive orders deal with greenhouse gas reduction:

- Executive Order S-01-07 regarding low carbon standard for transportation fuels http://gov.ca.gov/index.php?/executive-order/5172/
- Executive Order S-20-06 regarding implementation of AB 32 http://gov.ca.gov/index.php?/executive-order/4484/
- Executive Order S-20-04 regarding energy conservation by state http://gov.ca.gov/index.php?/executive-order/3360/

The following documents have been recently released to assist state and local governments and agencies with compliance with the above legislation, including defining how to address the issue in CEQA documents, in particular development and planning projects such as Miravale III. The recommendations in these guidance documents provide tools for entities and agencies to implement to voluntarily reduce

their greenhouse gas emissions and their susceptibility to the risks of adverse effects of global climate change by addressing it in planning and site design of development projects:

- California Air Resources Board, June 2008. Climate Change Draft Scoping Plan: a framework for change.
- California Air Pollution Control Officers Association, January 2008. CEQA & Climate Change.
- California Office of Planning and Research, June 19, 2008. CEQA and Climate Change: Addressing Climate Change Through CEQA.

Greenhouse Gas Emissions/Global Climate Change Thresholds

No air districts have established significance thresholds for greenhouse gas (GHG) emissions or a methodology for analyzing air quality impacts related to greenhouse gas emissions. With the adoption of AB 32, the state has set a goal of reducing GHG emissions to 1990 levels by 2020. It has been acknowledged by previous EIRs addressing this issue that it may be considered speculative to determine if a project would be consistent with the AB 32 goals. CO_2 emissions do not directly create environmental effects; rather it is the cumulative increased concentration of CO_2 in the atmosphere that results in global climate change and associated consequences. While it is possible to estimate the project's CO_2 emissions, it is typically not possible to determine whether those emissions (however small) would manifest into significant environmental impacts. The complexity of global and regional-scale physical, chemical, atmospheric, terrestrial, and aquatic systems preclude a meaningful determination of whether the CO_2 emitted by a single project (or in this case adoption of a Specific Plan) would result in a measurable or even, non-negligible change in climate. A quantitative standard of significance is not used in this EIR because of the global nature of the analysis required, instead a project's contribution to the cumulative significant impact of global climate change would be considered significant if, due to the size or nature of the project, it would generate a substantial increase in GHG emissions relative to existing conditions. In addition, the discussion considers whether or not the project would result in greenhouse gas emissions that would hinder or delay the State's ability to meet the reduction targets contained in AB 32.

Analysis Methodology

GHG emissions associated with the Miravale III Project were estimated using CO_2 emissions as a proxy for all GHG emissions. Urbemis 2007 version 9.2.2 was used to calculate CO_2 from operational and on-site area source emissions. The CO_2 emissions from non-vehicular sources associated with the project were calculated based upon the statewide factor of 40.7% of emissions that are attributed to transportation sources (California Energy Commission 2006). This is consistent with the current reporting protocol of the California Climate Action Registry (CCAR). Calculations of GHG emissions typically focus on CO_2 because it is the most commonly produced GHG in terms of both number of sources and volume generated, and because it is among the easiest GHGs to measure. However, it is important to note that other GHGs have a higher global warming potential than CO_2. Emissions of other GHGs from the Miravale III Project (and from almost all GHG emissions sources) would be low relative to emissions of CO_2 and would not contribute significantly to the overall generation of GHGs from the project.

Although the CCAR provides a methodology for calculating GHG emissions, the process is designed to be applied to a single or limited number of entities or operations where detailed information on emissions sources is available (e.g., usage of electricity and natural gas, numbers and types of vehicles and equipment in a fleet, type and usage of heating and cooling systems, emissions from manufacturing processes). Information at this level of detail is not available for the Miravale III Project. Given the lack of detailed design and operational information available at this time for facilities in the Miravale III

Specific Plan area, the CCAR emissions inventory methodology is considered to be not appropriate for estimating GHG emissions from the project. In addition, this EIR does not address GHG emissions and associated impacts during construction because these would be considered negligible compared to total operational, cumulative regional, state, national, and global GHG emissions.

Calculations of GHG Emissions

As discussed in the Analysis Methodology section, above, CO_2 emissions are used in this Draft EIR as a proxy for all GHG emissions. Urbemis 2007 v 9.2.2 was used to estimate CO_2 emissions shown in Table 4.3-7 from project-generated vehicle trips and on-site area source emissions (fossil fuel combustion and wood burning). According to the Urbemis model run in Appendix C, operations (including mobile and on-site area sources) due to buildout of the Specific Plan would result in emissions of 293,809 pounds per day of CO_2 which includes vehicular sources emitting 236,630 lbs per day and area sources (natural gas burning on-site) emitting 57,179 lbs per day. This estimate does not include emissions due to off-site electricity generation needed for the project. Converting to tons/year, the Specific Plan would result in approximately 53,620 tons of CO_2 per year, with 43,185 tons per year due to vehicular sources. To include off-site electricity generation and other GHG emissions, the transportation sector has been estimated to account for 40.7% of total GHG emissions in California (California Energy Commission 2006). Therefore, the project's non-transportation sector CO_2 emissions are estimated to be 62,921 tons per year for a total CO_2 emission estimate of approximately 106,100 tons per year.

This estimate of CO_2 emissions due to project implementation is likely much greater than the net new CO_2 emission that will actually occur. At the time of project buildout (beyond 2025), overall CO_2 emissions attributable to the Miravale III project could be substantially less than current emissions assumptions might indicate. This is due to the following factors:

- Although this future CO2 emission factor does assume certain reductions in vehicle emissions due to future vehicle models operating more efficiently, it does not take into account additional vehicle emission reductions that might take place in response to AB 1493, if mobile source emission reductions are ultimately implemented through this legislation.

- The emissions calculations described above do not take into account reductions in GHG emissions resulting from implementation of AB 32. Stationary emissions sources on the project site and stationary sources that serve the project site (e.g., power plants) will be subject to emissions reductions requirements of AB 32. The extent of these reductions has not yet been quantified by ARB.

- If GHG emissions reductions for vehicles are enacted, through either the requirements of AB 1493 or AB 32 or a federal regulation, CO2 emissions from the Specific Plan project would be further reduced. If regulations proposed to comply with AB 1493 survive current legal challenges, by project buildout CO2 emissions from vehicles associated with the project could be 20% to 30% less than under current conditions. If AB 1493 is repealed, it is unclear what vehicle emissions limits might be adopted as part of AB 32.

- The Miravale III Project includes numerous policies aimed at reducing the burning of fossil fuels (including transportation demand management, encouraging pedestrian and bike modes of transport, sustainable development, and energy efficiency policies). These policies are listed above City of Soledad General Plan policies and Miravale III Specific Plan policies.

- New homes are generally more energy efficient than older homes and by building new homes, it is possible that older, less efficient homes would be razed. The occupants of those older homes would reduce their carbon footprint by living in newer more efficient homes.

- Potential in-migration to the County and/or the State may result due to increased housing stock. This may be argued to result in more people living in a more temperate climate and thereby using less energy for climate control.

Conclusions

As described above, the cumulative increase in GHG concentrations in the atmosphere has resulted in and will continue to result in increases in global average temperature and associated shifts in climatic and environmental conditions. Multiple adverse environmental effects are attributable to global climate change, such as sea level rise, increased incidence and intensity of severe weather events (e.g., heavy rainfall, more severe flood events, droughts), and extirpation or extinction of plant and wildlife species. Given the significant adverse environmental effects linked to global climate change induced by GHGs, the emission of GHGs is considered a significant cumulative impact. Emissions of GHGs contributing to global climate change are attributable in large part to human activities associated with the industrial/manufacturing, utility, transportation, residential, and agricultural sectors (California Energy Commission 2006a). Therefore, the cumulative global emissions of GHGs contributing to global climate change can be attributed to every nation, region, and city, and virtually every individual on Earth. Aside from the difficulty of assessing the actual GHG emissions of project buildout (as discussed above), it is even more difficult to determine the significance of an individual project's contribution to global GHG emissions and associated global climate change impacts. This would require determining whether a project's GHG emissions—which may be considered negligible relative to global emissions— would result in a cumulatively considerable incremental contribution to the significant cumulative climate change impact due to all global GHG emissions.

In 2003, global emissions of carbon (i.e., only the carbon atoms within CO_2 molecules) solely from fossil fuel burning total an estimated 7,303 million metric tons (Marlands et al. 2006). This translates to approximately 29,400 million tons of CO_2. This is only a portion of global CO_2 emission because it only includes fossil fuel burning and does not address burning of vegetation or other natural sources. Total estimated CO_2 emissions from all sources associated with the Miravale III Project (which is potentially high given the issues discussed above) would be less than 0.0004% of this partial global total. CO_2 emission in California totaled approximately 391 million tons in 2004 (California Energy Commission 2006). The project's CO_2 emissions at project buildout represent 0.03% of this 2004 statewide emission amount.

In addition to uncertainties regarding the project's net contribution of CO_2 emissions to global climate change; it is also uncertain how current regulations might affect CO_2 emissions attributable to other global sources. Also, it cannot be determined how CO_2 emissions associated with the project might or might not influence actual physical effects of global climate change. For these reasons, it is uncertain whether the project would generate a substantial increase in GHG emissions relative to existing conditions, and whether emissions from buildout of individual projects with the specific plan area would make a cumulatively considerable incremental contribution to the significant cumulative impact of global climate change.

As a primarily residential development project, Miravale III is not considered to be the type of project that would substantially hinder or delay the State's ability to meet the reduction targets contained in AB 32. However, the project would potentially result in new greenhouse gas emissions and does not propose pro-active measures to reduce transportation emissions of CO_2 or improve energy efficiencies of project

facilities beyond Title 24 requirements; therefore, it is possible that the project may hinder or delay GHG emission reductions.

Impact **Implementation of the Miravale III Project may increase global greenhouse gas (GHG) emissions resulting in a potentially cumulatively considerable incremental contribution to significant cumulative global climate change impacts and the project may hinder or delay the State's ability to meet GHG reduction targets in AB 32.** ***This is considered a significant and unavoidable cumulative impact that can be reduced by implementation of Mitigation Measures # 4.3-3 and 4.13-1, however, not to a less-than-significant level.***

Impacts of Global Climate Change on the Project

Global climate change is expected to affect water resources in California overall, and in particular, areas that rely upon the Sierra Nevada snowfall and snowpack. Because this project is in an area that does not rely on this source of water, it would experience less of an impact due to this phenomenon. In addition, global climate change is expected to influence many interconnected phenomena, which will in turn affect the rate of climate change itself. Besides effects on water supply for areas served by Sierra Nevada precipitation, the following are other global climate change issues that may significantly adversely impact the project:

- Water supplies available in surface reservoirs
- Water demand
- Surface water quality
- Groundwater quality or recharge characteristics
- Fisheries and aquatic resources
- Flooding/flood control
- Sudden temperature and other climatic changes

Details and evaluation of these issues and other related issues are described in various reference documents, including the following: *Progress of Incorporating Climate Change into Management of California's Water Resources, Technical Memorandum Report* (DWR 2006), *Climate Change 2001: The Scientific Basis. Contribution of Working Group 1 to the Third Assessment Report of the Intergovernmental Panel on Climate Change* (IPCC), (IPCC, 2001), *Water Planning and Management Under Climate Change* (Gleick, P.H., 1997), *Climate Change and California Resources: A Survey and Summary of the Literature. The California Water Plan, Volume 4* (Kiparsky M. and P.H. Gleick, 2003), *The Effects of Climate Change on Agricultrue, Land Resources, Water Resources and Biodiversity in the United States* (U.S. Climate Change Program, May 2008), and *Climate Warming and California's Water Future* (Lund, J.R., et al, 2003) among others.

It can be assumed that under a long-term cumulative condition, one or more of the above significant adverse impacts may occur. The above issues which are applicable to this project are addressed in the relevant sections of this Draft EIR to the extent that the impacts are known and are not simply speculative.

5.2H Noise

Setting: The major noise source in Soledad, as in most other communities, is traffic. Railroads, aircraft, farming activities, quarry activities, and industrial and food packaging facilities also contribute to local ambient noise levels.

General Plan EIR: The impact to the existing and future noise environment due to development accommodated by the buildout of the General Plan was identified as a potentially significant impact. The impact was shown to be mitigated to less-than-significant by applying the policies and programs recommended by the Noise Element.

Cumulative Impact: The project would contribute at least 1 decibel to the cumulative noise level increase expected throughout Soledad and would be "cumulatively considerable." Table 5.2-6 summarizes the roadway segments where the project would contribute a measurable increase and cumulative noise level increases resulting from the project and other planned developments would be substantial.

Table 5.2-6
Cumulative Traffic Noise Level Increases Above Existing Levels

Roadway	Segment	Cumulative Noise Level Increase (dBA, CNEL)
San Vincente Road	Market St. to Gabilan Dr.	+9
	Gabilan Dr. to Project Entrance	+10

Source: *Miravale III Specific Plan Environmental Noise Assessment*. Illingworth & Rodkin, Inc. 2007.

Traffic noise levels will increase with the development of the project area and other planned developments in Soledad. In some locations, these increases would be substantial, and the project would contribute to the overall cumulative noise impact. This is a potentially significant impact.

Mitigation: Implementation of the Traffic and Noise mitigations in this EIR and programs and policies in the General Plan identified in Table 5.2-1 above.

5.2I Traffic

This section describes the results of the traffic analysis prepared by Hexagon Associates and Omni-Means (for the City-wide 2030 analysis) under cumulative conditions under the assumption of 2030 buildout, as described below.

General Plan EIR According to the General Plan EIR, the following circulation impacts were identified for buildout of the Soledad General Plan (2005 EIR):

- Buildout of the land uses recommended by the Draft General Plan will significantly increase traffic generation with a corresponding cumulative impact on the level of service of regional roadways (Highway 101), streets and intersections serving the City. This impact was considered significant and unavoidable.

- Buildout of the land uses recommended by the Draft General Plan will adversely affect the operation and level of service of the two freeway interchanges serving the City. This impact was considered significant and adverse.

- Buildout of the land uses recommended by the Draft General Plan could result in traffic hazards on city streets and intersections. This impact was considered adverse but not significant.

- Buildout of the land uses recommended by the Draft General Plan will significantly contribute to the demand for bicycle and pedestrian facilities in the City's planning area. This impact was considered adverse but not significant.

Buildout of the land uses recommended by the Draft General Plan will contribute to the demand for public transit serving the City's planning area. This impact was considered adverse but not significant.

2030 Buildout Conditions This section describes the results of the traffic analysis prepared by Hexagon Associates and Omni-Means (for the City-wide 2030 analysis) under cumulative conditions under the assumption of 2030 buildout, as described below. The traffic analysis evaluated two cumulative conditions: 1) baseline cumulative conditions without the project, and 2) cumulative conditions with the project. The cumulative traffic condition is defined as traffic conditions roughly 25 years into the future, or 2030 and beyond.

This section describes the long-term traffic impacts on the transportation system associated with the proposed development as well as land use growth and transportation improvements within the entire City of Soledad. The purpose of this analysis is to evaluate the long-term traffic impacts on the transportation system associated with the proposed development.

Trip Generation: Year 2030 traffic volumes were developed by Omni Means Engineers & Planning Consultants. The traffic forecasts for Year 2030 were produced using the Association of Monterey Bay Area Governments (AMBAG) Regional Traffic Model. The 2030 model includes land use growth and transportation improvements associated with buildout of all General Plans within the AMBAG region and 30 year through-traffic growth on major regional facilities.

The recently adopted 2005 Soledad General Plan is not accounted for in the land use assumptions contained in the AMBAG model. Additionally, the proposed Miravale III land uses are of greater intensity than those assumed in the General Plan. Therefore, Omni Means and AMBAG adjusted the land uses contained in the model to include the adopted General Plan and Miravale III land uses. The roadway network contained in the AMBAG model for the City of Soledad was expanded to include the expansion of the street network to serve future land uses.

Though the Year 2030 forecasts reflect approximately 23 years of development growth, the forecasts do not show significant increases in traffic volumes on US 101 and its ramps within the City of Soledad. The lack of volume increases on the regional facilities is primarily due to significant changes in land uses within Soledad that are being represented in the model. There currently is very little land uses besides residential within Soledad. As such, existing traffic volumes on the regional facilities reflect the unbalanced land uses within Soledad where trips originate within Soledad due to its substantial residential development and have destinations outside of Soledad in areas that contain industrial/commercial (employment) land uses. The model reflects the future addition of a significant amount of industrial/commercial (employment) within Soledad thus creating a more balanced land use scenario within the City of Soledad. The future balance of land uses will internalize many trips in Soledad.

Additionally, several new roadways that will be constructed to serve future development will provide for enhanced connectivity to US 101, specifically the Gloria/Camphora interchange.

Peak hour project trips associated with the proposed Miravale project were also produced as part of the forecasts completed by Omni Means. The Year 2030 Miravale III project trips differ from those presented in the near term project trips calculations due to changes in land uses and the transportation system as described above. It is expected that the development of more balanced land uses (employment vs. housing) will internalize many of the project trips within Soledad. The near-term project trip assignment and analysis depicts the existing unbalanced land use scenario. The Year 2030 projections and project trip assignment assumes a more balanced land use with project trip destinations within Soledad and the utilization of new and enhanced connections to US 101.

Year 2030 Level of Service Analysis: Level of service analysis was conducted for all freeway segments and interchange ramps within the City of Soledad. The traffic model is intended to provide projections for interregional facilities, and may project future forecasts that are significantly different than existing and expected future traffic volumes on city-level roadways. Therefore, no intersection analysis is presented. The freeway and ramp analysis consists of an evaluation of volume-to-capacity of each of the facilities.

Freeway Segment Analysis: Year 2030 conditions freeway segment analysis indicates that all freeway segments within the City of Soledad are projected to operate at LOS D or better conditions. The Miravale project will add between 250 and 770 vehicles to the freeway segments during the AM peak and 200-770 vehicles during the PM peak.

Freeway Ramp Analysis: Year 2030 conditions interchange ramp analysis indicates that all freeway ramps ad are projected to operate at LOS D or better conditions. The Miravale project will add between 30 and 770 vehicles to the identified ramps during the peak hours.

Year 2030 Freeway Facility Impacts and Mitigation Measures: Long-term traffic analysis of the proposed development levels for the project as well as long-term land use growth and transportation improvements within the entire City of Soledad indicate that the development levels will not have adverse impacts on the major regional facilities serving Soledad. Nonetheless, the proposed project as well as other development projects within the City of Soledad will be required to contribute to the regional development impact fee program as described under near-term project conditions.

Mitigation in this EIR addresses cumulative impacts. Additionally, cumulative development will be required to contribute to the regional development impact fee program as described under near-term project conditions in the Traffic Section of this report.

Mitigations: Implementation of the Traffic mitigations in this EIR and programs and policies in the General Plan identified in Table 5.2-1 above.

Cumulative development will be required to contribute to the regional development impact fee program as described under near-term project conditions in the Traffic Section of this report. Even with cumulative contribution to traffic mitigations, buildout of the land uses recommended by the Draft General Plan will significantly increase traffic generation with a corresponding cumulative impact on the level of service of regional roadways, streets and intersections serving the City. **The General Plan EIR found this cumulative impact to be significant and unavoidable.**

5.2J Population and Housing

Setting: This growth in population in the expansion areas including the project site would increase population and demands on housing and existing community facilities. According to the adopted General Plan, the site is within an area of planned growth and expansion although outside of the current City limits and sphere of influence for the City. The City has identified holding capacities for individual major properties within these expansion areas. The proposed Specific Plan for Miravale III proposes an increase in the applied density for the project site, approximately 1,500 units above the estimated holding capacity for the Miravale III site.

General Plan EIR: General Plan policies L-2 to L-7 address policies to phase develop and plan for expansion of City service capacity, per the General Plan EIR:

L-2 Further annexations to the City may occur when a) a substantial portion of the development capacity within the existing city limits has been developed, b) a substantial public benefit can be realized through the annexation, such as the provision of public open space, additional parkland, or the protection of scenic vistas, or natural resources, or c) a special type of use is proposed that cannot be practically accommodated in the existing city limits, and d) the project can be found to provide a financial benefit to the City or to be fiscally neutral. The Planning Commission shall review the merits of a request for annexation based on these criteria, and make a recommendation to the City Council.

L-3 A specific plan shall be required for all annexations and development of properties designated *Expansion Area*. Specific plans shall be prepared in accordance with the standards provided in Appendix B of the General Plan.

L-4 The City shall promote patterns of development that allow for the efficient and timely extension of infrastructure and services.

L-5 New development shall not be allowed unless adequate public services are available to serve such new development, or that can be provided at the time of development.

L-6 New development shall pay its fair share of providing additional public services needed to accommodate such development.

L-7 Master plans for sewer, water, roads, drainage and other public improvements shall be required for new development on large undeveloped parcels and may be included in the specific plan required by policy L-3, and as determined by the City.

Cumulative Impact: The project would represent an incremental increase in overall holding capacity identified in the 2005 General Plan EIR for the Mirassou, San Vincente and Northwest Expansion Areas and could be considered growth inducing if annexations and development in the area exceed development potential addressed in the General Plan EIR. The additional population increase (15,201) associated with buildout of the project site over the projected 15-20 years of project development represents approximately 54 percent of Soledad's existing (2007) population. Depending upon the timing of project development, this additional population represents a major portion of the projected City wide population of 28,000 by year 2020. Buildout of the City density over and above the development anticipated in the 2005 General Plan could impact planned services and city wide infrastructure or be considered growth

inducing. **This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.**

Cumulative Mitigation (Consistent with Project Mitigations Section 4-11)

4-11.1 Phase approval of development applications and annexations in the Mirassou, San Vincente and Northwest Expansion Areas to maintain holding capacity and population projections in Table 4.11-5 of the General Plan EIR. Monitor development approvals in these expansion areas to limit overall density and population growth to the holding capacity identified to ensure consistency with projections in approved City planning documents.

4-11.2 Implement General Plan policies L-2 to L-7 and other applicable policies for phased development and population growth in the project and expansion areas.

5.3 OTHER CUMULATIVE CONSIDERATIONS

Land Use

Future development of the project site as proposed by the Specific Plan would not significantly contribute to cumulative impacts associated with land use and planning. Land use effects would be localized and would not combine with similar effects in other locations. Further, there is no cumulative context to assess land use consistency and compatibility issues unless there is an environmental impact, whereby these impacts are discussed in the appropriate environmental discussion sections in this EIR. **The project would have a less-than-significant impact cumulative impact on land use.**

Hazardous Materials

The project, together with other cumulative development in the project area, could increase the use of hazardous materials. This could increase the occurrence of hazardous materials releases, resulting in potential health and safety risks. However, hazardous materials incidents, which usually involve inadvertent releases or accidental spills, are typically site-specific and occur on an isolated basis. Associated health and safety impacts are likewise normally limited to the persons using or working in the vicinity of the materials or to others in the immediate vicinity. Thus, the contribution of the project to risks from hazardous materials would not be cumulatively considerable. Any potential for such impacts would be minimized by implementation of federal, state, and local requirements regulating the use, storage, and transportation of hazardous materials. **Based on the above discussion, the cumulative impacts associated with hazards and hazardous materials would be less-than-significant.**

Cultural Resources

The project could significantly impact archaeological resources by disturbing buried resources. Mitigation is identified for the project to reduce impacts to cultural resources to a less-than-significant level. The project would not contribute to significant cumulative impacts to cultural resources. In addition, the incorporation of appropriate management measures to avoid or remove existing resources, protect resources, and/or document resources by cumulative development in the area, as required by the City and CEQA, would minimize impacts to cultural resources. **The project would have less-than-significant cumulative impacts on cultural resources.**

5.4 IRREVERSIBLE ENVIRONMENTAL CHANGES

Section 15126[f] of the State CEQA Guidelines requires EIRs to include a discussion of significant, irreversible environmental changes that would result from project implementation. This section is required for EIRs prepared for plans, policies and ordinances, and for actions involving LAFCO. The intent is to focus special attention on impacts that narrow the range of beneficial uses of the environment or pose long-term risks to health or safety. CEQA Section 15126.2(c) identifies irreversible environmental changes as those involving a large commitment of nonrenewable resources or irreversible damage resulting from environmental accidents.

The project would develop residential, commercial, office, and public facility uses on the site.

Development of the project will result in irreversible changes to the environment in the following areas:

- The permanent conversion of over 760 acres of prime farmland to urban and/or non-agricultural uses;
- The permanent loss of potential foraging habitat associated with the permanent conversion of open space and agricultural land to urban uses;
- The permanent loss of petroleum products and other materials used to produce energy during project operations;
- Permanent loss of nonrenewable resources during construction, including building materials;
- The permanent change of the visual character of the City and its environs from one consisting predominantly of agriculture and open space to a more suburban character. In addition, grading from the project would permanently alter the topography of the site.

Although the policies and programs of the draft Specific Plan are aimed at minimizing the effects of these changes on the environment, they will remain permanent and adverse when compared to current conditions.

This page left intentionally blank.

6.0 Alternatives

6.1 INTRODUCTION

CEQA Guidelines section 15126.6 requires the consideration of a range of reasonable alternatives to the proposed project that could feasibly attain the basic objectives of the proposed project. CEQA further requires that the discussion focus on alternatives capable of eliminating significant adverse impacts of the project, or reducing them to a less-than-significant level, even if the alternative would not fully attain the project objectives or would be more costly. According to CEQA, the range of alternatives discussed in an EIR is governed by the "rule of reason" that requires an EIR to evaluate only those alternatives necessary to allow a reasoned choice. An EIR need not consider an alternative where the effects cannot be reasonably ascertained, or and where implementation is remote and speculative.

Alternatives Not Analyzed in Detail

Alternative Location. CEQA Guidelines Section 15126.6(f)(2) provides guidelines regarding when it is appropriate to analyze an alternative location as part of the alternatives analysis. Specifically, Section 15126.6(f)(2)(a) states that alternative locations should be analyzed if the location would avoid or substantially lessen any of the significant effects of the project. Consistent with Section 15126.6(f)(2)(a), applicable case law indicates that an off-site alternative should be analyzed where significant impacts can be avoided by choosing another site. As previously identified, the project site is located within an area identified in the General Plan as a future expansion area and is located adjacent to existing residential development within the City of Soledad. This area is considered appropriate for urban expansion. Development within adjacent expansions areas would not necessarily result in the reduction of any significant environmental impacts. Furthermore, undeveloped privately owned parcels are not under the control of the project applicant. Since the selection of an alternative location would not substantially lessen project-related impacts and the applicant is unable to acquire feasible alternatives sites, an alternative location was not considered.

Alternatives Selected

The following section discusses the alternatives evaluated in this EIR and the comparative environmental effects of each. The alternatives considered in this analysis are as follows:

- *No Project Alternative – No Development*
- *Buildout Consistent with General Plan Alternative*
- *Reduced Project Alternative*
- *No Golf Course Alternative*
- *Alternative Design: Increased Senior Housing Alternative*

The alternatives chosen for this analysis, beyond those mandated by CEQA, were developed specifically to avoid or substantially reduce the significant impacts of the project. A comparison of the impacts for each alternative is presented in Table 6-1. A substantive discussion is provided for each issue area where a proposed alternative would lessen the significance of an impact. For an alternative that would result in approximately the same level of impact (i.e. less-than-significant, less-than-significant with mitigation) as the proposed project, a discussion of that issue area is not necessarily provided. It is important to note, however, that certain aspects of a given alternative may minimize the extent of impact, but may not necessarily affect the level of significance relative to the proposed project.

Table 6-1 Comparison of Impacts – Project Alternatives

6.2 SUMMARY OF PROJECT OBJECTIVES AND SIGNIFICANT IMPACTS

Objectives

The following are the primary objectives of the project:

- Provide a range of moderate-income housing for the existing and future residents of Soledad.
- Provide a mixed-use development of housing, parks, schools and neighborhood commercial uses to serve the local area and provide a balance of uses.
- Reserve land for commercial development to allow for future economic growth within the City and assist in maintaining a local jobs/housing balance.
- Provide public park lands to serve the recreational needs of the proposed development and surrounding community.
- Support the local economy by increasing income on the site through permits, fees, property taxes, and job creation.

Another project objective of the Specific Plan and development project is to implement the goals of the City of Soledad 2005 General Plan and 2003 Housing Element. A summary of these plans' goals are included in pertinent sections of this EIR.

Significant Impacts

The project would result in significant impacts in the following categories, as described in this EIR: aesthetics, agricultural resources, air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, public services, transportation/traffic, and utilities and service systems. All project impacts can be reduced to a less-than-significant level with implementation of mitigation identified in this EIR, with the exception of the following:

- Significant unavoidable project and cumulative impacts to a scenic vista and to the visual character of the project site.
- Significant unavoidable project and cumulative impacts due to the conversion of prime agricultural land and impacts to Williamson Act contracted lands.
- Significant unavoidable construction-related air quality impacts, as well as, significant and unavoidable project impacts due to the generation of regional emissions of an ozone precursor.
- Significant unavoidable biological impacts due to habitat loss, fragmentation, and impacts to federally listed species.
- Significant unavoidable noise impacts during construction, significant project/cumulative noise impacts from increases in traffic volumes, and impacts to existing and proposed noise-sensitive land uses.
- Significant and unavoidable growth-inducing impacts.
- Significant and unavoidable impacts due to conflicts with adopted land use policies intended to reduced and/or avoid environmental impacts.

6.3 NO PROJECT ALTERNATIVE

CEQA requires the discussion of the No Project alternative "to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project." The no development scenario represents baseline conditions and eliminates all development on the project site.

NO DEVELOPMENT SCENARIO

Description

The No Development scenario consists of leaving the site in its current undeveloped condition. The No Development alternative would avoid both the adverse and beneficial effects of the project. It would eliminate all of the significant environmental impacts of the project, but would fail to meet any of the project's objectives identified above.

Impacts

The No Development alternative would avoid the significant environmental impacts of the project in the following areas: aesthetics, air quality, biological resources, cultural resources, geology/soils/mineral resources, hazardous materials, land use and planning, noise, public services, traffic, and water quality. This alternative would also avoid construction-related impacts, including noise, dust, and water quality impacts; vegetation removal; and potential disturbance of buried archaeological resources. The No Development alternative would also avoid the all significant unavoidable impacts previously identified above.

Summary

The No Project – No Development alternative would avoid all of the environmental impacts of the project. However, this alternative would fail to meet any of the City and project objectives to provide an integrated mixed-use community within future expansion areas identified in the City of Soledad General Plan. This alternative would also fail to meet the primary objectives to provide a range of housing types for future Soledad Residents.

6.4 BUILDOUT CONSISTENT WITH GENERAL PLAN

Description

Development under this scenario would assume buildout of the project site consistent with existing policies contained within the General Plan. Under this scenario, a Specific Plan would be prepared, as required by the General Plan. Single family residential uses would be prohibited above the 400 foot elevation contour and the project would consist of the construction of approximately 2,680 units. Additional units identified in other expansion areas would not be applied to this alternative and no General Plan amendments would be required. This alternative would consist of an array of residential uses, including low, medium, and high density land uses, as well as commercial, and public uses.

Development under this alternative is assumed to result in approximately the same impacts in regard to cultural resources, geology and soils, and hazards and hazardous materials as the proposed project. Although development of the proposed alternative would substantially lessen the extent of project-related impacts, the proposed alternative would not reduce the overall level of significance (i.e. less-than-significant, less-than-significant with mitigation) for each of these respective issues. The following discussion addresses only those issues areas where significant project-related impacts would be minimized and/or avoided.

Impacts

Aesthetics. This alternative would result in less intensive urban development of the project site. More specifically, significant unavoidable impacts associated with development above the 400 foot elevation contour would be eliminated and the proposed alternative would not result in significant impacts to the existing Gabilan Range, which is considered a scenic vista. The area above the 400 foot contour would remain as open space, consistent with the requirements of the General Plan and views of the project site as perceived from adjacent public vantage points would be significantly lessened. Moreover, significant grading and changes in topography would not be necessary within the hillside portion of the project site as development would be eliminated within the visually sensitive areas on the Gabilan Range. Development of this alternative would still substantially alter the visual character of the project site by introducing urban development onto a previously undeveloped site. The effects from new light/glare sources would be comparable to the proposed project.

Agricultural Resources. Development of this alternative, while not changing the level of significance determination (i.e. significant unavoidable), would require less development of the project site and therefore less prime farmland would be converted to a non-agricultural use. Despite the reduction in units and the corresponding reduction in developable space, the project site would still be converted to a non-agricultural land use. Furthermore, the project area is identified in the General Plan as an area of future urban development.

Air Quality. Development of this alternative would reduce the level of emissions associated with buildout of the project site. More specifically, due to the reduction in units, project-generated traffic is anticipated to decline significantly in comparison to the proposed project. This reduction in traffic trips would reduce project emissions associated with the project. In addition, less area would be developed under this scenario, therefore, requiring less grading and project construction. While the duration of construction impacts are anticipated to be approximately the same as the proposed project, the amount of construction would be significantly less.

Biological Resources. Development of the proposed alternative would substantially lessen potential impacts to biological resources located within the project area. More specifically, as identified in the General Plan portions of the Gabilan Range are identified as Open Space. As development would not occur above the 400 foot elevation contour, these areas would remain as natural Open Space. As identified in the biological resources section of this EIR, impacts associated with the loss of Open Space was identified as a potentially significant impact that would affect a number of federally listed species. Although development of this scenario would still result in the introduction of urban features within the project site, the extent to which the site would be disturbed would be substantially less.

Hydrology/Water Quality. Development of this alternative would substantially reduce impervious surfaces due to the overall reduction of development. Although this alternative would reduce impervious surface areas, as well as off-site related impacts, this alternative would not reduce the overall level of significant (i.e. less-than-significant with mitigation) as compared to the proposed project. Moreover, development of this alternative would also be required to adhere to the requirements of the City of Soledad Storm Drainage Master Plan.

Land Use. As identified in this EIR, development of the proposed project would conflict with adopted General Plan policies that are intended to either avoid and/or mitigated a potential environmental impact. Development of this alternative would, however, be required to comply with existing General Plan policies, including the preservation of areas above the 400 foot elevation contour. The prohibition of development above this contour was identified as a mitigating factor for a number of issue areas. By complying with existing adopted General Plan policies this alternative would not result in any conflicts with policies intended to avoid and/or mitigate a potential adverse environmental impact. As such, this alternative would lessen the impact determination to a level considered less-than-significant.

Noise. Due to the overall reduction of units, the proposed project is anticipated to result in less project generated noise. Moreover, due to the reduction of units and the corresponding reduction in vehicular traffic associated with project development, the proposed alternative would also result in substantially less construction noise. Development would also be less intensive and therefore impacts to adjacent sensitive land uses could potentially be minimized and/or avoided through site planning and project design.

Population and Housing. This alternative would result in substantial growth-inducing impacts. As compared to the proposed project, however, this alternative would generate less population within the project area and would not require revisions to the General Plan in order to accommodate increased density. The alternative would be required to comply with the City's adopted Inclusionary Housing Ordinance and would provide a variety of residential land use types. As the project would result in less units, this alternative would also allow the City to maintain a jobs/housing ratio that is more balanced in nature.

Public Services. Although all project impacts can be reduced to a less-than-significant level through the incorporation of mitigation for public services, the proposed alternative would substantially lessen the demand for public services (i.e. fire, police, schools, parks, etc.). Moreover, preliminary estimates indicate that this alternative would generate approximately 550 high school aged children. The existing

high school would have sufficient capacity to accommodate the additional demands generated by this alternative. Future buildout of the General Plan, however, would still require that the City and School District identify a future high school site within the City. Additionally, as development would predominantly be located outside of the hillside areas, the proposed alternative would not be subject to potential wildland fires. This alternative would still require additional public services, including police and fire substations, but the demand for these services would be less due to the reduction in units and developable area. Development consistent with the General Plan would also provide additional parkland and open space as the hillside areas would be designated as Open Space areas.

Utilities and Service Systems. While the City of Soledad has adequate capacity to provide utilities to the project site, the proposed alternative would substantially lessen the demand for water and energy. Additionally, due to the reduction of units, the proposed alternative would generate less wastewater, solid waste, and water demand. As such, the overall demand for utilities would be reduced. While all project impacts would be mitigated to a less-than-significant level, the overall reduction of population associated with the proposed alternative would substantially lessen impacts to City services and infrastructure.

Traffic. Development of the proposed alternative is anticipated to significantly reduce the amount of project-generated traffic due to the overall reduction in the number of proposed units. While the level of significance (i.e. less-than-significant with mitigation) is not anticipated to change, this alternative would likely require less mitigation.

Summary

Buildout consistent with the City of Soledad's General Plan would substantially lessen potential impacts in terms of aesthetics, agricultural resources, air quality, biological resources, land use and planning, noise, population and housing, public services, utilities, and traffic. As identified in Table 6-1, development of this alternative would result in substantially the same impacts in regard to cultural resources, geology and soils, and hazards and hazardous materials. While this alternative would not change the level of significance determination for many of the impact areas, the proposed alternative, due to the reduction in project site, would lessen the extent to which the project would impact these resources.

6.5 REDUCED PROJECT

Description

This alternative consists of reducing development on the project site to avoid significant impacts. More specifically, development of this alternative would result in the reduction of residential uses on the project site by 50 percent. As a result, this alternative would result in the construction of 2,100 residential units. The Reduced Project alternative would also result in a 50% reduction of commercial uses on the project site as well. More specifically, this alternative would allow approximately 125,000 square feet of commercial space. All development under this scenario would occur within the predominantly level portions of the project site and no development would occur within the foothill areas. Development would primarily be concentrated adjacent to existing residential areas within the City of Soledad.

Development under this alternative is assumed to result in approximately the same impacts in regard to cultural resources, geology and soils, and hazards and hazardous materials as the proposed project. Development of the proposed alternative would substantially lessen the extent of project-related impacts; however, the proposed alternative would not reduce the overall level of significance (i.e. less-than-significant, less-than-significant with mitigation) for each of respective issue areas discussed below. The

following discussion addresses only the respective issues areas that would be minimized and/or avoided under the proposed alternative.

Impacts

Aesthetic. This alternative would result in less intensive urban development of the project site. Consistent with the General Plan Consistency Alternative, development of this alternative would eliminate potential impacts to the Gabilan Range, which is considered a scenic vista. Grading would no longer be necessary within the foothill areas and changes to topography would be minimal. Additionally, due to the overall reduction of units, this alternative would also reduce the extent of visual impacts associated with development of this alternative. More specifically, the development of 2,100 residential units would be less visible from adjacent public vantage points due to the reduction in developable area. Additionally, less commercial area would be developed and potential aesthetic impacts associated with the development of commercial uses adjacent to residential areas would also be minimized. To the extent that the project would reduce the amount of units, the proposed alternative would still result in the conversion of a previously undeveloped site into urban uses and would therefore transform the visual character of the site permanently.

Agricultural Resources. Development of this alternative, while not changing the level of significance determination (i.e. significant unavoidable), would require less development of the project site and therefore less prime farmland would be converted to a non-agricultural use. Regardless, this alternative would require the conversion of significant prime farmland into an urban use.

Air Quality. Air quality impacts associated with this alternative would be substantially less than the proposed project due to the reduction in commercial and residential land uses. Similar short-term construction activities would occur under this alternative. However, long-term emissions associated with vehicle trips and stationary sources (i.e., non-residential uses) would be incrementally decreased under this alternative. In the long-term, at project buildout, the Miravale III Project would exceed criteria pollutant emission thresholds (e.g., PM10, CO, NOx) resulting in a significant and unavoidable impact to air quality. A decrease in development intensity by 50 percent under the Reduced Project Alternative would reduce air quality impacts. Despite the reduction in units, the Reduced Project Alternative would not reduce project impacts to a level considered less-than-significant. However, since the Reduced Project Alternative would generate less air quality emissions, this alternative is considered to have less effect on air quality in relation to the proposed project.

Biological Resources. Development of the proposed alternative would substantially lessen potential impacts to biological resources located within the project area. By eliminating development within the foothill portions of the project site, the proposed project would not result in the loss of an area of significant biological value. This area would remain as Open Space consistent with the City's General Plan and would retain its natural features. As identified in the biological resources section of this EIR, impacts associated with the loss of Open Space was identified as a potentially significant impact that would affect a number of federally listed species. The proposed alternative would eliminate potential impacts to badgers, borrowing owl, Salinas pocket mouse, kit fox, and other species identified as special status. The grassland habitat located in the foothill portion of the Gabilan Range is considered a biologically sensitive area of the project site. Development of this alternative would substantially lessen project impacts. While specific mitigation would still be warranted, impacts could potentially be reduced to a less-than-significant level.

Hydrology/Water Quality. Development of this alternative would substantially reduce impervious surfaces due to the reduction of development. Although this alternative would reduce impervious surface areas, as well as off-site related impacts, this alternative would not reduce the overall level of significant

(i.e. less-than-significant with mitigation) as compared to the proposed project. Moreover, development of this alternative would also be required to adhere to the requirements of the City of Soledad Storm Drainage Master Plan.

Land Use. As identified in this EIR, development of the proposed project would conflict with adopted General Plan policies that are intended to either avoid and/or mitigated a potential environmental impact. This alternative would not conflict with any plans or policies intended to minimize and/or avoid an adverse environmental impact. This alternative would not require any General Plan amendments to insure consistency with adopted plans and policies pertaining to development within the project area.

Noise. In comparison to the proposed project, construction-related noise is anticipated to be similar due to the extent and duration of development. Consistent with the proposed project, mitigation measures would be applicable to reduce potential noise-related impacts. Project-related long-term noise impacts associated with vehicle trips and stationary sources (i.e. mechanical equipment), however, would be significantly less. Due to the reduction in vehicle trips and the decrease in commercial square footage, the Reduced Project Alternative would result in less noise impacts. The final configuration of land uses may warrant mitigation to assure that impacts do not exceed established thresholds. Development would also be less intensive and therefore impacts to adjacent sensitive land uses could potentially be minimized and/or avoided through site planning and project design.

Population and Housing. This alternative would result in substantial growth-inducing impacts. As compared to the proposed project, however, this alternative would generate less population within the project area and would not require revisions to the General Plan in order to accommodate increased density. The alternative would be required to comply with the City's adopted Inclusionary Housing Ordinance and would provide a variety of residential land use types. As the project would result in less units, this alternative would also allow the City to maintain a jobs/housing ratio that is more balanced in nature.

Public Services. Although all project impacts can be reduced to a less-than-significant level through the incorporation of mitigation for public services, the proposed alternative would substantially lessen the demand for public services (i.e. fire, police, schools, parks, etc.). This alternative would still require additional public services, including police and fire substations, but the demand for these services would be substantial less due to the reduction in units and developable area.

Utilities and Service Systems. The Reduced Project alternative would require upgrades and/or extensions of utilities such as water and wastewater facilities. As compared to the proposed project, this alternative would result in an incremental decrease in the demand for services. However, as identified in **Section 4.14 Utilities and Service Systems,** impacts would be mitigated to a level considered less-than-significant. Since the project would not generate as much demand for utilities, this alternative is considered to have fewer impacts on utilities as compared to the proposed project.

Traffic. Development of the proposed alternative is anticipated to significantly reduce the amount of project-generated traffic due to the overall reduction in the number of proposed units. While the level of significance (i.e. less-than-significant with mitigation) is not anticipated to change, this alternative would likely require less mitigation.

Summary

This alternative would result in approximately the same impacts as the proposed project in the areas of cultural resources, geology, and hazardous materials. By decreasing the extent of development, however, the Reduced Project alternative would reduce the overall site disturbance and construction-related

impacts, including grading, construction noise, and short-term air quality impacts. Furthermore, this alternative would substantially reduce the impact of the project on sensitive biological resources and would reduce aesthetic, agricultural, air quality, biological, land use, noise, population and housing, public services, utilities, and traffic impacts.

6.6 NO GOLF COURSE

Description

This alternative consists of eliminating the golf course and associated infrastructure in order to avoid potential significant adverse environmental impacts associated with agricultural resources, biological resources, cultural resources, hazardous materials, public services, utilities, and traffic. This alternative would still allow for the development of up to 4,200 residential units and commercial uses. As currently proposed, the golf course, driving range, and other associated infrastructure occupy approximately 160 acres of the 920 acre site. This area may be developed at some future time consistent with the program and policies identified in the General Plan, but additional impacts could result from additional development within the existing golf course alignment. These impacts would be beyond the scope of analysis contained in this EIR. Potential impacts include increased traffic, noise, deterioration of air quality, increased demands for public services and similar. For the purposes of this analysis, it is assumed that the existing golf course alignment would be utilized for low-intensity public recreational uses. Residential development within this alignment is beyond the scope of the analysis contained in this EIR and would be subject to additional review in accordance with the requirements of CEQA.

Development under this alternative is assumed to result in approximately the same impacts in regard to aesthetics, air quality, geology and soils, land use and planning, and noise as the proposed project. Development of the proposed alternative would substantially lessen the extent of project-related impacts; however, the proposed alternative would not necessarily reduce the overall level of significance (i.e. less-than-significant, less-than-significant with mitigation) for each of respective issue areas discussed below. Development of this alternative could, however, result in potentially significant impacts in terms of hydrology and water quality due to the elimination of the golf course and associated features, which include stormwater facilities. The following discussion addresses only the respective issues areas that would be minimized and/or avoided under the proposed alternative.

Impacts

Agricultural Resources. As identified in **Section 4.2 Agricultural Resources,** development of the proposed project would result in the conversion of 760 acres of prime farmland into urban uses. Development of the proposed alternative would, however, retain approximately 160 acres of prime farmland as Open Space or similar low-intensity recreational uses. Development of this alternative, while not reducing the overall significance of project-related impacts (i.e. significant and unavoidable), would substantially reduce the total amount of prime farmland permanently converted to non-agricultural uses. While this land would not be utilized for agricultural production, prime farmland would be retained as Open Space thereby minimizing potential project-related impacts.

Biological Resources. Development of the proposed alternative would lessen potential impacts to biological resources located within the project area. As previously identified, the loss of Open Space was identified as a potentially significant impact that would affect a number of federally listed species. Eliminating the golf course and retaining an additional 160 acres as Open Space or similar low-intensity recreational use would minimize potential impacts to badgers, borrowing owl, Salinas pocket mouse, kit fox, and other special-status species. Moreover, maintaining the golf course alignment as Open Space or

similar low-intensity recreational use would also provide additional connectivity between existing Open Space areas within the Gabilan Range and areas used as foraging habitat. Development of this alternative would substantially lessen project impacts; however, mitigation would still be warranted.

Cultural Resources. Development of the proposed alternative would avoid all project-related impacts to the historically significant Lorentzen house. As currently proposed, project development would result in the relocation of this structure in order to accommodate the proposed golf course and other project components. This alternative, however, would avoid project impacts by leaving the proposed golf course alignment as Open Space or a similar low-intensity recreational use. While standard mitigation regarding buried human remains would still pertain to this alternative, the no Golf Course Alternative would substantially project impacts to a historically significant resource such that all potential impacts could be feasibly avoid.

Hazards and Hazardous Materials. Development of the proposed alternative would reduce potential adverse environmental impacts associated with the maintenance and operation of the golf course. More specifically, development of this alternative would not require the use of pesticides and/or other types of chemicals in order to maintain the facility. While exposure of these chemicals is not anticipated to be significant, the elimination of the golf course would no longer require the application of potentially harmful chemicals. While this alternative would not reduce the overall level of significance of potential impacts due to the exposure to hazardous materials, this alternative would eliminate the need to routinely use and handle harmful chemicals.

Public Services and Recreation. Development of the proposed alternative has the potential to substantially increase Open Space or similar low-intensity recreational uses, such as parks, and thereby reduce potential impacts associated with project development by providing increased access to passive use recreational opportunities. More specifically, the proposed alternative would increase passive recreational uses by approximately 160 acres. Total Open Space provided as part of this alternative would account for approximately 25% of total land uses. Although not an official component of this alternative, additional public parks could be designated within the existing golf course alignment. While development of the proposed alternative would increase the total acreage of open space, this alternative would not necessarily reduce the level of significance (i.e. less-than-significant) of potential impacts. Mitigations requiring the payment of impact fees and other similar mitigations would still apply.

Utilities and Service Systems. Development of the proposed alternative would substantially lessen annual project demand. As indicated in **Section 4.14 Utilities and Service Systems** the proposed golf course would account for an annual water demand of approximately 543 acre feet per year. Although the golf course would be provided recycled water, this alternative would substantially lessen projected demands.

Traffic. Development of the proposed alternative is anticipated to reduce the amount of project-generated traffic associated with the golf course. The reduction of traffic trips, however, is not anticipated to be substantial as project traffic associated with the operation of the golf-course is not a significant component of project traffic. While the level of significance (i.e. less-than-significant with mitigation) is not anticipated to change, this alternative would likely require less mitigation.

Summary

This alternative would result in approximately the same impacts as the proposed project in the areas of aesthetics, air quality, geology and soils, land use and planning, and noise. By eliminating development of the golf course and thereby increasing the amount of area to be preserved as Open Space or similar low-intensity recreational use this alternative would reduce potential agricultural, biological, cultural, hazards, public services, and utilities impacts associated with project development. Eliminating development of the

proposed golf course, however, could result in additional development potential within the project area. As identified by the City of Soledad, the existing golf course could be developed for residential use in accordance with the City's General Plan. Additional residential development within the golf course alignment is beyond the scope of this analysis and could result in additional environmental impacts. These impacts would be subject to review under the requirements of CEQA.

6.7 ALTERNATIVE DESIGN: INCREASED SENIOR HOUSING ALTERNATIVE

Description

The Increased Senior Housing Alternative consists of increasing the number of senior level housing from 500 to 1,500 units in order to minimize and/or avoid potential impacts to public services and traffic. Build-out of this alternative would still result in the construction of 4,200 units and commercial uses; however, a larger proportion of these units, approximately 35 percent, would be restricted for senior level housing. This alternative is anticipated to result in approximately the same impacts as the proposed project in terms of aesthetics, agricultural resources, biological resources, cultural resources, geology and soils, hazards, hydrology and water quality, land use and planning, noise, and utilities as the proposed project. Development of this alternative, however, would lessen project impacts to school facilities. The following discussion addresses only the respective issues areas that would be minimized and/or avoided under the proposed alternative.

Impacts

Population and Housing. Development of the proposed alternative would increase the amount of senior level housing provided in conjunction with project development and therefore reduce potential impacts associated with development of the proposed project. The incorporation of additional senior level housing, however, would not reduce the level of significance of project-related impacts and mitigation measures would still be necessary to ensure that project impacts are reduced to a level considered less-than-significant.

Public Services and Recreation. Development of the proposed alternative would lessen potential impacts to educational resources. More specifically, as identified in **Section 4.12 Public Services and Recreation,** development of the proposed project would generate an estimated 4,291 new students. These additional students, per the Soledad Unified School District, would necessitate the construction of several additional school facilities in order to accommodate the projected students. According to the Soledad Unified School District, development of the proposed alternative would generate approximately 3,132 school aged children. Despite the overall reduction of school aged children, development of this alternative would still require additional school facilities, including a high school and an additional elementary school. Therefore, mitigation measures would still be warranted as part of the proposed alternative. While reducing overall projected student population growth, this alternative would not reduce and/or eliminate the need for additional educational facilities to mitigate project-related impacts.

Traffic. Development of the proposed alternative is anticipated to reduce the amount of project-generated traffic due to the increase in the number of senior level housing. As identified in the Traffic Impact Analysis prepared by Hexagon Transportation Consultants, Inc., senior level housing results in less daily traffic trips as compared to other housing types. More specifically, the ITE trip generation rate for senior housing is identified as 3.48 traffic trips per day. Assuming the construction of 1,500 senior housing units, preliminary estimates indicate that the proposed senior level housing would account for approximately 5,200 daily traffic trips. As compared to the proposed project, the increased traffic trips associated with the senior level housing would correspond with an overall reduction of project traffic by

an estimated 4,311 daily trips. Although this alternative would result in less daily traffic trips, project impacts are still anticipated to be significant.

Summary

Although development of this alternative is likely to lessen the extent of project impacts by reducing daily traffic trips and the number of projected students, this alternative would not reduce the overall level of significance of project impacts. Moreover, this alternative would still require mitigation in order to reduce/minimize potential impacts. For instance, development of this alternative would still necessitate an additional high school site in order to accommodate projected students and traffic improvements would still be necessary. While minimizing impacts related to public services and traffic, this project would result in approximately the same environmental impacts as the proposed project.

6.8 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

A comparison of the impacts of each alternative relative to the proposed project is presented in Table 6-1. CEQA requires that an environmentally superior alternative to the proposed project be specified. In general, the environmentally superior alternative is that which minimizes the adverse impacts of the project to the greatest extent, while achieving the basic objectives of the project.

The No Project – No Development alternative could be considered the environmentally superior alternative because all adverse impacts associated with project construction and operation would be avoided. However, the No Project – No Development alternative does not satisfy the primary project objective to provide a range of housing types for future Soledad residents. In addition, CEQA Guidelines section 15126.6(e)(2) states: "If the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

Among the remaining alternatives, the Reduced Project alternative would represent the environmentally superior alternative, since it avoids or reduces many of the project's impacts associated with more intense development on the site. While this alternative would result in less units than the "Buildout Consistent with the General Plan" Alternative, the General Plan alternative assumes buildout according to the maximum allowable density on the site. The Reduced Project alternative would allow the City to meet its objectives, while insuring that adverse environmental impacts are reduced to the extent feasible. This alternative would reduce impacts in other impact areas in accordance with the decrease in development.

APPENDIX A

Notice of Preparation (NOP) and Comments on the NOP

MIRAVALE PHASE III

Notice of Preparation
City of Soledad

To: _____
(Responsible Agency/Interested Person or Entity)

From: City of Soledad
(Lead Agency)

City of Soledad, City Hall
248 Main Street
Soledad, California 93960
Tel: (831) 678-3963
Fax: (831) 678-3965
E-mail: communitydev@cityofsoledad.com

Subject: Notice of Preparation (NOP) for the Draft Environmental Impact Report for Miravale Phase III Specific Plan

Project Applicant: Nader Agha

Public Review Period: NOP response period is from August 24, 2006 to September 23, 2006

NOP Scoping Meeting: One scoping meeting will be held to receive input on the EIR:

(1) September 7, 2006 at 5:00 PM at the City of Soledad City Hall Council Chambers, 248 Main Street, Soledad, CA 93960

The project description, location, and the potential environmental effects are discussed below.

The City of Soledad will be the Lead Agency and will prepare an Environmental Impact Report (EIR) for the Miravale Phase III Specific Plan Project. The California Environmental Quality Act (CEQA), Section 15082, states that once a decision is made to prepare an EIR, the lead agency must prepare a Notice of Preparation (NOP) to inform all responsible agencies of that decision. The purpose of the NOP is to provide responsible agencies and interested persons with sufficient information describing the proposed project and its potential environmental effects to enable them to make a meaningful response as to the scope and content of the information to be included in the EIR.

This NOP is being released to request comments on the scope of the EIR for the proposed project. The responses to this NOP will help the City of Soledad determine the scope of the EIR and ensure an appropriate level of environmental review. Project related documents and files are available at the address above.

Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice. Please send your responses to Don Fleming at the address above. We will need the name for a contact person in your agency.

Date _____ Signature _____

I. INTRODUCTION

PROJECT LOCATION:

The 920-acre project site is located within unincorporated lands of Monterey County on the northern edge of the City of Soledad, approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of the San Francisco Bay Area (see Figure 1). The project site is generally between San Vicente Road and Orchard Lane, and is surrounded by agricultural land to the north and east, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the west. The Assessor's Parcel Numbers are: 417-151-082, 417-151-083, 417-151-084, 417-151-085, 257-081-005, 257-081-026, 257-081-027, and 257-081-032.

PROJECT DESCRIPTION:

The Miravale Phase III Specific Plan project proposes a mixed-use development consisting of approximately 2,600 single-family residential units, 1,600 multi-family residential units, 300 senior housing units, 120 hotel rooms, 250,000 square feet of retail commercial space and an 18-hole golf course. Conceptual plans include a variety of residential types, including apartments, townhouses, and attached homes on small and large lots. The project also proposes three school sites (2 elementary schools and 1 middle school), a fire and police substation, and approximately 71 acres of open space and recreation areas, including parks, playgrounds, and a trail system (see Figure 2).

The project site is currently zoned by the County for farmland and permanent grazing uses and is being used for agricultural cultivation and grazing. It includes two existing single family units, which will be removed as part of the project. According to the City's General Plan, the majority of the project site is located within a designated Expansion Area, comprising all or a portion of three sub-areas: Northwest Expansion, San Vicente West, and Mirassou. A specific plan is required by the City in advance of annexation and development of each sub-area. Development of the project site will require annexation to the City pursuant to Local Agency Formation Commission of Monterey County (LAFCO) regulations.

The project entitlements will include, but not be limited to, General Plan Amendment, Specific Plan, Zone Change (Pre-Zoning), Architectural Review, Sphere of Influence Amendment, Annexation, Tentative Subdivision Map, and Development Agreements to allow for the proposed development.

II. PROBABLE ENVIRONMENTAL EFFECTS

ENVIRONMENTAL ISSUE AND PROBABLE EFFECTS

The environmental review of the project will focus on the following issues and probable environmental effects, as identified to date. The environmental analysis will address short-term (construction) and long term (life of project) impacts.

Aesthetics: The EIR will evaluate the visual effects of the project, based on existing visual characteristics, impacts to scenic views, proposed site layout/design, and density of development. The visual analysis will consider the City's policies on protection of views and aesthetics.

Agricultural Resources: According to the Important Farmlands Map, the project site contains farmland that is mapped as prime or of statewide importance. The site also contains lands under Williamson Act

contract. The EIR will analyze potential impacts to existing agricultural operations and land uses, including loss of farmland, impacts to Williamson Act properties, and compatibility issues.

Air Quality: The EIR will describe the air quality of the area and provide an assessment of the potential air quality impacts of the project in compliance with the Monterey Bay Unified Air Pollution Control District guidelines. Short-term air quality impacts associated with construction related activities will also be addressed.

Biological Resources: A biological assessment will be performed as part of the EIR to determine site conditions, the presence/absence of sensitive species and habitats, and potential impacts of the project on these resources.

Cultural Resources: The EIR will include a cultural resources investigation to determine the potential impacts from the project on any historic, architectural, or archaeological resources.

Geology and Soils: The EIR will address potential soil, geologic, and geotechnical hazards on the site, based on a preliminary geotechnical/geologic report. Such hazards may include seismicity, problematic soil conditions, liquefaction, and erosion.

Hazardous Materials/Health and Safety: The EIR will address potential hazards associated with development of the project site, including potential impacts from hazardous materials associated with past or current uses (e.g., agricultural chemicals, hydrocarbons, etc,) and the use, storage, or transport of hazardous materials.

Hydrology and Water Quality: The EIR will address drainage, flooding, and water quality conditions on the site. Potential impacts from development could include increases in runoff and flooding potential, as well as degradation of water quality from increased erosion and sedimentation. Proposed drainage and wastewater disposal systems will be evaluated.

Land Use and Planning: The EIR will address land use compatibility and project compliance with applicable land use policies. The project will require annexation of the project site into the City of Soledad boundaries, as well as expansion of the City's Sphere of Influence, subject to the review and approval by the Monterey County LAFCO. Existing land uses on and surrounding the project site will be described and potential land use impacts assessed (i.e., compatibility with surrounding uses, consistency with plans and policies, effects on the community).

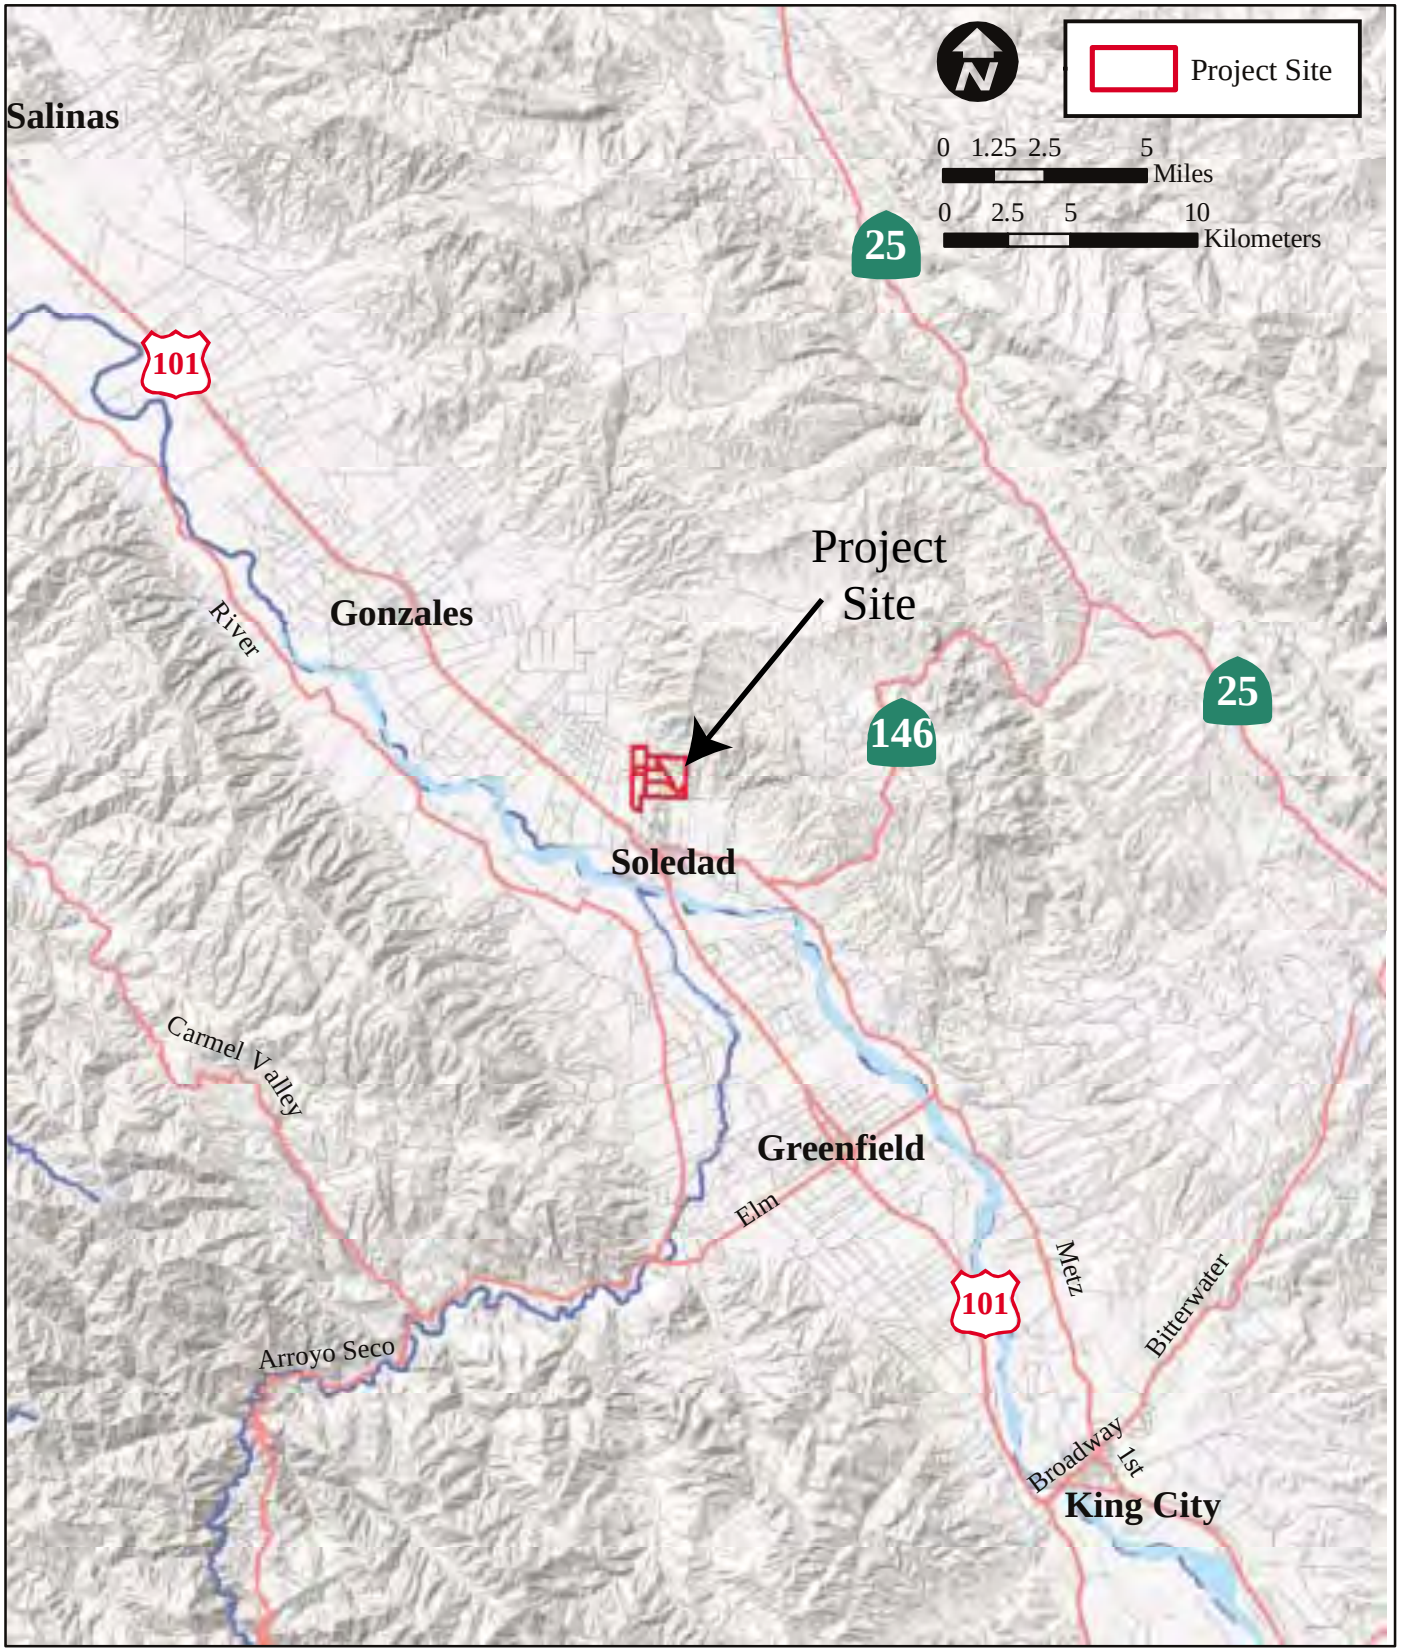
Noise: The EIR will describe the existing ambient noise levels in the vicinity, which are dominated by vehicular traffic. The EIR will assess the short-term (construction) and long-term (operational) noise impacts of the proposed project on the surrounding land uses, as well as noise impacts on proposed residential uses that may be affected by existing and future noise levels.

Population and Housing: A direct increase in population would occur due to proposed housing components of the project and an indirect increase may result from the creation of new jobs. The population and housing analysis in the EIR will consider the trends in population statistics for the local area and region.

Public Services/Utilities: The EIR will evaluate the existing public service systems serving the project area and evaluate the public service impacts of the project, including increased demands for sanitary sewer, storm drain, park, emergency, and school services.

Traffic and Circulation: The EIR will describe the existing and proposed roadway system, and evaluate traffic impacts. Traffic impacts, including degradation of levels of service on affected roadways and freeways, adequacy of site access, and provision of parking will be evaluated in a technical traffic study.

Water Supply: The EIR will describe the available water supply resources and projected demand for all phases of project implementation. This assessment will also address the proposed water system infrastructure to assess compliance with relevant standards (i.e., health and fire safety) and the adequacy of proposed storage and transmission capacity and pressures.



Growth Inducement: The EIR will evaluate the potential growth-inducing effects of the proposed development, including increases in jobs and housing, and improvements that may remove impediments to growth.

Cumulative Impacts: The EIR will evaluate the potential cumulative impacts of the project when combined with past, present and reasonably anticipated projects in the region. This evaluation will address (at a minimum) traffic, air quality, public services, and land use.

Alternatives: The EIR will consider a range of reasonable alternatives to the proposed project that could feasibly obtain most of the basic objectives of the proposed project, in accordance with CEQA Guidelines Section 15126.6.

MIRAVALE III SUBDIVISION

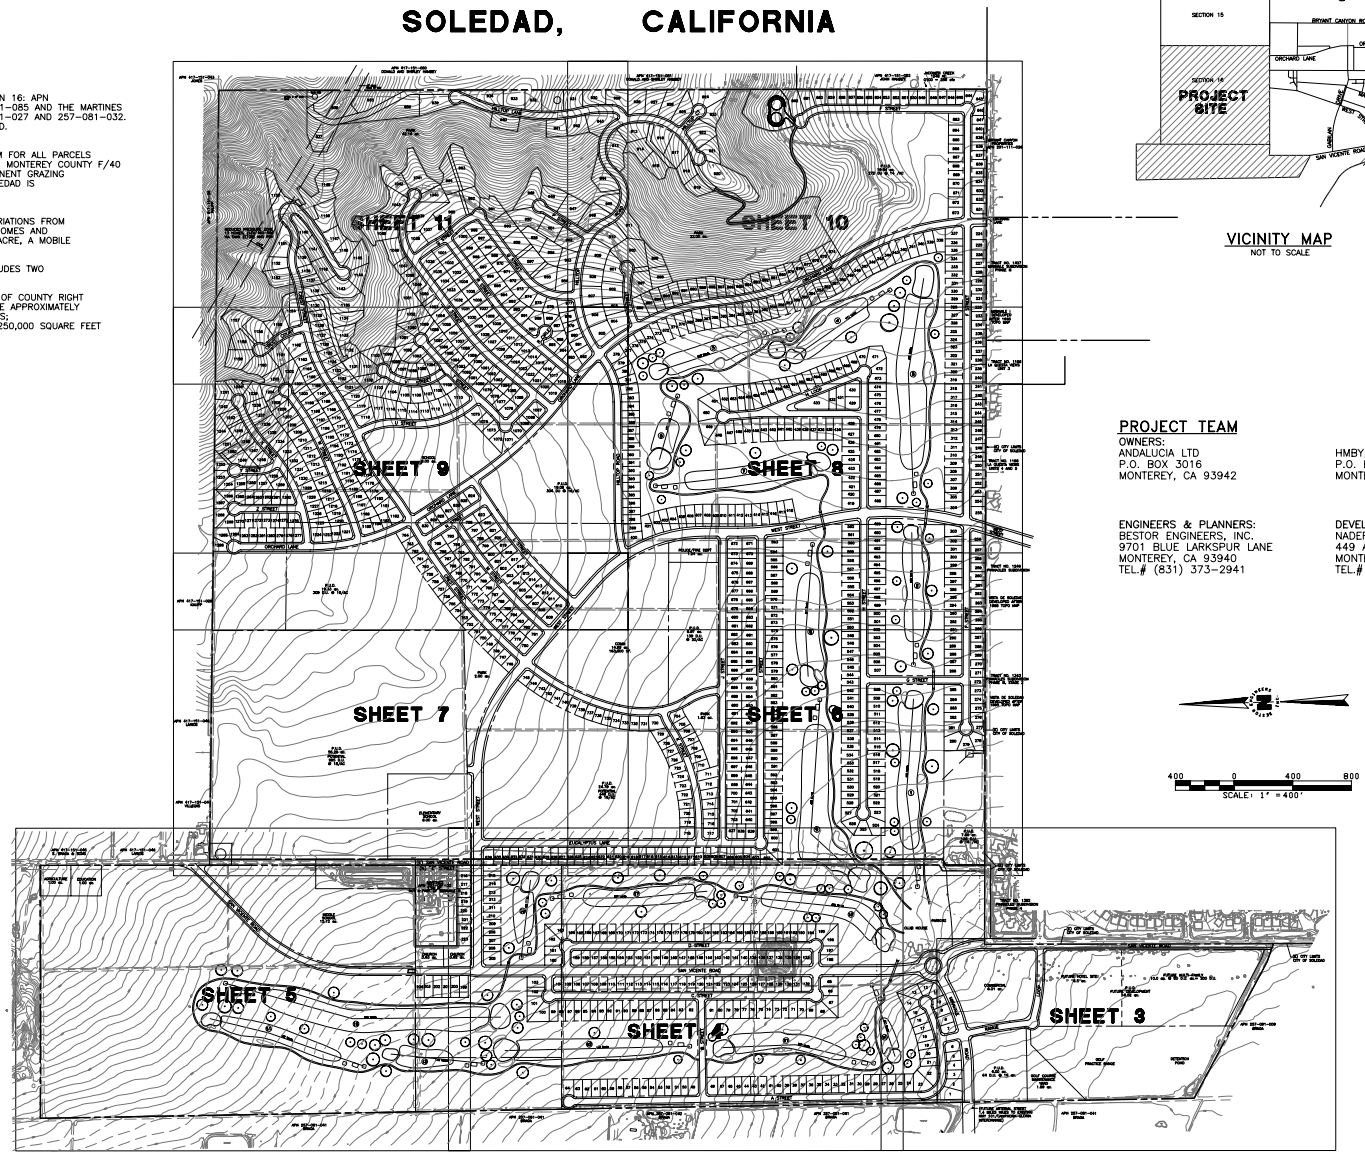
SOLEDAD, CALIFORNIA

NOTES

THE PROPERTY TO BE SUBDIVIDED CONSISTS OF SECTION 16: APN 417-151-082, 417-151-083, 417-151-084, 417-151-085 AND THE MARTINES PROPERTY APN 257-081-005, 257-081-026, 257-081-027 AND 257-081-032. THE PROPERTIES HAVE FRONTAGE ON SAN VICENTE ROAD.

EXISTING ZONING:
MONTEREY COUNTY F/40 (FARMLAND; 40-ACRE MINIMUM FOR ALL PARCELS EXCEPT 417-151-083. APN 417-151-083 ZONING IS MONTEREY COUNTY F/40 AND PG/40 (FARMLAND, 40-ACRE MINIMUM AND PERMANENT GRAZING 40-ACRE MINIMUM). ANNEXATION TO THE CITY OF SOLEDAD IS ANTICIPATED, SUBJECT TO LAFCO REGULATIONS.

PROPOSED ZONING:
R1,R1 WITH PLANNED UNIT DEVELOPMENT TO ALLOW VARIATIONS FROM 2,500 TO 6,000 SQUARE FEET. R-3 TO ALLOW TOWNHOMES AND APARTMENTS AT BETWEEN 14 AND 20 DWELLINGS PER ACRE, A MOBILE HOME PARK AND RETAIL COMMERCIAL.



THE PROPERTY IS CURRENTLY IN CULTIVATION. IT INCLUDES TWO EXISTING HOMES THAT WILL BE REMOVED.

TOTAL PROPERTY IS 918.829 ACRES PLUS 3.03 ACRES OF COUNTY RIGHT OF WAY TO BE ABANDONED. TOTAL PROPOSED USES ARE APPROXIMATELY 2,600 SINGLE FAMILY HOMES; 1,600 MULTI-FAMILY UNITS; 300 UNITS OF SENIOR HOUSING; A 120 ROOM HOTEL, 250,000 SQUARE FEET OF RETAIL, AND AN 18 HOLE GOLF COURSE.

PROPOSED UTILITY SUPPLIES ARE:
ELECTRICITY – PG&E
GAS – PG&E
CATV – CHARTER COMMUNICATION CO.
WATER – CITY OF SOLEDAD
SANITARY SEWER – CITY OF SOLEDAD
STORM DRAINAGE – CITY OF SOLEDAD
TELEPHONE – AT&T

PROPOSED USES

SINGLE FAMILY HOMES	2600 UNITS
MULTI-FAMILY HOMES	1600 UNITS
SENIOR HOUSING	300 UNITS
HOTEL	120 ROOMS

Re: Miravale Phase III Specific Plan
SCH# 2006081129

Attached for your review and comment is the Notice of Preparation (NOP) for the Miravale Phase III Specific Plan draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Don Fleming
City of Soledad
248 Main Street
Soledad, CA 93960

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Project Analyst, State Clearinghouse

Subject: Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Miravale Phase III Specific Plan **SCH# 2006081129**

Dear Mr. Fleming:

The Department of Conservation's Division of Land Resource Protection (Division) monitors farmland conversion on a statewide basis and administers the California Land Conservation (Williamson) Act and other agricultural land conservation programs. The Division has reviewed the above NOP and offers the following recommendations for the DEIR with respect to the project's potential impacts on agricultural land.

The proposed project involves a mixed-use development of residential, hotel, retail/commercial, and golf course uses on a 920-acre site. Entitlements associated with the project include general plan amendment, specific plan, zone change, architectural review, sphere of influence amendment, annexation, tentative subdivision map and development agreements. The NOP notes that the site includes Prime Farmland, Farmland of Statewide Importance and lands under Williamson Act contract. Therefore, the Division recommends that, at a minimum, the following items be specifically addressed to document and treat the project impacts on agricultural land and Williamson Act lands.

Agricultural Setting of the Project

The DEIR should describe the project setting in terms of the actual and potential agricultural productivity of the land. The Division's Monterey County Important Farmland Map, which defines farmland according to soil attributes and land use, can be used for this purpose. In addition, we recommend including the following information to characterize the agricultural land resource setting of the project.

- Current and past agricultural use of the project area. Include data on the types of crops grown, and crop yields and farmgate sales values.

- To help describe the full agricultural resource value of the soils on the site, we recommend the use of economic multipliers to assess the total contribution of the site's potential or actual agricultural production to the local, regional and state economies. State and Federal agencies such as the UC Cooperative Extension Service and USDA are sources of economic multipliers.

Project Impacts on Agricultural Land

- Type, amount, and location of farmland conversion resulting directly and indirectly (growth-inducement) from project implementation.
- Impacts on current and future agricultural operations; e.g., land-use conflicts, increases in land values and taxes, vandalism, etc.
- Incremental project impacts leading to cumulatively considerable impacts on agricultural land. This would include impacts from the proposed project as well as impacts from past, current and probable future projects.

Impacts on agricultural resources may also be quantified and qualified by use of established thresholds of significance (California Code of Regulations Section 15064.7). The Division has developed a California version of the USDA Land Evaluation and Site Assessment (LESA) Model, a semi-quantitative rating system for establishing the environmental significance of project-specific impacts on farmland. The model may also be used to rate the relative value of alternative project sites. The LESA Model is available on the Division's website noted later in this letter.

Williamson Act Lands

A project is deemed to be of statewide, regional or area-wide significance if it will result in cancellation of a Williamson Act contract for a parcel of 100 or more acres [California Code of Regulations Section 15206(b)(3)]. Since lands under Williamson Act contract exist in or adjacent to the project site, the Department recommends that the following information be provided in the DEIR:

- A map detailing the location of agricultural preserves and contracted land within each preserve. The DEIR should also tabulate the number of Williamson Act acres, according to land type (e.g., prime or non-prime agricultural land), which could be impacted directly or indirectly by the project.
- A discussion of Williamson Act contracts that may be terminated in order to accommodate the project. The DEIR should discuss the impacts that termination of Williamson Act contracts would have on nearby properties also under contract; i.e., growth-inducing impacts (in the sense that the removal of contract protection not only lifts a barrier to development, but results in higher property taxes, and thus, an incentive to shift to a more intensive land use, such as urban development.)
- As a general rule, land can be withdrawn from Williamson Act contract only through the nine-year nonrenewal process. Immediate termination via cancellation is reserved for "extraordinary", unforeseen situations (See Sierra Club v. City of Hayward (1981) 28 Cal.3d 840, 852-855).

The City or County of jurisdiction must approve a request for contract cancellation, and base that approval on specific findings that are supported by substantial evidence (Government Code Section 51282). If Williamson Act contract cancellation is proposed, we recommend that a discussion of the findings be included in the DEIR. Finally, the notice of the hearing to approve the tentative cancellation, and a copy of the landowner's petition, must be mailed to the Director of the Department of Conservation ten (10) working days prior to the hearing. (The notice should be mailed to Bridgett Luther, Director, Department of Conservation, c/o Division of Land Resource Protection, 801 K Street MS 18-01, Sacramento, CA 95814-3528.)

- If the project site is under Williamson Act contract, and any part of the site is to continue under contract after project completion, the DEIR should discuss the proposed uses for those lands. Uses of contracted land must meet compatibility standards identified in Government Code Sections 51238 - 51238.3. Otherwise, contract termination (see paragraph above) must occur prior to the initiation of the land use. The DEIR should also discuss plans for the city to succeed to existing contracts in the annexation area unless conditions specified in Government Code Section 51243.5 apply.
- An agricultural preserve is a zone authorized by the Williamson Act, and established by the local government, to designate land qualified to be placed under the Act's 10-year contracts. Preserves are also intended to create a setting for contract-protected lands that is conducive to continuing agricultural use. The uses of agricultural preserve land must be restricted by zoning or other means so as not to be incompatible with the agricultural use of contracted land within the preserve (Government Code Section 51230). Therefore, the DEIR should discuss any proposed general plan designation or zoning within agricultural preserves affected by the project.

Mitigation Measures and Alternatives

Feasible alternatives to the project's location or configuration that would lessen or avoid farmland conversion impacts should be considered in the DEIR. Similarly, while the direct conversion of agricultural land is often deemed to be an unavoidable impact by California Environmental Quality Act (CEQA) analyses, mitigation measures must nevertheless be considered.

The Division recommends the purchase of agricultural conservation easements on land of at least equal quality and size as partial compensation for the direct loss of agricultural land, as well as for the mitigation of growth inducing and cumulative impacts on agricultural land. We highlight this measure because of its growing acceptance and use by lead agencies as mitigation under CEQA.

Mitigation using conservation easements can be implemented by at least two alternative approaches: the outright purchase of conservation easements tied to the project, or via the donation of mitigation fees to a local, regional or statewide organization or agency, including land trusts and conservancies, whose purpose includes the purchase, holding and maintenance of agricultural conservation easements.
Whatever the approach, the conversion of agricultural land should be deemed an impact of at least regional significance and the search for mitigation lands conducted regionally, and not limited strictly to lands within the Soledad area.

Information about conservation easements is available on the Division's website, or by contacting the Division at the address and phone number listed below. The Division's website address is:

http://www.conservation.ca.gov/DLRP/

Of course, the use of conservation easements is only one form of mitigation that should be considered. The following mitigation measures could also be considered:

- Increasing home density or clustering residential units to allow a greater portion of the development site to remain in agricultural production.
- Protecting nearby farmland from *premature* conversion through the use of less than permanent long-term restrictions on use such as 20-year Farmland Security Zone contracts (Government Code Section 51296) or 10-year Williamson Act contracts (Government Code Section 51200 et seq.).
- Establishing buffers such as setbacks, berms, greenbelts, and open space areas to separate farmland from incompatible urban uses.
- Investing in the commercial viability of the remaining agricultural land in the project area through a mitigation bank which invests in agricultural infrastructure, water supplies and marketing.

The Department believes that the most effective approach to farmland conservation and impact mitigation is one that is integrated with general plan policies. For example, the measures suggested above could be most effectively applied as part of a comprehensive agricultural land conservation element in the City's general plan. Mitigation policies could then be applied systematically toward larger goals of sustaining an agricultural land resource base and economy. Within the context of a general plan mitigation strategy, other measures could be considered, such as the use of transfer of development credits, mitigation banking, and economic incentives for continuing agricultural uses.

Thank you for the opportunity to comment on the NOP. If you have questions on our comments, or require technical assistance or information on agricultural land conservation, please contact the Division at 801 K Street, MS 18-01, Sacramento, California 95814; or, phone (916) 324-0850.

Sincerely,

Brian Leahy

RECEIVED
SEP 01 2006
PLANNING DEPARTMENT

August 30, 2006

Mr. Don Fleming
City of Soledad, City Hall
248 Main Street
Soledad, CA 93960

Dear Mr. Fleming:

Subject: Miravale Phase III Specific Plan, Soledad, Monterey County

The Department of Fish and Game (DFG) has reviewed the documents provided for the subject project and we have the following comments.

Please provide a complete assessment (including but not limited to type, quantity and locations) of the habitats, flora and fauna within and adjacent to the project area, including endangered, threatened, and locally unique species and sensitive habitats. The assessment should include the reasonably foreseeable direct and indirect changes (temporary and permanent) that may occur with implementation of the project. Rare, threatened and endangered species to be addressed should include all those which meet the California Environmental Quality Act (CEQA) definition (see CEQA Guidelines, Section 15380). DFG recommended survey and monitoring protocols and guidelines are available at http://www.dfg.ca.gov/hcpb/species/stds_gdl/survmonitr.shtml.

Please be advised that a California Endangered Species Act (CESA) Permit must be obtained if the project has the potential to result in take of species of plants or animals listed under CESA, either during construction or over the life of the project. Issuance of a CESA Permit is subject to CEQA documentation; therefore, the CEQA document must specify impacts, mitigation measures, and a mitigation monitoring and reporting program. If the project will impact CESA listed species, early consultation is encouraged, as significant modification to the project and mitigation measures may be required in order to obtain a CESA Permit.

For any activity that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of a river or stream, or use material from a streambed, DFG may require a Streambed Alteration Agreement (SAA), pursuant to Section 1600 et seq. of the Fish and Game Code, with the applicant. Issuance of SAAs is subject to CEQA. DFG, as a responsible agency under CEQA, will consider the CEQA document for the project. The CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate

avoidance, mitigation, monitoring and reporting commitments for completion of the agreement. To obtain information about the SAA notification process, please access our website at www.dfg.ca.gov/1600; or to request a notification package, contact the Streambed Alteration Program at (707) 944-5520.

If you have any questions, please contact Mr. Carl Wilcox, Habitat Conservation Manager, at (707) 944-5525.

Sincerely,

Cindy Catalano

Dear Don Fleming,

RE: Notice of Preparation, Miravale Phase III Specific Plan, Monterey County SCH#2006081129

Thank you for the opportunity to review the above-referenced document. The Central Coast Regional Water Quality Control Board (Water Board) is a responsible agency under the California Environmental Quality Act (CEQA). Water Board staff understands that the project includes a mixed-use development consisting of approximately 2,600 single-family residential units, 1,600 multi-family residential units, 300 senior housing units, 120 hotel rooms, 250,000 square feet of retail space and an 18-hole golf course. We recommend you consider Low Impact Development (LID) design techniques for your proposed project. LID or equivalent methods are necessary to mitigate stormwater runoff pollution and stream erosion and sedimentation impacts that result from significantly increased downstream flows due to introduced impermeable surfaces.

LID is an alternative site design strategy that uses natural and engineered infiltration and storage techniques to control stormwater runoff where it is generated. The objective is to disperse LID devices uniformly across a site to minimize runoff. LID serves to preserve the hydrologic and environmental functions altered by conventional stormwater management. LID methods provide temporary retention areas; increase infiltration; allow for pollutant removal; and control the release of stormwater into adjacent waterways (Anne Guillette, Whole Building Design Guide). For further reference please see:

http://www.epa.gov/owow/nps/lid/

Eight Common LID Practices Include:

1. Site Design Layout to Reduce and Disconnect Impervious Surfaces
2. Native Vegetation Preservation
3. Bioretention
4. Tree Boxes to Capture and Infiltrate Street Runoff
5. Vegetated Swales, Buffers, and Strips
6. Roof Leader Flows Directed to Planter Boxes and Other Vegetated Areas
7. Permeable Pavement
8. Soil Amendments to Increase Infiltration Rates

Water Board staff considers a project that meets the following descriptions (inclusive) to be a "Low Impact Development" project:

A. Runoff Volume Control. The pre-development stormwater runoff volume is maintained by a combination of minimizing the site disturbance, and then providing distributed retention BMPs. Retention BMPs are structures that retain the excess (above pre-development project volumes) runoff resulting from the development for the design storm event (2-, 10-, and 25-year, 24-hour duration storm). Note that "retention" is required, as opposed to "detention"; retention may be achieved using infiltration methods, and capture-for-use methods. A "customized" or detailed runoff curve number (CN) evaluation is required to determine the required runoff volume. The storage required to maintain the pre-development volume may also be sufficient to maintain the pre-development peak rate.

B. Peak Runoff Rate Control. Low-impact development is designed to maintain the pre-development peak runoff discharge rate for the selected design storm events. This is done by maintaining the pre-development time of concentration and then using retention and/or detention BMPs (e.g., rain gardens, open drainage systems, etc.) that are distributed throughout the site. The goal is to use retention practices to control runoff volume and, if these retention practices are not sufficient to control the peak runoff rate, to use additional detention practices to control the peak runoff rate.

C. Flow Frequency Duration Control. Since low-impact development is designed to emulate the pre-development hydrologic regime through both volume and peak runoff rate controls, the flow frequency and duration for the post-development conditions must be identical (to the greatest degree possible) to those for the pre-development conditions. The impacts on the sediment and erosion and stream habitat potential at downstream reaches will then be minimized.

Your project may be subject to the NPDES Phase 2 Municipal Stormwater Permit (Permit). The Permit requires developments to meet Maximum Extent Practicable (MEP) standards to address urban runoff. In most cases, MEP standards are not met by conventional site layouts, construction methods, and storm water conveyance systems with "end of pipe" basins and treatment systems that do not address the changes in volume and rates of storm water runoff and urban pollutants (including thermal pollution). Low Impact Development does meet the MEP standard and is more effective at reducing pollutants in storm water runoff at a practicable cost.

Please consider these comments in the CEQA approval process for this project. If you have questions, please contact Donette Dunaway at (805) 549-3698.

Sincerely,

for Roger W. Briggs
Executive Officer

PLANNING DEPARTMENT

Mr. Don Fleming
City of Soledad
248 Main Street
Soledad, CA 93960

Dear Mr. Fleming:

Subject: Miravale Phase III Specific Plan, Soledad, Monterey County, SCH 2006081129

The Department of Fish and Game (DFG) has reviewed the documents provided for the subject project and we have the following comments.

Please provide a complete assessment (including but not limited to type, quantity and locations) of the habitats, flora and fauna within and adjacent to the project area, including endangered, threatened, and locally unique species and sensitive habitats. The assessment should include the reasonably foreseeable direct and indirect changes (temporary and permanent) that may occur with implementation of the project. Rare, threatened and endangered species to be addressed should include all those which meet the California Environmental Quality Act (CEQA) definition (see CEQA Guidelines, Section 15380). DFG recommended survey and monitoring protocols and guidelines are available at http://www.dfg.ca.gov/hcpb/species/stds_gdl/survmonitr.shtml.

Please be advised that a California Endangered Species Act (CESA) Permit must be obtained if the project has the potential to result in take of species of plants or animals listed under CESA, either during construction or over the life of the project. Issuance of a CESA Permit is subject to CEQA documentation; therefore, the CEQA document must specify impacts, mitigation measures, and a mitigation monitoring and reporting program. If the project will impact CESA listed species, early consultation is encouraged, as significant modification to the project and mitigation measures may be required in order to obtain a CESA Permit.

For any activity that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of a river or stream, or use material from a streambed, DFG may require a Streambed Alteration Agreement (SAA), pursuant to Section 1600 et seq. of the Fish and Game Code, with the applicant. Issuance of SAAs is subject to CEQA. DFG, as a responsible agency under CEQA, will

consider the CEQA document for the project. The CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring and reporting commitments for completion of the agreement. To obtain information about the SAA notification process, please access our website at www.dfg.ca.gov/1600; or to request a notification package, contact the Streambed Alteration Program at (707) 944-5520.

If you have any questions, please contact, Mr. Carl Wilcox, Habitat Conservation Manager, at (707) 944-5525.

Sincerely,

for Scott Wilson

Dear Mr. Fleming:

RE: NOTICE OF PREPARATION RESPONSE: MIRAVALE PHASE III

Thank you for the opportunity to respond to the Notice of Preparation (NOP) for the Draft Environmental Impact Report for Miravale Phase III Specific Plan.

In regards to my response, the following items warrant your attention:

1. The Miravale III subdivision has two elementary, one middle school/adult education combination center and Future Farmers of America (FFA) sites designated and dedicated for future growth; considering the loading factors that are being used and the schools that will be constructed districtwide adequacy for facilities should be sufficient. We are working with our school facility consultants to re-examine the loading factors.

   The sites should meet the necessary California Department of Education established standards. They should be safe and free of environmental toxics.

2. Our current high school enrollment is 1,048 students with maximum capacity of 1,400 students. The existing site has adequate space to add portable buildings to accommodate the steady growth. We are in the process of placing (4) portables at the high school in the next two to three months. However, with pending and future projects, our high school will exceed capacity. It is my recommendation that the General Plan be amended to show and to have future developers designate a 40-acre additional high school site in the northwest or future expansion areas.

Please feel free to contact me if you have any questions and thank you for your attention to this matter and consideration to amend the General Plan to include another future high school for our community

Sincerely,

Jorge Z. Guzman
District Superintendent

RE: Notice of Preparation for the Draft Environmental Impact Report for Miravale Phase III Specific Plan

Dear Mr. Fleming:

Thank you the courtesy shown by your staff in accommodating our request for an extension of time to submit comments for the Miravale III Notice of Preparation.

As you know, LAFCO has the statutory responsibility to make determinations regarding changes in local government boundaries. For purposes of CEQA compliance, we are a responsible agency for the Miravale project. LAFCO requests that analysis of the following issues be included in the environmental review process:

Open Space and Agricultural Resources

- A detailed review of the project's direct impact on open space and farmland mapped as prime and of statewide importance. The review should include a full assessment of recommendations for avoidance of impacts and mitigation of impacts, such as permanent conservation and agricultural buffers. Some examples of potential conservation actions are on-site open space and agricultural reserves, off-site replacement of agricultural lands, and payment of mitigation fees to a regional agricultural lands conservation bank program.

Land Use and Planning

- A review of the proposal's compatibility and compliance with the "factors to be considered in review of proposal" for LAFCO (see Section 56668 of the Government Code).
- A review of the proposal's compatibility and compliance with the adopted LAFCO of Monterey County's "Sphere Of Influence Policies and Criteria" (attached).

- A review of the proposal's compatibility and compliance with draft Sphere of Influence policies currently under consideration by LAFCO of Monterey County (attached).
- A review of compliance with regional population and employment forecasts and regional air quality plans.

Municipal Services

- A review of impacts on delivery of municipal services including water, sewer, fire, schools, police, emergency medical services, flood protection, parks and open space.

Cumulative Impact

- The cumulative impact to the Salinas Valley of the conversion of farmland mapped as prime and of statewide importance and any required mitigations.
- The cumulative impacts to regional roadways and regional jobs/housing balance.
- The cumulative impacts to the regional water supply.

Alternatives

- Alternatives that would avoid and lessen the project's direct and cumulative impacts, particularly to agricultural resources, availability of water, regional housing needs and regional traffic.

The Miravale III proposal will need to be considered as part of the City's comprehensive Sphere of Influence amendment proposal and subsequent annexation proposals. We extend an invitation to the City of Soledad to participate in LAFCO's preliminary review process as a way to promote early and informal dialogue, understanding and cooperation. The preliminary review process would consist of an informal presentation and discussion about the City's comprehensive growth plans as identified in the recently adopted General Plan. The Miravale III project would be part of that discussion. We encourage the City to take part in the preliminary review process prior to formal submittal of Soledad's comprehensive Sphere of Influence amendment proposal and annexation proposals to LAFCO.

In addition, please note the statutory requirement for early consultation between the City and County (Government Code Section 56425b) before the formal Sphere of Influence amendment is submitted to LAFCO.

We appreciate this opportunity to provide comments, and would be pleased to meet with your City staff and consultants for more detailed discussions.

Sincerely,

Kate McKenna

Kate McKenna, AICP
Executive Officer

LOCAL AGENCY FORMATION COMMISSION
(LAFCO)
OF MONTEREY COUNTY

SPHERE OF INFLUENCE POLICIES AND CRITERIA

April, 2003

I. LEGISLATIVE AUTHORITY

The State Legislature has provided Local Agency Formation Commissions (LAFCO's) with the following directions in the preparation of spheres of influence:

1. "Among the purposes of a Local Agency Formation Commission are the discouragement of urban sprawl and the encouragement of the orderly formation and development of local governmental agencies based upon local conditions and circumstances. One of the objects of the Local Agency Formation Commission is to make studies and to obtain and furnish information which will contribute to the logical and reasonable development of local governmental agencies so as to advantageously provide for the present and future needs of each County and its communities..."

2. "In order to carry out its purposes and responsibilities for planning and shaping the logical and orderly development and coordination of local governmental agencies so as to advantageously provide for the present and future needs of the County and its communities, the Local Agency Formation Commission shall develop and determine the sphere of influence of each governmental agency within the County. As used in this section, "sphere of influence" means a plan for the probable ultimate physical boundaries and service area of a local governmental agency. In determining the sphere of influence of each local governmental agency, the Commission shall consider and prepare a written statement of its determinations with respect to each of the following:

   a. The present and planned land uses in the area, including agricultural and open space lands.

   b. The present and probable need for public facilities and services in the area.

   c. The present capacity of public facilities and the adequacy of public services which the agency provides or is authorized to provide.

   d. The existence of any social or economic communities of interest in the area if the Commission determines that they are relevant to the agency."

3. Every determination made by a Commission involving proposals for changes of organization or reorganization shall be consistent with the spheres of influence of the local agencies affected by those determinations.

4. The Commission may recommend governmental reorganizations to particular agencies in the County, using spheres of influence as the basis for such recommendations."

II. DEFINITIONS

1. Agricultural Lands: Land currently used for the purpose of producing an agricultural commodity for commercial purposes, land left fallow under a crop rotational program, or land enrolled in an agricultural subsidy or set-aside program (Government Code Section 56016).

2. Agricultural Preserve: Lands subject to an existing land conservation agreement established pursuant to the California Land Conservation Act of 1965 (the Williamson Act, Government Code Section 51200 et seq.).

3. County: Monterey County.

4. Essential Services: Those basic services necessary to protect the health, safety, and general well-being of a community, including but not limited to police, fire, water, sanitation, etc.

5. General Purpose Government: A City or County government.

6. LAFCO: Monterey County Local Agency Formation Commission.

7. Local Agency: A City or special district.

8. Open Space Lands: Parcel or area of land or water which is substantially unimproved and devoted to open space use as defined in Government Code Section 65560.

9. Planning Concern Area: An area established by the Local Agency Formation Commission with the assistance of the appropriate cities and the County designating a general area of concern of a city for which planning decisions and other governmental actions of the County may have an impact on the city. A "Planning Concern Area" will usually be larger than the adopted sphere of influence boundary and may take into consideration the planning area of the city as identified within their local general plans.

10. Prime Agricultural Land: (A) Land that, if irrigated, qualifies for rating as Class I or II in the USDA Natural Resources Conservation Service land-use capacity classification, whether or not the land is actually irrigated, provided that irrigation is feasible; (B) land that qualifies for rating 80-100 in the Storie Index Rating; (C) land that supports livestock used for the production of food and fiber and that has an annual carrying capacity equivalent to at least one animal unit per acre; (D) land planted with fruit or nut-bearing trees, vines, bushes, or crops that have a non-bearing period of less than five years and that will return during the commercial bearing period on an annual basis from the production of unprocessed agricultural plant production not less than four hundred dollars ($400) per acre for three of the previous five calendar years; (E) Land that has returned

from the production of unprocessed agricultural plant products an annual gross value of not less than four hundred dollars ($400) per acre for three of the previous five calendar years. (Government Code Section 56064).

11. Regional Agencies: Association of Monterey Bay Area Governments (AMBAG), Regional Water Quality Control Board, Central Coast Regional Coastal Commission, Air Pollution Control Board, etc.

12. Sphere of Influence: A plan for the probable physical boundaries and service area of a local agency. The area around a local agency eligible for annexation and extension of urban service within a twenty-year period.

13. Sphere of Influence Boundary: Boundary, adopted by the Monterey County Local Agency Formation Commission, which delineates the limits beyond which a local governmental agency will not annex territory.

14. Urban Services: Those services which are provided to an urban area including, but not limited to, police, structural fire protection, non-agricultural water, sewer, drainage, street lighting, streets and roads.

15. Urban Service Districts: Special districts which are authorized to provide public sanitary sewer services or domestic water distribution services.

16. Urban Service Area: Urban developed areas within an urban service district or city sphere of influence, which is now served by existing urban facilities, utilities, and services or is proposed to be served by urban facilities, utilities and services within the next five years.

17. Urban Transition Area: Area within the spheres of influence boundaries of a city or an urban service district which is not programmed for urban facilities or utility extensions within the next five years. This area will most likely be used for urban expansion within approximately five to twenty years.

18. Future Study Area: Territory outside of an adopted sphere of influence that may warrant inclusion in the sphere in future years. Further study would have to be completed prior to inclusion.

19. Principal County: Principal County has the meaning contained in any definition of principal county, as set forth in the principal act. If the principal act has no definition of principal county, or if there is any inconsistency between the definitions contained in two or more applicable principal acts, principal county means the county having all or the greater portion of the entire assessed value, as shown on the last equalized assessment roll of the county or counties, of all taxable property within a district or districts for which a change of organization or reorganization is proposed.

III. POLICY GUIDELINES FOR SPHERES OF INFLUENCE

The Commission will generally apply the following policy guidelines in the spheres of influence program, in addition to the local conditions and circumstances of each local agency. The Monterey County Local Agency Formation Commission will consider the particular local conditions and circumstances of each agency and community.

1. LAFCO intends that its sphere of influence determination will serve as a master plan for the future organization of local government within the County. The spheres shall be used to discourage urban sprawl; limit proliferation of local governmental agencies; encourage efficiency, economy and orderly changes in local government; promote compact, community centered urban development; and minimize adverse impacts on lands classified as prime agriculture.

2. The sphere of influence lines shall be a declaration of policy which shall be a primary guide to LAFCO in the decision on any proposal under its jurisdiction. Every determination made by the Commission shall be consistent with the spheres of influence of the agencies affected by those determinations.

3. Any proposal which is inconsistent with an agency's adopted sphere of influence shall not be approved until the Commission, at a noticed public hearing, has considered an amendment or revision to that agency's sphere of influence.

4. Inclusion within an agency's sphere of influence does not assure annexation to that agency. The Commission shall evaluate boundary change proposals as they relate to all of the relevant factors listed in the Cortese-Knox Local Government Reorganization Act of 1985 (Government Code Section 56841 et seq.).

5. When possible, a single larger general purpose agency, rather than a number of adjacent smaller ones, established for a given service in the same general area will be preferred. Where an area could be assigned to the sphere of influence of more than one agency providing a particular needed service, the following hierarchy shall apply dependent upon ability to serve.

   a. Inclusion within a City sphere of influence.

   b. Inclusion within a multi-purpose district sphere of influence.

   c. Inclusion within a single-purpose district sphere of influence.

   In deciding which of two or more equally ranked agencies shall include an area within its sphere of influence, LAFCO shall consider the agencies' service and financial capabilities, social and economic interdependence, topographic factors, and the effect that eventual service extension will have on adjacent agencies.

6. Duplication of authority to perform similar functions in the same territory will be avoided. Sphere of influence boundaries shall not create islands or corridors unless it can be

demonstrated that the irregular boundaries represent the most logical and orderly service area of an agency.

7. The adopted sphere of influence shall reflect City and County General Plans, plans of regional agencies, growth management policies, annexation policies, resource management policies, and any other policies related to ultimate boundary or service area of an affected agency unless those plans or policies conflict with the legislative intent of the Cortese-Knox-Hertzberg Act of 2000 (Government Code Section 56000 et seq.).

   Where inconsistencies between plans exist, LAFCO shall rely upon that plan which most closely follows the Legislature's directive to discourage urban sprawl, direct development away from prime agricultural land and open-space lands, and encourage the orderly formation and development of local governmental agencies based upon local conditions and circumstances.

8. Extension of urban type services promotes urban development and such development belongs in cities or areas of development concentration in the unincorporated area of Monterey County. In evaluating proposals involving urban development requiring an urban level of governmental services, the Commission will discourage the formation of new special districts or premature annexation of territory within existing city spheres of influence or logical expansion area. The Commission will discourage boundary change proposals involving urban development outside adopted city spheres of influence that have the potential to negatively impact prime agriculture or open space lands, public service capacity, existing local governmental agencies, or generally represents illogical growth patterns.

9. This Commission, in recognition of the mandated requirements for considering impacts on open space lands and agricultural lands, will develop and determine spheres of influence for Cities and urban service districts in such a manner as to promote the long-term preservation and protection of this County's "Resources." The Commission believes the public interest will be best served by considering "Resources" in a broad sense to include open space, recreational opportunities, wildlife, and agricultural land. Sphere of influence determinations must conform with the Commission's Agricultural Preservation Policy adopted in November, 1979.

10. The Commission recognizes the many inter-relationships and impacts which one agency's land use, planning, and governmental decisions may have on other agencies even though they may be outside of the "sphere of influence" of the secondary agency. Consequently, this Commission, when necessary, will seek to establish and identify Areas of Planning Concern for each city within the County. The "Planning Concern Area" will seek to identify those areas which in a broad sense affect the city in terms of planning and land use decisions. Such "Planning Concern Areas" will be established with the assistance and guidance of the affected cities and the County. The "Planning Concern Area" normally will extend beyond the adopted "sphere of influence" of the city. Once established, the Commission will solicit the cooperation and involvement of the affected cities and the County to jointly involve one another in planning decisions for these areas.

IV. PROCEDURAL GUIDELINES

1. LAFCO will designate a sphere of influence for each local agency representing the agency's probable physical boundary within a zero to twenty year period.

2. LAFCO shall consider the following factors in determining or amending an agency's sphere of influence:

   a. Present and future need for agency services and the service levels specified for the subject area in applicable general plans, growth management plans, annexation policies, resource management plans, and any other plans or policies related to an agency's ultimate boundary and service area.

   b. Capability of the local agency to provide essential and urban services, taking into account evidence of resource capacity sufficient to provide for internal needs and urban expansion.

   c. The existence of agricultural preserves, agricultural lands and open space lands in the area and the effect that inclusion within a sphere of influence shall have on the physical and economic integrity of maintaining the land in non-urban use.

   d. Present and future cost and adequacy of services anticipated to be extended within the sphere of influence.

   e. Present and projected population growth, population densities, land uses, land area, ownership patterns, assessed valuations, and proximity to other populated area.

   f. The agency's capital improvement or other plans that delineate planned facility expansions and the timing of that expansion.

   g. Social or economic communities of interest in the area.

3. The Commission may establish an urban service area within an adopted sphere of influence to discourage urban sprawl and to promote compact growth patterns. Urban service areas consist of territory now served by urban facilities, utilities and services or proposed to be served within the next five years, and may include the following:

   a. Urbanized Areas. This includes all existing areas, either incorporated or unincorporated, developed to urban densities.

   b. Urban Expansion Areas. This consists of vacant land, either incorporated or unincorporated, which is capable of holding urban growth expected within the next five years.

   The territory included within urban service areas will be considered by LAFCO to be eligible for annexation within five years. Consideration will be given to city and special

district capability to provide needed services with related time schedules for planned expansion of services. Cities and special districts are encouraged to develop Capital Improvement Programs and other plans for the phased extension of services to assist LAFCO in determining logical urban service area boundaries.

4. The Commission may establish urban transition areas within adopted spheres of influence to discourage premature pressure for development. Transition areas consist of the residual lands between designated urban service areas and the ultimate sphere of influence boundary. This land will most likely be used for urban expansion within approximately five (5) to twenty (20) years. Territory included within urban transition areas, but not within urban service areas, generally will not be considered eligible for annexation to receive urban services within five years.

5. LAFCO may adopt a zero sphere of influence encompassing no territory for an agency. This occurs where LAFCO determines that the public service functions of the agency are either non-existent, no longer needed, or should be reallocated to some other agency of government.

   The local agency which has been assigned a zero sphere of influence should ultimately be dissolved. Special districts that lie substantially within the boundary or sphere of influence of a general purpose government which is capable of assuming the public service responsibilities and functions of that special district may be allocated a zero sphere of influence designation.

6. Territory not in need of urban services, including open space, agriculture, recreational, rural lands or residential rural areas, shall not be assigned to an agency's sphere of influence unless the area's exclusion would impede the planned, orderly and efficient development of an area.

7. LAFCO may adopt a sphere of influence that excludes territory currently within that agency's boundaries. This occurs where LAFCO determines that the territory consists of agricultural lands, open space lands or agricultural preserves whose preservation would be jeopardized by inclusion within the agency's sphere of influence. Exclusion of these areas from an agency's sphere of influence indicates that detachment is appropriate.

8. Two or more local agencies providing the same service(s) may be allocated a consolidated sphere of influence to include the areas served by both agencies. This would be the case where LAFCO believes that the particular service(s) should be provided to the entire area by a single local agency.

9. LAFCO may establish future study areas outside of adopted spheres of influence. These areas indicate territory which may ultimately be appropriate for inclusion within an agency's sphere upon future study or modified conditions.

10. LAFCO shall adopt, amend or revise sphere of influence determinations following the procedural steps set forth in the Cortese-Knox-Hertzberg Act of 2000 (Government Code Section 56076 et seq.).

11. LAFCO shall review sphere of influence determinations not less than every five years. If a local agency or the County desires amendment or revision of an adopted sphere of influence, the local agency by resolution may file such a request with the Executive Officer. The request shall state the nature of the proposed amendment and the reasons for the request, include a map of the proposed amendment, and contain additional data and information as may be required by the Executive Officer.

12. The Commission encourages any private individual desiring a revision of an adopted sphere of influence to request that the affected local agency initiate sphere reconsideration by resolution to promote consultation between the parties.

13. At least 30 days prior to submitting an application to the Commission for a determination of a new sphere of influence, or to update an existing sphere of influence for a city, representatives from the city shall meet with county representatives to discuss the proposed sphere, and its boundaries, and explore methods to reach agreement on the boundaries, development standards, and zoning requirements within the sphere to ensure that development within the sphere occurs in a manner that reflects the concerns of the affected city and is accomplished in a manner that promotes the logical and orderly development of areas within the sphere. If no agreement is reached between the city and county within 30 days, then the parties may, by mutual agreement, extend discussions for an additional period of 30 days. If an agreement is reached between the city and county regarding the boundaries, development standards, and zoning requirements within the proposed sphere, the agreement shall be forwarded to the Commission, and the Commission shall consider and adopt a sphere of influence for the city consistent with the policies adopted by the Commission pursuant to this section, and the Commission shall give great weight to the agreement in the Commission's final determination of the city sphere.

14. If the Commission's final determination is consistent with the agreement reached between the city and county pursuant to subdivision 13, the agreement shall be adopted by both the city and county after a noticed public hearing. Once the agreement has been adopted by the affected local agencies and their respective general plans reflect that agreement, then any development approved by the county within the sphere shall be consistent with the terms of that agreement.

15. If no agreement is reached pursuant to subdivision 13, the application may be submitted to the Commission and the Commission shall consider a sphere of influence for the city consistent with the policies adopted by the Commission pursuant to this section.

16. When adopting, amending, or updating a sphere of influence for a special district, the Commission shall do all of the following:

    a. Require existing districts to file written statements with the Commission specifying the functions or classes of services provided by those districts.

b. Establish the nature, location, and extent of any functions or classes of services provided by existing districts.

17. In order to prepare and to update spheres of influence in accordance with Section 56425, the Commission shall conduct a service review of the municipal services provided in the county or other appropriate area designated by the Commission. The Commission shall include in the area designated for service review the county, the region, the subregion, or any other geographic area as is appropriate for an analysis of the service or services to be reviewed, and shall prepare a written statement of its determinations with respect to each of the following:

    a. Infrastructure needs or deficiencies.

    b. Growth and population projections for the affected area.

    c. Financing constraints and opportunities.

    d. Cost avoidance opportunities.

    e. Opportunities for rate restructuring.

    f. Opportunities for shared facilities.

    g. Government structure options, including advantages and disadvantages of consolidation or reorganization of service providers.

    h. Evaluation of management efficiencies.

    i. Local accountability and governance.

18. In conducting a service review, the Commission shall comprehensively review all of the agencies that provide the identified service or services within the designated geographic area.

19. The Commission shall conduct a service review before, or in conjunction with, but no later than the time it is considering an action to establish a sphere of influence in accordance with Section 56425 or Section 56426.5 or to update a sphere of influence pursuant to Section 56425.

20. Individuals desiring LAFCO to initiate revision or amendment of an existing sphere of influence shall file a written request with the Executive Officer. The request shall state the nature of the proposed amendment and the reasons for the request, include a map of the proposed amendment area, and contain additional data and information as may be required by the Executive Officer.

21. The Executive Officer shall review each request for amendment, prepare a report and recommendation, and place the request on the agenda of the next meeting of the

Commission for which notice can be given after determining conformance with the California Environmental Quality Act. Copies of the Executive Officer report shall be provided to the person(s) making the request, each affected local agency, and each person who has filed a request for a report.

22. Any local agency, county, or private individual making such a request shall reimburse the Commission for the actual and direct costs incurred by the Commission. The Commission may waive such requirement if it finds that the request may be considered as part of its periodic review of spheres of influence.

23. The Monterey County Local Agency Formation Commission shall adopt, amend, or revise spheres of influence after a public hearing called and held for that purpose. At least 15 days prior to the date of any such hearing, the Executive Officer shall give mailed notice of the hearing to each affected local agency and the County, and to any interested party who has filed a written request for such notice with the Executive Officer. In addition, at least 15 days prior to the date of any such hearing, the Executive Officer shall cause notice of the hearing to be published in a newspaper of general circulation which is circulated within the territory affected by the sphere of influence proposed to be adopted or amended.

    LAFCO may continue from time to time any sphere of influence hearing. At any sphere of influence hearing, LAFCO shall hear and consider oral or written testimony presented by any affected local agency, the County, or any interested person who wishes to appear.

24. On the date and time set for hearing and provided in the notice, the Commission may, without further notice, consider the amendments to a sphere of influence or set a future date for the hearing on the request.

AGENDA ITEM NO. 8.c

LAFCO *of Monterey County*

LOCAL AGENCY FORMATION COMMISSION

KATE McKENNA, AICP
Executive Officer

DATE: September 25, 2006

TO: Chair and Members of the Formation Commission

FROM: Kate McKenna, AICP, Executive Officer

SUBJECT: ANNEXATION AND SPHERE OF INFLUENCE POLICIES

SUMMARY OF RECOMMENDATIONS:

It is recommended that the Commission adopt a Resolution to revise local annexation and Sphere of Influence policies to include two new policies relating to regional traffic impact mitigation and urban development patterns.

EXECUTIVE OFFICER'S REPORT:

Commissioners Calcagno and DiMaggio have requested that the following draft policies be placed on the agenda for consideration:

1. For annexations and Spheres of Influence applications, LAFCO of Monterey County shall consider as part of its decision whether the proposal mitigates its regional traffic impacts by, for example, monetary contribution to a regional transportation improvement fund as established by the Transportation Agency of Monterey County or otherwise;

2. For annexations and Sphere of Influence applications, LAFCO of Monterey County shall consider as part of its decision whether the city in which the annexation or Sphere of Influence amendment is proposed has included certain goals, policies, and objectives into its General Plan that encourage mixed uses, mixed densities, and development patterns that will result in increased efficiency of land use, and that encourage and provide planned, well-ordered, efficient urban development patterns.

LAFCO counsel analyzed the proposed policies and determined that LAFCO has the statutory authority to adopt them. Counsel recommended minor changes in wording, reflected above. Authority is vested in at least two provisions of the Cortese-Knox-Hertzberg Act of 2000:

Government Code Sec. **56300(a)** -- "It is the intent of the Legislature that each commission, not later than January 1, 2002, shall establish written policies and procedures and exercise its powers pursuant to this part in a manner consistent with those policies and procedures and that encourages and provides planned, well-ordered, efficient urban development patterns ..."

Government Code Sec. **56668** -- "Factors to be considered in the review of a proposal shall include, but not be limited to, all of the following:

a) the likelihood of significant growth in the area, and in adjacent incorporated and unincorporated areas, during the next 10 years;

b) the present cost and adequacy of governmental services and controls in the area; probable future need for those services and controls ("services" are expressly defined to include "public facilities necessary to provide those services");

c) conformity of the proposal and of its anticipated effects with . . . adopted commission policies on providing planned, orderly, efficient patterns of urban development; and

d) consistency with city or county general plan and specific plans."

The proposed policy revisions are categorically exempt from the California Environmental Quality Act under Class 7 (protection of natural resources) and Class 8 (protection of the environment).

Respectfully submitted,

Kate McKenna, AICP
Executive Officer

Enclosure: Resolution

THE LOCAL AGENCY FORMATION COMMISSION
OF MONTEREY COUNTY

RESOLUTION NO. 06 – XX

RESOLUTION OF THE LOCAL AGENCY FORMATION COMMISSION ADOPTING REVISIONS TO ANNEXATION AND SPHERE OF INFLUENCE POLICIES

WHEREAS, these proceedings are taken in conformance with the provisions of the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, Section 56300(a), and Section 56668 of the Government Code; and

WHEREAS, these proceedings were duly noticed in accordance with the requirements of Cortese-Knox-Hertzberg Act of 2000; and

WHEREAS, the Local Agency Formation Commission of Monterey County is required by the Cortese-Knox-Hertzberg Act of 2000 to establish written policies and procedures; and

WHEREAS, the Commission desires to revise its Annexation and Sphere of Influence policies; and

WHEREAS, regional traffic impacts of an annexation proposal or sphere of influence amendment can affect the adequacy and future needs of governmental services and facilities; and

WHEREAS, regional traffic impacts of an annexation proposal or sphere of influence amendment are reflective of whether or not the proposal promotes efficient patterns of urban development; and

WHEREAS, regional traffic impacts of an annexation proposal or sphere of influence amendment can affect the economic vitality of our agricultural natural resources; and

WHEREAS, regional traffic impacts of an annexation proposal or sphere of influence amendment can adversely affect the environment through air quality and noise impacts; and

WHEREAS, an annexation proposal or sphere of influence amendment for a city whose general plan includes goals, policies, and objectives that encourages mixed uses, and mixed densities encourages planned, well-ordered, efficient urban development patterns; and

WHEREAS, an annexation proposal or sphere of influence amendment for a city whose general plan includes goals, policies, and objectives that encourages mixed uses, and mixed densities is protective of our agricultural and open space resources; and

WHEREAS, an annexation proposal or sphere of influence amendment for a city whose general plan includes goals, policies, and objectives that encourages mixed uses, and mixed densities is protective of the environment;

NOW, THEREFORE, the Local Agency Formation Commission of Monterey County does HEREBY RESOLVE as follows:

That the policy revisions are exempt from CEQA based on class 7 and class 8 categorical exemptions; and

That the LAFCO Commission shall revise its Annexation and Sphere of Influence policies to include:

a) For annexations and Sphere of Influence applications, LAFCO of Monterey County shall consider as part of its decision whether the proposal mitigates its regional traffic impacts by, for example, monetary contribution to a regional transportation improvement fund as established by the Transportation Agency of Monterey County or otherwise, and

b) For annexations and Sphere of Influence applications, LAFCO of Monterey County shall consider as part of its decision whether the city in which the annexation or Sphere of Influence amendment is proposed has included certain goals, policies, and objectives into its General Plan that encourage mixed uses, mixed densities, and development patterns that will result in increased efficiency of land use, and that encourage and provide planned, well-ordered, efficient urban development patterns.

UPON MOTION OF Commissioner _____, seconded by Commissioner _____, the foregoing resolution is adopted this 25th day of September 2006 by the following vote:

AYES:
NOES:
ABSENT:
ABSTAIN:

ATTEST: I certify that the within instrument is a true and complete copy of the original resolution of said Commission on file within this office.

Witness my hand this ____ day of September, 2006

RECEIVED
SEP 21 2006
PLANNING DEPARTMENT

Mr. Don Fleming, Community Development Director
City of Soledad
248 Main Street
Soledad, California 93960

SUBJECT: NOP FOR MIRAVALE PHASE III SPECIFIC PLAN

Dear Mr. Fleming:

Staff reviewed the referenced document and has the following suggestions for a scope of work for the air quality analysis:

Specific Plan's Cumulative Air Quality Impact on Regional Ozone
The District uses consistency with the 2004 Air Quality Management Plan (AQMP) for the North Central Coast Air Basin to determine a specific plan's cumulative impact on regional air quality (ozone levels). Please request a formal consistency determination from AMBAG for the proposed 4,500 residential units and include it in the Draft EIR.

Specific Plan's Localized Air Quality Impact on Carbon Monoxide Levels
Localized impact is evaluated by determining if build-out identified in the Specific Plan would create or substantially contribute to carbon monoxide "hotspots" (where federal or State ambient air quality standards are exceeded). If project or cumulative traffic would cause LOS to decline from D or better to E or F, dispersion modeling should be undertaken to determine if carbon monoxide concentrations would violate ambient air quality standards at sensitive receptor locations.

Odors, Nuisances and Sensitive Receptors
If the Specific Plan would revise land use designations that might result in development of odors, nuisances or sensitive receptors in adjacent land uses, the Draft EIR should include an assessment of those impacts. District Rule 402, Nuisances, should be reviewed for applicable requirements.

Mitigation Measures
Mitigation measures should be identified for any significant impacts on air quality. The Draft EIR should quantify the emission reduction effectiveness of each measure, identify the agencies responsible for implementation and monitoring, and determine whether mitigation measures reduce impacts to a less-than-significant level.

Projects Constructed in Accord with the Specific Plan

The Draft EIR should indicate that projects constructed in accord with the Specific Plan could have impacts on air quality, which would be evaluated when the projects are proposed. The District has established the following thresholds of significance for individual projects: 137 lbs/day for VOC or NO_x, 82 lbs/day for PM_{10}, 150 lbs/day for SO_x, a significant decline in LOS, and a cancer risk greater than 10 per 1,000,000 people. (Please refer to Table 5-3 on page 5-5, and page 9-2 of the District's CEQA Air Quality Guidelines, July 2004).

Siting New Sensitive Receptors within 500 Feet of Urban / Rural Roads

In April 2005, the California Environmental Protection Agency / California Air Resources Board published the "Air Quality and Land Use Handbook: A Community Health Perspective"[1]. Focusing on community health and prevention of exposure to air pollution that could be substantially elevated near freeways, it includes the following recommendations:

Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles/day.

If any of the proposed residential development might be located within 500 feet of a rural road with 50,000 vehicles per day, the District suggests that the Specific Plan address the recommendations cited above.

The District's CEQA Air Quality Guidelines may be found on the District's website at www.mbuapcd.org under "Air Quality Plan".

Thank you for the opportunity to review the document.

Sincerely,

Jean Getchell
Supervising Planner
Planning and Air Monitoring Division

RECEIVED
SEP 25 2006
CITY OF SOLEDAD

September 20, 2006

Mr. Don Fleming
City of Soledad
City Hall
248 Main Street
Soledad, California 93930

SUBJECT: Comments on the Notice of Preparation for the Draft Environmental Impact Report for Miravale Phase III Specific Plan

Dear Mr. Fleming:

The Transportation Agency for Monterey County is the Regional Transportation Planning Agency and Congestion Management Agency for Monterey County. Transportation Agency staff has reviewed the Notice of Preparation for the Draft Environmental Impact Report for Miravale Phase III Specific Plan, a 920-acre project within unincorporated lands of Monterey County proposing a mixed-use development consisting of approximately 2,600 single-family residential units, 1,600 multi-family residential units, 300 senior housing units, 120 hotel rooms, 250,000 square feet of retail commercial space and an 18-hole golf course. Transportation Agency staff offers the following comments for your consideration:

Regional Road and Highway Impacts

1. The traffic analysis should evaluate the traffic impacts of the project to regional roads and highways under both "project-specific" and "cumulative" conditions, specifically US 101. The Transportation Agency and Caltrans consider payment of regional development impact fees, as identified in our Agency's *Nexus Study for a Regional Development Impact Fee,* on an ad hoc basis as adequate mitigation for new developments' cumulative impacts to state highways and regional roads across Monterey County. Under this program, regional impact fees would be discounted for any overlap with the City of Soledad's local impact fee program and for any affordable housing units that are included in the development.

Currently, the regional development impact fee is being updated to explore the implementation of zones for fee calculation based on geographic sub-regions, to utilize the most recent General Plan updates and land use assumptions, and to reevaluate the commercial trip generation rates. Taking these program refinements into consideration, the City of Greenfield Council at its August meeting adopted a Notice of Intent to adopt a regional development impact fee and to condition all new development projects with payment of the regional fee on a project-by-project basis. Transportation Agency staff will be presenting and asking for the adoption of the same Notice of Intent at the City of King Council this month, and will look to make a similar request to the City of Soledad Council in the near future.

2. The Level of Service for each regional roadway segment and intersection analyzed in the DEIR should be calculated under both project-specific and "cumulative conditions" and disclosed in the Draft Environmental Impact Report. "Cumulative conditions" should be clearly defined in the document. Roadway performance deficiencies and feasible mitigation measures under both scenarios should be identified.

3. If the development is to be located in a planned annexation area and construction is set to begin before the annexation is approved, the Transportation Agency recommends that the infrastructure, particularly roadways, sidewalks, and gutters, be constructed to a standard no less than what the City currently requires to ensure that the City or new residents will not have to bear the cost of upgrades once the annexation is complete.

Pedestrian, Bicycle, & Transit Travel

4. The Transportation Agency supports accommodation of alternative forms of transportation (rail, bus transit, bicycle and pedestrian transportation), both through the design of transportation facilities, and through the design and orientation of land uses. Our Agency urges that the attached list of alternative measures be considered and implemented by the development to promote alternatives to automobile travel and accommodate access to the project by transit, bicycle and foot. A discussion of any travel demand reduction measures to be implemented by the City of Soledad should be included in the Draft Environmental Impact Report. Monterey-Salinas Transit's *Designing for Transit* Guideline Manual should also be used as a resource for accommodating transit access to the project site.

Thank you for the opportunity to review this document. If you have any questions, please contact Michael Zeller of my staff at (831) 775-0903.

Sincerely,

Debra L. Hale
Executive Director

ATT: Transportation Agency Development Principles
List of Alternative Measures

Transportation Agency for Monterey County
Transportation-Related Principles for Community Development

Mission

The Transportation Agency for Monterey County aims to develop and maintain a multi-modal transportation system that enhances the mobility, safety, access, environmental quality, and economic activities in Monterey County.

The purpose of the following set of principles is to reduce future impacts to Monterey County's regional transportation system, reduce the cost of transportation infrastructure, and improve the Transportation Agency's ability to meet Monterey County's regional transportation needs. Our agency recommends that new land use development in the county adhere to the following set of principles, which emphasize developing a land use pattern that is supportive of non-single occupant auto modes of transportation so as to maximize the carrying-capacity of Monterey County's existing regional transportation infrastructure.

1. Land Use

- **1.a** Encourage mixed use developments to accommodate short trips by non-auto modes
- **1.b** Encourage growth in areas where transportation infrastructure exists or is most cost-effective to extend
- **1.c** Encourage a balance of employment and housing to reduce regional commute demands
- **1.d** Encourage higher residential densities in core areas or around transit stops to support regular transit service throughout the region
- **1.e** Encourage land use jurisdictions to utilize the Caltrans Traffic Impact Studies Guide or develop traffic impact study guidelines of their own when analyzing the impacts of growth on the regional transportation system
- **1.f** Require new development to pay for its proportional impact to the transportation system, preferably via regional and local fee programs, or on-street project construction

2. Street Network Design

- **2.a** Provide an interconnected street system for new development to facilitate short trips by non-auto modes of transportation using the following features:
  - **2.a.1** Provide a grid-based street network.
  - **2.a.2** Encourage short block lengths in new development
  - **2.a.3** Discourage cul-de-sac streets in new development unless they incorporate pedestrian and bike easements that reduce trip lengths
- **2.b** Incorporate traffic calming features into the street network to slow the flow of traffic and enhance the pedestrian environment:
  - **2.b.1** Provide curb bulb-outs at intersections to reduce the length of pedestrian crossings
  - **2.b.2** Allow on street parking to slow the flow of cars and create pedestrian/auto buffer
  - **2.b.3** Provide landscaped buffers between pedestrians and motorized traffic and provide pedestrian-scale street lighting no more than 15 feet high

- ❖ **2.c** Design streets to accommodate all modes of transportation
  - **2.c.1** Incorporate sidewalks and bicycle lanes into new street construction
  - **2.c.2** Accommodate safe bicycle travel by providing on-street bicycle lanes and routes instead of separated bicycle paths
  - **2.c.3** Incorporate bus pullouts, transit stops, transit shelters and other transit amenities to serve new development according to the MST Designing for Transit Handbook

3. Site Design

- ❖ **3.a** Orient buildings to face the street in new development to improve access for pedestrians from sidewalks
- ❖ **3.b** Incorporate residential uses over commercial uses in commercial areas to encourage trips by foot, bike, or transit and improve access by each of these modes
- ❖ **3.b** Incorporate reduced building setbacks, especially in commercial areas, to reduce the length of pedestrian trips and facilitate easy access
- ❖ **3.c** Locate on-site parking to the rear of structures or underground
- ❖ **3.d** Provide pedestrian facilities connecting building entrances with the street where parking is not provided to the rear of structures to enhance pedestrian access and safety
- ❖ **3.f** Incorporate bicycle storage facilities into site plans to accommodate access by bicyclists

4. Transportation Demand Management

- ❖ **4.a** Encourage telecommuting in non-residential development as a traffic mitigation measure
- ❖ **4.b** Encourage flexible work schedules for employees as a traffic mitigation measure
- ❖ **4.c** Encourage employers to utilize available rideshare programs or create their own
- ❖ **4.d** Encourage employers to offer transit incentives to employees to mitigate traffic impacts
- ❖ **4.e** Provide preferential carpool or vanpool parking in non-residential developments
- ❖ **4.e** Encourage large employers to offer child care facilities as resources allow and encourage all employers to provide information on nearby child care resources
- ❖ **4.f** Locate child care facilities near employment centers

SAMPLES OF ALTERNATIVE MEASURES

1. Provide ridesharing, public transportation and nearby licensed child care facility information to tenants/buyers as part of move-in materials.

2. Print transit information on promotional materials.

3. Install bicycle amenities, such as bicycle racks and bicycle lanes.

4. Provide bus pullouts, pedestrian access, transit stops, shelters and amenities as part of the site plan.

5. Provide locked and secure transportation information centers or kiosks with bus route/schedule information, in common areas.

6. Provide pedestrian facilities linking transit stops and common areas.

7. Provide resources for site amenities that reduce vehicular trip making.

8. Park-and-ride facilities.

9. On-site childcare facilities.

10. Shuttle bus service, bus pools or improved transit service as part of the development.

11. Facilities to encourage telecommuting.

12. Pedestrian and bicycle system improvements.

13. Transit oriented design and/or pedestrian oriented design.

14. Provide preferential carpool/vanpool parking spaces.

15. Implement a parking surcharge for single occupant vehicles.

16. Provide shower/locker facilities.

17. Employ or appoint a transportation/rideshare coordinator.

18. Implement a rideshare program.

19. Provide incentives for employees to rideshare or take public transportation.

20. Implement compressed work schedules.

SAMPLES OF STREET AND ROAD IMPROVEMENTS

1. Safety improvements
2. Traffic signal improvements.
3. Traffic signals.
4. Turning or auxiliary lanes.
5. Add travel lanes.
6. Improve highway interchange.
7. Construct interchange.
8. Construct new street or road.

PLANNING DEPARTMENT

MON-146-.24
SCH# 2006081129

Don Fleming
City of Soledad
248 Main Street
Soledad, CA 93960

Dear Mr. Fleming:

COMMENTS TO MIRAVALE PHASE III DEVELOPMENT NOTICE OF PREPARATION

The California Department of Transportation (Department), District 5, Development Review, has reviewed the above referenced Notice of Preparation and offers the following comments in preparing your Environmental Impact Report (EIR).

1. The Department supports local development that is consistent with State planning priorities intended to promote equity, strengthen the economy, protect the environment, and promote public health and safety. We accomplish this by working with local jurisdictions to achieve a shared vision of how the transportation system should and can accommodate interregional and local travel and development.

2. To ensure the traffic study in the Draft EIR includes the information needed by the Department to analyze the impacts (both cumulative and project-specific) of this project, it is recommended that the analysis be prepared in accordance with the Department's *"Guide for the Preparation of Traffic Impact Studies."* An alternative methodology that produces technically comparable results can also be used.

3. Because the Department is responsible for the safety, operations, and maintenance of the State transportation system, our Level of Service (LOS) standards should be used to determine the significance of the project's impact. We endeavor to maintain a target LOS at the transition between LOS C and LOS D on all State transportation facilities. In cases where a State facility is already operating at an unacceptable LOS, *any* additional trips added should be considered a significant cumulative traffic impact, and should be mitigated accordingly.

4. Our future comments to this, and any subsequent EIR for the project will stress the importance of using the Association of Monterey Bay Area Governments Model for traffic analysis, and to include all impacted transportation agencies early and often in the development discussions.

5. The traffic study should include information on existing traffic volumes within the study area, including the State transportation system, and should be based on recent traffic volumes less than two years old. Counts older than two years cannot be used. Feel free to contact us for assistance in acquiring the most recent count data available.

6. The methodologies used to calculate the LOS should be consistent with the methods in the current version of the Highway Capacity Manual. All LOS calculations should also be included in the Draft EIR's as an appendix made available for review.

7. The Transportation Agency for Monterey County (TAMC) has prepared a Nexus Study, dated September 2005, for a proposed Regional Development Impact Fee Program which identifies proposed regional transportation improvements. Based on the proposed TAMC program, this project should contribute a "fair share" contribution as mitigation for its' cumulative impacts to the regional transportation system as a condition of approval. The conditions of approval should also stipulate that if the TAMC program is not implemented by December 31, 2006, the fees identified for these developments will be transferred to Caltrans to help fund improvements, including, but not limited to, U.S. 101 corridor improvements.

8. Special attention should be focused on all roadway segments analyzed in the traffic study that have higher than statewide average collision rates. The EIR should identify these areas and specify special mitigation measures as a result of the increased traffic with this development.

9. At any time during the environmental review and approval process, the Department retains the statutory right to request a formal scoping meeting to resolve any issues of concern. Such formal scoping meeting requests are allowed per the provisions of the California Public Resources Code Section 21083.9 [a] [1].

10. The issuance of any encroachment permit will be based upon reviewing complete engineering drawings, traffic studies, hydraulic calculations, environmental reports, etc.

We look forward to receiving the Draft EIR, and providing comments from a more thorough analysis. District 5 staff has been, and will continue to be, committed to working very closely with you to achieve a shared vision of how the transportation system should and can accommodate interregional and local travel.

If you have any questions, or need further clarification on items discussed above, please don't hesitate to call me at (805) 542-4751.

Sincerely,

JOHN J. OLEJNIK
Associate Transportation Planner
District 5 Development Review Coordinator

APPENDIX B

Specific Plan Permitted Uses

LDR & LDR-H / M3-R-1 Permitted Uses		
Category	**Regulation**	**Interpretation**
Land Use	Low Density Residential (LDR) Hillside Low Density Residential (LDR - H)	
Zoning District	M3-R-1	
Density Range	1 to 10	This zone is primarily 1-6 du/ac. Density above 6 du/ac is allowed in order to accommodate affordable duplex and triplex units.
Permitted Uses		
The following uses shall be permitted in the R-1 district:		
Single family dwellings Accessory Buildings (including garage) Churches	Duets, duplexes, or triplexes. Refer also to Section 17.10.020 of the Municipal Code	Home occupations, subject to Section 17.38.140 of the Municipal Code

VR/ M3-VR Permitted Uses		
VR/ M3-VR		
Category	**Restriction**	**Interpretation**
Land Use	Village Residential (VR)	
Zoning	Village Residential (M3-VR)	
Density Range	12-30 dwelling units / gross acre	
Permitted Uses		
Single-Family dwellings, duplexes, triplexes, apartments, clustered "pack" style homes, townhouses, condominiums, accessory buildings, neighborhood serving uses - including garages, and day nurseries. Any other uses that the Planning Commission finds to be consistent with the purpose of this section and the Specific Plan.		

C / M3-GC & M3-CC Permitted Uses

Category	Restriction	Interpretation
Land Use	Commercial (C)	
Zoning	(M3-GC & M3-VC)	Includes Village Commercial and Gateway Commercial
Permitted Uses		
Village Commercial (VC)		**Gateway Commercial (GC)**
Bakery goods, barbershop, beauty shop, bicycle shop, books, clothing store, deli, department store, drug store, dry cleaner, florist shop, furniture store, garden supplies, gift shops, grocery store, hardware store, health foods, hobby shops, ice cream, laundromats, meat market, music store, newspaper stand, pet shop, photographic supplies, electronic stores, restaurants, shoe repair store, sporting goods, stationary store, toy store, any other use which the planning commission finds to be consistent with the purposes of this section		Auto parts, bakery goods, barbershop, beauty shop, bicycle shop, books, clothing store, community center, day care, deli, department store, drug store, dry cleaner, florist shop, furniture store, garden supplies, gift shops, grocery store, gym, hardware store, health foods, hobby shops, ice cream, laundromats, meat market, music store, newspaper stand, pet shop, photographic supplies, electronic stores, restaurants, spa, shoe repair store, sporting goods, stationary store, toy store, specialty retail, art gallery, any other use which the planning commission finds to be consistent with the purposes of this section
Conditional Uses		
Village Commercial (VC)		**Gateway Commercial (GC)**
Banks and other financial institutions, buildings with more than 50,000sf of gross floor area (75,000 sf for two or more stories), bowling alleys, cocktail lounges, liquor products, pool and billiards, any use the planning commission determines consistent with the provisions of this section.		Antiques and the sales of used items, banks and other financial institutions, buildings with more than 10,000sf of gross floor area (15,000 sf for two or more stories), bowling alleys, cocktail lounges, liquor products, office, pool and billiards, hotel, wine tasting room, live music venues, all drive throughs, used items including furniture and clothing where owned and operated by a non-profit organization, and any use the planning commission determines consistent with the provisions of this section.
Prohibited Uses VC & GC		
Liquor stores as a principal use, bars, automobile body and paint shop, exclusive automobile repair; sheet metal shop; fortune tellers, adult entertainment; gambling; pawn shops, thrift shops, and flea markets. All drive throughs are prohibited in Village Commercial.		

APPENDIX C

Hillside Development Standards

City of Soledad Miravale III Specific Plan
Hillside Development Standards & Guidelines
December 19, 2006

I. Introduction

The City of Soledad is situated in the mid-Salinas Valley at the base of the Gabion Mountains. The mountains provide a backdrop to the City of Soledad. It is the intent to preserve this natural asset by assuring that development on the hillside:

- Maintains the existing open rural character,
- Is in harmony with the natural setting,
- Conserves land forms and other features of the natural landscape,
- Preserves wildlife habitat and movement corridors,
- Protects and preserves viewsheds of the mountains, and
- Promotes the establishment of native trees and shrubs.

A. Goal

The goal of the Hillside Development Standards and Guidelines is to work hand-in-hand with the city's discretionary development review process to achieve design excellence that fosters sustainable development and preserves the natural environment.

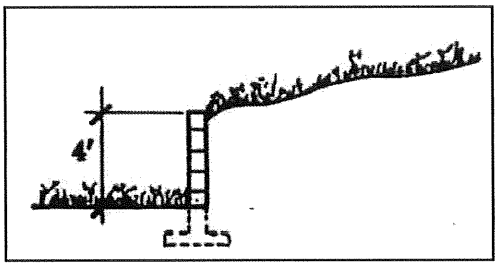
B. Location

These Hillside Development Standards and Guidelines apply to lots with an average slope of 30% or greater. Refer to the Land Use Figure 2-1.

C. Hillside Development Standards versus Guidelines

The Hillside Development Standards and Guidelines contain both standards and guidelines. Refer to the low density residential chapter for standards that are not addressed in this chapter.

- Standards -- Mandatory non-discretionary regulations that must be followed. The word "shall" or "prohibited" denotes a standard or mandatory regulation.

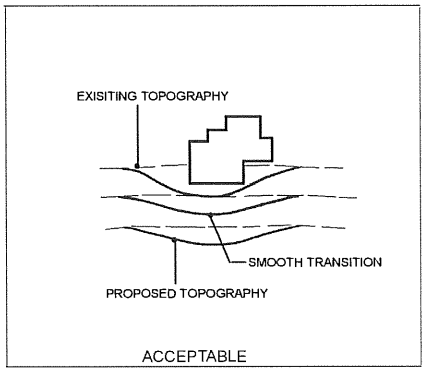


- Guidelines -- Discretionary statements that present good ideas or recommendations on how to achieve the objectives established by these Hillside Development Standards and Guidelines. The word "should" denotes that they are guidelines. Therefore. if a statement does not include the word "shall" or "prohibited", it is a guideline.

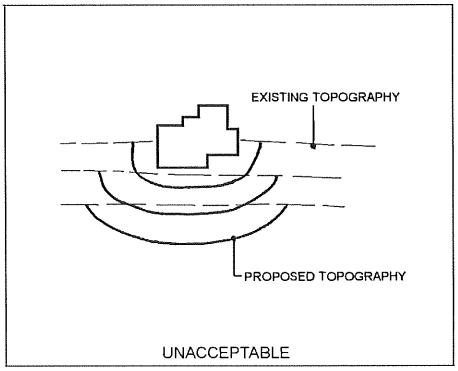
II. Site Planning

Increased lot sizes is the preferred approach in areas of 30% slope or greater. In areas with a 30% slope or greater, street sections should be reduced to two 10' travel lanes, parallel parking on one side of the street, and no sidewalks. This will help reduce the impacts of grading and create a more rural character.

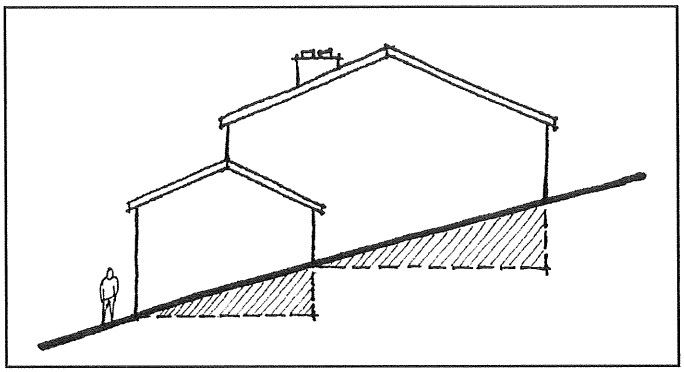
A. Grading Design



- Keep a low profile and conform to the natural slopes.
- Minimize grading on individual lots; generally, locate houses close to the street; minimize the grading of visible driveways.
- The grading plan shall minimize as much as possible erosion, sedimentation, fire, and water quality concerns.
- All cuts and fills shall be at 2:1 slope or less unless stabilized by a retaining wall or curbing as approved by the City Engineer.
- Retaining walls above 4' in height are discouraged.



- Retaining walls more than 18" in height (measured from the immediate grade) shall be textured and colored to complement adjacent building surface or landscaping.
- To minimize grading and slope disturbance, stepped or raised foundation systems should be implemented where feasible. Raised foundations should be limited to 5' from existing grade.
- No cut slopes should be over 8' in height for homes and attached garages (this excludes cellars).
- No cut slopes should be over 4' in height for accessory buildings, tennis courts, pools, driveways, decks, and yards.
- No fill slopes should be over 3' in height.



Preserve Natural Topography

- Grading transitions from existing to proposed land forms must be gradual and reflect the gradients of the existing natural slopes of the immediate area. Slopes should be rounded and contoured to blend with existing terrain.

- Grading should retain as much natural vegetation (especially trees) as possible.
- Development on hillsides shall accommodate a majority of the grade differential by stepping the buildings to reflect the slope of the natural topography.

Stepped Buildings are preferred on a hillside as opposed to large cuts or fills

- In sloped areas devoid of trees, native trees should be planted to help stabilize slope and promote the establishment of native trees.
- Attractive natural amenities such as rock outcroppings, vegetation, streams, and drainage areas should be incorporated into the development.
- Include planting that is compatible with native hillside vegetation and that provides a visual transition from developed to open areas.
- Grading plans shall include provisions for restoration of vegetation on cut and fill areas. Manufactured slopes shall be planted with fire-resistant plantings that will also help control erosion.
- Grading is not allowed during the rainy season (October 15 to April 15) unless approved by City Engineer. If grading is planned to occur between October 15 and April 15, interim provisions for erosion and sedimentation control shall be in place before grading begins in accordance with the city's storm water ordinance.

B. Fire Hazards

- A 100' buffer of irrigated landscaping shall be provided between open space areas and building structures, and may be a combination of private property and open spaces area.
- A landscape plan shall be provided and will be reviewed by the City Planning and Public Works Department and with input from the Fire Department.
- The landscape plan shall create a defensible space around the homes, and if there is a fire ladder on the property, it shall be eliminated in an environmentally sensitive manner.

- Hillside areas shall have adequate fire exits. Adequate and dependable water supplies for fire protection and suppression purposes shall be provided. If no public hydrant is available, there shall be an on-site water supply in a storage facility.
- Above-ground water tanks shall not be located in required setback areas.

C. Drainage

- Runoffs should be dispersed within a subject property to the extent possible.
- Upslope drainage is to be carefully considered during design in order to minimize impacts to downslope development.
- Manmade drainage channels shall receive a naturalizing treatment such as rock and landscaping so that the structure appears as a natural part of the environment.
- Comply with the city's storm water ordinance.
- Large drainage structures should be avoided.
- Manmade drainage channels should be placed in the least visible locations possible.

III. Building Design

- Structures should be designed to complement the site surroundings. Compatible colors and materials should be utilized.
- Foundations should step down slopes and conform to the terrain. Exposed pilings or structures cantilevered over slopes should be avoided when possible. If necessary, landscaping or other screening methods should be used to minimize visual impacts.
- Architectural features such as porches, balconies, chimneys, door placement, window proportions, dormers, wood detailing, fencing, siding, and color scheme should be used to complement the overall building design, site and neighborhood context.
- Exterior wall materials, trim and architectural details should be provided on all elevations. All elevations exposed to public rights-of-way should be architecturally enhanced.
- Building wall and roof planes should be varied and articulated into smaller modules and features to reduce the structures apparent bulk and size. Roofing colors should be soft earth tones to minimize reflective glare and visual impacts.
- Unsightly utility and mechanical equipment should be screened from view. Roof mounted air conditioners, coolers or antennas are discouraged.
- The prominence of the garage should be minimized to create a visual relationship between the front entrance of the home and the street.
- Orient upper floor, windows, decks, and balconies to avoid impacting the privacy of neighbors. Use landscaping to screen views to your neighbors living areas most sensitive to privacy.
- Buildings shall be designed to minimize bulk, mass, and volume so as to not be prominently visible from a distance or from surrounding properties.
- Buildings should be designed to conform to the natural topography of the site and run with contours. Blending with existing terrain reduces the appearance of bulk.
- Design structure to step up slope avoiding large blank walls or support columns.

A. Decks

- Decks which are attached to the ground (non-cantilevered decks) may not be higher than 5' above finish grade.
- If grade changes more than 5', decks may be stepped down slope with levels being no more than 5' in height above grade.
- Exposed deck supports are allowed on decks less than 5' in height above finish grade.

REEL 830 PAGE 711

RECORDED AT REQUEST OF

COUNTY OF MONTEREY

FEB 28 3 33 PM '73

OFFICE OF RECORDER
COUNTY OF MONTEREY
SALINAS, CALIFORNIA

REEL 830 PAGE 711

Before the Board of Supervisors in and for the County of Monterey, State of California

RESOLUTION NO. 73-34-25

Establishing an Agricultural Preserve with Uniform Rules Including Compatible Uses. . .) Philip R. Kelsey

WHEREAS, the County of Monterey has been requested to establish the herein agricultural preserve; and

WHEREAS, the County of Monterey is authorized to establish agricultural preserves pursuant to the California Land Conservation Act of 1965; and

WHEREAS, the procedural requirements to establish an agricultural preserve as required by the Act have been followed; and

WHEREAS, the land to be included within the agricultural preserve is used for the purpose of producing agricultural commodities for commercial purposes and compatible uses; and

WHEREAS, no land is within one mile of any city in the County of Monterey at the time this preserve is created; and

WHEREAS, the following uniform rules shall apply within this preserve;

Compatible uses for land to be included within the agricultural preserve are found to be those set out in Exhibit "A" attached hereto, and made a part hereof.

Grounds for cancellation are those set out in the Land Conservation Act and no other.

NOW, THEREFORE, BE IT RESOLVED, that the following real property located in the County of Monterey, State of California, being within Monterey County Assessor's Parcel Number(s) 257-081-03

and being more particularly described in Exhibit "B" attached hereto and made a part hereof, is hereby designated and established as an agricultural preserve within the meaning of and pursuant to the Land Conservation Act of 1965 and shall be known as and referred to as Agricultural Preserve No. 73-25.

On motion of Supervisor Church, seconded by Supervisor Branson, the foregoing resolution is adopted this 23rd day of January, 1973, by the following vote:

AYES: Supervisors Church, Atteridge, Tavernetti, Branson.
NOES: None.
ABSENT: None. Supervisor Poyner abstains.

COUNTY OF MONTEREY, STATE OF CALIFORNIA, ss.

I, ERNEST A. MAGGINI, County Clerk and ex-officio Clerk of the Board of Supervisors of the County of Monterey, State of California, hereby certify that the foregoing is a full, true and correct copy of an original order of said Board of Supervisors duly made and entered in the minutes thereof at page ... of Minute Book 28, on the 23rd day of January, 1973, and now remaining of record in my office.

Witness my hand and the seal of said Board of Supervisors this 23rd day of January, 1973.

ERNEST A. MAGGINI,
County Clerk and ex-officio Clerk of the Board of Supervisors, County of Monterey, State of California.

By ... Deputy.

EXHIBIT "A"

LAND CONSERVATION AGREEMENT

COMPATIBLE USES

The following is a list of land uses determined to be compatible with the agricultural use of the land subject to this agreement:

1. The drying, packing or other processing of an agricultural commodity usually performed on the premises where it is produced but not including slaughter houses, fertilizer yards, bone yards or plants for the reduction of animal or vegetable matter.

2. Structures necessary and incidental to the agricultural use of the land.

3. Single family dwellings incidental to the agricultural use of the land for the residence of the owner, and the family of the owner.

Single family dwellings incidental to the agricultural use of the land for the residence of the lessee of the land and the family of the lessee.

4. Dwellings for persons employed by owner or lessee in the agricultural use of the land.

5. An aircraft landing strip incidental to the agricultural use of the land.

6. The erection, construction, alteration or maintenance of gas, electric, water or communication utility facilities.

7. The erection, construction, alteration or maintenance of radio, television or microwave antennas, transmitters and related facilities.

8. Public or private hunting of wildlife or fishing.

9. Public or private hunting clubs and accessory structures.

10. Public or private rifle and pistol practice range, trap or skeet field, archery range or other similar use.

11. Public or private riding or hiking trails.

EXHIBIT "B"

REEL 830 PAGE 713

PARCEL I:

That certain real property, lying, being and situate in the Rancho San Vicente, in County of Monterey, State of California, being a portion of Subdivision C in Lot 2, as said subdivision and Lot are shown and so designated on map entitled, "MAP OF RE-SURVEY OF PART OF SAN VICENTE RANCHO", filed on the 8th day of June, 1918, in Volume 1 of Surveys, at page 94, Records of the said County of Monterey, said real property being particularly described as follows, to-wit:

BEGINNING at a one-inch diameter steel bar standing in the easterly boundary of said subdivision C, from which the original 4" x 4" post set in a rock mound at the northeast corner of said subdivision C bears N. 00° 00½' W., 4142.2 feet distant; thence along said easterly boundary S. 00° 00½' E., 2557.6 feet to a one inch diameter steel bar; thence leave said easterly boundary and running S. 89° 59½' W., 1681.4 feet to a one inch diameter steel bar; thence N. 00° 59' W., 2558.0 feet to a one inch diameter steel bar; thence N. 89° 59½' E., 1724.9 feet to the place of beginning.

CONTAINING an area of 100.00 acres of land; meridian conforming with the meridian shown on filed map hereinabove referred to.

PARCEL II:

Certain real property lying, being and situate in Rancho San Vicente in County of Monterey, State of California, being a portion of subdivision C in Lot 2, as said subdivision and Lot are shown and so designated on map entitled, "MAP OF RE-SURVEY OF PART OF SAN VICENTE RANCHO", filed on the 8th day of June 1918, in Volume 1 of Surveys, at page 94, Records of the said County of Monterey, said real property being particularly described as follows, to-wit:

BEGINNING at a one inch diameter steel bar standing in the easterly boundary of said subdivision C, from which the original 4" x 4" post set in a rock mound at the northeast corner of said subdivision C bears N. 00° 00½' W., 6699.8 feet distant; thence along said easterly boundary S. 00° 00½' E., 996.3 feet to a one inch diameter steel bar; thence leave said easterly boundary and running S. 89° 59½' W., 1664 4 feet to a one inch diameter steel bar; thence N. 0° 59' W., 996.4 feet to a one inch diameter steel bar; thence N. 89° 59½' E., 1681.4 feet to the place of beginning.

CONTAINING an area of 38.26 acres of land; meridian conforming to the meridian shown on filed map herein referred to.

Exhibit "[illegible]" - page 2

EXCEPTING FROM PARCEL II, the following described portion:

BEGINNING at a 1" diameter steel bar standing at the most Northeasterly corner of the hereinabove mentioned 38.26 acre tract of land from which the original 4" x 4" post set in a rock mound at the Northeast corner of said Subdivision C bears N. 0° 00½' W., 6699.8 feet distant; thence from said point of beginning, and running along the Easterly boundary of said 38.26 acre tract of land,

(1) S. 0° 00½' E., 996.3 feet to a 1" diameter steel bar standing at the most Southeasterly corner of said 38.26 acre tract of land; thence leave said Easterly boundary and running along the Southerly boundary of said 38.26 acre tract of land.

(2) S. 89° 59½' W., 1311.65 feet; thence leave said Southerly boundary and running

(3) N. 0° 00½' W., 996.3 feet to a point in the NOrtherly boundary of said 38.26 acre tract of land; thence along last mentioned boundary,

(4) N. 89° 59½' E., 1311.65 feet to the place of beginning.

CONTAINING an area of 30.0 acres of land.

Courses all true.

LAND CONSERVATION CONTRACT

THIS CONTRACT made and entered into this 27th day of February 1973, by and between the COUNTY OF MONTEREY, a political subdivision of the State of California, hereinafter called "County" and PHILIP R. KELSEY hereinafter called "Owner".

WITNESSETH:

WHEREAS, Owner possesses certain real property located within the County of Monterey, State of California, which is presently devoted to the production of food and fibre and is described in Exhibit A attached hereto and made a part hereof; and

WHEREAS, the property is located in an agricultural preserve (No. 73-25) heretofore established by County by Resolution No. 73-54-25; and

WHEREAS, both Owner and County desire to limit the use of the property to agricultural and compatible uses;

NOW, THEREFORE, County and Owner agree as follows:

1. CONTRACT SUBJECT TO CALIFORNIA LAND CONSERVATION ACT OF 1965, AS AMENDED.

This contract is entered into pursuant to Chapter 7 (commencing with Section 51200) of Part 1, Division 1, Title 5 of the Government Code, which is known as the California Land Conservation Act of 1965, or as the Williamson Act. This contract is subject to all of the provisions of this act including any amendments thereto which may be enacted from time to time.

2. RESTRICTION ON USE OF PROPERTY

During the term of this contract, and any and all renewals thereof, the property described in Exhibit A shall not be used by Owner, or Owner's successors in interest, for any purpose other than the production of food and fibre for commercial purposes and uses compatible thereto. A list of all such compatible uses is set forth in Exhibit B, attached hereto and by this reference incorporated herein. County, by uniform rule adopted by the Board of Supervisors of County, may from time to time during the term of this contract and all renewals thereof, add to the list of compatible uses which shall be uniform throughout the agricultural preserve in which the property in Exhibit A is located; provided, however, County may not during the term of this contract or any renewal thereof, without the prior written consent of Owner, remove any of the compatible uses for the subject property which are set forth in Exhibit B. The provisions of this contract and any uniform rule supplementing the list of compatible uses are not intended to limit or supersede the planning and zoning powers of County.

3. TERM OF CONTRACT

This contract shall become effective on the 28th day of

February, 1973, and shall remain in full force and effect for an initial term of twenty years. The initial term of twenty years shall be measured commencing as of the first day of January next succeeding the date of execution. Each succeeding first day of January shall be deemed to be the annual renewal date of this contract. This contract shall be automatically renewed on each succeeding January 1 and one additional year shall be added automatically to the initial term unless notice of nonrenewal is given as provided in paragraph 4.

4. NOTICE OF NONRENEWAL

(a) If either party desires in any year not to renew this contract, that party shall serve written notice of nonrenewal upon the other party in advance of the annual renewal date of this contract. Unless such written notice of nonrenewal is served by Owner at least 90 days prior to the renewal date, or by County at least 60 days prior to the renewal date, this contract shall be considered renewed as provided in paragraph 3 above.

(b) If either party serves written notice of nonrenewal in any year within the time limits of (a) above, this contract shall remain in effect for the balance of the period remaining since the original execution or the last renewal of this contract, as the case may be.

5. NO COMPENSATION

Owner shall not receive any payment from County in consideration of the obligations imposed under this contract, it being recognized and agreed that the consideration for the execution of this contract is the substantial benefit to be derived therefrom, and the advantage that may accrue to Owner as a result of the effect upon the assessed value of the property on account of the restrictions on the use of the property contained herein.

6. SUCCESSORS IN INTEREST

This contract and the restrictions imposed hereunder shall run with the property described in Exhibit A and shall be binding upon the heirs, executors, administrators, trustees, successors, and assigns of Owner. This contract shall also be transferred from County to any succeeding city or county acquiring jurisdiction over the property described in Exhibit A. On the completion of annexation proceedings by a city, that city shall succeed to all rights, duties and powers of the County under this contract for that portion of the property described in Exhibit A annexed to the city.

7. DIVISION OF LAND

The property described in Exhibit A shall not be divided without the written approval of the County first had and obtained. This contract is divisible in the event the property described in Exhibit A is divided. Owner agrees to submit any proposed division to County for its approval and County, if it approves said division, shall, as a condition of its approval of the division, require the execution by Owner of contract identical to this contract on each parcel created by the division. Owner agrees to execute such contract.

8. CONDEMNATION

When any action in eminent domain for the condemnation of the fee title of any land described in Exhibit A is filed or when such

land is acquired in lieu of eminent domain for a public improvement by a public agency or person, or whenever there is any such action or acquisition by the federal government, or any person, instrumentality or agency acting under authority or power of the federal government, this contract becomes null and void as to the land actually being condemned or so acquired as of the date the action is filed or so acquired.

9. CANCELLATION

This contract may be cancelled by the mutual agreement of the parties hereto and the approval of the State of California in the manner provided in this paragraph. It is understood by the parties hereto that the existence of an opportunity for another use of the property shall not be sufficient reason for the cancellation of this contract. A potential alternative use of the property may be considered only if there is no proximate non-contracted land suitable for the use to which it is proposed that this property be put. The parties further understand that the uneconomic character of an existing agricultural use shall not be sufficient reason for cancellation of this contract, but may be considered only if there is no other reasonable or comparable agricultural use to which the land may be put.

(a) Upon the written request of Owner to cancel this contract, the Board of Supervisors of the County of Monterey may adopt a resolution consenting to such request. Prior to the adoption of a resolution consenting to the request of the landowner to cancel this contract, the Board of Supervisors of County shall hold a public hearing on the matter. Notice of the hearing shall be mailed to each and every owner of property under contract within the agricultural preserve in which the property described in Exhibit A is located, and shall be published pursuant to Section 6061 of the Government Code. If at the hearing, or prior thereto, the owners of 51 percent of the acreage under contract in the agricultural preserve protest the cancellation of this contract, the Board of Supervisors shall not consent to cancel this contract.

(b) If the Board of Supervisors adopts a resolution consenting to the request of Owner to cancel this contract, the parties shall request that the cancellation be approved by the State Director of Agriculture upon the recommendation of the State Board of Agriculture. The State Board of Agriculture may recommend and the State Director of Agriculture may approve the cancellation only if they find: (1) The cancellation is not inconsistent with the purposes of the California Land Conservation Act of 1965 as amended; and (2) the cancellation is in the public interest.

(c) The provisions of sub-paragraph (b) of this paragraph 9 relating to the State Board of Agriculture and the Director of Agriculture shall be applicable only if both the State Board and the State Director consent to act as described herein. If either the State Board or the State Director fail or refuse to act within 60 days after being requested to do so, the Board of Supervisors of the County of Monterey shall act in the place and stead of the State Board and State Director and shall make all findings and decisions required by sub-paragraph (b).

10. LIABILITY OF OWNER UPON CANCELLATION

(a) Prior to any action by the Board of Supervisors giving tentative approval to the cancellation of this contract, the County Assessor shall determine the full cash value of the land as though it were free of the contractual restrictions imposed by this contract. The Assessor shall multiply such value by the most recent county ratio announced pursuant to Section 401 of the Revenue and Taxation Code, and shall certify the product to the Board of Supervisors as the cancellation valuation of the land for the purpose of determining the cancellation fee. The Board of Supervisors shall thereafter and prior to giving tentative approval to the cancellation of this contract determine and certify to the County Auditor the amount of the cancellation fee which the Owner must pay the County Treasurer as deferred taxes upon cancellation. That fee shall be an amount equal to 50 percent of the cancellation value of the property; provided, however, if after the date this contract was initially entered into the publicly announced County ratio of assessed to full cash value is changed, the percentage payment shall be changed so no greater percent of full cash value will be paid than would have been paid had there been no change in ratio. It is agreed by the parties hereto that the publicly announced County ratio at the time this contract is executed is 25 percent of full cash value.

(b) If the State Board of Agriculture recommends that it is in the public interest to do so, and the State Director of Agriculture so finds, the Director may waive any such payment or any portion thereof, or may make such payment or portion thereof, contingent upon the future use made of the property and its economic return to Owner for a period of time not to exceed the unexpired term of the contract had it not been cancelled, provided: (i) the cancellation is caused by an involuntary transfer or change in the use which may be made of the property and the property is not immediately suitable, nor will be immediately used, for a purpose which produces a greater economic return to Owner; and (ii) County has recommended to the State Board of Agriculture that no such payment be required or that the deferment of such payment or portion thereof be allowed, and the board of Supervisors has determined it is in the best interests of the public conservation of agricultural land and that such payment be either deferred or not required.

(c) The provisions of sub-paragraph (b) of this paragraph 10 relating to the State Board of Agriculture and the Director of Agriculture shall be applicable only if the State Board and the State Director both consent to act as described herein. If either the State Board or the State Director fail or refuse to act within 60 days after being requested to do so, the Board of Supervisors of the County of Monterey shall act in the place and stead of the State Board and the State Director and shall make all findings and decisions required by sub-paragraph (b).

(d) Owner shall make payment of the cancellation fee in full prior to the cancellation becoming effective.

11. NOTICES

All notices required or permitted by this contract shall be given in writing and may be mailed or delivered in person. If mailed the address of Owner shall be the last known address on the assessment records of County, and County's address shall be In Care of Board of Supervisors, Courthouse, Salinas, California, and deposit in the mail, postage prepaid, shall be deemed receipt thereof.

12. COSTS OF LITIGATION

In case County shall, without any fault on its part, be made a party to any litigation commenced by or against Owner, then Owner shall and will pay all costs and reasonable attorneys' fees incurred by or imposed upon County by or in connection with such litigation, and owner shall and will pay all costs and reasonable attorneys' fees which may be incurred or paid by County in enforcing the covenants and agreements of this contract.

IN WITNESS WHEREOF the parties hereto have caused this contract to be executed; by Owner on February 15, 1973 and by County on February 27, 1973.

LAND CONSERVATION AGREEMENT

COMPATIBLE USES

The following is a list of land uses determined to be compatible with the agricultural use of the land subject to this agreement:

1. The drying, packing or other processing of an agricultural commodity usually performed on the premises where it is produced but not including slaughter houses, fertilizer yards, bone yards or plants for the reduction of animal or vegetable matter.

2. Structures necessary and incidental to the agricultural use of the land.

3. Single family dwellings incidental to the agricultural use of the land for the residence of the owner, and the family of the owner.

Single family dwellings incidental to the agricultural use of the land for the residence of the lessee of the land and the family of the lessee.

4. Dwellings for persons employed by owner or lessee in the agricultural use of the land.

5. An aircraft landing strip incidental to the agricultural use of the land.

6. The erection, construction, alteration or maintenance of gas, electric, water or communication utility facilities.

7. The erection, construction, alteration or maintenance of radio, television or microwave antennas, transmitters and related facilities.

8. Public or private hunting of wildlife or fishing.

9. Public or private hunting clubs and accessory structures.

10. Public or private rifle and pistol practice range, trap or skeet field, archery range or other similar use.

11. Public or private riding or hiking trails.

EXHIBIT "A"

NOTICE OF NONRENEWAL OF
LAND CONSERVATION CONTRACT NO. 73-25

LEGAL DESCRIPTION

PARCEL I

That certain real property , lying, being and situate in the Rancho San Vicente, in the County of Monterey, State of California, being a portion of Subdivision C in Lot 2, as said subdivision and Lot are shown and so designated on map entitled, "MAP OF RE-SURVEY OF PART OF SAN VICENTE RANCHO", filed on the 8th day of June, 1918, in Volume 1 of Surveys, at page 94, Records of the said County of Monterey, said real property being particularly described as follows, to-wit:

Beginning at a one-inch diameter steel bar standing in the easterly boundary of said subdivision C, from which the original 4" x 4" post sat in a rock mound at the northeast corner of said subdivision C bears N. 00° 00 ½' W. 4142.2 feet distant; thence along said easterly boundary S. 00° ½ ' E., 2557.6 feet to a one inch diameter steel bar; thence leave said easterly boundary and running S. 89° 59 ½' W., 1681.4 feet to a one inch diameter steel bar; thence N. 00° 59' W., 2558.0 feet to a one inch diameter steel bar; thence N. 89° 59 ½' E., 1724.9 feet to the place of beginning.

CONTAINING an area of 100.00 acres of land; meridian conforming with the meridian shown on filed map hereinabove referred to.

PARCEL II:

Certain real property lying, being and situate in Rancho San Vicente in County of Monterey, State of California, being a portion of sub-division C in Lot 2, as said subdivision and Lot are shown and so designated on map entitled, "Map OF RE-SURVEY OF PART OF SAN VICENTE RANCHO", filed on the 8th day of June 1918, in Volume 1 of Surveys, at page 94, Records of the said County of Monterey, said real property being particularly described as follows, to-wit:

BEGINNING at a one inch diameter steel bar standing in the easterly boundary of said subdivision C, from which the original 4" x 4" post set in a rock mound at the northeast corner of said subdivision C bears N. 00° 00½′ W., 6699.8 feet distant: thence along said easterly boundary S. 00° 00½′ E., 996.3 feet to a one inch diameter steel bar; thence leave said easterly boundary and running S. 89° 59 ½′ W., 1664.4 feet to a one inch diameter steel bar; thence N. 0° 59′ W., 996.4 feet to a one inch steel bar; thence N. 89° 59 ½′ E., 1681.4 feet to the place of beginning.

CONTAINING and area of 38.26 acres of land; meridian conforming to the meridian shown on filed map herein referred to.

EXCEPTING FROM PARCEL II, the following described portion:

BEGINNING at a 1" diameter steel bar standing at the most North-easterly corner of the hereinabove mentioned 38.26 acre tract of land from which the original 4" x 4" post set in a rock mound at the Northeast corner of said Subdivision C bears N. 0° 00 ½′ W., 6699.8 feet distant; thence from said point of beginning, and running along the Easterly boundary of said 38.26 acre tract of land,

(1) S. 0° 00 ½′ E. 996.3 feet to a 1" diameter steel bar standing at the most Southeasterly corner of said 38.26 acre tract of land; thence leave said Easterly boundary and running along the Southerly boundary of said 38.26 acre tract of land,

(2) S. 89° 59 ½′ W., 1311.65 feet; thence leave said Southerly boundary and running

(3) N. 0° 00 ½′ W., 996.3 feet to a point in the Northerly boundary of said 38.26 acre tract of land; thence along the last mentioned boundary,

(4) N. 89° 59 ½′ E., 1311.65 feet to the place of beginning.

CONTAINING an area of 30.0 acres of land.

Courses all true.

OPERATIONAL (Vehicle) EMISSION ESTIMATES

Analysis Year: 2020 Temperature (F): 50 Season: Winter

EMFAC Version: EMFAC2002 (9/2002)

Summary of Land Uses:

Unit Type	Acreage	Trip Rate	No. Units	Total Trips
Single family housing	161.60	6.88 trips/dwelling unit	986.00	6,783.68
Apartments low rise	59.30	4.78 trips/dwelling unit	1,126.00	5,386.78
Hotel		7.58 trips/rooms	120.00	909.60
Strip mall		44.30 trips/1000 sq. ft.	275.00	12,182.50
		Sum of Total Trips		25,262.56
		Total Vehicle Miles Traveled		209,691.39

Vehicle Assumptions:

Fleet Mix:

Vehicle Type	Percent Type	Non-Catalyst	Catalyst	Diesel
Light Auto	54.40	0.40	99.40	0.20
Light Truck < 3,750 lbs	15.30	0.70	98.00	1.30
Light Truck 3,751- 5,750	16.40	0.60	98.80	0.60
Med Truck 5,751- 8,500	7.30	0.00	98.60	1.40
Lite-Heavy 8,501-10,000	1.10	0.00	81.80	18.20
Lite-Heavy 10,001-14,000	0.30	0.00	66.70	33.30
Med-Heavy 14,001-33,000	1.00	0.00	20.00	80.00
Heavy-Heavy 33,001-60,000	0.80	0.00	0.00	100.00
Line Haul > 60,000 lbs	0.00	0.00	0.00	100.00
Urban Bus	0.20	0.00	50.00	50.00
Motorcycle	1.60	50.00	50.00	0.00
School Bus	0.10	0.00	0.00	100.00
Motor Home	1.50	0.00	93.30	6.70

Travel Conditions

	Residential			Commercial		
	Home-Work	Home-Shop	Home-Other	Commute	Non-Work	Customer
Urban Trip Length (miles)	10.0	5.0	6.5	9.6	9.6	9.6
Rural Trip Length (miles)	10.0	5.0	6.5	9.6	9.6	9.6
Trip Speeds (mph)	30.0	20.0	25.0	30.0	30.0	30.0
% of Trips - Residential	22.6	27.4	50.0			
% of Trips - Commercial (by land use)						
Hotel				5.0	2.5	92.5
Strip mall				2.0	1.0	97.0

Changes made to the default values for Land Use Trip Percentages

The Trip Rate and/or Acreage values for Single family housing
have changed from the defaults 9.57/328.67 to 6.88/161.6
The Trip Rate and/or Acreage values for Apartments low rise
have changed from the defaults 6.9/70.38 to 4.784/59.3

Changes made to the default values for Area

Changes made to the default values for Operations

The operational emission year changed from 2005 to 2020.

AMBAG CONSISTENCY LETTER

AMBAG
ASSOCIATION OF MONTEREY BAY AREA GOVERNMENTS

February 21, 2007

Alina Pommerenck
Illingworth & Rodkin, Inc.
505 Petaluma Boulevard South
Petaluma, CA 94952

Dear Ms. Pommerenck:

This letter is in response to your February 10, 2007 request for a determination of consistency of the Miravale Phase III Subdivision EIR with the *Air Quality Management Plan for the Monterey Bay Region* (AQMP).

Consistency of the institutional/commercial portions of this project are determined by comparing the estimated current population of the jurisdiction in which the project is located with the applicable population forecast in the AQMP. If the estimated current population does not exceed the forecast, indirect emissions associated with the project are deemed to be consistent with the AQMP.

As the current population of the nearest city, Soledad is 28,075 (1/1/06 Department of Finance estimate). The forecasted population for Soledad in the year 2010, the next forecasted year, is 32,413. As the current population of Soledad is less than the forecasted population, the institutional/commercial/industrial portion of the Miravale Phase III Subdivision EIR is **consistent** with the AQMP.

Consistency of housing projects with the AQMP is analyzed by comparing the total potential population growth facilitated by the project with the forecasted growth for Monterey County. The *2004 Population, Housing Unit, and Employment Forecasts* adopted by the AMBAG Board of Directors on April 14, 2004 are the forecasts used for this consistency determination.

AMBAG staff surveyed each jurisdiction in Monterey County to determine the number of housing units that jurisdictions have approved but have not yet received a building permit. The total number of units is 8,395. Building permit data was also collected. A total of 867 housing units have received building permits between January and December 2006. The California Department of Finance estimates there are 138,617 dwelling units in Monterey County as of 1/01/06. Combined, there are 147,879 existing, approved, and or permitted housing units in Monterey County as of 2006.

APPENDIX F

Special-status Species Potentially Present in the Project Vicinity

Appendix F. Table of Special-status Species Potentially Present in the Project Vicinity. Sources: USFWS Listed Species in Monterey County, CNDDB occurrences from Soledad quad and all surrounding quads, published and unpublished data, and personal knowledge.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
MAMMALS			
Antrozous pallidus Pallid bat	--/CSC	A wide variety of habitat are utilized, including grasslands, shrublands, woodlands, and forest from sea level up through mixed conifer forests. Most common in open, dry habitats with rocky areas for roosting. Also relatively common on bridges.	**Medium.** No CNDDB occurrences within 10 miles of the project site. Appropriate foraging habitat and marginally appropriate roosting habitat is present within project boundaries.
Dipodomys elephantinus big-eared kangaroo rat	--/ CSC	Chaparral covered slopes of the southern part of the Gabilian Range, in the vicinity of the Pinnacles. Forages under shrubs and in open burrows for cover and nesting.	**Not Present.** Appropriate habitat not present. Species not captured during onsite small mammal trapping study.
Enhydra lutris nereis southern sea-otter	FT/	Found in nearshore marine habitats environments of California from Ano Nuevo to Point Sal. Often associated with giant kelp and bull kelp, these opportunistic foragers eat mainly abalones, sea urchins, crabs, and clams.	**Not Present.** Habitat absent.
Eumops perotis californicus Western mastiff-bat	FSC/ CSC	Many open habitats including conifer and deciduous woodlands, coastal scrub, grassland, and chaparral. Roost in crevices in cliff faces, high buildings, trees, and tunnels.	**Unlikely.** No CNDDB occurrences of this species within 10 miles of the project site. The project site supports marginally appropriate foraging and roosting habitat for this species.
Neotoma fuscipes luciana Monterey dusky-footed woodrat	--/ CSC	Dense chaparral, oak and riparian woodland, and in mixed coniferous forest that has a well developed understory. Prefers fairly moist habitat but is also found in drier habitats such as pinyon-juniper woodland.	**Not Present.** Appropriate habitat not present. No woodrat nests observed.
Perognathus inornatus psamnophilus Salinas pocket mouse	FSC/ CSC	Typically found in grasslands and blue oak savanna, needs friable soils.	**Present.** One male was captured during onsite small mammal sampling, and appropriate habitat is

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			present in foothill portions of the site.
Taxidea taxus American badger	--/CSC	dry, open grasslands, fields, and pastures	**Present.** CNDDB reports an occurrence of this species approximately 6 miles south of the project site. Appropriate habitat is present in foothill portions of the site. American badger dens observed near onsite reservoirs and in foothill habitats.
Vulpes macrotis mutica San Joaquin Kit fox	FE/ ST	Open, level areas with loose-textured soils supporting scattered, shrubby vegetation with little human disturbance. Live in annual grasslands or grassy open stages dominated by scattered brush, shrubs, and scrub.	**Present.** The CNDDB reports the presence of SJKF critical habitat within 2 km of project boundaries. Appropriate denning habitat is present in foothill portions of the site. Active and fallow agricultural lands may provide foraging and dispersal habitat for this species. This species is assumed present.
BIRDS			
Accipiter cooperii Cooper's hawk	--/ CSC	Resident throughout most of the wooded portion of the state. Dense stands of live oak, riparian deciduous, or other forest habitats near water used most frequently. Seldom found in areas without dense tree stands, or patchy woodland habitats.	**Low.** No CNDDB occurrences of this species within 10 miles of the project site. Appropriate nesting habitat not present within project boundaries.
Accipiter striatus sharp-shinned hawk	--/ CSC	Uses dense stands in close proximity to open areas. Roosts in intermediate to high-canopy forest. Nests in dense, even-aged, single-layered forest canopy. Winters in woodlands.	**Low.** No CNDDB occurrences of this species within 10 miles of the project site. Appropriate nesting habitat not present within project boundaries.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
Agelaius tricolor tricolored blackbird	--/ CSC	Nest in colonies in dense riparian vegetation, along rivers, lagoons, lakes, and ponds. Forages over grassland or aquatic habitats.	**Low.** No CNDDB occurrences within 10 miles of the project site. No tric's observed at the onsite reservoir and/or ag lands during multiple site visits by qualified biologists (Pers. Obs. David Keegan)
Aquila chrysaetos golden eagle	--/CSC	Use rolling foot-hills, mountain terrain, wide arid plateaus deeply cut by streams and canyons, open mountain slopes, cliffs, and rocky outcrops. Nest in secluded cliffs with overhanging ledges as well as large trees.	**Medium.** No CNDDB occurrences within 10 miles of the project site, however, appropriate foraging habitat is present throughout the project site. No nesting habitat present.
Athene cunicularia Western burrowing owl	FSC/ CSC	Burrows are protected. Require open grassland habitats with low-growing vegetation and abandoned burrows. Prefers these areas assoc. with some raised perches.	**Present.** No CNDDB occurrences within 10-miles of the project site, however, DD&A and Biosearch biologists have observed several burrowing owls and occupied burrows in the course of protocol-level surveys for this species.
Brachyramphus marmoratus marbled murrelet	FT/	Occur year-round in marine subtidal and pelagic habitats from the Oregon border to Point Sal. Partial to coastlines with stands of mature redwood and Douglas-fir. Requires dense mature forests of redwood and/or Douglas-fir for breeding and nesting.	**Not Present.** No appropriate habitat.
Buteo swainsoni Swainson's hawk	FSC/ ST	Generally found associate with plains, range, open hills, and sparse trees.	**Unlikley,** No CNDDB occurrences within 10-miles of the project site. This species typically forages in the vicinity of nesting habitat. No nesting habitat present within

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			or adjacent to the project site.
Circus cyaneus Northern harrier	--/ CSC	Generally found in flat open areas with tall, dense grasses, shrubs, and edges for cover and breeding. Use tall grasses in wetlands or at wetland borders for nesting.	**Present.** No CNDDB occurrences within 10-miles of the project site, however, appropriate foraging habitat is present, and one individual was observed foraging over foothill portions of the site.
Charadrius alexandrinus nivosus Western snowy plover	FT/ CSC	Sandy beaches on marine and estuarine shores, also salt pond levees and the shores of large alkali lakes. Requires sandy, gravelly or friable soil substrate for nesting.	**Not Present.** No habitat present.
Eremophila alpestris California horned lark	---/CSC	Variety of open habitats, usually where large trees and/or shrubs are absent. Found from grasslands along the coast to deserts at sea-level and alpine dwarf-shrub habitats are higher elevations. Builds open cup-like nests on the ground.	**Medium.** No CNDDB occurrences, but this species is often not reported. Appropriate habitat for this species is present within project boundaries, but none have been observed.
Elanus leucurus white-tailed kite	--/ CFP	Open groves, river valleys, marshes, and grasslands. Prefer such area with low roosts (fences etc.). Nest in shrubs and trees adjacent to grasslands.	**Present.** No CNDDB occurrences within 10-miles of the site, however, appropriate foraging habitat is present throughout grassland portions of the site, and DD&A and Biosearch biologists have observed this species within proposed development boundaries.
Falco columbarius Merlin	--/CSC	Uses a variety of habitats in both winter and during migration.	**Low.** No CNDDB occurrences within 10-miles of the site, however, appropriate foraging habitat is present throughout grassland portions of

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			the site. This species does not nest within Monterey County.
Falco peregrinus American Peregrine Falcon	FE/SE	Forages for other birds over a variety of habitats. Breeds primarily on rocky cliffs.	**Unlikely** No CNDDB occurrences within 10-miles of the site. No appropriate nesting habitat. Project site is >30 miles from the coast.
Riparian riparia bank swallow	--/ ST	Nest colonially in sand banks. Found near water; fields, marshes, streams, and lakes.	**Not Present.** Appropriate nesting habitat is not present within the project site or immediate vicinity (pers. comm. Don Roberson).
Sterna antillarum browni California least tern	FE/ SE	Sea beaches, bays; large rivers, bars.	**Not Present.** Appropriate habitat not present.
Vireo bellii pusillus Least Bell's vireo	FE/SE	Riparian habitats. Breed in willow riparian forest supporting a dense, shrubby understory. Oak woodland with a willow riparian understory is also used in some areas, and individuals sometimes enter adjacent chaparral, coastal sage scrub, or desert scrub habitats to forage.	**Not Present.** Appropriate habitat not present.
REPTILES AND AMPHIBIANS			
Ambystoma californiense California tiger salamander	FT/ CSC	Annual grassland and grassy understory of valley-foothill hardwood habitats in central and northern California. Need underground refuges and vernal pools or other seasonal water sources.	**Present.** CTS Critical Habitat is present within 5km of project boundaries. CTS occurrence records within 6 km. Project site is within historic distribution of the species, and DD&A biologists confirmed CTS breeding at the onsite Reservoir in the course of aquatic sampling for this species.
Gambelia silus blunt-nosed leopard lizard	FE/ SE	Suitable habitat for this species includes sparsely vegetated scrub and grassland habitats in areas of low topographic relief. In areas of high relief, distribution, distribution is usually confined	**Unlikely.** No CNDDB occurrences within 10-miles of the project site. Marginally appropriate habitat

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
		to broad sandy washes. Found on alkali flats, large washes, arroyos, canyons, and low foothills from 100-3000ft.	present, but none observed during multiple site visits.
Phrynosoma coronatum frontale Coast horned lizard	--/ CSC	Associated with open patches of sandy soils in washes, chaparral, scrub, and grasslands.	**Medium.** No CNDDB occurrences within 10-miles of the site, however, appropriate habitat is present throughout the fallow and grassland portions of the site.
Rana aurora draytonii California red-legged frog	FT/ CSC	Lowlands and foothills in or near permanent or late-season sources of deep water with dense, shrubby, or emergent riparian vegetation. During late summer or fall adults are known to utilize a variety of upland habitats with leaf litter or mammal burrows.	**Low.** CRLF Critical Habitat is present within 10 km of project boundaries. CRLF occurrence records within 7 km. Project site is within historic distribution of the species, and supports appropriate aquatic breeding habitat and associated upland habitat at the "reservoir" and surrounding foothills. However, no CRLF eggs, larvae, or adults have been observed onsite in the course of multiple breeding season site visits by qualified biologists (David Keegan, Pers. Obs.).
Scaphiopus hammondii Western spadefoot	--/ CSC	Grasslands with shallow temporary pools are optimal habitats for the Western spadefoot. Occur primarily in grassland habitats, but can be found in valley and foothill woodlands. Vernal pools are essential for breeding and egg laying.	**Low.** CNDDB reports one occurrence of this species within 6 km of the site. Project site is within historic distribution of the species, and supports appropriate aquatic breeding habitat and associated upland habitat at the "reservoir" and surrounding foothills.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			However, no WST eggs, larvae, or adults have been observed onsite in the course of multiple breeding season site visits by qualified biologists (David Keegan, Pers. Obs.).
Taricha torosa torosa coast range newt	CSC	Occurs mainly in valley-foothill hardwood, valley-foothill hardwood-conifer, coastal scrub, and mixed chaparral but is known to occur in grasslands and mixed conifer types. Seek cover under rocks and logs, in mammal burrows, rock fissures, or man-made structures such as wells. Breed in intermittent ponds, streams, lakes, and reservoir.	**Unlikely.** No CNDDB occurrences within 10-miles of the project site. Coast range newts are only known from locations south of Salinas River in Monterey County. Salinas River is >2.5 miles south of project site.
FISH			
Eucyclogobius newberryi tidewater goby	FE/ CSC	Brackish water habitats, found in shallow lagoons and lower stream reaches.	**Not Present.** No navigable waters present.
Oncorhynchus mykiss irideus Steelhead-Central California Coast.	FT/ CSC	Coastal perennial and near perennial streams, with suitable spawning and rearing habitat and no major barriers.	**Not Present.** No navigable waters present.
INVERTEBRATES			
Branchinecta conservatio Conservancy fairy shrimp	FE/	Require ephemeral pools with no flow. Grasslands of the northern two-thirds of the Central Valley, spanning a north-south distance of about 300 km, at elevations of 5-145 meters. Require ephemeral pools with no flow.	**Not Present.** No appropriate aquatic habitat present.
Branchinecta longiantenna longhorn fairy shrimp	FE/ none	Require ephemeral pools with no flow. Restricted distribution; Eastern edge of the Central Coast Mountains Region. Require ephemeral pools, typically associated with clear to turbid, clay and grass-bottomed pools.	**Not Present.** No appropriate aquatic habitat present.
Branchinecta lynchii vernal pool fairy shrimp	FT/ --	Require ephemeral pools with no flow. Associated with vernal pool/grasslands from near Red Bluff (Shasta County), through the central valley, and into the South Coast Mountains Region.	**Not Present.** No appropriate aquatic habitat present.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
		Require ephemeral pools with no flow.	
Danaus plexippus Monarch butterfly	--/--	Overwinters in coastal California using colonial roosts generally found in Eucalyptus, pine and acacia trees. Overwintering habitat for this species within the Coastal Zone represents ESHA. Local ordinances often protect this species as well.	**Not Present.** Appropriate habitat (groves and microclimate) present.
Euphilotes enoptes smithi Smith's blue butterfly	FE/--	Most commonly associated with coastal dunes and coastal sage scrub plant communities in Monterey and Santa Cruz Counties. Plant hosts are *Erigonum latifolium* and *E. Parvifolium*.	**Not Present.** Obligate host plants not present.
Linderiella occidentalis California linderiella fairy shrimp	FSC/	Ephemeral ponds with no flow. Generally associated with hardpans.	**Not Present.** No appropriate aquatic habitat present.
PLANTS			
Abies bracteata Bristlecone fir	--/1B	Endemic to the Santa Lucia Mountains.	**Not Present.** No fir present.
Arctostaphylos gabilanensis Gabilan Mountains manzanita	--/1B	Endemic to chaparral and chaparral/pine woodland habitats of the Gabilan Mountains of California, along the borders of San Benito and Monterey counties.	**Not Present.** No manzanita present.
Astragalus tener var. *tener* alkali milk-vetch	-- / SE / 1B	Playas, valley and foothill grassland (adobe clay), vernal pools/ alkaline; elevation 1-60 meters. Annual herb, blooms March-June.	**Not Present.** No appropriate habitat.
Caulanthus coulteri var. lemmoniii Lemmon's jewel flower	--/1B	Open, grassy areas; on hillside slopes and in fields, canyons, and arroyos. Soils include alkaline soils, shaley clay, sandstone talus, and decomposed serpentine. Predominantly found within Valley Grassland community, occasionally in Pinyon-Juniper Woodland. 80 - 1600 m. Annual herb; blooms March-May.	**Medium.** Marginally appropriate habitat present in the mixed grassland/rocky outcrop portions of the project site, and not identifiable at the time of the DD&A site assessments. Spring-time floristic survey or preconstruction survey recommended.
Centromadia parryi ssp. *congdonii* Congdon' tarplant	-- / -- /1B	Valley and foothill grassland (alkaline); elevation 1-230 meters.	**Not Present.** Lack of appropriate soils (lack of heavy

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
		Annual herb, blooms June-November	soils).
Chorizanthe pungens var. pungens Monterey spineflower	FT/ 1B	Chaparral (maritime), cismontane woodland, coastal dunes, coastal scrub, valley and foothill grassland/ sandy; elevation 3-450 meters. Annual herb, blooms April-June.	**Not Present.** Lack of appropriate habitat (lack of sandy soils).
Chorizanthe robusta var. robusta robust spineflower	FE/ 1B	Cismontane woodland (openings), coastal dunes, coastal scrub/ sandy or gravelly; elevation 3-300 meters. Annual herb, blooms April-September.	**Not Present.** Lack of appropriate habitat (lack of sandy soils).
Cupressus goveniana ssp. goveniana gowen cypress	FT/ 1B	Closed cone coniferous forest, chaparral (maritime); elevation 30-300 meters. Tree (evergreen).	**Not Present.** Conspicuous species not present.
Eriogonum nortonii pinnacle buckwheat	FSC/ 1B	Chaparral, valley and foothill grassland/ sandy, often on recent burns; elevation 300-975 meters. Annual herb, blooms May-June.	**Not Present.** Conspicuous species not present.
Erysimum menziesii ssp. menziesii Menzie's wallflower	FE/ SE/ 1B	Coastal dunes. Perennial herb, blooms March-June.	**Not Present.** Appropriate habitat not present.
Holocarpha macradenia Santa Cruz tarplant	FT/ SE	Coastal prairies, valley foothill grasslands/ often clay. Annual herb, blooms June-October	**Not Present.** No mesic sites. No soils (lack of clay).
Layia carnosa Beach layia	FE/ SE/ 1B	Coastal dunes., coastal scrub (sandy; elevation 0-60 meters. Annual herb, blooms March-July.	**Not Present.** Appropriate habitat not present.
Lembertia congdonii San Joaquin wollythreads	FE/ 1B	Chenopod scrub, valley and foothill grassland (sandy); elevation 60-800 meters. Annual herb, blooms February-May	**Not Present.** No habitat. No soils (lack of sandy soils).
Lupinus tidestromii Tidestrom's lupine	FE/SE/1B	Coastal dunes; elevation 0-100 meters. Perennial herb (rhizomatous), blooms April-June.	**Not Present.** Appropriate habitat not present.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
Malacothamnus aboriginum indian valley bush mallow	FSC/ 1B	Chaparral, cimontane woodland/ rocky.	**Not Present.** Appropriate habitat not present.
Malacothrix saxatilis var. arachnoidea Carmel Valley macothrix	FSC/ 1B	Chaparral (rocky); elevation 25-335 meters. Perennial herb (rhizomatous), blooms March-December.	**Not Present.** Appropriate habitat not present.
Navarretia negelliformis ssp. radians shining navarretia	FSC/ 1B	Cismontane woodland, valley foothill grasslands, vernal pools	**Not Present.** Appropriate habitat not present.
Potentilla hickmanii Hickman's cinqufoil	FE/ SE / 1B	Coastal bluff scrub, closed cone coniferous forests, meadows(vernally mesic), marshes and swamps (freshwater). Perennial herb, blooms April-August.	**Not Present.** Appropriate habitat not present.
Yadon's rein orchid *Piperia yadonii*	FE/-- 1B	Sandy soils in coastal bluff scrub, closed-cone coniferous forest, and maritime chaparral. Annual.	**Not Present.** Appropriate habitat not present.
Plagiobothrys uncinatus Hooked popcorn flower	--/1B	Chaparral, Cismontane woodlands, Valley-foothill grasslands.	**Not Present.** No mesic habitat.
Texosporium sancti-jacobi woven-spored lichen	FSC/1B	Found in arid to semi-arid grasslands, shrublands, or savannas. Parent materials are noncalcareous, including basalt, granite, and mixed alluviums. Soils developed on these parent materials vary greatly, from very fine textured soils on basalt to sandy loams, to soils with a very high content of fine or coarse sand. Soil depth varies greatly.	**Not Present.** Appropriate habitat not present.

Unlikely: The project area and/or immediate vicinity do not provide suitable habitat for a part particular species. Project area is outside of the species range.

Low Potential: Project area and/or immediate vicinity provides only limited habitat for a particular species. The known range for a particular species may be outside of the project area.

Medium Potential: The project area and/or immediate vicinity provide suitable habitat for a particular species, though there are no known sightings in the area.

High potential: The project area and/or immediate vicinity provide ideal habitat conditions for a particular species and/or the species is known to occur in the area.

Key to Status Codes

CSC	CDFG Species of concern
FSC	Federal Species of concern
CFP	CDFG Fully Protected Animal
SE	State Endangered

RE: Storm Water Master Plan
City of Soledad
RMA Job No. 06712

SUBJECT: Hydraulic Analysis of the proposed storm drain system for the Miravale-III Sub-division

RM-Associates (RMA) has developed a working model of the Miravale-III sub-division storm drain collection system using HYDRA software, version 6.4. HYDRA is a software product for the analysis, design, and management of storm, sanitary, and combined sewer systems. RMA employed it to analyze and critique the storm drain system being proposed by the developer. The following discusses the model's development, analysis, and conclusions:

A. Delineation of Collection System

RMA modeled the collection system from layout drawings obtained from others. For the purposes of this study, the collection system was divided into three sections (Systems 100, 200, 300; see attached drawing):

Collection System 100 encompasses the upper north-west section of the sub-division. This system is primarily catching offsite flows coming from the outside watersheds to the north. It also catches water from basins earmarked for future residential development as well as the Williamson Act property. The system outlets into a proposed intermediate 21 acre-feet (AF) basin. This basin in turn can discharge out into Collection System 200.

Collection System 200 encompasses the upper half of the sub-division. This system includes the residential areas that are in the foothill basins. This is the most difficult part of the drainage system hydraulically speaking. The system outlets into the proposed primary ponding basin (i.e., the golf course driving range) that is located at the south-west corner of the sub-division.

Collection System 300 encompasses the lower half of the sub-division. This system includes a portion of the residential areas in the foothill basins, as well as one catchment for offsite water coming in from the east. It also outlets into the proposed primary ponding basin.

The total number of pipes and manholes were quantified. Drain inlets that were in close proximity to each other and also drain into common manholes were ignored to simplify the modeling process (i.e, clustered drain inlets modeled as one). Manhole inlet rim and invert elevations were determined. Pipe lengths and size were also quantified. A uniform pipe roughness factor of 0.013 (concrete pipe) was used. Also, the maximum allowable flow through the pipe, (d/D) was set at 0.90.

B. Delineation of Drainage Basins

RMA developed the model's drainage basins by studying the drainage patterns of the collection system, land usage, and the Hydraulic Soil Group Classifications. Per city standard, the Modified SCS Method (Santa Barbara Urban Hydrograph Method) was deployed. HYDRA requires the following drainage basin data to execute the SCS Method:

- Basin area (acres)
- Time-of-concentration (Tc): For each individual basin, the time of concentration was measured from the most remote location, then along the gutter flow-line back to the catch basin.
- Runoff Curve Numbers: This was assigned after reviewing the basin's land usage in conjunction with its Hydrologic Soils Group classifications.

C. Collection System PASS/FAIL Criteria

The following specification was used to analyze the proposed storm drain collection system for the Miravale-III sub-division:

Storm Drain System Design Year Criteria:

Design storm (years)	Design Storm return period applied to:
2	(Not used)
5	(Not used)
10	Residential and "local", where local is defined as schools, parks, and the golf course.
20	(Not used)
25	Commercial/Industrial/Major trunk lines
100	Offsite runoff "Q" must be a 100-year storm event

COLLECTION SYSTEM "PASS/FAIL" CRITERIA

	PIPELINES
1	Residential: The hydraulic grade line (HGL) must be no higher than 0.5 feet below the gutter.
2	Commercial/Industrial: The HGL must be no more that 0.5' above the gutter.
3	Main Trunks: The HGL can be no more than 1.0' above the gutter.
4	Pipe velocities must be between the range of 2 to 8 fps.
5	New pipes must be less than running 100% full at the design storm.
	PONDING BASINS
6	Both the upper and lower retention basin must have enough capacity to hold runoff produced from a 100-year, 24 hour storm event.

D. Off-site Runoff "Q"

The storm flows emanating from offsite watersheds were added into the HYDRA model as a "flow injection". Based on the above specification, the primary trunk lines must be able to handle the following 100-year offsite flow:

Offsite Watershed Flows

Injection point	Peak Flow; Q_{100} (cfs)
1	82.5
2	22.6
3	87.4
4	236.0

E. Design Storm Development

Accepted engineering methodologies for a transient intensity design storm are (1) the SCS (NRCS) synthetic storm, and (2) the Alternating Block Method. RMA employed the SCS Method which is based on the following:

- The NRCS developed a series of synthetic distributions that can be used in the United States to create a 24-hour design storm. The NRCS rainfall distribution map shows Soledad as a "Type I" storm.
- The step duration (time increment) used was 15 minutes.
- The design intensity was derived from the City standard IDF curve "Soledad IDF Station". This produced the following total precipitation amounts for 24 hour storms:

Storm Intensity and Precipitation Totals

Design storm	Intensity (inches/hour)	Precipitation (inches)
10	0.09	2.16"
25	0.11	2.64"
100	0.14	3.36"

Design storm files for the 10, 25 and 100 year storm events were consequently developed to create "storm files" to be used by HYDRA. The program produces a "flow file" which links the

collection system to the drainage basins for scenario analysis. The "flow file" in turn runs along with a "storm file" to produce analysis results.

F. Results of the Model Analysis:

With all the above data entered into the HYDRA program, the following results were obtained (see attached System Summary and Reservoir Summary Results):

- Pipe Collection System 100 "**FAILS**". Using the 10-year storm criteria with 100-year offsite point injections, the pipes are all running in excess of 100% capacity (all pipes in surcharge). In addition, all pipes except one have flow velocities over 8 fps, with pipe "110-03" hitting 26.4 fps. The hydraulic grade line (HGL) for about one quarter of the line is above the ground.

- The upper 21 acre-feet (AF) pond basin "**PASSES**". Based on the 25-year storm volume criteria, the basin fills to 696,896 cf (16 AF), or 76% of capacity. The model still needs to be run with a 100-year storm, which may push the basin to capacity.

- Pipe Collection System 200 largely "**FAILS**". Per specification, Collection System 200 must pass the 10-year storm criteria with 100-year offsite point injections. In addition, the main trunk line that borders the north side of the development must be able to pass the 25-year storm criteria with 100-year point injections. The model shows the majority of the pipeline in a surcharge condition. Also, the majority of the pipes are exhibiting excessive velocities, with pipe "220-08" hitting 21.8 fps for a 10-year storm and 34.2 fps during a 25-year storm event. The majority of the HGL is above the ground except for the pipeline in the vicinity of the primary ponding basin (lower branch of collection Section 200). None of the collection system passes all the stipulated specification.

- Collection System 300 "**PASS/FAILS**". Per specification, Collection System 300 must pass the 10-year storm criteria (no offsite injections are applicable). In addition, the main trunk line that runs to the commercial area (a portion of collection system 340 and 351) as well as the main trunk line that borders the south side of the development (system 300) must be able to pass the 25-year storm criteria with the 100-year offsite point injection. About two-thirds of the system was able to pass the stipulated design storm. However, the majority of the pipes are displaying excessive velocities with pipe "300-05" hitting 19.7 fps during the 25-year storm event. The HGL is below the ground at all locations (PASS) except for pipe section "342". A portion of the pipes in Collection System 300 passed all the stipulated specification (Collection Systems 310, 330, ½ of 360, 370, 341, 343, 348, and 351).

- The primary ponding basin "**FAILS**". Using the 25-year retention specification, the basin must hold 12.2 million cubic feet (281 AF). RMA estimates the basin capacity at about 106 AF, therefore it is about 2.6 times too small. The model still needs to be run with a 100-year storm flow.

G. Observations taken from the model:

The HYDRA model also suggests the following:

- The proposed design has not adequately addressed the upper basins in the north-east portion of the proposed sub-division (foothills), including the immediate offsite up hill drainage areas. The steeper slopes are problematic; manhole turbulence, excessive velocities, street flooding, etc. Without some type of diversion to deal with water coming off the immediate offsite drainage areas, these basins must drain into the sub-division and into the proposed on-site collection system.

- The temporary drainage channel being proposed through the parcels labeled "future housing" is a concern. There is the legal issue of passing pubic water through a private development. Also, the additional water may push the upper ponding basin past its capacity.

- The overflow at the main ponding basin will be producing high overflows into the adjacent properties to the north during large storm events. The 25-year storm model calculated an extremely high "Q" overflow of 448 cfs. The potential for flooding the downstream adjacent property owner(s) needs to be addressed.

H. Model Limitations

Limitations to the computer model include:

- The model does not take into account the quality of storm water discharge in a 24-hour period into under laying soil through percolation. Please refer to the soils report which indicates perch groundwater beneath the large basin.

- The proposed design shows two "end-of-the-line" tie-in diversions into the existing San Vicente Boulevard trunk main. An upper diversion proposes to allow a maximum 60 cfs into the city system. The model as now run did not allow any water from this point. For the lower diversion, the design did not quantify a proposed maximum flow. Based on the hydraulics of a 24" diversion pipe, RMA modeled the lower diversion using a maximum flow rate of 15 cfs. (See additional discussion, Hydraulic analysis of existing storm drain system for upper San Vicente Basin.)

- The program models the hydraulic grade line starting from the invert of the pipe that outlet into the ponding basins. The HGL elevations shown on the report were calculated from this starting point. The user must manually input a higher HGL at the pipe outlet to model a ponding basin at ½ full, ¾ full, etc. A higher HGL starting point will only create even higher hydraulic grade lines upstream.

I. Conclusion/Recommendations

- The HYDRA model suggests serious problems with the proposed storm drain collection system for the Miravale-III sub-division. RMA recommends that the City ask the developer to perform additional engineering on the entire system to insure that it will perform to an acceptable standard.

- RMA requests instructions from the City on exactly what additional engineering oversight would be appropriate on this project.

Respectfully Submitted,

Robert T. James, P.E.

APPENDIX H

Miravale Phase III Development Standards

Table 2-4

LDR & LDR-H / M3-R-1 Development Standards

Category	Regulation	Interpretation
Land Use	Low Density Residential (LDR) Hillside Low Density Residential (LDR - H)	
Zoning District	M3-R-1	
Density Range	1 to 10	This zone is primarily 1-6 du/ac. Density above 6 du/ac is allowed in order to accommodate affordable duplex and triplex units.
Permitted Uses		
The following uses shall be permitted in the R-1 district:		
Single family dwellings Accessory Buildings (including garage) Churches	Duets, duplexes, or triplexes. Refer also to Section 17.10.020 of the Municipal Code	Home occupations, subject to Section 17.38.140 of the Municipal Code
Lot Configuration		
Lot Area	5,000sf minimum	
Corner Lot	6,000sf minimum	
Width		
Interior Lot	50 feet minimum	
Corner Lot	60 feet minimum	
Depth		
Local Street frontage	100 feet minimum	
Collector Street frontage	100 feet minimum	
Curved / Cul-de-sac Frontage	40 feet minimum	
Building Massing		
Lot Coverage	40% maximum	Roof overhangs, patio overhangs, unenclosed shade structures and the like are exempt from the building covereage calculation.
Building Height	2 stories maximum	
Accessory Building*	14 feet maximum	1 story maximum
	**Accessory structures contingent on appropriate design as defined in the CC&R's.*	
Setbacks		
Front Yard		
Living Space	15 feet minimum	Architectural features may extend up to 2.5' into the adjacent setback.
Porch	9 feet minimum	Porches and balconies may extend 6' into required front and rear yards, 2' into side yards.
Garage	20 feet minimum	
Side Yards		
Interior	5 feet minimum	
Exterior	10 feet minimum	
Side Loaded Garage	25 feet minimum	
Rear Yard		
Primary Building	20 feet minimum	A minimum of 1,000 sf open space/yard shall be provided to the side or rear of the main dwelling or in an "L" or "U" design.
Accessory Building	5 feet minimum	
Off Street Parking		
Parking Requirements	2 spaces/ unit minimum	Minimum two covered spaces within a garage or carport

Table 2-5 VR/ M3-VR Development Standards

VR/ M3-VR		
Category	**Restriction**	**Interpretation**
Land Use	Village Residential (VR)	
Zoning	Village Residential (M3-VR)	
Density Range	12-30 dwelling units / gross acre	
Permitted Uses		
Single-Family dwellings, duplexes, triplexes, apartments, clustered "pack" style homes, townhouses, condominiums, accessory buildings, neighborhood serving uses - including garages, and day nurseries. Any other uses that the Planning Commission finds to be consistent with the purpose of this section and the Specific Plan.		
Lot Configuration		
Lot Area	2,000 sf minimum 6,000 sf minimum for apartments	Lot area may be reduce up to 10% in constrained locations provided all setback and usable rear yard area requirements are met.
Width		
Interior Lot	35' feet minimum	
Exterior Lot	40' feet minimum	
Depth	65' feet minimum	
Curve / Cul-De-Sac Frontage	30' feet minimum	Measured at property line. May have a lot frontage less than specified provided all setback and rear yard area requirements are met.
Building Massing		
Lot Coverage	65% of lot maximum	Roof overhangs, patio covers, unenclosed shade structures and the like are exempt from the building coverage calculation.
Height	3 stories maximum	
Setbacks		
Front		
Living Space	10' minimum	Architectural features may extend up to 2.5' into the adjacent setback.
Porch	5' minimum	Porches and balconies may extend 5' into required front and rear yards, 2' into side yards.
Garage	20' minimum	

Side		
Interior	5' minimum	
Exterior	10' minimum	
Rear		
Residential	10' minimum	A 100' wide landsscaped buffer strip irrigated with recycled water is required measured from the structure on the lot closest to the open space.
Accessory Structure	5' minimum per story	Rear loading attached garages shall provide a 5' minimum setback.
Distance Between Buildings		
Residential Buildings	10' minimum	
Accessory Structures	6' minimum	
Fencing	Refer to Section 17.36.010 of the Municipal Code	
Landscaping & Open Space		
Private/Common Open Space		
Townhomes / Condos	500 sf minimum	
Apartments	300 sf minimum for studio 350 sf minimum for 1 bedroom 50 sf additional per bedroom > 1 bedroom	A portion of the required usable open space shall be private*, otherwise it shall be shared in common space *Private open space includes: patios, porches, balconies, terraces, and decks. A minimum of 80 sf for ground floor units and 48 sf for units located on the second level or above.
4+ Units	Provide a landscaped 4' wide minimum strip along the periphery of the project site. The front yard setback shall contain a varying landscaped strip varying in width from 6' wide to 10' wide.	
Parking	Refer to Section 17.36.020 of the Municipal Code	
Signage	Refer to Section 17.36.030 of the Municipal Code	

Table 2-6

C / M3-GC & M3-CC Development Standards

Category	Restriction	Interpretation
Land Use Zoning	Commercial (C) (M3-GC & M3-VC)	Includes Village Commercial and Gateway Commercial
Permitted Uses		
Village Commercial (VC) Bakery goods, barbershop, beauty shop, bicycle shop, books, clothing store, deli, department store, drug store, dry cleaner, florist shop, furniture store, garden supplies, gift shops, grocery store, hardware store, health foods, hobby shops, ice cream, laundromats, meat market, music store, newspaper stand, pet shop, photographic supplies, electronic stores, restaurants, shoe repair store, sporting goods, stationary store, toy store, any other use which the planning commission finds to be consistent with the purposes of this section		Gateway Commercial (GC) Auto parts, bakery goods, barbershop, beauty shop, bicycle shop, books, clothing store, community center, day care, deli, department store, drug store, dry cleaner, florist shop, furniture store, garden supplies, gift shops, grocery store, gym, hardware store, health foods, hobby shops, ice cream, laundromats, meat market, music store, newspaper stand, pet shop, photographic supplies, electronic stores, restaurants, spa, shoe repair store, sporting goods, stationary store, toy store, specialty retail, art gallery, any other use which the planning commission finds to be consistent with the purposes of this section
Conditional Uses		
Village Commercial (VC)		Gateway Commercial (GC)
Banks and other financial institutions, buildings with more than 50,000sf of gross floor area (75,000 sf for two or more stories), bowling alleys, cocktail lounges, liquor products, pool and billiards, any use the planning commission determines consistent with the provisions of this section.		Antiques and the sales of used items, banks and other financial institutions, buildings with more than 10,000sf of gross floor area (15,000 sf for two or more stories), bowling alleys, cocktail lounges, liquor products, office, pool and billiards, hotel, wine tasting room, live music venues, all drive throughs, used items including furniture and clothing where owned and operated by a non-profit organization, and any use the planning commission determines consistent with the provisions of this section.
Prohibited Uses VC & GC		
Liquor stores as a principal use, bars, automobile body and paint shop, exclusive automobile repair; sheet metal shop; fortune tellers, adult entertainment; gambling; pawn shops, thrift shops, and flea markets. All drive throughs are prohibited in Village Commercial.		
Lot Configuration VC & GC		
Landscape Area Coverage	10% of lot minimum	Area between front/street side property line and the building, excluding driveways, shall be landscaped. Parking lot areas shall be planted to reduce the impact of large paving areas.

Building Massing

APPENDIX I

LAFCO Compatibility Table

Project Compatibility with Relevant Monterey County LAFCO Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Compatibility**
Monterey County LAFCO			
Adopted Sphere of Influence Policies			
1	LAFCO intends that its sphere of influence determination will serve as a master plan for the future organization of local government within the County. The spheres shall be used to discourage urban sprawl; limit proliferation of local governmental agencies; encourage efficiency, economy and orderly changes in local government; promote compact, community centered urban development; and minimize adverse impacts on lands classified as prime agriculture.	N/A	As outlined within Program 2.1 of the 2005 City of Soledad General Plan the City intends to apply to LAFCO for a comprehensive amendment of its sphere of influence that will be consistent with the 2005 General Plan and compatible with the City's ability to provide the full range of public services, including water supply; wastewater collection and treatment; storm drainage; and police and fire protection to the proposed Specific Plan area. The Miravale III Specific Plan will be included within this proposal.
2	The sphere of influence lines shall be a declaration of policy which shall be a primary guide to LAFCO in the decision on any proposal under its jurisdiction. Every determination made by the Commission shall be consistent with the spheres of influence of the agencies affected by those determinations.	N/A	The Miravale III Specific Plan incorporates city centered growth principles; project approval would ultimately allow for the expansion of the urbanized area of the City of Soledad where urban services are available to support such development.
3	Any proposal which is inconsistent with an agency's adopted sphere of influence shall not be approved until the Commission, at a noticed public hearing, has considered an amendment or revision to that agency's sphere of influence.	N/A	The proposed project is located outside of the City's current Sphere of Influence. Development of the project site would require an application to amend the City's Sphere of Influence to include the project area, which is identified in the Soledad General Plan as an area of future urban expansion.
4	Inclusion within an agency's sphere of influence does not assure annexation to that agency. The Commission shall evaluate boundary change proposals as they relate to all of the relevant factors listed in the Cortese-Knox Local Government Reorganization Act of 1985 (Government Code	N/A	Not applicable.

Project Compatibility with Relevant Monterey County LAFCO Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Compatibility**
	Section 56841 et seq.).		
5	When possible, a single larger general purpose agency, rather than a number of adjacent smaller ones, established for a given service in the same general area will be preferred. Where an area could be assigned to the sphere of influence of more than one agency providing a particular needed service, the following hierarchy shall apply dependent upon ability to serve. a. Inclusion within a City sphere of influence. b. Inclusion within a multi-purpose district sphere of influence. c. Inclusion within a single-purpose district sphere of influence. In deciding which of two or more equally ranked agencies shall include an area within its sphere of influence, LAFCO shall consider the agencies' service and financial capabilities, social and economic interdependence, topographic factors, and the effect that eventual service extension will have on adjacent agencies.	N/A	When the outward urban expansion of the City occurs as contemplated by the General Plan and detailed within the Miravale Phase III Specific Plan, the City will petition LAFCO to detach the Specific Plan area from all underlying service providers and for the area to be served by the City. A comprehensive service plan for the Specific Plan area will be available concurrently or in advance of such reorganization.
6	Duplication of authority to perform similar functions in the same territory will be avoided. Sphere of influence boundaries shall not create islands or corridors unless it can be demonstrated that the irregular boundaries represent the most logical and orderly service area of an agency.	N/A	The extension of the City of Soledad's Sphere of Influence would not create any "islands" and/or corridors. The proposed project site is contiguous to the existing City.
7	The adopted sphere of influence shall reflect City and County General Plans, plans of regional agencies, growth management policies, annexation policies, resource management policies, and any other policies related to ultimate boundary or service area of an affected agency unless those plans or policies conflict with the legislative	N/A	The Miravale Specific Plan is intended to implement the City of Soledad's General Plan land use and development provisions pertaining to designated Expansion Areas in an orderly and comprehensive manner. The Specific Plan accomplishes this through the establishment of land use, infrastructure, public services and financing provisions and

Project Compatibility with Relevant Monterey County LAFCO Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Compatibility**
	intent of the Cortese-Knox Act of 1985 (Government Code Section 56000 et seq.). Where inconsistencies between plans exist, LAFCO shall rely upon that plan which most closely follows the Legislature's directive to discourage urban sprawl, direct development away from prime agricultural land and open-space lands, and encourage the orderly formation and development of local governmental agencies based upon local conditions and circumstances.		programs to direct future development. The Specific Plan ensures a balance between growth and public infrastructure and services by ensuring that development pays its fair share of infrastructure and pubic service and facility costs, and that such infrastructure and services are in place as needed by each planned phase of development.
8	Extension of urban type services promotes urban development and such development belongs in cities or areas of development concentration in the unincorporated area of Monterey County. In evaluating proposals involving urban development requiring an urban level of governmental services, the Commission will discourage the formation of new special districts or premature annexation of territory within existing city spheres of influence or logical expansion area. The Commission will discourage boundary change proposals involving urban development outside adopted city spheres of influence that have the potential to negatively impact prime agriculture or open space lands, public service capacity, existing local governmental agencies, or generally represents illogical growth patterns.	Policies 5.1.1.1-5.1.3 5.1.2.1-5.1.2-2 5.1.3.1-5.1.3.5 5.1.4.1-5.1.4.11 5.2.1.1-5.2.1.4 5.2.2.1-5.2.2-8	The proposed project site is located adjacent to existing residential development within the City of Soledad and is identified as a future expansion area under the City's General Plan. As demonstrated in **Sections 4.12 Public Services** and **4.14 Utilities and Service Systems** adequate services and utilities are available or would be provided to serve the proposed development. While the project would result in the loss of agricultural lands classified as "prime farmland" the project site is identified as a future area of urban expansion. Moreover, development and annexation of the project site would not create any "islands" and/or corridors.
9	This Commission, in recognition of the mandated requirements for considering impacts on open space lands and agricultural lands, will develop and determine spheres of influence for Cities and urban service districts in such a manner as to promote the long-term preservation and protection of this County's "Resources." The Commission believes the public interest will be best served by considering "Resources" in a broad sense to include open space,	Policies 4.1.2.1-4.1.2.12	According to the City of Soledad General Plan, the project site is located within an area identified for future expansion. The proposed project, which includes residential, commercial, recreational, and public uses, would be consistent with the City's General Plan upon project approval. As identified in **Section 4.12 Public Services** development of the proposed project would provide open space opportunities for area residents, in addition to improved public parkland. While the

Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Compatibility**
	recreational opportunities, wildlife, and agricultural land. Sphere of influence determinations must conform with the Commission's Agricultural Preservation Policy adopted in November, 1979.		proposed project would result in the permanent conversion of agricultural land into an urban use, this area was contemplated under the 2005 General Plan as a future area of commercial and residential development. For more information regarding the project's impacts on agricultural resources, please refer to **Section 4.2 Agricultural Resources.**
Draft Sphere of Influence Policies			
1	For annexations and Spheres of Influence applications, LAFCO of Monterey County shall consider as part of its decision whether the proposal mitigates its regional traffic impacts by, for example, monetary contribution to regional transportation improvement fund as established by the Transportation Agency of Monterey County or otherwise:	Please refer to Section 3.1 of the Miravale Phase III Specific Plan	As indicated in **Section 4.13 Traffic and Circulation,** development of the proposed project would be required to mitigate regional transportation impacts through the payment of regional impact fees.
2	For annexations and Sphere of Influence applications, LAFCO of Monterey County shall consider as part of its decision whether the city in which the annexation or Sphere of Influence amendment is proposed has included certain goals, policies, and objectives into its General Plan that encourage mixed uses, mixed densities, and development patterns that will result in increased efficiency of land use, and that encourage and provide planned, well-ordered, efficient urban development patterns.	Policies 2.6.a-2.6.j 2.7.a-2.7.g 2.8.a-2.8.o	The City's adopted General Plan, as well as, the Miravale Phase III Specific Plan contain specific policies and measures to insure that development of the project site provides a mix of densities types, and development patterns to increase the efficiency of land use by providing commercial, recreational, residential, and public land uses within the project area.
Government Code Section 56668 "Factors to be considered in the review of a proposal"			
a	Population and population density; land area and land use; per capita assessed valuation; topography, natural boundaries, and drainage basins; proximity to other populated areas; the likelihood of significant growth in the area, and in adjacent incorporated and unincorporated areas, during the next 10 years.	Policies 4.1.2.1-4.1.2.12 2.6.a-2.6.j 2.7.a-2.7.g 2.8.a-2.8.o	The proposed project site is adjacent to existing residential neighborhoods located within the City of Soledad. For more information regarding population, land use, topography, natural boundaries, drainage basins, and other information,, please refer to **Sections 4.4 Biological Resources, 4.8 Hydrology and Water Quality,** and **4.11 Population and Housing.**

Project Compatibility with Relevant Monterey County LAFCO Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Compatibility**
b	Need for organized community services; the present cost and adequacy of governmental services and controls in the area; probable future needs for those services and controls; probable effect of the proposed incorporation, formation, annexation, or exclusion and of alternative courses of action on the cost and adequacy of services and controls in the area and adjacent areas. "Services," as used in this subdivision, refers to governmental services whether or not the services are services which would be provided by local agencies subject to this division, and includes the public facilities necessary to provide those services.	Policies 5.1.1.1-5.1.3 5.1.2.1-5.1.2-2 5.1.3.1-5.1.3.5 5.1.4.1-5.1.4.11 5.2.1.1-5.2.1.4 5.2.2.1-5.2.2-8	As discussed in **Section 4.12 Public Services** and **Section 4.14 Utilities and Services Systems** the proposed project would be served by adequate facilities. Existing services would be extended to the project site and final design of all project infrastructure would be subject to the review and approval of the City of Soledad.
c	The effect of the proposed action and of alternative actions, on adjacent areas, on mutual social and economic interests, and on the local governmental structure of the county.	N/A	Information currently not available.
d	The conformity of both the proposal and its anticipated effects with both the adopted commission policies on providing planned, orderly, efficient patterns of urban development, and the policies and priorities set forth in Section 56377.	N/A	The project site is located within an area identified in the Soledad General Plan as a future expansion area. This area is intended to accommodate projected growth as identified in the General Plan. Adequate services and public facilities would be provided as part of project development. Further, the Miravale Phase III Specific Plan identifies policies and guidelines to insure the orderly and efficient development of the project site consistent with the needs of the City.
e	The effect of the proposal on maintaining the physical and economic integrity of agricultural lands, as defined by Section 56016.	See Section 6.0 of the Miravale Phase III Specific Plan.	Development of the proposed project would occur in approximately four phases over approximately 20 years. The project site has been identified as a future expansion area under the City's General Plan. Portions of the project site currently under a Williamson Act contract would remain undeveloped until such time that the contract expires. For more information regarding the projects impact on agricultural resources, please refer to **Section 4.2 Agricultural Resources.**

Project Compatibility with Relevant Monterey County LAFCO Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Compatibility**
f	The definiteness and certainty of the boundaries of the territory, the nonconformance of proposed boundaries with lines of assessment or ownership, the creation of islands or corridors of unincorporated territory, and other similar matters affecting the proposed boundaries.	N/A	The proposed project site is adjacent to and contiguous with existing residential development within the City of Soledad. Amending the City's Sphere of Influence to include the project site would not result in the creation of any islands and/or corridors that would not be contiguous to the existing City. Moreover, adequate services would be extended to the project site to accommodate project development.
g	Consistency with city or county general and specific plans.	N/A	The project, as proposed, would be consistent with the City's General Plan. More specifically, the proposed project includes several General Plan amendments to insure that development of the site is consistent with the City's vision of the project area. The Miravale Phase III Specific Plan was prepared to insure a consistent and orderly vision of development within the project area.
h	The sphere of influence of any local agency which may be applicable to the proposal being reviewed.	N/A	The project site is immediately adjacent to the City of Soledad and is located within an area identified for future expansion.
i	The comments of any affected local agency or other public agency.	N/A	Not applicable at this time.
J	The ability of the newly formed or receiving entity to provide the services which are the subject of the application to the area, including the sufficiency of revenues for those services following the proposed boundary change.	N/A	As discussed in **Section 4.12 Public Services** and **Section 4.14 Utilities and Services Systems** the proposed project would be served by adequate facilities. Existing services would be extended to the project site and final design of all project infrastructure would be subject to the review and approval of the City of Soledad.
k	Timely availability of water supplies adequate for projected needs as specified in Section 65352.5.	N/A	As discussed in **Section 4.14 Utilities and Services Systems** the City has adequate water supply available to support full buildout of the General Plan, including the proposed project. According to the Water Supply Assessment prepared for the project, adequate water is available to accommodate project

Project Compatibility with Relevant Monterey County LAFCO Policies			
Policy Number	**Policy Summary**	**Applicable Specific Plan Policy Number**	**Compatibility**
			development.
l	The extent to which the proposal will affect a city or cities and the county in achieving their respective fair shares of the regional housing needs as determined by the appropriate council of governments consistent with Article 10.6 (commencing with Section 65580) of Chapter 3 of Division 1 of Title 7.	N/A	Development of the proposed project would provide approximately 4,200 residential units, including low, medium, and high density units. As identified in **Section 4.11 Population and Housing,** development of the proposed project would allow the City to achieve their fair share of the regional housing needs. Please refer to that section for further discussion.
m	Any information or comments from the landowner or owners.	N/A	Not applicable at this time.
n	Any information relating to existing land use designations.	N/A	According to the Monterey County General Plan, the project site is currently designated as Farmland and Permanent Grazing. Upon annexation, the project site would be designated for commercial, residential, recreational, and open space uses. Please see **Section 4.9 Land Use and Planning** for further information.

Notes:
1. Intersection control based on existing conditions
   -TWSC = Two-way stop-controlled intersection
   -AWSC = Four-way stop-controlled intersection
2. Significant impacts are shown in **BOLD** and boxed.
3. *Italics* and **BOLD** indicates signal warrant met.

Notes:
1. Intersection control based on existing conditions
   -TWSC = Two-way stop-controlled intersection
   -AWSC = Four-way stop-controlled intersection
2. Significant impacts are shown in **BOLD** and boxed.
3. *Italics* and **BOLD** indicates signal warrant met.

Source:
ITE Trip Generation, 7th Edition

Notes:
/a/ Single-Family Detached Housing (210) average rates used for proposed single-family units
/b/ Apartment (220) average rates used for proposed multi-family units
/c/ Senior Adult Housing-Attached (252) average rates used for proposed senior housing units
/d/ Hotel (310) average rates used for proposed hotel units
/e/ Specialty Retail Center (814) average rates used for proposed retail space. No AM peak hour rates are available for Specialty Retail, therefore half of the PM peak hour rates were assumed for the AM peak hour.
/f/ A reduction of of residential trips equal to 90% of Retail "A" and 50% of Retail "B" was applied for internalization of retail/residential uses.
/e/ A reduction of 25% to account for pass-by trips was applied to retail use during the PM peak hour

1.0 Introduction and Purpose of Report

1.1 Project Description and Location

The City of Soledad proposes to adopt a Specific Plan for the Miravale Phase III Project. This project is proposed to be located on the northern edge of the City of Soledad (see Figures 1 and 2) and consists of a mixed use development of 1,470 single-family residential units at an average density of 6.1 dwelling units/acre, 2,614 units in village residential settings consisting of a variety of attached housing styles at an average density of 18.99 dwelling units/acre. Commercial uses include a 120 room hotel, up to 275,000 square feet of retail commercial uses and an 18-hole golf course and driving range. Two elementary and one middle school sites are also planned, along with fire and police substations, and 75 acres of parkland and open space and a 1.67 acre church site. Table 1 depicts a summary of these proposed land uses. The project site is generally between San Vicente Road and Orchard Lane, and is surrounded by agricultural land to the north and east, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the west. Figure 3 depicts the overall land use plan for the Specific Plan.

The project site is currently zoned for farmland and grazing, which has comprised the recent historic uses, with row crops cultivated on the lower, more level terrain below the 400-foot contour line and grazing uses above this line. Row crops have been irrigated with groundwater from the Salinas Basin.

1.2 Purpose of Water Supply Assessment.

The City of Soledad is required to consider this water supply assessment (Water Code section 10910 et. seq.) and written verification of supply (Government Code section 66473.7) as part of the review and approval process for the land use entitlements on the Project. This water supply assessment and written verification of supply will be included in the draft Environmental Impact Report for the Miravale III Specific Plan.

1.3 Requirements for Water Supply Assessments

On October 9, 2001 former Governor Gray Davis signed into law Senate Bills 610 (Costa) and 221 (Kuehl) (Chapters 643 and 642, respectively, Statutes of 2001) requiring the preparation of a water supply assessment in conjunction with project review under the California Environmental Quality Act (CEQA), and a written verification of water supply where a tentative subdivision map is proposed for approval. The general intent of SB 221 and 610 was to create additional assurance that certain new developments could be provided with a reliable supply of water. It also intended that existing users and others dependent on common sources of water affected by new development were informed of the development's effect on those supplies, and plans to maintain reliable supplies. The legislation also serves to better inform decision makers regarding the water supply implications of development.

SB 610 requires that a water supply assessment be prepared for certain developments, including residential developments in excess of 500 units, where an environmental impact report or negative declaration is being prepared under CEQA. The requirement adds a specific water supply assessment protocol for land use jurisdictions to follow and consider in evaluating the environmental impacts for a proposed project. In the present case, a Water Supply Assessment must be included in the Environmental Impact Report prepared for the proposed Specific Plan. The City of Soledad must determine, based on the entire record, whether water supplies projected in the water supply assessment will be sufficient to satisfy the demands of the proposed project in addition to existing and planned future uses over a 20-year planning horizon.

SB 221 requires a city or county to include as a condition of approval of any tentative map, parcel map or development agreement for residential developments of 500 dwelling units or more, a requirement that a "sufficient

water supply" be available.[1] Proof of this supply must be on the basis of a written verification from the public water system that will serve the development. The City of Soledad is the public water supplier for the proposed development. The City requested an independent analysis of water supply availability for the project from Byron Buck and Associates.

1.4 Relationship of this Document to City of Soledad Urban Water Management Plan

The Urban Water Management Planning Act requires municipal water providers serving over 3,000 acre-feet per year (AF/Y) of water or having 3,000 service connections to prepare plans (urban water management plans or UWMPs) on a five-year, ongoing basis. A UWMP must demonstrate the continued ability to provide water supplies for current and future expected development under normal, single dry and multiple dry year scenarios. These plans also require the assessment of urban water conservation measures and wastewater recycling. Pursuant to Section 10632 of the California Water Code, the plans must also include a water shortage contingency plan outlining how water providers will manage water shortages of up to 50 percent of their normal supplies in a given year.[2]

Soledad adopted a revised UWMP in December of 2005. The 2005 UWMP projects demands for 20 years and UWMPs are updated on a five-year basis, with the next update coming in 2010. As provided for in the law, this water supply assessment incorporates by reference and relies upon many of the planning assumptions and projections of the 2005 UWMP in assessing the water

---

[1] Under SB221, a "sufficient water supply" is defined as *"... the total water supply available during normal, single dry and multiple dry years within a 20-year projection that will meet the projected demand associated with the proposed subdivision, in additional to existing and planned future uses..."* (Government Code 66473.7(a)(2).) This does not mean that 100 percent of the development's normal or unrestricted water demand must be met 100 percent of the time, nor does it mean that the new development may not have any impact on the service level to existing customers of the water provider. A "sufficient water supply" may be found to exist for a proposed subdivision as well as for existing customers as long as an acceptable water supply can be estimated and planned for during a record drought (ACWA, 2002).

[2] Like SB 610 and SB 221, specific levels of supply reliability are not mandated (i.e., whether a specific level of demand can be met over a designated frequency). Rather, the law provides that a specific level of reliability is a local policy decision of the water provider.

demand of the proposed project relative to the overall increase in demands expected by Soledad. The 2005 UWMP assumes the development of the Miravale III Project in evaluating the demands to be made on Soledad's water supplies, although proposed uses discussed herein are more detailed, allowing for a more refined water demand analysis. The UWMP anticipates the Miravale project to phase in beginning in 2010 through 2025 (UWMP, p.6). The 2005 UWMP finds a sufficient supply available to meet expected water demands based upon the general plan build-out of the City.

2.0 Project Water Demands and Forecasting Methods

2.1 Project Water Demands

Table 2 depicts projected average annual water demands for the Miravale III project using water use factors that are based upon local climate and geography for land uses proposed. The analysis recognizes that plumbing fixtures in new development will comply with current plumbing code standards, requiring low flow plumbing devices. Soledad is planning to implement an aggressive wastewater recycling program, where current and future wastewater flows will be treated to tertiary treatment standards allowing for reuse in irrigation applications. The City is currently expanding its wastewater treatment plant to 5.5 million gallons per day (MGD) treatment capacity and a 4.3 MGD disposal capacity and is planning to purchase the wastewater treatment plant owned by the State Department of Corrections and Rehabilitation and leased and operated by the City with a disposal capacity of 1.2 MGD. By 2010 the City plans to upgrade both facilities to meet tertiary treatment standards, allowing for use of recycled water for irrigation. The recycled water from these plants not used for urban reuse is ultimately planned to substitute for groundwater use by agricultural land uses surrounding the City.

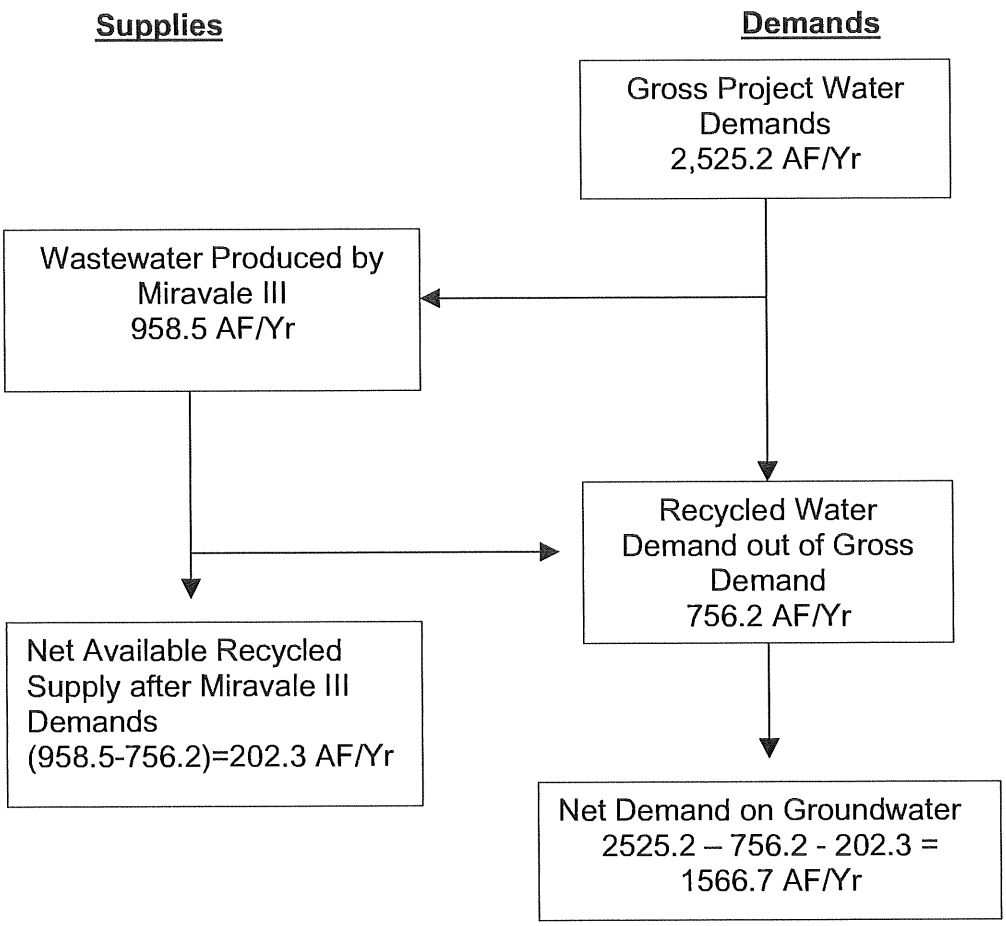
A satellite recycled water plant with an initial capacity of 1.0 MGD treatment capacity expandable to 2+MGD will be constructed with the project. The

development will also provide sufficient storage pond capacity for build out of the project in an amount necessary to be able to store excess recycled water in times of low demand, such as rain events. This plant will store water in the golf course pond, allowing for recycled water use at the golf course and throughout the development. The Miravale III project will be designed to utilize recycled wastewater for the golf course, parkland, roadway landscaping and single family residential front-yard irrigation demands. This will lower the net demand for groundwater pumped to supply the development.

Table 2 depicts projected demands based upon currently proposed land uses and densities. Actual water demands will vary depending upon the ultimate mix of specific uses, water use behavior of the residents and property managers, and landscape development and maintenance practices. These estimates are based on long-term averages at full project build-out. In any given year, consumption is expected to vary year-to-year by as much as seven percent, depending on weather and precipitation, with the greater use in drier years. During the first few years after any given phase of development occurs, expected water use would likely be higher for landscape uses on a unit basis as new landscape plantings require additional water to become established. After plantings mature, landscape use would reduce to a more static level.

2.2 Forecasting Methodology

Analysis of water demands for a project such as the Miravale III development where prior land uses existed must take into account the local context of historic and future water use. The development site was historically in agricultural uses, with the lower, more level lands irrigated for row crop production with groundwater pumped from the Salinas groundwater basin. Upland areas of the site were used for dry-land grazing, resulting in no groundwater demand. Historic water use for the site was estimated based upon aerial photo analysis of cropped areas and typical water consumption and irrigation efficiencies for row crops, allowing for proper soil salinity management and annual rotational



fallowing (about 20 percent of lands would be fallowed annually to allow for good soil management practice).[3]

Development into residential, commercial and recreational uses will replace agricultural water use. Additionally, as mentioned above, recycled water will be extensively used in the development, and the residential and commercial uses will also produce wastewater that will become reusable water supply through the recycled water systems. Thus, an analysis of water use must account for these factors in order to indicate what the net demand on the local and regional groundwater aquifer system, the primary water source for the City of Soledad and the Salinas Valley region. The analysis as shown in Table 2 follows this general water demand equation: (gross water demands including potable and recycled water demands) - (wastewater produced for recycling – recycled water demand) = Net groundwater water demand for the project. Then, (net groundwater water demand for the project) – (net groundwater demand from historic uses) = net total change in groundwater demand/aquifer impact. Figure 4 shows this diagrammatically.

Legal requirements for water supply assessments do not specify a particular method to project usage, nor are specific water use factors mandated for given land uses, as such use varies by location and other use factors such as population and visitor densities. Because water demand forecasts are estimates, not guarantees, with them come varying degrees of uncertainty. For example, for residential uses of the project the analysis utilizes a conservative average consumption factor for each residential unit, broken in to standard (<.0.25 acre) and larger lot classes. Lot sizes in the development and the number of persons per household will vary, and landscaping preferences and practices of future residents will cause individual units to vary from the mean value figures used in

[3] There is no data available on actual fallowing practices for this site. However, this assumption is conservative in that if fallowing was not practiced, prior consumption would be about 20 percent higher than estimated herein and the net benefit of the Miravale project on the groundwater basin as proposed would be even greater.

Figure 4
Miravale III Water Balance

this analysis. Such variations, however, would not affect the overall conclusions in this analysis.

3.0 Available Water Supply

The City of Soledad is the municipal purveyor of water for lands within its limits. Soledad's water supply is groundwater from the Forebay Subarea of the Salinas Valley groundwater basin. The status of the groundwater basins, their management and current production of Soledad from the Salinas Basin and Soledad's legal entitlement to groundwater is discussed in detail in Section 3 of the 2005 Urban Water Management Plan. Historic and projected groundwater to be pumped is found in Tables II and III in the UWMP. The City pumped 1,716 AF in 2000 and that has grown to 2,345 AF in 2004. The City anticipates pumping up to 8,458 AF in 2025 and by extension, 8,764 AF in twenty years time, at 2026. However, this projection is conservative in that it does not represent all new demands on the groundwater basin, as existing agricultural uses will be retired in this process, mitigating much of the impact on the basin.

The City's UWMP also discusses the Salinas Valley Water Project, the regional plan to manage surface and groundwater for the Salinas Valley and its groundwater basin, overseen by the Monterey County Water Resources Agency. Soledad's total groundwater production currently constitutes less than 2 percent of the annual Salinas Valley Groundwater Basin yield. The large buffering capacity of this basin insulates its users from water shortages more common within systems dependent upon annual surface water runoff. Therefore, Soledad's supplies do not vary significantly due to annual hydrology. As such normal, single dry, and multiple dry years are considered similar for water supply planning purposes.

The Salinas Valley groundwater basin is not an adjudicated basin and there are currently no limits on groundwater that may be pumped for overlying uses within the Forebay Subarea. While the basin has experienced overdraft at its coastal

margins, no overdraft concerns exist in the Soledad region, or in the Forebay Subarea of the aquifer. The adoption of the Salinas Valley Water Project convinced the State Water Resources Control Board that adjudication was not the proper approach to address issues of overdraft in this basin, rather that the physical solutions offered by the Salinas Valley Water Project would bring the basin into balance over time.

The City has, however, experienced local groundwater contamination from nitrate and pesticide contamination that has had to be managed, as discussed in Section 3 of the UWMP.

(5) 40% landscape			
(6) 10% buffer area irrigated only, drought tolerant landscape			
(7) no change in land use			

4.0 Water Conservation

Water conservation and Soledad's efforts to implement the Best Management Practices (BMPs) for Urban Water Conservation are discussed in Section 8 of the 2005 UWMP. Conservation effects of current water conserving plumbing code requirements on water demands are built into the demand forecasts for Soledad. The proposed Miravale III project will be fully metered and required to comply with current plumbing code requirements calling for low-flow plumbing fixtures.

5.0 Water Supply Sufficiency Analysis

As shown in Table 2, while the City will have to pump about 1,566 AF/Y to meet the demands of the project, the net effect of the Miravale III Specific Plan development as proposed, when taking into account prior groundwater use on the site by agricultural uses, will be a reduction in historic net groundwater pumping from the basin by approximately 501 acre-feet per year. Therefore, the project will assist the Monterey County Resources Agency in achieving balanced use and recharge to the Salinas Valley groundwater basin through the Salinas Valley Water Project. This net increase in regionally available water supply can be attributed to the recycled water component of the project and the City's overall recycled water plans. These plans must be pursued to assure a net positive impact on the region's water resources.

6.0 Availability of Water Treatment and Delivery System Capacity

The significant growth in Soledad, including the Miravale III project, will require commensurate investment in water supply infrastructure for the City, and the Miravale III development in particular. Soledad's current plans to upgrade its water delivery infrastructure are described in Section 7 of the 2005 UWMP and include installation of two new high capacity wells, 1.4 million gallons of system storage, two miles of new transmission mains, four new pump stations and

remote electronic monitoring and management systems. The Miravale III water distribution system on site will be designed for five pressure zones, with development of the zones phased in along with other improvements. In-tract distribution systems will be designed and constructed by the developer to accommodate necessary demand and fire flows for the project in accordance with City design standards. No treatment other than chlorination for maintenance of system disinfection is currently expected.

7.0 Regulatory Permits Necessary for Supply Delivery

Soledad's local supplies are maintained under a public water supply permit from the State Department of Health Services. Additions to Soledad's water supply infrastructure will require the permits to be updated to include new supply facilities for the Miravale III development. Soledad is the permitting entity for local building codes with respect to construction of water treatment and delivery facilities. Implementation of recycled water systems will require new authorizations from the Department of Health Services. No other discretionary permits are expected to be necessary for supply infrastructure as sensitive resources such as wetlands or other waters of the United States are not affected.

8.0 Effect on Agricultural and Industrial Users Not Supplied by the City of Soledad but Reliant on the Same Sources

Agricultural users in the Salinas Valley generally rely on the same basin-wide supply from the Salinas Valley Groundwater Basin. These uses are taken into account in the basin planning of the Monterey County Water Resources Agency as part of developing a water balance for the Basin. Because of Soledad's plans for recycled water and the net reduction in demand on the Salinas Valley groundwater basin due to the Miravale III project's aggressive use of recycled water, the Miravale project will have a net positive impact on water supplies available for other users of the Salinas Valley groundwater basin.

9.0 Summary Water Supply Sufficiency Determination

Pursuant to Section 10910 of the California Water Code, and based on the foregoing analysis and representations by the project's proponents and the City of Soledad, Soledad has determined that its currently projected water supplies are sufficient to meet the projected annual water demands of existing and previously approved uses and the Miravale III project during normal, single dry and multiple dry years during the next twenty years.

Pursuant to California Government Code Section 66473.7, Soledad has determined based on the foregoing analysis and representations by the project's proponents that it has sufficient currently available water supply available within normal, single-dry and multiple dry years over the next 20 years, in addition to existing and planned future uses to provide for the anticipated water demands of the Miravale III Tentative Subdivision Map.

City of Soledad, 2006 Miravale III Specific Plan. 2006

City of Soledad, Miravale Phase III Notice of Preparation. August, 2006

Monterey County Water Resources Agency, Salinas Valley Water Project EIR, 1998.

The Miravale Phase III Subdivision EIR outlines the four phased build out of the 920 acre project site over the next twenty years. The totals for the completed project are 1,470 single-family residential units, 2,730 multi-family units, and 120 hotel rooms. Due to the phasing of the project in five year intervals the actual building schedule is:

2008-2013	304 Single Family units, and 71 Multi-family units = 375 residential
2013-2018	682 Single Family units, and 358 Multi-family units = 1,040 residential
2018-2023	280 Single Family units, and 358 Multi-family units = 438 residential
2023-2028	204 Single Family units, 746 Multi-family units, and 500 senior housing units = 1,450 residential

The combination of the existing and approved housing units in Monterey County (147,879) plus the 375 increase of proposed housing units in the Miravale Phase III Subdivision EIR is 147,907 still less then the regional forecasts for Monterey County (161,255) in year 2015. The 1,040 residential units to be added by 2018 is also less than the forecasted county limits, as is each future build phase. Therefore the Miravale Phase III Subdivision EIR is **consistent** with the 2004 regional forecasts and the Air Quality Management Plan.

Please feel free to contact me if you have any questions about this determination.

Sincerely,

David Roemer
Associate Planner

TECHNICAL APPENDIX T-1

Agricultural Resources Report &
Land Evaluation & Site Assessment for Miravale III (Buchanan Associates)

AGRICULTURAL RESOURCES

Project implementation would result in the conversion of 760 acres of prime agricultural land to residential and commercial uses. Impacts related to the loss of such agriculturally suitable land would be significant and unavoidable. Potential impacts related to land use conflicts between proposed development and adjacent agricultural uses would be significant but can be largely mitigated.

Monterey County Agricultural Resources

Monterey County is one of the primary agricultural regions in the State of California. The total value of agricultural products produced has been increasing steadily in real dollars (accounting for inflation) since 1990. Monterey County ranked third in the state in the value of crops produced in 2002 and as of 2005 was ranked fourth. Table 1 shows important crop revenues for Monterey County in 2002 and 2005. The data reflect the continuing importance of leaf lettuce and strawberries, as well as, the increasing importance of winegrapes and nursery crops. Conversely, the recent significant expansion of spinach production may be tempered in the near term. The gross value of agricultural production is multiplied by a factor of two to three times through the local economy due to the involvement of other sectors of the economy, including industry, retail trade and commercial services.

Table 1. Changes in value of selected Monterey County crops between 2002 and 2005

Crop	Value	
	2002	2005
Leaf lettuce	$429,400,000	$600,800,000
Head lettuce	$309,150,000	$311,800,000
Broccoli	$265,900,000	$156,100,000
Strawberries	$226,850,000	$385,750,000
Nursery	$218,700,000	$276,200,000
Grapes	$147,100,000	$254,600,000
Spinach	$49,100,000	$164,800,000
Spring Mix	$119,320,000	$132,277,000

Source: Monterey County Crop Report, 2002 and 2005

Project Area Setting

The Project Area is located in an area north and west of the current Soledad City limits currently undergoing a transition from agricultural to residential and commercial uses. Currently approximately 430 acres of the 929 acre Project Area appear to currently be used for the production of irrigated row crops including grapes (approx. 155 acres), lettuce, and leafy greens (approx. 275 acres) . At the time of initial site visit, approximately 330 acres in the Project Area were not actively cropped. The remaining non-irrigated land area (approximately 170 acres) is grassland. Equipment storage areas, worker housing, other buildings, and water detention and impoundment ponds comprise approximately 7 acres of the non-cropped area. Within the Project Area one parcel

of approximately 100 acres is under Williamson Act contract, but is currently in non-renewal status with cancellation pending in 2016.

Land uses surrounding the proposed Project Area are varied. The northern and eastern boundaries are largely grazing and fallow lands, although approximately 2,000 feet in the southwest corner is adjacent to San Vincente Rd. and existing residential areas. The southern boundary is adjacent to predominantly residential development, while all of the western boundary is adjacent to irrigated row crop land. Current crop production (winegrapes) is within approximately 50 feet of the exisitng residential areas on the southern boundary, while residential development at the southeastern corner of the Project Area was estimated to be approximately 150 feet from adjacent field crop land.

Impact Analysis

The City of Soledad has applied an objective methodology to determine thresholds of significance for impact to agricultural resources that is consistent with California Environmental Quality Act (CEQA) Guidelines. In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;
- conflict with existing zoning for agricultural use, or a Williamson Act contract; or
- involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use.

Methodology

The California Agricultural Land Evaluation and Site Assessment model (LESA) was used to rate potential impacts due to project development. This provides an objective quantitative approach for rating the relative quality of land resources based upon specific measurable features. The LESA model is a point-based approach to assessing the relative value of agricultural land resources which relies on two separate sets of factors: land evaluation, which are primarily soil-based qualities of land, and site assessment factors that are intended to measure social, economic, and geographic attributes. The formulation of a California Agricultural LESA Model is the result of Senate Bill 850 (Chapter 812 /1993), which charges the Resources Agency, in consultation with the Governor's Office of Planning and Research, with developing an amendment to Appendix G of the California Environmental Quality Act (CEQA) Guidelines concerning agricultural lands. Such an amendment is intended "to provide lead agencies with an optional methodology to ensure that significant effects on the environment of agricultural land conversions are quantitatively and consistently considered in the environmental review process".

The California Agricultural LESA Model is composed of six different factors. Two Land Evaluation factors are based upon measures of soil resource quality. Four Site Assessment factors provide measures of a given project's size, water resource availability, surrounding agricultural lands, and surrounding protected resource lands (e.g. open space, conservation easement, or Williamson Act contract). For a given project, each of these factors is separately rated on a 100 point scale. The factors are then weighted relative to one another and combined, resulting in a single numeric score for a given project, with a maximum attainable score of 100 points. It is this project score that becomes the basis for making a determination of a project's potential significance, based upon a range of established scoring thresholds.

Agricultural Land Capability

Overall, there are three separate land classification systems which determine an area's suitability of agriculture and/or provide definition for prime agricultural lands. Increasingly in California, the Department of Conservation's Farmland Mapping criteria are being applied to the assessment of agricultural land capability and determination of impacts due to development of these lands.

Natural Resources Conservation Service (NRCS) Land Capability Class System

Land Capability Classes (LCC) rate soils according to their characteristics and slopes. These classifications range from a 'high' of I-1 to a 'low' of VIIIs-1. Classes I and II are generally considered to be of prime agricultural significance. The NRCS also assigns a Storie Index Rating to soils, which is based exclusively on soil characteristics only. Lands which qualify for a Storie Index Rating of 80 to 100 are considered agriculturally significant.

Cortese-Knox Local Government Reorganization Act of 1985

The Cortese-Knox Act, defines "prime agricultural land" as an area of land, whether a single parcel or contiguous parcels, which has not been developed for a use other than agriculture and which meets any of the following qualifications:

1. Land which qualifies for rating as class I or class II in the Soil Conservation Service land use capability classification and that qualifies for rating 80 through 100 Storie Index Rating.
2. Land which is used to maintain livestock for commercial purposes, which has an annual carrying capacity equivalent to at least one animal unit per acre as defined by the United States Department of Agriculture in the National Handbook on Range and Related Grazing lands.
3. Land planted with fruit or nut-bearing trees, vines, bushes, or crops which have a nonbearing period of less than five years and which will return during the commercial bearing period on an annual basis for the production of unprocessed agricultural plant production not less than two hundred dollars ($200) per acre.
4. Land which has returned from the production of unprocessed agricultural plant products an annual gross value of not less than two hundred dollars ($200) per acre for three of the previous five calendar years.

State Farmland Mapping & Monitoring Program

The State of California's Farmland Mapping and Monitoring Program (FMMP) monitors land use change affecting California's agricultural land. The program, administered by the California Department of Conservation, Office of Land Conservation, produces maps and statistical data to be used for assessing the importance of agricultural lands, which is rated according to soil quality and irrigation status. The best quality land is called Prime Farmland; other classifications, in descending order according to their suitability, include Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Grazing Land, Urban and Built-up Land, and Other Lands.

Prime farmland is land with the best combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date of 1992 (or since 1988).

Farmland of Statewide Importance is land similar to prime farmland, but with minor shortcomings, such as greater slopes or with less ability to hold and store moisture. The land must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date (or since 1988).

Unique Farmland is land of lesser quality soils used for the production of the State's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards, as found in some climatic zones in California. The land must have been cultivated at some time during the two update cycles prior to the mapping date (or since 1988).

Grazing Land is land on which the existing vegetation is suited to the grazing of livestock. The minimum mapping unit for this category is 40 acres.

Urban and Built-Up Land is occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. Common examples include residential, industrial, commercial, institutional facilities, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, and water control structures.

Other Land is not included in other mapping category. For example, low density rural development; brush, timber; wetlands and riparian areas not suitable for livestock grazing; confined livestock; poultry or aquaculture facilities; strip mines, borrow pits; and water bodies smaller than 40 acres. Vacant and nonagricultural land surrounded on all sides by urban development and greater than 40.

Project Area Soil Capability Ratings

Fourteen soil types are found on the Project Area as shown in Figure 1 and Table 2. According to the USDA Soil Survey for Monterey County, the total potentially irrigated land within the Project Area is approximately 82 percent of the total Project Area (760 acres).

NRCS Land Capability Classification - Based on this systems' criteria, approximately 561 acres are considered prime agricultural land due to their Capability Class I and II rating (Table 2).

Cortese-Knox Capability Classification - Three of the four criteria (refer to prior page description) apply to classifying prime lands within the project area. Approximately 500 acres meet criteria #1 exclusively, approximately 430 acres meet criteria #3, while the total potentially irrigated land area of 760 acres (actively cropped plus recently fallowed) could meet criteria #4.

California Department of Conservation - The 760 acres of potentially irrigated land have soils classified as Prime Farmland and Farmland of Statewide Importance by the Important Farmlands Mapping Program.

Regulatory Considerations

The Williamson Act

The California Land Conservation Act, also known as the Williamson Act, was adopted in 1965 in order to encourage the preservation of the state's agricultural lands and to prevent its premature conversion to urban uses. In order to preserve these uses, this act established an agricultural preserve contract procedure by which any county or city within the state taxes landowners at a lower rate using a scale based on the actual use of the land for agricultural purposes, as opposed to its unrestricted market value. In return, the owners guarantee that these properties would remain under agricultural production for a 10-year period. This contract is renewed automatically unless a notice of non-renewal is filed by the owner. In this manner, each agricultural preserve contract (at any given date) is always operable at least nine years into the future. The owner of the property may file a Notice of Non-Renewal, which would cause the contract to expire in 10 years. After the contract has expired, a landowner may apply to remove that property from an agricultural preserve. The landowner also has the option of petitioning the Board of Supervisors for the cancellation of the contract. Cancellation of the contract involves payment of substantial cancellation fees.

As noted previously, within the Project Area there is one parcel of approximately 100 acres that is currently in non-renewal status with anticipated cancellation in 2016.

City of Soledad General Plan

The Agricultural Resources section of the Soledad General Plan contain goals and policies that seek to limit adverse impacts to agricultural operations due to new development, and further, to protect and preserve agricultural land. The following are relevant:

C/OS-1 The City shall discourage "leapfrog" development and development in peninsulas extending into agricultural lands to avoid adverse effects on agricultural operations.

C/OS-2 The City shall retain the agricultural land use designation on lands within its planning area until the land is needed for urban development.

C/OS-3 The City shall ensure that new development and public infrastructure projects do not encourage expansion of urban uses outside the general plan area into areas designated Agriculture by the Monterey County General Plan.

C/OS-4 The City shall support the agricultural economy by encouraging the location of agricultural support industries in the City, establishing and promoting marketing of local farm products, and providing its regional fair share of adequate housing to meet the needs of agricultural labor.

C/OS-5 The City shall require a right-to-farm condition to all future subdivision maps adjacent to farmlands.

C/OS-6 The City shall require development within or adjacent to designated agricultural areas to minimize conflicts with adjacent agricultural uses.

Monterey County General Plan (1982)

The proposed project is outside of the current Soledad City limits in an unincorporated area of Monterey County. The Agricultural Element of the current draft County General Plan also contains a goal and policies that seek to promote the long-term conservation of productive and potentially productive agricultural land. Further, the draft Plan also contains a goal and policies to assure that the County's land use policies do not inappropriately limit or constrain "routine and ongoing agricultural activities". The following provide some guidance:

AG–1.1 Land uses that would interfere with routine and ongoing agricultural operations on viable farmlands designated as prime, of statewide importance, unique, or of local importance shall be prohibited.

AG–1.4 Viable agricultural land uses, including ancillary and support uses, on farmland designated as Prime, of Statewide Importance, Unique, or of Local Importance shall be conserved, enhanced and expanded through agricultural land use designations and encouragement of large lot agricultural zoning, except as provided in a Community Plan.

AG–1.5 An ordinance establishing policies that provide tax and economic incentives to enhance the competitive capabilities of farms and ranches, thereby promoting long-term conservation, enhancement, and expansion of viable agricultural lands shall be enacted.

AG-1.12 The County shall prepare, adopt and implement a program that requires projects involving a change of land use designation resulting in the loss of Important Farmland (as mapped by the California Department of Conservation Farmland Mapping and Monitoring Program) or involving land to be annexed to an incorporated area, in consultation with the cities to mitigate the loss of Important Farmland resulting from annexation, to mitigate the loss of that acreage. The program may include ratios, payment of fees, or some other mechanisms. Until such time as the program has been established, the County shall consult and cooperate with the cities so that projects shall mitigate the loss of Important Farmland on an individual basis as much as is feasible as determined by the Board of Supervisors. The acreage in a project or annexation that is to be utilized for inclusionary

housing shall not be subject to this mitigation policy. A Community Plan or Rural Center Plan that includes a mitigation program shall not be subject to this policy. This policy would not apply to annexations covered by the 2006 Greater Salinas Area Memorandum of Understanding (MOU) between the County of Monterey and the City of Salinas.

AG–3.1 "Routine and Ongoing Agricultural Activities" shall be allowed pursuant to the policies in this plan. Activities that may have significant impacts are subject to a greater level of review.

Standards of Significance

As noted earlier, a number of qualitative and quantitative methods are used to determine potential impacts of agricultural land conversion. Monterey County also relies on the Agricultural Commissioner to assess the potential for development activities to impact the agricultural productivity of a given site. Among the criteria used by the Commissioner are:

- *The soil type(s), and its suitability for agriculture as defined by the USDA Natural Resources Conservation Service (NRCS);*
- *Present and past agricultural use of the site;*
- *The size, shape and slope of the site in question;*
- *The availability and use of irrigation;*
- *Agricultural practices on surrounding properties;*

The California LESA Model is weighted so that 50 percent of the total LESA score of a given project is derived from the Land Evaluation factors, and 50 percent from the Site Assessment factors. Individual factor weights are listed below, with the sum of the factor weights required to equal 100 percent.

Table 3. LESA Model project rating factors

- Land Evaluation Factors
  - Land Capability Classification (25%)
  - Storie Index Rating (25%)
  - **Land Evaluation Subtotal (50%)**
- Site Assessment Factors
  - Project Size (15%)
  - Water Resource Availability (15%)
  - Surrounding Agricultural Lands (15%)
  - Surrounding Protected Resource Lands (5%)
  - **Site Assessment Subtotal (50%)**
- Total LESA Factor Weighting 100%

A single LESA score is generated for a given project after all of the individual Land Evaluation (LE) and Site Assessment (SA) factors have been scored and weighted (Table 4). The final project scoring is based on a scale of 100 points, with a given project being capable of deriving a maximum of 50 points from the Land Evaluation factors and 50 points from the Site Assessment factors. Scoring thresholds are based upon both the total LESA score as well as the component LE and SA subscores. In this manner the scoring thresholds are dependent upon the attainment of a minimum score for the LE and SA subscores so that a single threshold is not the result of heavily skewed subscores (i.e., a site with a very high LE score, but a very low SA score, or vice versa).

Table 4. California LESA Model Scoring Thresholds for Significance

Total LESA Score	**Scoring Decision**
0 to 39 Points	Not Considered Significant
40 to 59 Points	Considered Significant only if LE and SA subscores are each greater than or equal to 20
60 to 79 Points	Considered Significant unless either LE or SA subscore is less than 20
80 to 100 Points	Considered Significant

Impacts and Mitigation

The LESA model rating results in a significant impact determination for the proposed project (Table 5). This is largely due to the predominance of prime soils and large land area of the Project Area, as well as, a high percentage of agricultural land in the Zone of Influence surrounding the Project Area.

Table 5. LESA Model project score results

Land Evaluation Factors	Weighted Rating
Land Capability Classification	18.25
Storie Index Rating	15.95
Land Evaluation Subtotal	**34.2**
Site Assessment Factors	
Project Size	15.0
Water Resource Availability	12.1
Surrounding Agricultural Lands	14.25
Surrounding Protected Resource Lands	0.0
Site Assessment Subtotal	**41.4**
Total LESA Score	**75.6**

Impact 1

The proposed project will convert a total of 929 acres of agricultural and grazing land to residential and commercial uses. Of this total the project would convert approximately 760 acres of Prime Farmland to non-agricultural use. This has been determined to be a significant impact.

As the City of Soledad is largely surrounded by agricultural land, the City may have limited options other than conversion of farmland if it is to grow to meet population and housing demand. There are a number of policies and programs in place that attempt to limit the loss of farmland. The policies of the City of Soledad and policies in the current and draft County General Plans strongly encourage new development to occur only within areas that are within the City's urbanizing area and discourage the conversion of agricultural lands to urban uses where urban services are not available.

The project area is contiguous to the City's current boundaries and part of "expansion areas" identified in the General Plan as appropriate areas for accommodation of the City's planner growth over the next 25 to 50 years. The impacts to agricultural lands due to development accommodated by the Land Use Element was identified as a Class I unavoidable significant impact due to the conversion of 3500 acres of state-identified prime agricultural land. Therefore, the proposed project constitutes a part of the previously-identified impact, and would not result in an additional significant impact to the one already determined.

Impact 2

The proposed project has the potential to impact routine and on-going agricultural activities on the areas adjacent to the northern, eastern, and western boundaries of the Project Area. The following mitigation measures are recommended to reduce these impacts to the extent possible.

(2-1) Mitigation Measure - Access for agricultural equipment and vehicles to the adjoining row crop land on the western boundary shall continue be provided from the ramp to Highway 101 North (see Figure 2). The current access road to the Braga property should remain at the current width to allow for passing and ensure adequate turnaround space for field equipment.

Significance After Mitigation - Implementation of this measure would reduce impacts to routine and on-going agricultural operations on lands west of the proposed Project Area.

(2-2) Mitigation Measure - Adequate buffer areas between urban and agricultural uses shall be incorporated into the final design of the proposed project. The inclusion of an agricultural buffer is to protect the public health, safety and welfare of people and protect the economic viability agricultural production. Buffers are required to lessen public and animal exposure to agricultural chemicals, dust, noise and odors and protect agricultural operations and land from vandalism, pilferage, trespassing and complaints against standard legal agricultural practices. The requirements for and attributes of functional buffers may differ dependent on the nature of routine and on-going agricultural operations and practices. Generally agricultural buffers can include constructed fences or walls, earthen berms, roadways, drainage ditches, parking areas, landscaped or other vegetated areas. In some cases, buffers should be considered temporary, when it is anticipated that further development beyond the existing boundary is planned. The current County General Plan does not specify requirements, including distance, for agricultural buffers. However, the proposed draft General Plan (AG–1.2) includes the following guidelines:

The following criteria shall be used to establish agricultural buffers to protect existing agricultural operations:

a. Factors to consider include the type of non-agricultural use proposed, site conditions and anticipated agricultural practices. Other factors include weather patterns, crop type, machinery and pesticide use, existence of topographical features, trees and shrubs, and possible development of landscape berm to separate the non-agricultural use from the existing agricultural use.

b. Drainage, shading, vegetation, and erosion control shall be considered in the establishment of an agricultural buffer area and be made beneficial to the adjacent agricultural use.

c. Buffers shall be designed to comply with applicable state and local laws regulating school buffers, pesticide setbacks, and other controls.

d. Agricultural buffers and/or easements shall be provided from the proposed new use and not from the adjacent agricultural land unless by mutual agreement between the two landowners.

e. Agricultural buffers are designed to be used for the purposes and manner described in this policy and for no other purposes unless agreed to by abutting landowners.

f. Buffer maintenance will be the responsibility of the underlying fee title owner.

g. Buffers are not meant to be permanent and will be terminated once the underlying reason for the buffer no longer exists.

Western Boundary Buffer - All of the land on the western edge and southwest corner of the Project Area adjoins row crop lands used for vegetable production. Routine and on-going operations will typically generate dust and noise, and require application of pesticides (likely ground applied). The current access road immediately adjacent to this boundary has heavy agricultural equipment traffic and is used for temporary storage of field equipment. There are also two surface impoundments for irrigation close to the project boundary. An additional factor to consider is prevailing wind direction and duration which increase the likelihood for potential conflict between agricultural and residential land uses. Currently the Monterey County Agricultural Commissioner recommends at least a 200 foot buffer from residences for ground application of pesticides. Aerial application permit conditions require 1,000 and up to 600 foot distances for fixed wing and helicopter application, respectively.

Therefore, an adequate buffer shall require some type of physical barrier combined with adequate distance (minimum 200 feet) in areas where residential and commercial structures are to be located. This is required to minimize the potential liabilities related to safety and potential injury, theft, and vandalism. The proposed Urban Reserve and golf course fairways in the northwest area (currently Williamson Act contract lands) would provide adequate buffer distance as long as access to adjacent fields can be restricted. Vegetation in the area will need to be managed to be consistent with agricultural pest and food safety management requirements for leafy green and vegetable crops. The proposed project has included a planned buffer along the residential areas that shall meet minimum requirements for distance and include physical barriers. Any planned landscaping must be consistent with agricultural pest and food safety management requirements for leafy greens and other vegetable crops.

Northern Boundary Buffer - Most of the land on the northern edge of the Project Area adjoins rural residential and grazing lands or non-agricultural land owned by the City of Soledad. Routine operations on these lands are less likely to generate conflicts between land uses, therefore adequate buffer could be achieved with physical barriers and a minimum 50 foot distance from residential structures. As a significant portion of the northern boundary towards the east will be park open space, this should serve as adequate buffer as long as public access to adjacent private lands is restricted.

Eastern Boundary Buffer - All of the land on the eastern edge of the Project Area adjoins rural residential and grazing lands. Routine operations on these lands are less likely to generate conflicts between land uses, therefore adequate buffer could be achieved with physical barriers and a minimum 50 foot distance from residential structures.

Significance After Mitigation - Implementation of the above measures would reduce land use impacts related to agricultural operations to a less than significant level.

(2-3) Mitigation Measure - New residents and workers within the Project Area shall be informed of the County's "Right-to-Farm" ordinance. Effective noticing is essential to make property owners and other located near agricultural operations aware of potential conditions that are accepted practices within Monterey County.

Significance After Mitigation - Implementation of this measure would reduce impacts to routine and on-going agricultural operations on lands adjacent to the proposed Project Area.

Cumulative Impact of Agricultural Land Conversion

Conversion of agricultural land to urban uses continues to be a public policy issue in California. The Farmland Mapping and Monitoring Program (FMMP) has determined that approximately 828,445 acres (approximately 1.8 percent of California's landmass) were converted to urban and built-up uses between 2000–2002. Of the total acres converted, 397,097 were formerly cropland and 172,857 were formerly grazing land.

Monterey County cities and residential communities continue to grow and in recent years, agricultural land has been converted to residential and other non-agricultural uses. Based on data from the FMMP for the years 2000 to 2004 (Table 6), it would appear that the majority of residential and commercial development has occurred on prime farmlands (prime and important lands, combined). However, the conversion of prime irrigated lands is not consistently related to the increases in urban land areas. As example, Table 7 shows that between 2000 and 2002, approximately 12.5 percent of irrigated farmland loss was due to conversion to urban development. During this period total irrigated agricultural acreage increased by 1,596 acres. The additional prime land is largely attributable to the conversion of non-irrigated grazing and other lands.

Table 6. Change in Monterey County prime and important farmland acreage

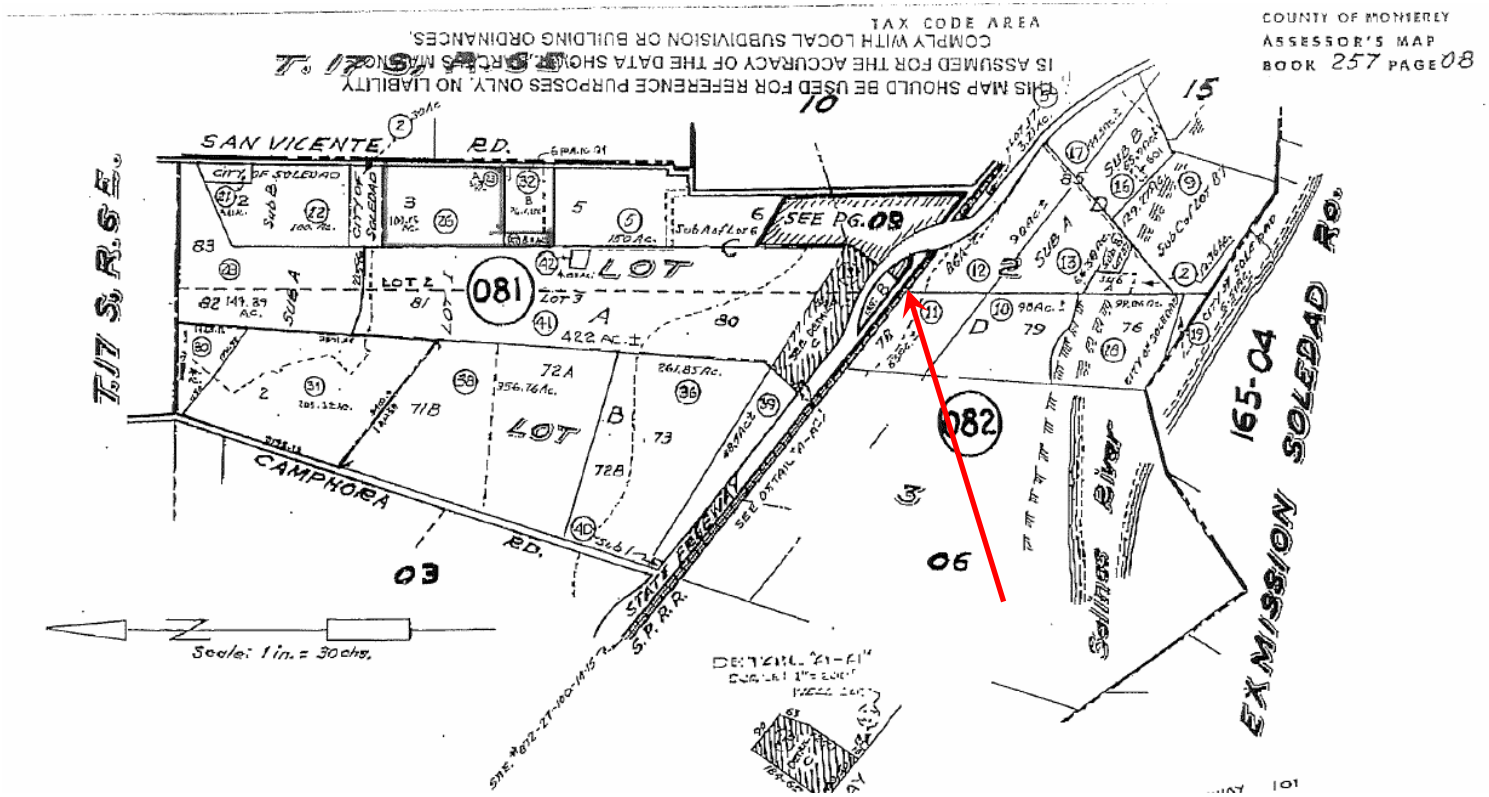
CATEGORY	YEARS INVENTORIED			NET CHANGE (%)	
	1984	2000	2004	1984-2000	2000-2004
Prime Farmland	176,779	169,255	169,368	-4.3	0.1
Farmland of Statewide Importance	37,762	45,877	44,544	21.5	-2.9
Prime Farmland Subtotal	214,541	215,132	213,912	0.2	-0.6
			Acres	*591*	*-1220*
Grazing Land	1,081,510	1,060,663	1,066,539	-1.9	0.6
			Acres	*-20,847*	*5876*
Agricultural Land Subtotal	1,306,926	1,299,937	1,306,929	-0.5	0.5
			Acres	*-6989*	*6992*
Urban and Built-Up Land	42,374	52,486	54,293	23.9	3.4
			Acres	*10,112*	*1807*

Source: California Department of Conservation Farmland Mapping and Monitoring Program, 1994-2000

*Due to the incorporation of digital soil survey data (SSURGO) in 2000, acreages for farmland, grazing and other land categories may differ from those published in the 1998-2000 Farmland Conversion Report.

Table 7. Change in Monterey County irrigated farmland acreage between 2000 and 2002

Land converted to irrigated			Land converted from irrigated			
Prime	Statewide and Unique	Total	Urban	Grazing	Other	Total
1295	2953	4248	331	1461	860	2652



The proposed project would incrementally contribute to this significant cumulative impact by converting approximately 760 acres of prime cropland to a non-agricultural use and is therefore considered significant and unavoidable.

The draft County General Plan includes a policy where "... impacts to productive farmlands resulting from urban development shall be mitigated through the implementation of agricultural land conservation programs. Mitigation shall be provided at a ratio of 1 acre conserved for each acre impacted. In lieu of conserving land through a conservation easement, another mitigation approach is payment of a fee based upon a one to one replacement for a farmland conservation easement or farmland deed restriction established by the Board of Supervisors by resolution or through an enforceable agreement with the developer. The in lieu fee option must be approved by the Board of Supervisors. The fee shall be equal to or greater than the value of a previous farmland conservation transaction in the planning area plus the estimated cost of legal, appraisal and other costs, including staff time, to acquire property for agricultural mitigation...".

(1-1) Mitigation Measure - Currently there are no formal mitigation fee and/or conservation easement policies in place. There are grant programs provided by the State's Department of Conservation to assist in the acquisition of conservation easements and the Monterey County Agricultural and Historical Conservancy Inc. has successfully acquired easements in the Salinas Valley.

Impact after Mitigation - No measures are available to fully mitigate the loss of prime agricultural land, therefore even after mitigation the impact will be significant. This conclusion reiterates the conclusion of the City of Soledad Agricultural Resources section for the eventual phased development of adjacent agricultural land. The impacts to agricultural lands due to development accommodated by the Land Use Element was identified as a Class I unavoidable significant impact due to the conversion of 3500 acres of state-identified prime agricultural land. Therefore, the proposed project constitutes a part of the previously-identified impact, and would not result in an additional significant impact to the one already determined.

Introduction

This report describes the impacts of the proposed Miravale Phase III specific plan and vested tentative map for mixed-use development in Soledad, California. This study was conducted using methodologies and assumptions recommended within the air quality impact assessment guidelines of the Monterey Bay Unified Air Pollution Control District (MBUAPCD). In keeping with these guidelines, this report describes existing air quality, temporary construction-related impacts, potential direct and indirect long-term emissions associated with the Plan-facilitated build out scenario, and the impacts of these emissions on both the local and regional scale. Mitigation measures warranted to reduce or eliminate any identified significant impacts are described.

This analysis was conducted following guidance provided by the Monterey Bay Air Pollution Control District (MBAPCD) CEQA Guidelines. Emissions, which are the quantity of pollutant that the project would emit both directly and indirectly, are measured in pounds per day. The amount of pollutant material measured per volumetric unit of air is referred to as the concentration and is typically measured in parts per million (ppm) or micrograms per cubic meter ($\mu g/m^3$). Stationary sources associated with the project, which could result in adverse air quality impacts that would contribute to air quality emissions, have not been identified.

Overall Regulatory Setting

The Federal Clean Air Act governs air quality in the United States. In addition to being subject to federal requirements, air quality in California is also governed by more stringent regulations under the California Clean Air Act. At the federal level, the United States Environmental Protection Agency (USEPA) administers the Clean Air Act (CAA). The California Clean Air Act is administered by the California Air Resources Board (CARB) at the State level and by the Air Quality Management Districts at the regional and local levels. The Monterey Bay Air Pollution Control District (MBAPCD) regulates air quality at the regional level.

United States Environmental Protection Agency

The USEPA is responsible for enforcing the Federal CAA. The USEPA is also responsible for establishing the National Ambient Air Quality Standards (NAAQS). The NAAQS are required under the 1977 CAA and subsequent amendments. The USEPA regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain types of locomotives. The agency has jurisdiction over emission sources outside state waters (e.g., beyond the outer continental shelf) and establishes various emission standards, including those for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission standards established by the CARB.

California Air Resources Board

In California, the CARB, which became part of the California Environmental Protection Agency (CalEPA) in 1991, is responsible for meeting the state requirements of the Federal CAA, administering the California CAA, and establishing the California Ambient Air Quality Standards (CAAQS). The California CAA, as amended in 1992, requires all air districts in the

State to endeavor to achieve and maintain the California Ambient Air Quality Standards (CAAQS). The CARB regulates mobile air pollution sources, such as motor vehicles. The agency is responsible for setting emission standards for vehicles sold in California and for other emission sources, such as consumer products and certain off-road equipment. The CARB has established passenger vehicle fuel specifications. The CARB oversees the functions of local air pollution control districts and air quality management districts, which in turn administer air quality activities at the regional and county level.

Monterey Bay Unified Air Pollution Control District

The Monterey Bay Unified Air Pollution Control District (MBAPCD) is primarily responsible for assuring that the National and State ambient air quality standards are attained and maintained in the Monterey Bay Area. The MBAPCD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to reduce motor vehicle emissions, conducting public education campaigns, as well as many other activities.

National and State Ambient Air Quality Standards

As required by the Federal Clean Air Act, the NAAQS have been established for six major air pollutants: carbon monoxide (CO), nitrogen oxides (NO_x), ozone (O_3), respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), sulfur oxides, and lead. Pursuant to the California Clean Air Act, the State of California has also established ambient air quality standards. These standards are generally more stringent than the corresponding federal standards and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride and visibility reducing particles.

Both State and Federal standards are summarized in Table 1. The “primary” standards have been established to protect the public health. The “secondary” standards are intended to protect the nation’s welfare and account for air pollutant effects on soil, water, visibility, materials, vegetation and other aspects of the general welfare. The CAAQS are more stringent than the NAAQS. Thus, the CAAQS are used as the comparative standard in this analysis.

Table 1 Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards	National Standards [a]	
			Primary [b,c]	Secondary [b,d]
Ozone	8-hour	0.07 ppm (137 µg/m^3)	0.08 ppm (157 µg/m^3)	—
	1-hour	0.09 ppm (180 µg/m^3)	—[e]	Same as primary
Carbon monoxide	8-hour	9 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	—
	1-hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	—
Nitrogen dioxide	Annual	0.030 ppm	0.053 ppm (100 µg/m^3)	Same as primary
	1-hour	0.18 ppm	—	—
Sulfur dioxide	Annual	—	0.03 ppm (80 µg/m^3)	—
	24-hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)	—
	3-hour	—	—	0.5 ppm (1,300 µg/m^3)
	1-hour	0.25 ppm (655 µg/m^3)	—	—
PM_{10}	Annual	20 µg/m^3	--[f]	Same as primary
	24-hour	50 µg/m^3	150 µg/m^3	Same as primary
$PM_{2.5}$	Annual	12 µg/m^3	15 µg/m^3	
	24-hour	—	35 µg/m^3 [f]	
Lead	Calendar quarter	—	1.5 µg/m^3	Same as primary
	30-day average	1.5 µg/m^3	—	—

Notes: (a) Standards, other than for ozone and those based on annual averages, are not to be exceeded more than once a year. The ozone standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above the standard is equal to or less than one.

(b) Concentrations are expressed first in units in which they were promulgated. Equivalent units given in parenthesis.

(c) Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health. Each state must attain the primary standards no later than 3 years after that state's implementation plan is approved by the EPA.

(d) Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

(e) The national 1-hour ozone standard was revoked by U.S. EPA on June 15, 2005.

(f) The annual PM_{10} standard was revoked by U.S. EPA on September 21, 2006 and a new $PM_{2.5}$ 24-hour standard was established.

Air Pollutants & Effect

Air quality studies generally focus on five pollutants that are most commonly measured and regulated: CO, O_3, NO_2, SO_2, and suspended particulate, i.e., PM_{10} and $PM_{2.5}$. These are referred to as "criteria " air pollutants. In addition, there are toxic air contaminants (TACs), which are a broad class of compounds that can have a range of health effects.

Ozone

Ground-level ozone is the principal component of smog. Ozone is not directly emitted into the atmosphere, but instead forms through a photochemical reaction of reactive organic gases (ROG) and nitrogen oxides (NO_X), which are known as ozone precursors. Ozone levels are highest from late spring through autumn when precursor emissions are high and meteorological conditions are warm and stagnant. Motor vehicles create the majority of reactive organic gas and nitrogen oxide emissions in the California. In April 2005, the California Air Resources Board approved a new eight-hour standard of 0.070 ppm and retained the one-hour ozone standard of 0.09 ppm after an extensive review of the scientific literature. Evidence from the reviewed studies indicate that significant harmful health effects could occur among both adults and children if exposed to levels above these standards. Exposure to levels of ozone above current ambient air quality standards can lead to human health effects such as lung inflammation and tissue damage and impaired lung functioning. Ozone exposure is also associated with symptoms such as coughing, chest tightness, shortness of breath, and the worsening of asthma symptoms. The greatest risk for harmful health effects belongs to outdoor workers, athletes, children and others who spend greater amounts of time outdoors during periods where ozone levels exceed air quality standards. Elevated ozone levels can reduce crop and timber yields, as well as damage native plants. Ozone can also damage materials such as rubber, fabrics and plastics.

Particulate Matter (PM_{10} and $PM_{2.5}$)

Particulate matter (PM) is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, and dust. Particles 10 microns or less in diameter are defined as "respirable particulate matter" or "PM_{10} ". Fine particles are 2.5 microns or less in diameter ($PM_{2.5}$) and can contribute significantly to regional haze and reduction of visibility. Inhalable particulates found in the region come from smoke, vehicle exhaust, and dust. Although particulates are found naturally in the air, most particulate matter found in the region are emitted either directly or indirectly by wood burning, motor vehicles, construction, agricultural activities, and wind erosion of disturbed areas. Most $PM_{2.5}$ is comprised of combustion products such as smoke or vehicle exhaust. Respirable particulate matter, especially $PM_{2.5}$, is unhealthy to breathe and has been associated with premature mortality and other serious health effects. PM_{10} poses a health concern because these particulates can be inhaled into and accumulate in the respiratory system. $PM_{2.5}$ is believed to pose the greatest health risks. Because of their small size (approximately three percent of the average width of a human hair), fine particles can lodge deeply into the lungs. Extensive research reviewed by CARB indicates that exposure to outdoor PM_{10} and $PM_{2.5}$ levels exceeding current ambient air quality standards is associated with increased risk of hospitalization for lung and heart-related respiratory illness, including

emergency room visits for asthma. PM exposure is also associated with increased risk of premature deaths, especially in the elderly and people with pre-existing cardiopulmonary disease. In children, studies have shown associations between PM exposure and reduced lung function and increased respiratory symptoms and illnesses. Besides reducing visibility, the acidic portion of PM (e.g., nitrates and sulfates) can harm crops, forests, aquatic and other ecosystems.

The State of California regularly reviews scientific literature regarding the health effects of exposure to particulate matter and other pollutants. On July 5, 2003, the CARB adopted new standard for particulate matter, lowering the level of the annual standard for PM_{10} and establishing a new annual standard for $PM_{2.5}$.

Carbon Monoxide. CO, a colorless and odorless gas, interferes with the transfer of oxygen to the brain. It can cause dizziness and fatigue, and can impair central nervous system functions. CO is emitted almost exclusively from the incomplete combustion of fossil fuels. Automobile exhausts release most of the CO in the area. A substantial amount also comes from burning wood in fireplaces and wood stoves. CO is a non-reactive air pollutant that dissipates relatively quickly, so ambient CO concentrations generally follows the spatial and temporal distributions of vehicular traffic. The highest CO concentrations measured in the Monterey Bay area are typically recorded during the winter.

Nitrogen Dioxide. NO_2, a reddish-brown gas, irritates the lungs. It can cause breathing difficulties at high concentrations. Like O_3, NO_2 is not directly emitted, but is formed through a reaction between nitric oxide (NO) and atmospheric oxygen. NO and NO_2 are collectively referred to as nitrogen oxides (NO_x) and are major contributors to O_3 formation. NO_2 also contributes to the formation of PM_{10} (see discussion of PM_{10} below). NO_2 concentrations in the air basin have been well below ambient air quality standards; therefore, NO_2 concentrations from land use projects are not a concern. In February 2007, the California Air Resources Board approved a new annual standard of 0.030 ppm and lowered the existing one-hour standard to 0.25 ppm.

Sulfur Oxides. Sulfur oxides, primarily SO_2, are a product of high-sulfur fuel combustion. The main sources of SO_2 are coal and oil used in power stations, in industries, and for domestic heating. SO_2 is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. SO_2 concentrations have been reduced to levels well below the state and national standards, but further reductions in emissions are needed to attain compliance with standards for PM_{10}, of which SO_2 is a contributor. Regional SO_2 concentrations have been well below ambient air quality standards; therefore, SO_2 concentrations from land use projects are not a concern.

Toxic Air Contaminants (TAC)

TACs are a broad class of compounds known to cause morbidity or mortality (usually because they cause cancer) and include, but are not limited to, the criteria air pollutants listed above. TACs are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., dry cleaners). TACs are typically found in low concentrations, even near their source (e.g., benzene near a freeway). Because chronic exposure can result in adverse health effects, TACs are regulated at the regional, state, and federal level.

Diesel exhaust is the predominant TAC in urban air and is estimated to represent about two-thirds of the cancer risk from TACs (based on the statewide average). According to the CARB, diesel exhaust is a complex mixture of gases, vapors and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue. Some of the chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by the ARB, and are listed as carcinogens either under the state's Proposition 65 or under the federal Hazardous Air Pollutants programs. California has adopted a comprehensive diesel risk reduction program. The U.S. EPA has adopted low sulfur diesel fuel standards that will reduce diesel particulate matter substantially. These went into effect in late 2006.

In cooler weather, smoke from residential wood combustion can be a source of TACs. Localized high TAC concentrations can result when cold stagnant air traps smoke near the ground and, with no wind, the pollution can persist for many hours. This occurs in sheltered valleys during the winter. Wood smoke also contains a significant amount of PM_{10} and $PM_{2.5}$. Wood smoke is an irritant and is implicated in worsening asthma and other chronic lung problems.

Air Quality Planning

Monterey Bay Unified Air Pollution Control District

The Monterey Bay Unified Air Pollution Control District (MBUAPCD) is one of 35 districts established to protect air quality in California. Its jurisdiction is in the North Central Coast Air Basin (NCCAB), comprised of Monterey, Santa Cruz and San Benito counties. The NCAB does not meet the State Ambient Air Quality Standards for ozone or inhalable particulate matter (PM_{10}).

The California Clean Air Act of 1988 required preparation of a 1991 plan showing how the State ozone standard would be met. Air quality plans addressing the California Clean Air Act are developed about every three years. The plans are meant to demonstrate progress toward meeting the more stringent 1-hour O3 CAAQS. The latest plan, which was adopted in September 2004, is called the 2004 Air Quality Management Plan for the Monterey Bay Region. This plan includes a comprehensive strategy to reduce emissions from stationary, area, and mobile sources. The plan objective is to indicate how the region would make progress toward attaining the stricter state air quality standards, as mandated by the California Clean Air Act. The plan is designed to achieve a region-wide reduction of O_3 precursor pollutants through the expeditious implementation of all feasible measures.

The clean air planning efforts for O_3 will also reduce PM_{10} and $PM_{2.5}$, since a substantial amount of this air pollutant comes from combustion emissions such as vehicle exhaust. In addition, attainment of the PM_{10} standard is addressed in the "1998 Report on Attainment of the California Particulate Matter Standards in the Monterey Bay Region."

Physical Setting

Climate and Topography

The project site is located on east of Highway 101 on the eastern border of the City of Soledad, about 35 miles southeast of Monterey Bay, and about 25 miles south of Salinas. Winds from the northwest are most common in Soledad and the rest of the Salinas Valley. In general, wind flow is aligned along the valley orientation. In the winter, winds tend to flow down the Salinas Valley from the southeast toward Monterey Bay, averaging about 2.6 miles per hour (mph). In the spring, winds tend to blow from the west (on-shore) averaging about 3.8 mph. In the summer, winds are primarily westerly northwesterly, averaging about 6.5 mph. In the fall, winds flow from the southeast during the night, and switch to the west and northwest by about 10 am, and average about 2.4 mph. [1] Rainfall in the area averages about 13.4 inches per year, with almost all substantial precipitation occurring between November and April. The presence or absence of winter storms and rainfall affect dust generation on plowed fields, wildfires, and other factors influencing local air quality. Temperatures are generally mild, with little winter frost, and summer maxima rarely exceeding 100 F.

Climate, or the average weather condition, affects air quality in several ways. Wind patterns can remove or bring in air pollutants emitted by stationary or mobile sources. Inversions, a condition where warm air traps cooler air underneath it, can hold pollutants near the ground by limiting upward mixing (dilution). Communities with cold climates may burn wood or other fuels for residential heating, whereas areas with hot climates may have higher emissions of some pollutants from automobiles. Topography also plays a part, as valleys often trap emissions by limiting lateral dispersion.

Air Monitoring Data

Air quality in the region is controlled by the rate of pollutant emissions and meteorological conditions. Meteorological conditions such as wind speed, atmospheric stability, and mixing height may all affect the atmosphere's ability to mix and disperse pollutants. Long-term variations in air quality typically result from changes in air pollutant emissions, while frequent, short-term variations result from changes in atmospheric conditions. While the City of Soledad enjoys fairly good air quality that meets most State and Federal standards, other parts of the air basin do not. Surface winds often move pollutants from their emission source to other areas where an impact may be felt. The MBUAPCD and other government agencies operate a network of air quality monitoring stations throughout the air basin. There are two monitoring stations located within the project vicinity, one located at Salinas High School and the other located at 750 Metz Road in King City. Pollutants monitored on a continuous basis at the Salinas site include ozone, PM_{10} and $PM_{2.5}$, CO, and NO_x - NO_2, and at the King City site include ozone and PM_{10}. Air pollutant concentrations measured at stations closest to the project area are shown in Table 2.

NA = data not available.

Attainment Status

Areas that do not violate ambient air quality standards are considered to have attained the standard. Violations of ambient air quality standards are based on air pollutant monitoring data and are judged differently for each air pollutant. The NCCAB as a whole does not meet state ambient air quality standards for PM_{10} and is non-attainment-transitional for state ground level O_3. The U.S. EPA considers the region to be a maintenance area since the 8-hour ozone standard has been attained. For all other standards, the U.S. EPA and the State have classified the region as attainment or unclassified/attainment.

Sensitive Receptors

Some groups of people are more affected by air pollution than others. CARB has identified the following people who are most likely to be affected by air pollution: children under 14, the elderly over 65, athletes, and people with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive receptors. Locations that may contain a high concentration of these sensitive population groups include residential areas, hospitals, daycare facilities, elder care facilities, elementary schools, and parks.

Environmental Impacts and Mitigations

Thresholds of Significance

The project site is located within the jurisdictional boundary of the Monterey Bay Unified Air Pollution Control District (MBUAPCD). Based on the *CEQA Air Quality Guidelines* adopted by the MBUAPCD, significant impacts would occur when: [2],[3]

- Specific plans or projects conflict with or obstruct implementation of the applicable air quality plan.

- Projects affect the attainment and maintenance of regional ozone levels by emitting 137 pounds per day (lb/day) or more of an ozone precursor air pollutant, which are VOC or NO_x.

- Projects locally affect particulate matter levels by emitting greater than 82 lbs/day of PM_{10} on site and cause an exceedance of the State PM_{10} standard at an existing or reasonably foreseeable receptor as averaged over 24 hours.

- Specific plans or projects cause or contribute to an exceedance of a CO standard as measured by Level of Service (LOS) degradation at a project-effected intersection and confirmed by dispersion modeling. This applies to project-affected intersections with substantial traffic that are degraded from a LOS of E or worse.

- Specific plans or projects expose sensitive receptors or the general public to substantial levels of toxic air contaminants.

- Specific plans or projects create or expose a substantial number of people to objectionable odors or nuisances.

The MBUAPCD emissions thresholds apply to projects and not specific plans. Since the project includes a vested tentative map, the MBUAPCD thresholds would apply to each phase. For cumulative impacts, the MBUAPCD recommends that the project be assessed for consistency with the 2004 Air Quality Management Plan for the North Central Coast Air Basin. This was done by requesting a formal consistency determination from the AMBAG.

The specific plan does not include siting of sensitive receptors (e.g., residences) near roadways with sufficient volumes to expose sensitive receptors to unhealthy air pollution levels. CARB recommends a buffer of 500 feet between sensitive receptors and freeways or rural roads with an average of 50,000 vehicles or more per day[4].

Environmental Impacts

Impact AQ-1: **Construction Period Impacts –PM_{10} from Fugitive Dust**
Construction activities, such as clearing, excavation and grading operations, construction vehicle traffic on unpaved ground, and wind blowing over exposed earth would generate dust and particulate matter. This would be a ***significant impact.***

Construction would primarily be accomplished using diesel powered heavy equipment. Dust is generated from a variety of project construction activities that include grading, import/export of fill material, and vehicle travel on unpaved surfaces. Dust from construction includes PM_{10}. Soil can also be tracked-out onto paved roads where it is entrained in the air by passing cars and trucks. Additionally, dust can be generated by wind erosion of exposed areas. The rate of dust emissions is related to the type and size of the disturbance, meteorological conditions, and soil conditions. Construction activities can result in localized high concentrations of PM_{10} and affect regional levels of PM_{10}. High levels of PM_{10} can lead to adverse health effects, nuisance concerns, and reduced visibility.

The MBUAQMD CEQA Guidelines consider on-site emissions of 82 pounds per day or greater of PM_{10} from construction activity to be significant. Due to the variables that affect construction emissions, quantification of construction period emissions is difficult. The initial phases of construction that generate the highest emissions of PM_{10} from fugitive dust would be of most concern. The site would be constructed in four phases, each lasting about 5 years and assumed to begin in 2008.

Grading plans were not available, so the extent of earth disturbance and the need for import or export of fill material is not known at this time. Therefore, detailed construction emissions cannot be quantified. During other construction phases, additional material would be imported to the site. This would include base rock, select soil/gravel for trenches and building pads, concrete, and asphalt for paving. Building materials would also be imported to the site.

Fugitive dust emissions would occur during each of the construction phases. The greatest amount of dust emissions would be generated during the initial grading phase where the soil disturbance activities would be the most intense (i.e., cut and fill activities involving scrapers and other equipment). The other construction phases would generate dust emissions, but of a lesser degree than grading since the intensity of soil disturbance activities would be reduced.

Uncontrolled daily fugitive dust emissions can be approximated for grading construction activities using emission factors developed as part of a study conducted for the South Coast Air Quality Management District (MRI, 1996). This study developed fugitive dust (PM_{10}) emission factors for construction activities at seven sites in Las Vegas, Coachella Valley, the South Coast area, and in the San Joaquin Valley. A general overall emission factor of 0.11 tons per acre per month would represent typical daily emissions. On the most active days during grading, emissions may be higher. The identified a worst-case overall emission factor that would apply to the most intense construction sites was 0.42 tons per acre per month. The study developed specific emission factors that require specific construction information such as the amount of

earthwork and the detail of control measures. Since that type of information is generally not available, overall emission factors were used to estimate daily emissions.

One of the sites studied in the MRI report was in the San Joaquin Valley, a 40-acre commercial development in Fresno (Site 5.2). This site was the most similar to the proposed project site, and therefore, those emission factors were applied to this project. For the Fresno site, an overall typical worst-day construction emission factor of 4.1 pounds per acre per work hour was developed. This emission factor includes emissions associated with general construction activities, as well as those from intensive earth-moving activities. Using this emission factor for the proposed project would result in emissions of 82 pounds per day if 2.5 acres were actively graded in one day with some dust control measures. Grading activity that encompasses more than 2.5 acres in a single day could result in on-site PM_{10} emissions exceeding 82 pounds per day without additional mitigation. When specific project details and grading activities are known, better emission estimates could be made to refine construction plans and possibly remain below the 82 pound per day threshold with a larger area of disturbance.

In addition, PM_{10} emissions would occur as a result of wind erosion over disturbed areas during dry windy conditions and from vehicle track out. These emissions are not accounted for in the emission factors applied to grading and construction activities. Ordinarily, these emissions would be considerably small in comparison with grading activities. Emissions from wind erosion are difficult to predict since one has to know the area that is disturbed enough so that wind could cause erosion and then a wind speed above a certain threshold has to occur for a known duration. Wind erosion emissions would vary considerably, but could be controlled through active watering of the site throughout the construction period, including days that construction is not occurring, but soils are disturbed.

Given the size of the project sites likely to be built out under the specific plan and the possibility that construction could occur simultaneously on different areas throughout the site, grading activity areas could exceed 2.5 acres per day. This would result in a ***significant impact*** to air quality.

Mitigation Measure AQ-1:

Impacts can be greatly reduced by implementing fugitive dust control measures. The significance of construction dust air quality impacts is typically determined by the control measures that will be implemented. Implementation of the measures listed below would reduce the dust impacts associated with grading and new construction to a *less-than-significant* level.

Prior to start of construction, the project applicant or contractor shall submit to the City of Soledad Public Works Department a construction dust mitigation plan. This plan shall specify the methods of dust control that would be utilized, demonstrate the availability of needed equipment and personnel, use of reclaimed water for dust control, and identify a responsible individual who, if needed, can authorize implementation of additional measures. The construction dust mitigation plan shall, at a minimum, include the following measures:

- Limit grading activity to a maximum of 2.5 acres daily. As more detailed construction information becomes available, emissions from grading activities could be reassessed to determine if the area of grading could be increased. Such an assessment would have to be

conducted using appropriate assumptions and mitigation measures. The dust control plan shall include any such assessment.

- Water all active construction areas at least twice daily and more often during windy periods. Active areas adjacent to existing businesses should be kept damp at all times. If necessary during windy periods, watering is to occur on all days of the week regardless of onsite activities.

- Cover all hauling trucks or maintain at least two feet of freeboard.

- Pave, apply water at least twice daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas.

- Sweep daily (with water sweepers) all paved access roads, parking areas, and staging areas at construction sites.

- Sweep streets daily (with water sweepers) if visible soil material is deposited onto the adjacent roads.

- Hydro-seed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas that are inactive for 10 days or more).

- Enclose, cover, water twice daily, or apply (non-toxic) soil binders to exposed stockpiles.

- Limit traffic speeds on any unpaved roads to 15 mph.

- Replant vegetation in disturbed areas as quickly as possible.

- Suspend excavation and grading activity when hourly-averaged winds exceed 15 mph and visible dust clouds cannot be contained within the site.

The combined effect of the above measures, including the use of a dust suppressant, which represent Best Management Practices, and limiting the size of the grading area would reduce project impacts to a l*ess-than-significant* level only if emissions can be limited to 82 pounds per day or subsequent dispersion modeling of construction activities demonstrates that PM_{10} concentrations from construction activity would not cause an exceedance of the State ambient air quality standard, as averaged over 24 hours. Since limits to construction activities are probably not feasible for this project and dispersion modeling conducted at this time (due to lack of detailed construction plans), the impact is considered to remain ***significant with mitigation***.

Impact AQ-2: **Construction Period Impacts –Diesel exhaust from equipment**
Construction activities would involve use of heavy-duty off-road equipment and large trucks that use diesel fuel resulting in emissions of diesel particulate matter and NOx. This would be a ***potentially significant impact.***

The California Air Resources Board has identified diesel particulate matter as a toxic air contaminant. It is one of many toxic air contaminants; however, it is estimated to contribute

about 70% to the overall potential inhalation cancer risk. Improved diesel engines technologies along with reformulated diesel fuel are expected to substantially lower the risk from diesel exhaust.

The heavy construction equipment utilized to construct this project would be diesel fueled. Grading of the site is expected to result in the highest emissions of diesel particulate matter during the construction period. Grading plans are not known at this time, therefore, the amount and types of equipment and their schedule cannot be determined. The projects could be constructed in a series of projects over many years. There are typically two different periods of grading: a "rough" grading phase that requires excavators and a dozers and then a "fine" grading phase that may include motor graders, rollers, scrapers, and loaders. These equipment are typically used from 4 to 8 hours per day. Other phases of construction use smaller sized equipment (e.g., some loaders, forklifts, etc.), but include numerous heavy-duty truck deliveries for cement, asphalt, building materials, and landscape materials.

The Miravale III site is fairly open and flat. There are residential neighborhoods bounding the southern project border. Since the projects are likely to be constructed in phases, new occupants of earlier phases of the project could become sensitive receptors affected by construction.

Construction equipment can emit substantial amounts of NOx that could have a small, but cumulative affect on ozone concentrations. The MBUAPCD CEQA guidelines do not have thresholds that apply to these emissions. Therefore, the impact is considered less than significant if reasonable and feasible measures to reduce emissions are employed.

Diesel exhaust includes air contaminants that can cause health effects. The increased health risk from these types of emissions (i.e., increased cancer risk) are calculated over a 70-year continuous exposure period at locations of sensitive receptors. Truck travel and construction equipment exhaust may result in elevated levels of diesel particulate matter for short time periods. However, these activities would occur for such a relatively short period that the impact would be considered as l*ess-than-significant* provided that mitigation measures (Mitigation Measure AQ-2) are implemented to minimize exposure to sensitive receptors.

Mitigation Measure AQ-2:

Projects developed under the specific plan should be evaluated for individual construction period air quality impacts. Project-specific mitigation measures would be identified at that time. However, the following mitigation measures should be implemented for all projects to reduce diesel particulate emissions from on-site construction equipment:

- Use off-road construction equipment, manufactured during or after 1996 that meets the NO_x emissions standard of 6.9 grams per brake-horsepower hour or use alternative fuels (such as biodiesel) that result in lower particulate emissions.

- The contractor shall install temporary electrical service whenever possible to avoid the need for independently powered equipment (e.g. compressors).

- Diesel equipment standing idle for more than two minutes shall be turned off. This would include trucks waiting to deliver or receive soil, aggregate, or other bulk materials. Rotating

drum concrete trucks could keep their engines running continuously as long as they were onsite and staged away from residential areas.

- Properly tune and maintain equipment for low emissions.
- Stage large diesel powered equipment at least 200 feet from any active land uses (e.g., residences).
- Limit the pieces of equipment used at any one time.
- Minimize the use of diesel-powered equipment (i.e., wheeled tractor, wheeled loader, roller) by using gasoline-powered equipment to reduce NO_x emissions.
- Limit the hours of operation for heavy-duty equipment.

The combined effect of the above measures would reduce project impacts to a *less-than-significant* level**.**

Impact AQ-3: **Plan Generated Operational Impacts**

Implementation of the proposed specific plan would result in increases in long-term operational emissions of ozone precursor pollutants. These emissions would exceed significance thresholds established by the MBUAPCD. *This represents a* ***significant impact*** *since these emissions could cumulatively contribute to potential exceedances of ambient air quality standards for ozone. Mitigation measure AQ-3 suggests measures to reduce emissions of these air pollutants that could be provided for the entire specific plan.*

The Specific Plan proposes development of 1,470 single-family residences and 2,730 multi-family residences, in addition to a 120-room hotel, 275,000 square feet of retail, an 18-hole golf course as well as schools and parks. The plan would be built out over a 20-year period in four phases. The project's traffic analysis forecasts that the Miravale III specific plan would generate about 35,504 daily vehicle trips at full build out. Emissions from these trips would affect regional air quality in terms of contributing to possible exceedances of ambient air quality standards for ozone. Direct and indirect emissions from each phase of the proposed specific plan were calculated using the latest available version of the URBEMIS model (i.e., URBEMIS 2002 ver. 8.7) distributed by Rimpo Associates through www.urbemis.com and the updated model template provided through the MBUAPCD website. Specific Plan related emissions were calculated in accordance with the proposed phasing schedule.

The model predicts daily emissions associated with land use developments. The model combines predicted daily traffic activity associated with the different land use types, with emission factors from the State's mobile emission factor model (i.e., EMFAC2002). The project sizes and estimated traffic generation were input to the URBEMIS 2002 model to predict daily emissions of ROG, CO, NOx and $PM_{10.}$

Specific plan traffic generation provided by Hexagon Transportation Consultants, Inc. for the DEIR, was used in the model to provide daily traffic generation estimates based on selected land uses. The URBEMIS2002 model default for passby trips was not used. Instead, trip reduction percentages provided by the traffic engineer based on the reduction of internal trips due to mixed uses were utilized. The trip rates used in URBEMIS2002 were adjusted to reflect these reductions.

The URBEMIS 2002 model also predicted area source emissions associated with build out of the specific plan uses. Area source emissions of ROG, NOx, and PM_{10} were predicted for summer, and the area source emissions of CO were predicted for winter in accordance with the MBUAPCD CEQA Guidelines. The project emissions were predicted for a normal weekday representative of the traffic generation used for the traffic study. Daily emissions from the build out of the specific plan are reported in Table 4. Model output is provided in Attachment 1.

Table 4 Daily Project Emissions based on URBEMIS2002 Modeling

Scenario	Volataile Organic Compounds (VOC) - Summer	Nitrogen Oxides (NOx) - Summer	Carbon Monoxide (CO) - Winter	Respirable Particulates (PM_{10}) - Summer
Phase 1 (2008-2013)				
Area Emissions	35 lbs	7 lbs	394 lbs	>1.0
Operational Emissions	51 lbs	69 lbs	658 lbs	133 lbs
Total	86 lbs	76 lbs	1052 lbs	133 lbs
Phase 2 (2013-2018)				
Area Emissions	168 lbs	25 lbs	2204 lbs	>1.0
Operational Emissions	98 lbs	117 lbs	1197 lbs	358 lbs
Total	266 lbs	141 lbs	3401 lbs	358 lbs
Phase 3 (2018-2023)				
Area Emissions	216 lbs	32 lbs	2869 lbs	>1.0
Operational Emissions	81 lbs	90 lbs	907 lbs	358 lbs
Total	297 lbs	122 lbs	3776 lbs	358 lbs
Phase 4 (2023-2028)				
Area Emissions	329 lbs	46 lbs	4380 lbs	>1.0
Operational Emissions	82 lbs	82 lbs	887 lbs	426
Total	411 lbs	128 lbs	5267 lbs	426

Source: URBEMIS2002 Air Emissions From Land Use Ver. 8.7

Emissions from the project would vary over time as the project is built out and emission rates change due to improvements in overall vehicle emission controls. During the interim build-out period, NOx emissions would be highest after build out of Phase 2, which is assumed to occur in 2018. Emission rates of NOx would decrease at a rate faster than traffic would increase under cumulative build out of the project. Therefore, future total NOx emissions after 2020 with Phases 3 and 4 would decrease below Phase 1 and 2 levels. That is cumulative build out of Phase 1 through 4 in 2028 would have emissions below the cumulative build out of Phase 1 and 2 in 2018 even though additional traffic trips would be generated. This is due to the implementation of more stringent vehicle emissions standards and fleet turnover. Turnover occurs when older, more polluting vehicles, are replaced with newer and cleaner vehicles that have durable emission control systems.

On the other hand, VOC emissions are affected by use of consumer products and new motor vehicle trips. Substantial VOC emissions would occur from increased emissions of consumer products associated with new residential development in the air basin. A wide variety of consumer products that include air fresheners, household cleaners, automotive products, and personal care products result in VOC emissions. The emissions reported by URBEMIS2002 tend to be slightly higher than current CARB estimates, since the model is based on older data. CARB does develop requirements for consumer products aimed at reducing VOC emissions. Current CARB estimates used to develop the countywide emissions inventory indicate that these emissions are about 18% lower than reported in Table 4. In any event, emissions of ROG/VOC would be expected to exceed the MBUAPCD thresholds when projects under this specific plan are developed. This would continue to be mostly attributable to the use of consumer products by new residences. As a result, *significant* impacts to regional air quality, with respect to emissions of ozone precursors are predicted.

The MBUAPCD thresholds for PM_{10} only apply to onsite emissions of PM_{10}. These would include wood smoke emissions. The addition of new residences for all phases could result in significant emissions from wood burning in open-type fireplaces. Use of low-emitting wood burning devices would mitigate this impact and should be considered in the Specific Plan.

Since build-out of the Miravale III Specific Plan would result in emissions of NOx and VOCs that exceed MBUAPCD thresholds, the impact is considered *significant*.

Mitigation Measure AQ-3:

The Specific Plan should incorporate design features that could be implemented to reduce emissions of ozone precursor air pollutants. As discussed above, much of the future project emissions of VOCs would be attributable to the use of consumer products. These are not possible to control at a project level. However, mobile sources would contribute to these VOC emissions. Reducing mobile source and area source emissions from specific plan development would reduce VOC and NOx emissions, but not to a less than significant level. Controlling PM_{10} emissions through requirements for fireplaces and wood heating devices would substantially reduce on-site PM_{10} emissions associated with future specific plan projects.

The project shall apply the following measures to the extent appropriate for the specific land uses proposed:

- Develop a Transportation Demand Management Program with the intent of reducing vehicle trips and vehicle miles traveled associated with build out of the specific plan. Components of this plan may include:
    - Develop parking strategies for commercial and retail uses that reduce single occupant vehicle trips
    - Provide bicycle storage/parking facilities.
    - Provide shower/locker facilities in light industrial and office uses.
    - Provide onsite or near site child care centers for large employment centers.
    - Develop park-and-ride lots.
    - Provide opportunities to include or increase transit service to the plan area

- Include plans to incorporate safe and efficient modes of bicycle and pedestrian transportation. Bicycle routes and pedestrian paths should include amenities such as signs and traffic signal activation (e.g., loop activators).
- Identify energy efficiency goals for new developments that would conserve energy beyond requirements of the State Title 24 building code.
- Provide exterior electrical outlets on new buildings that encourage use of electrical landscape equipment.
- Prohibit open wood burning fireplaces in new residences unless they are natural gas-fired or EPA certified wood heaters that meet EPA's particulate emission standard of 7.5 grams per hour.

Impact AQ-4: **Local Carbon Monoxide Concentrations**
Development of the project would result in higher traffic volumes that could exceed significance thresholds established by the MBUAPCD. This would be a ***potentially significant impact.***

Emissions thresholds established for carbon monoxide apply to direct or stationary sources. Emissions of carbon monoxide (CO) emitted from traffic generated by the project are first evaluated by assessing the impacts of specific plan-generated traffic on existing and future traffic conditions. The MBUAPCD guidelines require CO hotspot analysis under the following project conditions:

- Intersections where the Level of Service (LOS) would degrade below D

- Volume to capacity ratio increases by 0.05 at LOS E or F intersections

- The delay at LOS E or F intersections increases by 10 seconds or more

- Reserve capacity at unsignalized LOS E or F intersection decrease by 50 or more

Highest CO concentrations typically occur during the winter where traffic congestion occurs. Congested intersections with high volumes of traffic could cause CO “hot spots”, where localized high concentrations of CO occur. This specific plan area is located in a fairly rural

setting where traffic volumes are much lower than urban settings such as Salinas. The highest CO level measured in the District, which is representative of more urban settings, is well below the State standards.

The traffic study for the specific plan evaluated operations at intersections in the area. Several intersections with stop sign controls were predicted to have LOS E or F conditions in the future. However, these intersections would not have large enough volumes to warrant a CO "hot spot". The degraded LOS is the result of a single approach being delayed by a Stop sign. Mitigation measures were identified by the Traffic Engineer to improve the LOS to an acceptable level. As a result, modeling of CO concentrations was not conducted to analyze the specific plan impacts. CO impacts associated with acceptable intersection operation would not exceed State or federal ambient air quality standards. As a result, the impact is considered l*ess than significant.*

Mitigation Measure AQ-4: None required.

Impact AQ-5: **Project Stationary Sources**
The Miravale III project does not include any known light industrial or commercial uses with potential air pollutant sources that could adversely impact adjacent or nearby residences proposed as part of the project. This would be a ***less-than-significant impact.***

Stationary sources of air pollutants that could be associated with uses of the light industrial or commercial uses have not been identified. Light industrial or commercial uses could include sources of air pollution that may adversely affect sensitive receptors such as nearby proposed residences. Such common sources are emergency generators that use diesel fuel, dry cleaning operations, gas stations, and truck loading areas. The exact nature of possible on-site stationary sources cannot be determined at this time; thus specific air impacts from these potential sources to future occupants of project cannot be estimated. However, these types of sources may require construction and operational permits from the MBUAPCD, which would include new source review and possible application of Best Available Control Technology emission control measures. Since they would need to comply with all applicable MBUAPCD regulations, regulated stationary on-site sources are generally not considered to have a significant air quality impact. Stationary sources that are exempt from MBUAPCD permit requirements because they fall below emission thresholds for permitting would not be considered to have a significant air quality impact. For this reason, this impact is considered *less-than-significant*.

Mitigation Measure AQ-5: None required.

Impact AQ-6*:* **Nuisances and Odors**
The project would not include any activities that are typical sources of objectionable odors. However, future agricultural activities adjacent to the west-northwest of the site could affect some planned residences. This would be a ***significant impact***.

Typical sources of objectionable odors include chemical plants, sewage treatment plants, large composting facilities, rendering plants, and other large industrial facilities that emit odorous

compounds. This specific plan would not include any such activities and thus would not create objectionable odors. The project is not considered to create significant odors.

Land uses near the specific plan area are generally vacant undeveloped land or lands used for agricultural uses. Vacant or undeveloped lands with no approved future uses do not pose a potential for nuisances caused by odors or dust generation. The plan would include residences along the western boundary that would be adjacent to active farming lands. Agricultural activities could result in short-term nuisances that could affect these lands. The most common nuisance could be blowing dust. The project would lie downwind of these fields most of the time, especially during spring and summer when northwest winds are persistent. New residences may experience frequent episodes of dust blowing across their property. This would result in conflicts between existing agricultural and new residential uses. As a result, this would be considered a ***significant impact***.

Mitigation Measure AQ-6: Include buffers and vegetation to reduce wind blown dust from adjacent agricultural fields.

The specific plan should include an adequate buffer with planted trees that would reduce wind blown dust from active agricultural field that border the western portion of the site adjacent to planned residential uses.

Impact: **Cumulative Air Quality Impacts**

The specific plan consists of mostly residential with commercial retail uses and schools that were found by AMBAG to be consistent with the 2004 regional forecasts and the Air Quality Management Plan; therefore, it would not conflict with regional efforts to attain and maintain ambient air quality standards. Projects developed under the specific plan may have individually significant impacts that may not be mitigated to a less than significant level. As a result, the specific plan may contribute significantly to a ***significant cumulative*** air quality impact.

Specific plans are evaluated for cumulative impacts both by determining the consistency of the proposed project with the applicable regional air quality plan and the specific plan's individual impacts to air quality.

The MBUAQMD *2004 Air Quality Management Plan for the Monterey Bay Region* (AQMP) addresses attainment of the State ozone standard. MBUAPCD has included emissions related to population growth in the AQMP using projections adopted by the Association of Monterey Bay Area Governments (AMBAG). For this specific plan, consistency with population forecasts is determined by comparing plan build-out population at the year of project completion with the appropriate five-year forecast increment for the jurisdiction that the project is located (i.e., Soledad). Projects or plans that would not cause the estimated cumulative population to exceed forecasts are considered consistent with air quality planning efforts. According to AMBAG, this project is consistent with the 2004 regional forecasts for Monterey County and the Air Quality Management Plan. A letter from AMBAG documenting the consistency determination is included as Attachment 2.

As described in impact AQ-3, individual projects developed could have significant air quality impacts with respect to direct and indirect emissions of ozone precursor pollutants. These impacts are typically identified at the time project-level analyses are conducted. Current modeling indicates the potential for projects to have VOC emissions in excess of the MBUAPCD thresholds. Therefore, this was identified as a potentially significant impact. Mitigation measures to reduce this impact (i.e., Mitigation Measure AQ-3) were suggested to apply to the entire specific plan. Because much of the emissions from projects would be associated with use of consumer products that cannot be mitigated, the impact could be considered significant and unavoidable. This represents a potentially significant cumulative impact to air quality.

TECHNICAL APPENDIX T-3

Preliminary Biological Assessment Report (DD&A)

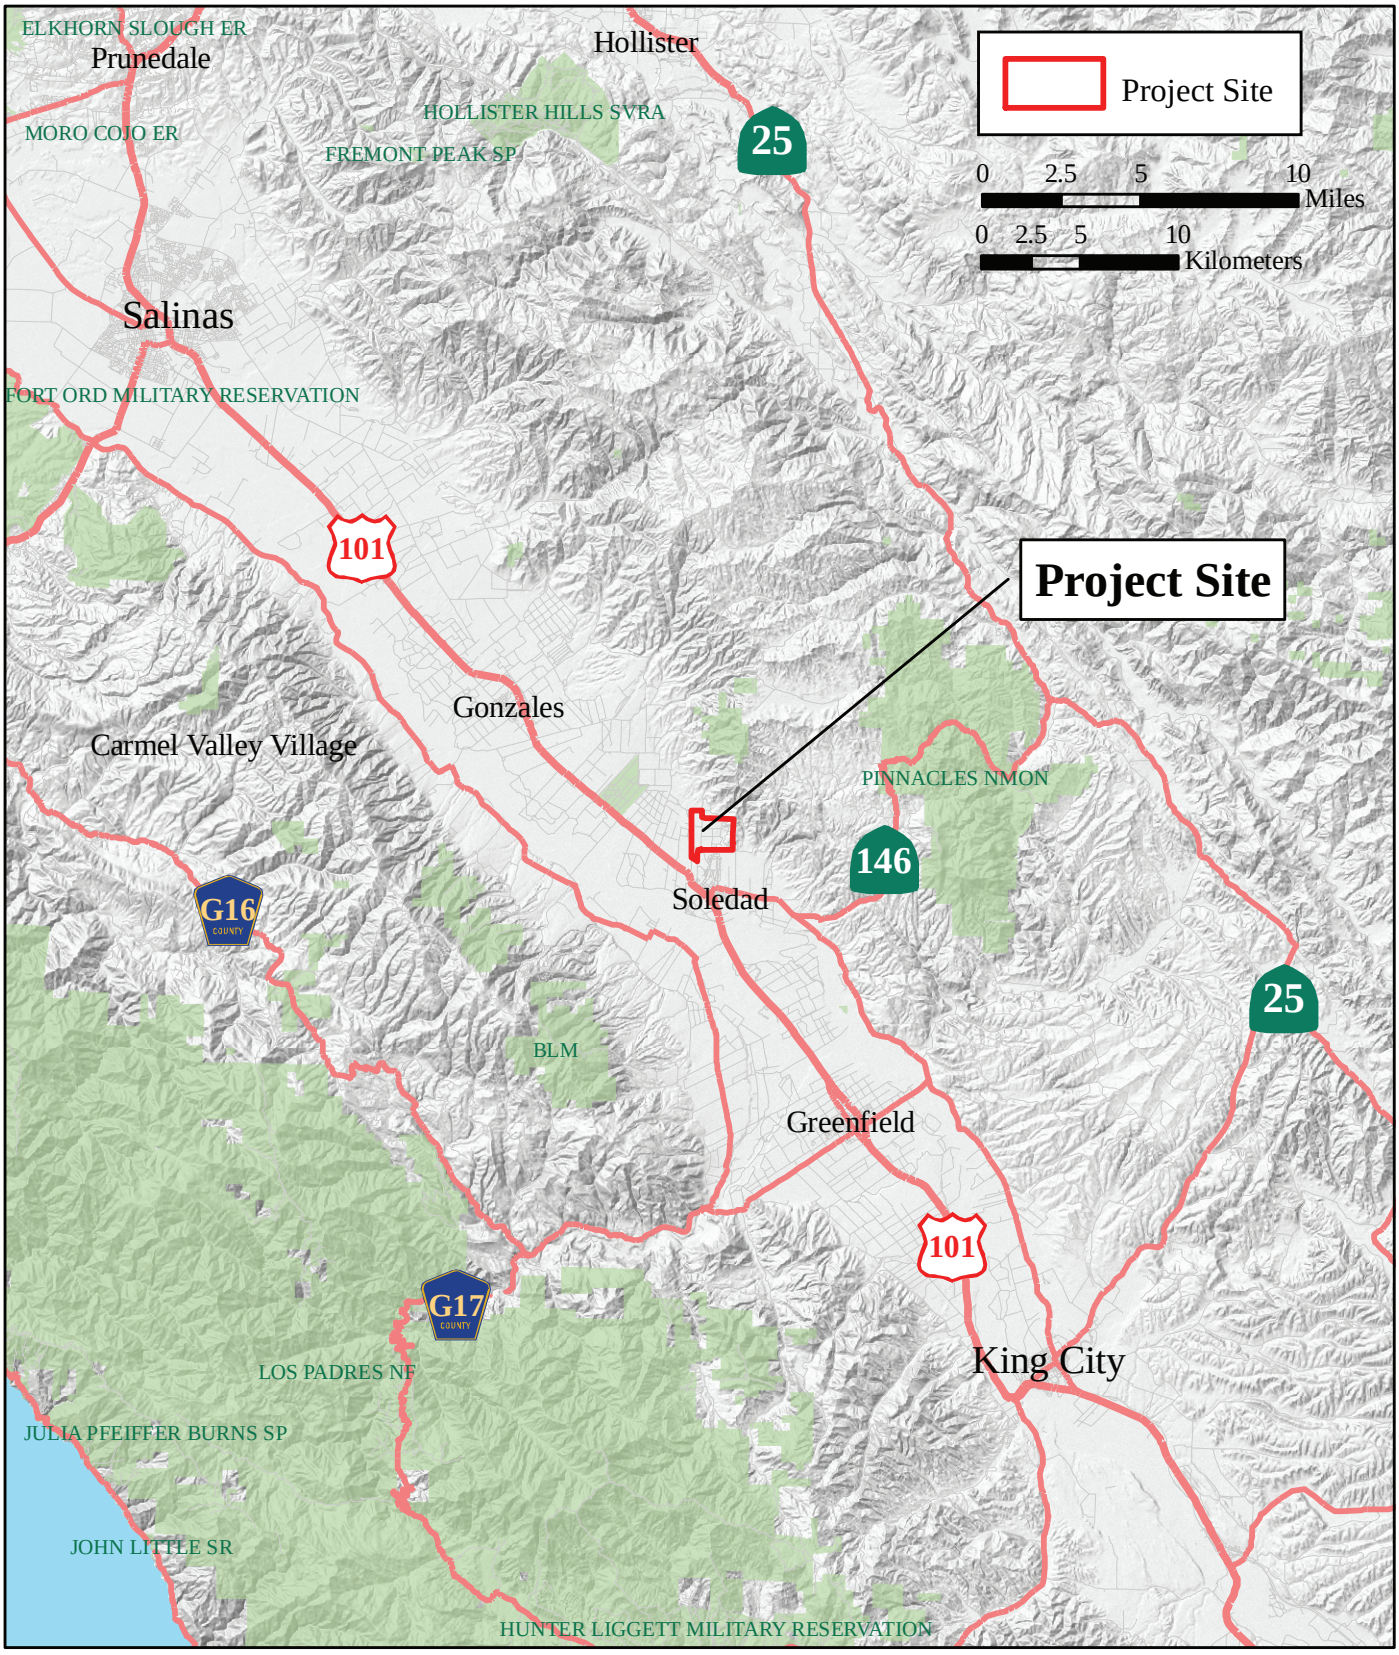
June 18, 2008

Don Fleming
Community Development Director
City of Soledad
248 Main Street
Soledad, CA 93960
(831)678-3963 Ext. 114

Subject: Preliminary Biological Assessment Report for the Proposed Miravale Phase III Specific Plan, City of Soledad, CA.

Dear Mr. Flemming,

Thank you for providing Denise Duffy & Associates, Inc. (DD&A) with the opportunity to provide additional environmental services for the proposed Miravale Phase III Specific Plan in the City of Soledad, CA. The purpose of this Preliminary Biological Assessment is to identify the potential occurrence of special-status plant and wildlife species, and sensitive habitats at the project site, characterize the existing biotic resources located in the area, and discuss potential project impacts to those resources. In addition, this report recommends measures to avoid or reduce any potential impacts that have been identified.



Project Location

The project is located within unincorporated lands of Monterey County (County) on the northern edge of the City of Soledad, approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of the San Francisco Bay Area (Figure 1). The 920-acre project site is generally between San Vicente Road and Orchard Lane and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east.

The City of Soledad is located in the Salinas Valley; downtown Soledad is located approximately 1 mile south of the project site. Two freeway interchanges connect the local surface streets to Highway 101, providing access to the remainder of the County. These interchanges are located 1.75 miles south and 0.5 mile southwest of the project. The Salinas River is located 1.25 miles south of Metz Road, which is located 1.25 miles south of the project site (2.5 miles to Salinas River from project site).

Project Description

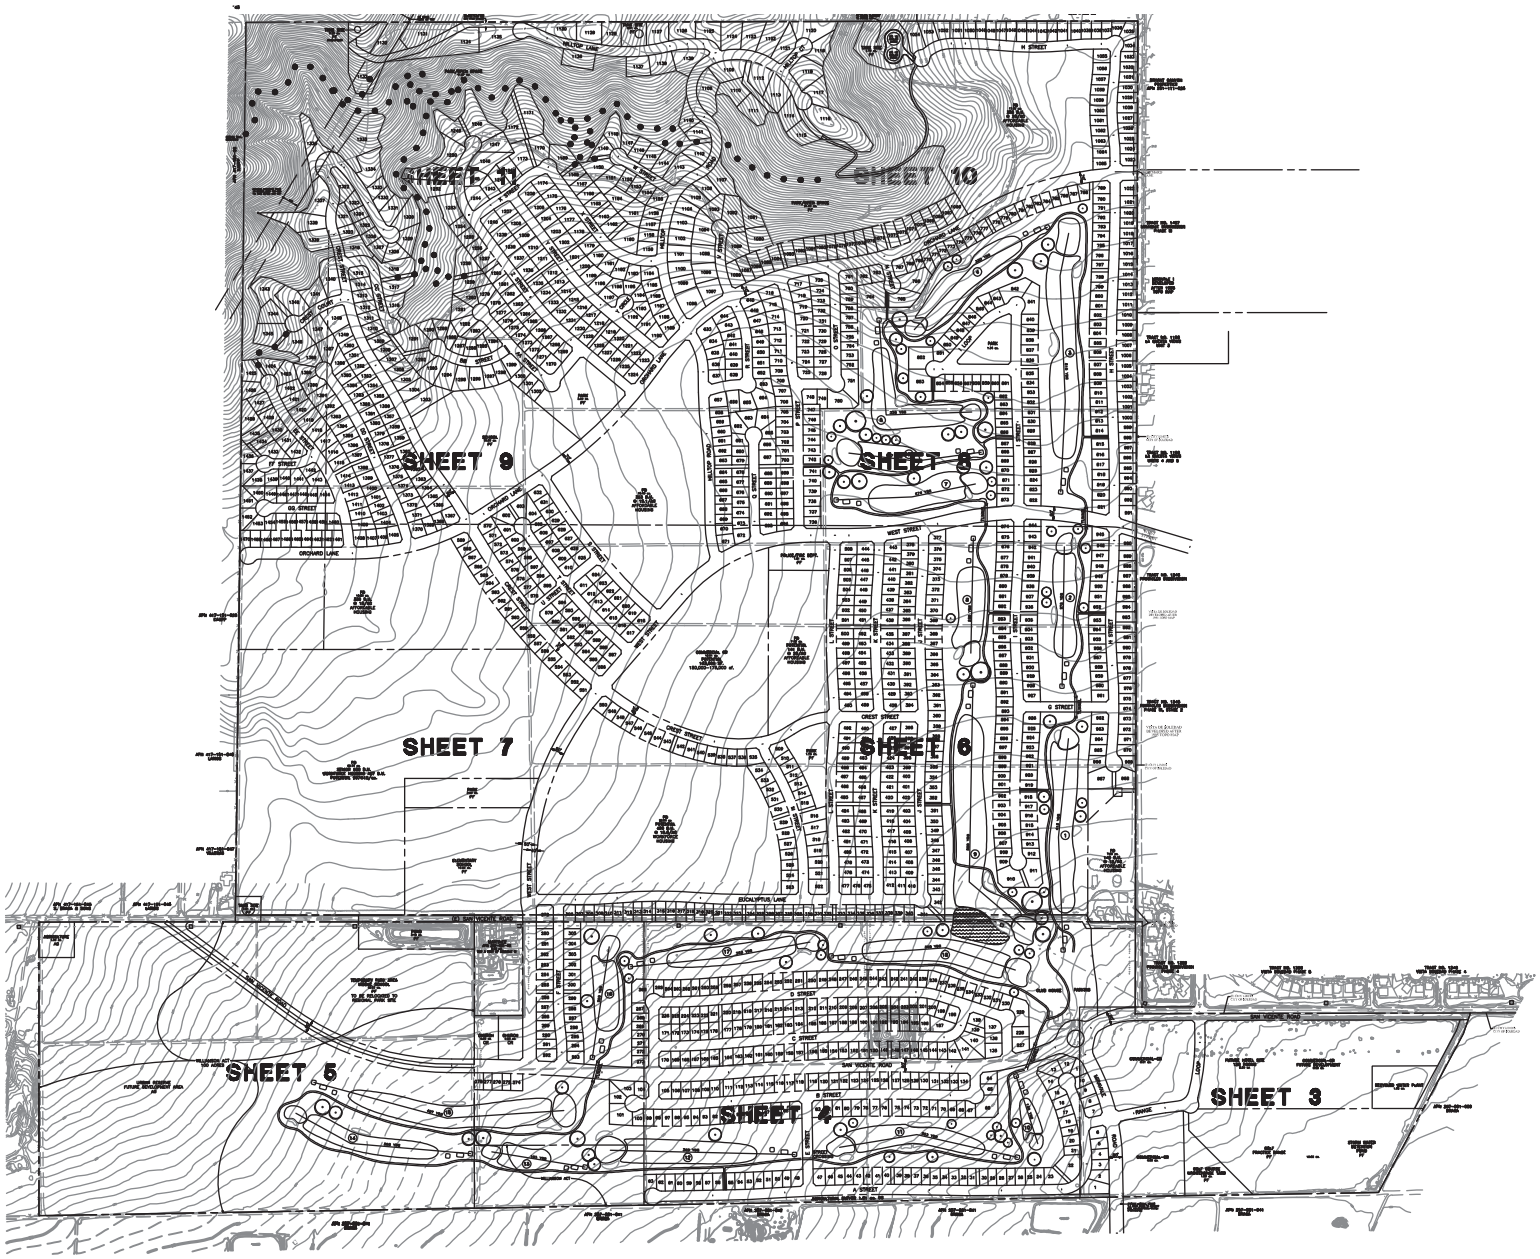
The project consists of the development and implementation of the Miravale Phase III Specific Plan. The Specific Plan calls for a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units (includes affordable housing, workforce housing, and senior housing units), 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. Conceptual

N	Vicinity Map	Figure 1

plans include a variety of residential types, including apartments, townhouses, and attached homes on small and large lots (Figure 2). The project also proposes three school sites (2 elementary schools and 1 middle school), a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system.

The project site is zoned for farmland and permanent grazing uses and is currently being used for agricultural cultivation. Large portions of the site are fallow. The project site includes two existing single family units, which will be removed as part of the proposed project.

Methods



Special-status Species

The project site was surveyed for special-status plant and wildlife species, and appropriate habitat for these species. Special-status species are those plants and animals that have been formally Listed or Proposed as Endangered or Threatened, or are Candidates for such listing under the federal Endangered Species Act (ESA) or the California Endangered Species Act (CESA). Listed and Proposed species are afforded protection under these acts. Plants on the California Native Plant Society (CNPS) lists 1A, 1B, and 2 are also treated as special-status species, as well as CDFG species of special concern. Species of special concern are those that face extirpation in California if current trends continue. Although they have no special legal status, these species (and federal species of concern) are given management consideration whenever possible. Impacts to these species may be considered significant according to the California Environmental Quality Act (CEQA).

In order to determine which special-status species are known or have the potential to occur at the proposed Miravale III project site, California Natural Diversity Data Base (CNDDB) occurrence records for the Soledad quad and all surrounding quads (9 quads total) were reviewed. In addition, the United States Fish and Wildlife Service (USFWS) list of federally protected species known to occur in County was reviewed. DD&A also contacts other knowledgeable biologists familiar with the region for any additional occurrence information that may not appear in the CNDDB. From these sources, combined with personal knowledge and experience, a list of special-status plant and wildlife species known, or with the potential to occur, in the vicinity of the project site was compiled. Appendix A lists these species along with their legal status, habitat requirements, and a brief statement of the likelihood to occur. Figure 3 presents the nearest occurrence records for special-status plant and wildlife species.

Sensitive Habitats

The project site was surveyed for sensitive habitats. Sensitive habitats include riparian corridors, wetlands, habitats for legally protected species and California Department of Fish and Game (CDFG) species of special concern, areas of high biological diversity, areas providing important wildlife habitat, and unusual or regionally restricted habitat types. Habitat types considered sensitive include those protected on the CNDDB's working list of "high priority" habitats (i.e. those habitats that are rare or endangered within the borders of California) (Holland 1986; CDFG 1997) and those that are Critical Habitat in accordance with the Endangered Species Act

CNDDB Occurrence Data Map

Figure 3

Botany

Also reviewed were habitat and distribution information in local and state floras (Howitt and Howell 1964, 1973; Munz and Keck 1973; Hickman 1993; Matthews 1997). Current status information for plant species protected as Threatened or Endangered under the federal ESA and for federal Proposed and Candidate species was obtained from USFWS (2007). The CNPS Inventory (Tibor 2002) was reviewed to identify species on CNPS Lists 1 and 2.

The plants present within the project site were surveyed on more than one occasion. All plant species were identified to the intraspecific taxon necessary to exclude them as being special-status using keys and descriptions in Hickman (1993) and Matthews (1997). Scientific nomenclature for plants in this report follows Hickman (1993); common names follow Matthews (1997). A list of plants observed within the project area is included in Appendix G.

Habitats within the project site were characterized during field surveying. Data was recorded on physiognomy of the vegetation and on dominant and characteristic species, as well as basic ecological factors, including topography, slope, aspect, soil type, hydrologic regime, and evident disturbance. The generalized vegetation classification schemes for California of Holland (1986) and Sawyer and Keeler-Wolf (1995) were consulted in classifying the vegetation of the project site. The final classification and characterization of the vegetation of the project site is based on field observations.

Wildlife

A focused review of literature and data sources was conducted in order to determine which special-status wildlife species have potential to occur at the proposed project site, and field surveys were conducted on several occasions. Current agency status information was obtained from USFWS (2007) for species protected as Threatened or Endangered, as well as Proposed and Candidate species for listing, under the federal ESA. Agency status information was obtained from CDFG (2007) for species protected as threatened or endangered by the state of California under the CESA, or protected as "species of special concern" by CDFG. In addition, the following literature and data sources are standard reference used in document preparation: CDFG reports on special-status wildlife (Remsen 1978; Williams 1986; Jennings and Hayes 1994; Thelander 1994); California Wildlife Habitat Relationships (CWHR) species-habitat models (Zeiner et. al. 1988, 1990a, 1990b); as well as general wildlife references (Stebbins 1985 and 2003, Peterson, 1990, Sibley 2002, etc.). A list of all special-status species reported to occur in the vicinity of the project site was compiled by review of the CNDDB (within the Soledad quad or any surrounding quad) and USFWS species-list, is presented in Appendix A. A list of all wildlife species observed within project boundaries is included as Appendix H.

Federal Laws and Regulations

Federal Endangered Species Act

Provisions of the federal Endangered Species Act (ESA) of 1973 (16 USC 1532 *et seq.*, as amended) protects federally listed threatened or endangered species and their habitats from unlawful take. Listed species include those for which proposed and final rules have been published in the Federal Register U.S. Fish and Wildlife Service or NOAA Fisheries (formerly known as the National Marine Fisheries Service). The ESA is administered by the USFWS and NOAA Fisheries. In general, NOAA Fisheries is responsible for the protection of ESA-listed marine species and anadromous fish, whereas other listed species are under USFWS jurisdiction.

Federal Candidate species are "taxa for which (USFWS) has on file sufficient information on biological vulnerability and threats to support issuance of a proposed rule to list, but issuance of the proposed rule is precluded." Federal Candidate species are not afforded formal protection, although USFWS encourages other federal agencies to give consideration to Candidate species in environmental planning. In 1996, the USFWS discontinued the Category 3 and 4 classifications for federal Candidate species (USFWS, 1996). Species either are identified as Candidate species with a listing priority classification, designated as federal "species of concern," or are no longer given any federal status.

Section 9 of ESA prohibits the take of any fish or wildlife species listed under ESA as endangered. Take, as defined by ESA, is "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Harm is defined as "any act that kills or injures the species, including significant habitat modification." In addition, Section 9 prohibits removing, digging up, and maliciously damaging or destroying federally listed plants on sites under federal jurisdiction. Section 9 does not prohibit take of federally listed plants on sites which are not under federal jurisdiction. If there is the potential for take of a federally listed species, a Section 7 (federal agency) or Section 10 (private land owner) USFWS Incidental Take Permit may be required to authorize the "incidental take" of that species. Federal agency actions include activities that are on federal land, conducted by a federal agency, funded by a federal agency, or authorized by a federal agency (including issuance of federal permits).

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1918 prohibits killing, possessing, or trading migratory birds except in accordance with regulation prescribed by the Secretary of the Interior. Most actions that result in taking or in permanent or temporary possession of a protected species constitute violations of the MBTA. The USFWS is responsible for overseeing compliance with the MBTA.

Wetlands and Waters of the U.S.

Natural drainage channels and wetlands are considered Waters of the United States (Waters). The U.S. Army Corps of Engineers (ACOE) regulates the filing or grading of such Waters under Section 10 o the Rivers and Harbors Act and Section 404 of the Clean Water Act. The extent of jurisdiction within drainage channels is defined by Ordinary High Water (OHW) marks on the banks of the feature. Jurisdictional wetlands are delineated by the presence of hydrophytic soils, hydrology, and vegetation. Activities that involve discharge or fill into jurisdictional waters are subject to the permit requirements of the ACOE. Discharge permits are typically issued on the condition that the project proponent provides mitigation which results in no net loss of wetland function or value. In addition to individual discharge permits, he ACOE issues nationwide permits applicable to certain activities. Under the nationwide permits, discharge of fill must e minimized to the extent practicable. No discharge permit can be issue until the Regional Water Quality Control Board (RWQCB) issues a certification (or waiver) that the proposed activity will meet state water quality standards. The RWQCB is also responsible for enforcing National Pollutant Discharge Elimination System (NPDES) permits, including the General Construction Activity Storm Water Permit.

State Laws and Regulations

California Endangered Species Act

The California Endangered Species Act (CESA) was enacted in 1984. The California Code of Regulations (Title 14, Section 670.5) lists animal species considered endangered or threatened by the state. Section 2090 of CESA requires state agencies to comply with endangered species protection and recovery and to promote conservation of these species. Section 2080 of the Fish and Game Code

prohibits "take" of any species that the commission determines to be an endangered species or a threatened species. "Take" is defined in Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." It does not include habitat destruction in the definition of take. A Section 2081 Incidental Take Permit from the CDFG is required to "take" any state listed species.

Native Plant Protection Act

The California Native Plant Protection Act (NPPA) of 1977 directed the CDFG to carry out the legislature's intent to "preserve, protect and enhance rare and endangered plants in the state." The Act prohibits importing rare and endangered plants into California, taking rare and endangered plants, and selling rare and endangered plants. The CESA and NPPA authorized the California Fish and Game Commission to designate endangered, threatened and rare species and to regulate the taking of these species (§2050-2098, Fish and Game Code). Plants listed as rare under the NPPA are not protected under CESA.

California Fish and Game Code

CDFG has jurisdiction over the bed and bank of natural drainages according to provisions of Section 1601 and 1603 of the California Fish and Game Code. Activities that would disturb these drainages are regulated by CDFG via a Stream bed Alteration Agreement. Such an agreement typically stipulates certain measures that will protect the habitat values of the hydrologic feature being impacted.

Raptors (e.g., eagles, hawks, and owls) and their nests are protected under both federal and state laws and regulations. Section 3503 of the CDFG Code prohibits the killing, possession, or destruction of bird eggs or bird nests. Section 3503.5 and 3513 prohibit the killing, possession, or destruction of all nesting birds (including raptors and passerines). Section 3503.5 states that it is "unlawful to take, possess, or destroy the nest or eggs of any such bird except otherwise provided by this code or any regulation adopted pursuant thereto." Section 3513 prohibits the take or possession of any migratory nongame birds designated under the federal MBTA. Section 3800 prohibits take of nongame birds.

The classification of Fully Protected was the state's initial effort in the 1960's to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish (Section 5515), mammals (Section 4700), amphibians and reptiles (Section 5050), and birds (Section 3511). Most Fully Protected species have also been listed as threatened or endangered species under the more recent endangered species laws and regulations. Fully Protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock.

The CDFG also maintains a list of animal "species of special concern," most of which are species whose breeding populations in California may face extirpation if current population trends continue. Although these species have no legal status, the CDFG recommends considering these species during analysis of proposed project impacts to protect declining populations and avoid the need to list them as endangered in the future.

The Natural Heritage Division of the CDFG administers the state Rare Species Program. The CDFG maintains lists of designated endangered, threatened, and rare plant and animal species. Listed species either were designated under the NPPA or designated by the Fish and Game Commission. In addition to recognizing three levels of endangerment, the CDFG can afford interim protection to Candidate species while they are being reviewed by the CDFG Commission.

Other State Conservation Programs

Under provisions of Section 15380(d) of CEQA, the project lead agency and CDFG, in making a determination of significance, must treat non-listed plant and animal species as equivalent to listed species if such species satisfy the minimum biological criteria for listing. In general, the CDFG considers plant species on List 1 or 2 of the California Native Plant Society's (CNPS) *Inventory of Rare and Endangered Vascular Plants of California* (Tibor 2001) as qualifying for legal protection under this CEQA provision. Species on CNPS List 3 or 4 may, but generally do not, qualify for protection under this provision.

Surveying Personnel

DD&A was contracted to assess the potential presence of special-status plants, animals, and/or habitats within the proposed Miravale III residential development in the City of Soledad, CA. Prior to conducting the site assessment, DD&A reviewed all available site plans and created a GIS figure presenting all California Natural Diversity Database (CNDDB) reported occurrences of special-status species within 10 kilometers of the project site (Figure 3).

David Keegan, DD&A Senior Wildlife Biologist, conducted an initial site visit on July, 19, 2006 with the project engineer (Jim Wurtz, Bestor Engineers), and was onsite between approximately 1000-1300 hours (note: other DD&A staff present included Brett Becker, Tyler Potter, and Elizabeth Guzman). David Keegan and Josh Harwayne, DD&A Senior Environmental Scientists, conducted a site review on July 28, 2006, and were onsite between approximately 1000-1500 hours; a preliminary wetland assessment was completed. As the proposed development site is relatively large (920-acres), the site was reviewed via meandering transects. All data were recorded on site plans and/or aerials and in "Rite-in-the-rain" notebooks. Site photographs were recorded using a digital camera.

DD&A contracted Don Roberson (noted Monterey Bay Ornithologist) to assess the "reservoir" portion of the Miravale III site for the potential presence of nesting bank swallows *(Riparia riparia)*. David Keegan and Don Roberson visited the site on August 10, 2006 for approximately 2.5 hours.

DD&A contracted Mark Allaback (Wildlife Biologist) and David Laabs (Wildlife Biologist) of Biosearch to prepare studies on a number of species, including: presence/absence of the Salinas pocket mouse *(Perognathus inornatus psammolphilus*) via a small mammal trapping study (Appendix B); preparation of a San Joaquin Kit Fox *(Vulpes macrotis mutica*) Early Evaluation Report for USFWS review (Appendix C); California tiger salamander Habitat Assessment Report (Appendix D); and, Protocol-level Western burrowing owl *(Athene cunicularia*) surveys at the site (Appendix F). Small mammal trapping and San Joaquin Kit fox habitat evaluation occurred August 28-September 1, 2006. David Keegan, Mark Allaback, and David Laabs were onsite together on August 28, 2006 from 1800-2100 hours to design and initiate the study. David Keegan baited the traps on August 29 and 30th, 2006, requiring approximately 3 hours just before sunset each evening (1700-2000 hours per visit). David Keegan and David Laabs checked and closed the traps during 0700-1000 hours on August 30th and 31th, 2006. David Laabs and Mark Allaback checked and closed the traps during 0700-1000 hours on September 1, 2006, then discontinued the study and removed all associated materials. See Appendix B for additional information. The site visits conducted in the course of the small mammal trapping were sufficient to prepare the SJKF Early Evaluation Report for USFWS (see Appendix C).

David Laabs conducted an additional site visit on October 17, 2006 to assess all onsite aquatic basins for the potential presence of California tiger salamander (*Ambystoma californiense*, CTS), and was onsite approximately 3 hours (Appendix C). Based on the USFWS review of the habitat assessment, protocol-level surveys for this species were initiated by David Keegan on May 8, 2007 (initial round of aquatic

sampling at each basin); DD&A biologists were onsite for approximately 5 hours. A second round of aquatic sampling occurred on May 24, 2007; DD&A biologists were onsite for approximately 5 hours. The third round occurred on June 12, 2007; DD&A biologists were onsite for approximately 5 hours. DD&A biologists completed a fourth sampling event at the onsite reservoir on June 26, 2007 to capture CTS larvae and/or paedomorphs and to collect tissue from each individual for genetic analysis at the Shaffer Lab (U.C. Davis). Mark Allaback was also present on June 12, 2007.

The first non-breeding season burrowing owl survey was conducted on January 18, 2007; DD&A and Biosearch biologists were onsite for approximately 4 hours. The second survey was conducted January 31, 2007; DD&A and Biosearch biologists were onsite for approximately 4 hours. The first breeding season survey (third survey total) was conducted on June 26, 2007; biologists were onsite for approximately 4 hours. The second and final breeding season survey was completed on July 11, 2007; biologists were onsite for approximately 4 hours. DD&A and Biosearch biologists were onsite for approximately 4 hours for the final survey, with an additional 7 hours dedicated to mapping ground squirrel burrow clusters present sporadically throughout the site. The results of these surveys are presented in Appendix F.

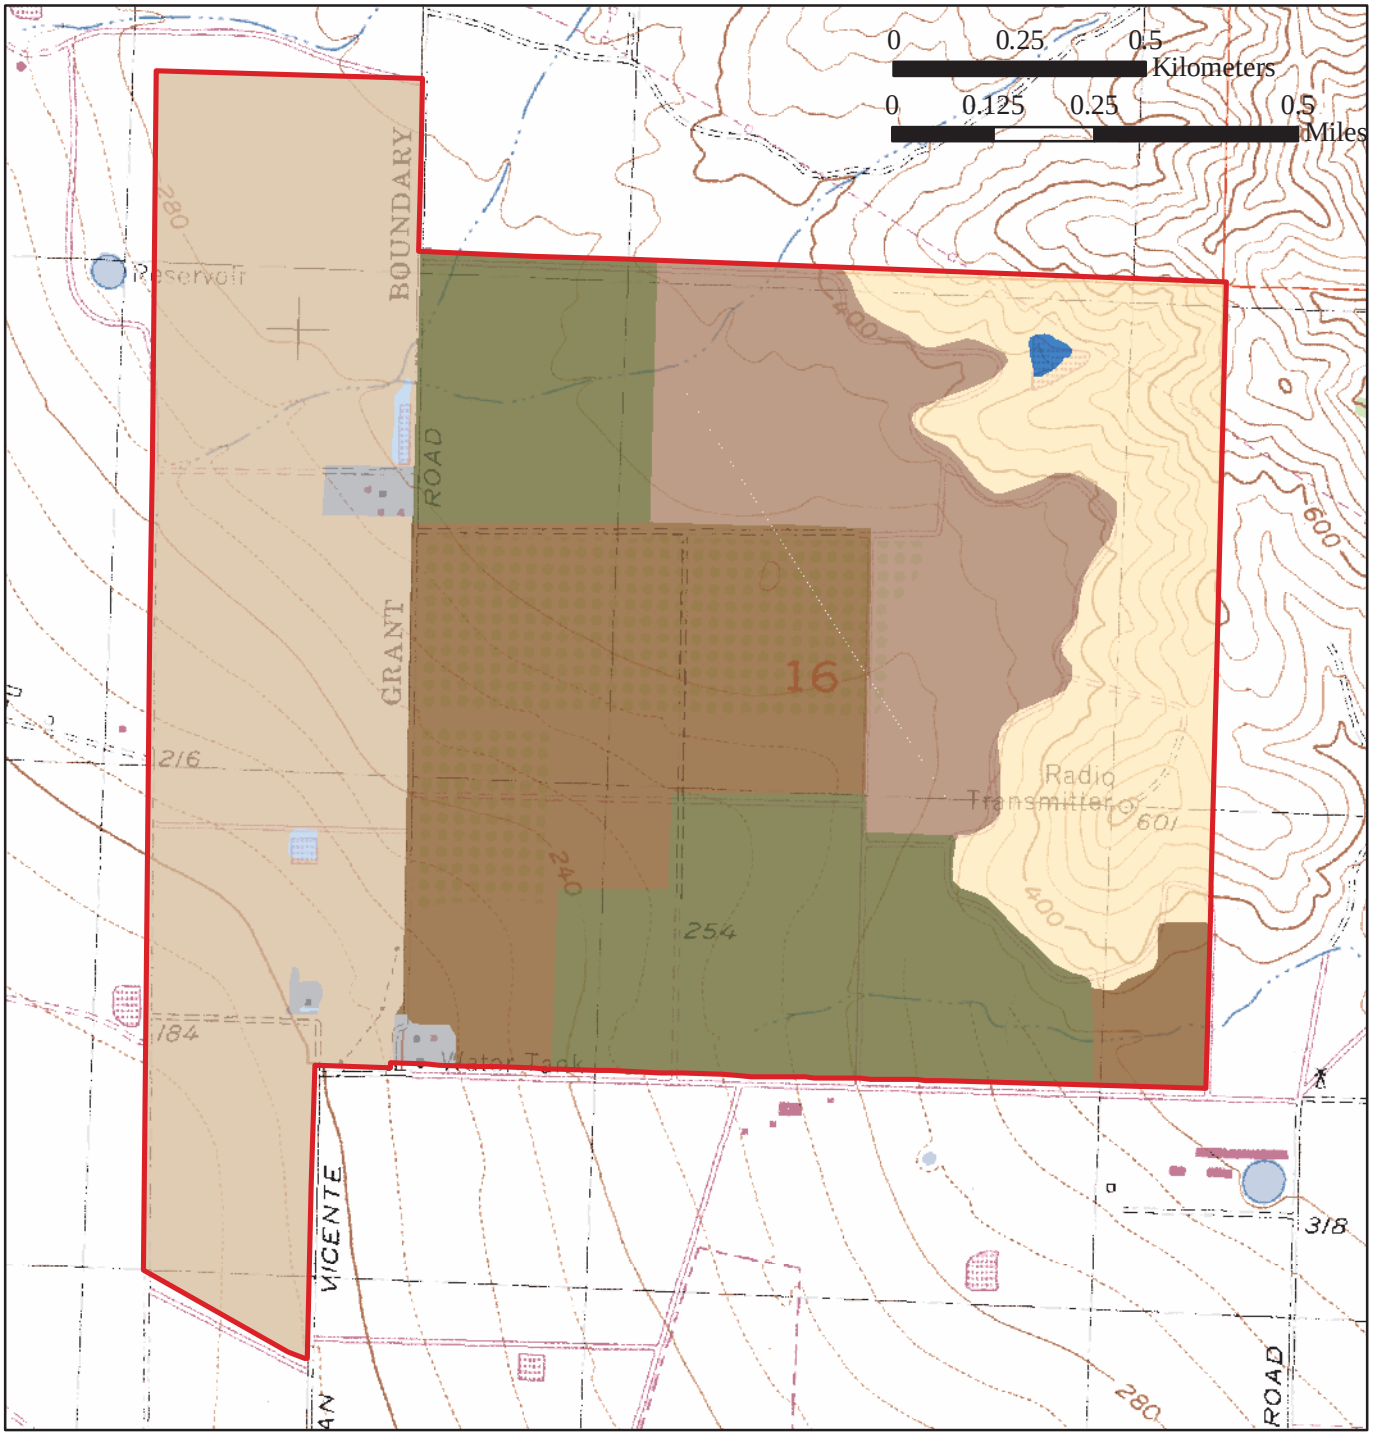
Results:

General Site Characteristics

The 920-acre Miravale III site is located immediately north of the edge of urban development associated with the City of Soledad and extends into the Gabilan Range foothills in the northern portion of the site. The Salinas River is located approximately 2.5 miles south of the project site. The Salinas River Watershed covers approximately 4,600 square miles of San Luis Obispo and Monterey counties. The Salinas River flows northwesterly through the Salinas valley, emptying into the Monterey Bay National Marine Sanctuary. The Salinas Valley lies in the Coast Ranges and is defined to the west by the Sierra de Salinas and to the east by the Gabilan Range. The valley is approximately 10 miles wide and 155 miles long. The primary land uses in the Salinas Valley (Salinas River watershed) are row crops, vineyards, pasture and grazing lands, as well as urban areas, military bases and public open space. The County portion of the watershed includes the Salinas River and its primary tributaries, the Arroyo Seco, Nacimiento, and San Antonio rivers.

The project site is bisected by San Vicente Road. Approximately 20% of the project site is located to the west of San Vicente Road, with the remaining 80% located to the east of this feature (Figure 4). West of San Vicente Road, all lands present within the proposed project boundaries currently support active agricultural production and the associated network of irrigation channels/ditches/basins. To the east of San Vicente Road, the vast majority of the proposed project site currently supports active and fallow agricultural land uses (and associated irrigation ponds and channels). In addition to active and fallow agricultural lands present to the east of San Vicente Road, the northwestern portion of the site abruptly transitions into mixed grasslands as proposed development extends into the Gabilan Range foothills. An existing farm road runs along much of the border between agricultural portions of the site and the foothill/grassland portions of the site.

Habitat Types



Habitats present within project boundaries can be divided into seven generalized types: active agriculture, fallow agriculture, mixed grassland, rocky-outcrops, “reservoir,” agricultural basins, and “home-sites” (including residential homes, out-buildings, driveways, etc.).

Active Agriculture

Agriculture is the dominant land use in the vicinity of the project site, and approximately 461.7 acres of the site currently supports active agricultural production (Figure 4, Figures 5a and 5b). As agricultural areas are generally maintained to eradicate non-desirable vegetation (anything but the focus crop), plant diversity is typically quite low in these areas. As such, those portions of the site currently supporting grape production contain limited amounts of understory development. The limited amount of ground vegetation that persists within active agricultural portions of the site are dominated by black mustard (*Brassica nigra*), dandelion (*Agoseris grandiflora*), and bristly ox tongue (*Picris echioides*). Please note that active agricultural portions of the site contain a network of dirt-roads; a linear windbreak of non-native trees (Tamarisk [*Tamarisk* sp.] and Eucalyptus [*Eucalyptus* sp.]) is present along the dirt road separating the east side of the site from San Vicente Road. Roads within this habitat type are typically denuded and/or support only ruderal vegetation species. Agricultural areas represent potential wildlife dispersal and foraging habitat and may provide connectivity to adjacent habitats. Many avian species are attracted to active grapevines. In addition, some wildlife species may persist in active agricultural lands despite eradication efforts, such as California ground squirrel (*Spermophilus beecheyi*) and Botta's pocket gopher (*Thomomys bottae*). The presence of ground squirrel burrows within active agricultural lands may provide habitat for other denning wildlife species, including Western burrowing owls (*Athene cunicularia*) and San Joaquin kit fox (*Vulpes macrotis mutica).* The presence of large mature Eucalyptus *(Eucalyptus sp.)* and Tamarisk (*Tamarix sp.*) trees along San Vicente road represents potential nesting/denning sites for bats and/or raptors.

Fallow Agriculture

For the sake of this report, the "fallow agriculture" habitat type includes all portions of the site currently supporting arable lands that are not under rotation, and/or lands which recently supported crops but are not currently being used for that purpose. Approximately 314.8-acres of fallow agricultural lands are present within project boundaries. Fallow agricultural portions of the site are currently dominated by mustard and ripgut brome (*Bromus diandrus*). As presented on Figure 4, approximately 130.3-acres (40%) of the "fallow agriculture" habitat onsite has been disked in the past several years, with the remaining 192.9-acres (60%) undisced. Disked fallow agricultural portions of the project site currently support very limited numbers/amounts of small mammal burrows and/or mature vegetation, but would likely support greater amounts of mature vegetation and small mammal burrows if left fallow. Undisced fallow agricultural portions of the project site currently support relatively mature vegetation and numerous mammalian burrows. Undisced portions of the site were observed to support a variety of wildlife species (California ground squirrel, Botta's pocket gopher, California vole [Microtus californicus], black-tailed jackrabbit [*Lepus californicus*], Brewer's blackbird [*Euphagus cyanocephalus*], red-winged blackbird [*Agelaius phoeniceus*], American crow [*Corvus bracyrhynchos*], etc.) Please note that fallow agricultural portions of the site contain a system of dirt-roads. Roads within this habitat type are typically denuded and/or support only ruderal vegetation species. As noted above in the description of active agricultural areas, a linear arrangement of mature Tamarisk and Eucalyptus trees line the dirt road separating the eastern portion of the site from San Vicente Road. These trees may represent potential bat and/or raptor nesting/roosting sites.

Habitat Classification

- Active Agriculture - Row Crops
- Active Agriculture - Vineyard
- Agricultural Basin
- Disced Fallow Agriculture
- Homeland
- Mixed Grasslands
- Reservior
- Un-disced Fallow Agriculture

Mixed Grassland

Approximately 141.3-acres of the Gabilan Range-foothill associated portions of the site are included in this habitat description (Figure 5b). This habitat type includes all onsite mixed grasslands and is composed of both introduced grass species and native perennial grasses. Although ruderal plants have reduced native perennial grasses throughout much of the site as a result of past disturbance and the recent removal of grazing (reported to have occurred in 2005 by Mike Mirassou the onsite grower), both native and non-native species remain onsite. Dominant species in the "mixed grassland" habitat type include: wild oat (*Avena fatua*), rattail fescue *(Vulpia myorus)*, soft-chess (*Bromus hordaceous)*, and needle grass (*Nasella sp.)*. Subdominate herbs and/or forbs included naked buckwheat (*Eriogonum nudum*), yarrow (*Achillea millefolium*), Lessingia (*Lessingia* sp.), deerweed (*Lotus scoperious*), and chamise (*Adenostoma fasciculatum*), storksbill (*Erodium botrys*), curly dock (*Rumex crispus*), English plantain (*Plantago lanceolata*), and poison-hemlock (*Conium maculatum)*. Vegetation throughout the grasslands is relatively sparse on south facing slopes. Please note that a limited network of dirt roads is also present within the mixed grassland portions of the site (from past ranching/grazing activities). These roads are typically denuded of vegetation or support limited ruderal species.

In general, grasslands provide an important foraging resource for a wide variety of wildlife species. The invertebrate fauna of grasslands is diverse and abundant, and many species perform important regeneration functions, such as pollinating grasses and wildflowers. The grasses and forbs in the grasslands produce abundant seeds, roots, and leaves, providing food for many wildlife species. Common wildlife species that eat foliage and seeds which likely occur in the grasslands within the project area include: mourning dove (*Zenaida macroura*), savannah sparrow (*Passerculus sandwichensis*), red-winged blackbird, house finch (*Carpodacus mexicanus*), American goldfinch (*Carduelis tristis*), Botta's pocket gopher, California vole, and California ground squirrel. The numerous insects and invertebrates that thrive on grassland plants attract vertebrate species, such as the Western fence lizard (*Sceloporus occidentalis)*, American robin (*Turdus migratorius*), and Brewer's blackbird. Passerine birds, typical of grasslands include: Western bluebird (*Sialia mexicana*), Western meadowlark (*Sturnella neglecta*), and several swallow species (*Hirundo and Petrochelidon* sp.).

Rocky Outcrops

Dozens of various-sized rocky outcrops are present throughout the foothill/grassland portions of the project site (particularly near the onsite reservoir). These outcrops vary in size from <5 square feet to >50 square feet. Vegetative species composition at these rocky outcrops overlaps broadly with the surrounding foothill/grasslands portions of the site, with slight variation. In addition to the dominant vegetative species presented in relation to the foothill portions of the site above, these rocky outcrop areas also support sticky monkey flower (*Mimulus aurantiacus*), coyote bush (*Baccharis* sp.), cudweed (*Gnaphalium* sp.), and Dudleya (*Dudleya* sp.). Small mammal utilization of these areas may differ slightly from surrounding grasslands (i.e. kangaroo rats) and these rocky outcrops provide possible denning and/or basking sites for a variety of wildlife (fox, badger, snakes, raptors, etc.). Mike Mirassou, the current onsite grower, reports that a "rattlesnake den" was observed in the Spring of 2006 in a rocky outcrop located just north of the onsite reservoir. David Keegan observed a rattlesnake at a den entrance associated with a rocky outcrop in 2007. Western burrowing owls were observed utilizing rocky outcrops in the vicinity of the onsite reservoir as a temporary roost while foraging in the early morning hours (personal observation, David Keegan and David Laabs).

Reservoir

As presented on Figure 5b and in Appendix D, an onsite "reservoir" (a.k.a "Pond 1") is situated in the northeast corner of the site at an elevation of 450 feet. This basin is approximately 1.2 acres. Emergent

vegetation is present in approximately 5% of its surface. It is permanent and is impounded with a large berm. The depth of this pond was approximately 25 feet in July, 2007. Uplands surrounding this reservoir consist of annual grasslands and rocky outcrops. Water from this reservoir is pumped for agricultural use, and water levels may fluctuate widely throughout the year. Until approximately 5 years ago, the reservoir was utilized as a stock-pond by onsite cattle. Vegetation in this pond is not currently maintained with herbicides and/or pesticides, but rather, is managed through raising and lowering water levels.

The onsite reservoir represents aquatic and fringe wetland habitat and is utilized by a variety of wildlife given the surrounding mixed grassland/foothill habitat. Emergent vegetation at the reservoir is dominated by bulrush (*Typha latifolia*), nut-sedge (*Cyperus eragrostis*) and dock. A relatively low (<12 feet tall) earthen bank is present immediately east and south of the reservoir. The earthen bank separates the "reservoir" and "mixed grassland" habitat types in this portion of the project site. A levee and road separate the southwestern portion of the "reservoir habitat" from adjacent grasslands and agricultural lands. Mixed grasslands and rocky outcrops are present to the north of the site, and the slope of this area exceeds 30%.

Avian species observed at the pond included American kestrel, killdeer (*Charadrius vociferous*), red-winged blackbirds, Brewer's blackbird, brown-headed cowbirds (*Molothrus ater*), cliff swallows, barn swallows, and morning doves (*Zenaida macroura*). Mammalian species observed at the reservoir included California ground squirrel and Botta's pocket gopher (note: several small mammal species included in Appendix H were trapped immediately north of the reservoir). Only one reptile species was observed at the reservoir: Western fence lizard. Although no adult amphibians were observed at the reservoir, hundreds of Pacific treefrog larvae were clearly visible during early site assessments. According to the grower that lives at the property, this pond was drained to remove warm water fish approximately 5 years ago, and no fish have been reintroduced since that time. In addition, no pesticides or herbicides are being applied to the emergent vegetation at this reservoir, and small mammal eradication efforts are not currently undertaken in the surrounding uplands. Given that this reservoir is perennial, free of non-native/invasive aquatic predators and competitors, and is surrounded by appropriate upland/estivation habitat, this site represents a potential breeding location for sensitive and/or listed amphibian species which historically occurred in the area. The presence of tiger salamander larvae in the reservoir was confirmed via aquatic sampling on March 8, 2007; tissue samples were subsequently collected and sent to the Shaffer Lab (U.C. Davis) for genetic analysis where it was determined that these tiger salamanders are between 89-100% non-native (see tiger salamander discussion below for more information).

Agricultural Basins

Three agricultural basins are present within the Miravale III Specific Plan project boundaries west of San Vicente Road; these are referred to as Pond 2, Pond 3, and Pond 4. Each of these agricultural basins are associated with an extensive irrigation network operated to deliver water to the surrounding row crops (Figures 4-5). Each basin was observed to be fully enclosed by silt fencing during aquatic sampling for CTS in May of 2007. Monterey County encourages growers to erect fencing around crops at this time given an e-coli contamination incident in the Salinas Valley in 2006. This fencing is intended to exclude deer, pigs, and other large mammals from entering and potentially contaminating crops.

"Pond 2" is a basin located along San Vicente Road in the northwestern portion of the site. This basin covers approximately 0.5 acres and is situated at 280 feet above sea level. Pond 2 is ephemeral and sandy soils indicate it does not hold water well. Water has not been observed in "Pond 2" during any of the DD&A site visits. An inlet pipe is the hydrologic source for this pond. No emergent vegetation is supported. Upland habitats surrounding Pond 2 are in active agricultural production on three sides.

"Home-sites" are situated to the south. The nearest grassland habitat is approximately 1.0 km to the northeast.

"Pond 3" is a basin in the southwestern corn of the site. This pond covers approximately 0.1 acres and is situated at 180 feet above sea level. This pond has consistently been observed to hold water throughout various DD&A site assessment and may be managed as a perennial water source. Approximately 2% of the surface area supports emergent vegetation. Water levels are expected to be highly variable and the pond is dependent on piped water to fill. Upland habitats surrounding Pond 3 are in active agricultural production on all sides. The nearest grassland habitat is approximately 1.3 km to the east. Ground squirrel burrows are absent from the area surrounding Pond 3; limited pocket gopher burrows were observed.

"Pond 4" is a small basin in the southwestern corner of the site. It covers approximately 0.1 acres and is situated at 80 feet above sea level. This pond has consistently been observed to retain water during DD&A site visits, however, water levels fluctuate widely. The hydrologic source at this site is piped in agricultural run-off. No emergent vegetation is supported at this pond. The banks of this aquatic resource are quite steep; the maximum depth is assumed greater than 10 feet. Upland habitats surrounding Pond 4 are in active agricultural production on all sides. The nearest grassland habitat is approximately 1.8 km to the northeast. Burrowing mammals are largely absent from the area surrounding Pond 4.

As noted in the CTS Habitat Assessment in Appendix D, numerous additional agricultural basins are located outside of project boundaries but within 2km of the project site.

Home-sites

Two "home-sites" (including a labor camp) are present west of San Vicente Road within the Miravale III project site; each of these areas is proposed for future development. Additional home-sites are present immediately adjacent to project boundaries. For the sake of this report, "home-sites" include residential homes, barns, out-buildings, driveways, roads, and any associated landscaping. In general, these home-sites do not support any separate or unique habitats different than those identified above, but they do support mature trees (mixed species composition), and older barns and out-buildings. The presence of older barns and outbuildings within these home-sites presents potential habitat for a variety of raptors (i.e. barn owls) and bat species. Likewise, the presence of mature trees within these home-sites represents potential nesting raptor (and other bird) habitat and may represent potential bat roosting habitat. Please note that "Pond 2" described above is associated with a home-site but is presented as a separate habitat type (agricultural basin) for ease of discussion.

Sensitive Habitats

Based on a review of the CNDDB in combination with the DD&A site assessments, the following sensitive habitat types are present; aquatic resources and federal and state listed wildlife species habitat.

No wetland delineations were undertaken at the Miravale III project site, but a wetland assessment was completed that documented the presence of fringe wetlands. A small vegetated fringe wetland exists adjacent to the onsite reservoir. In addition, fringe wetlands are associated with the agricultural basins to the east of San Vicente Road. Please note that these types of fringe wetlands are not typically ACOE jurisdictional given current regulations regarding Section 404 of the Clean Water Act, but only ACOE may determine their jurisdictionality. While the onsite fringe wetlands are not likely jurisdictional to the ACOE (but subject to ACOE review), impacts to these resources are subject to review under CEQA Impacts to these areas would also be regulated by ESA if any listed or special-status wildlife species utilize these areas as breeding habitat.

As previously noted, tiger salamander larvae and paedomorphs were documented at Pond 1 and tissue samples were collected for genetic analysis by the Shaffer Lab at U.C. Davis (n=22) . The Shaffer Lab documented that these tissue samples were between 89-100% non-native at the specific loci tested; this information was forwarded to USFWS Ventura for their evaluation. USFWS subsequently determined that onsite tiger salamanders are not included within the species "California tiger salamander" and are not afforded protection under ESA (pers. comm.. Doug Cooper, USFWS Ventura). As such, USFWS has declined to take jurisdiction over onsite tiger salamanders.

While the onsite aquatic habitats are not regulated for utilization by hybridized/non-native tiger salamander, these areas provided potential habitat for other regulated amphibian species including California red-legged frog and spadefoot toad. If either of these species is present at any onsite aquatic resource, additional coordination and/or permitting with the regulatory agencies will be required.

Although mixed grassland habitats are not typically considered a "sensitive habitat," San Joaquin kit fox (*Vulpes macrotis mutica*) are assumed present within project boundaries, particularly in the mixed grassland portions of the site. Any impact to a habitat which is known or assumed to support a federally listed wildlife species may represent "take" under the Endangered Species Act. Consultation with USFWS is recommended to satisfy ESA prior to project initiation (i.e. issuance of grading permits). In addition to supporting kit fox, these areas were documented to support the following California species of special concern; American badger (*Taxidea taxus*), Salinas pocket mouse (*Perognathus inornatus psammolphilus*), western burrowing owl (*Athene cunicularia*), loggerheard shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). As such, impacts to grassland habitat would impact a variety of federal and/or state protected species and this habitat; mixed grasslands represent a sensitive habitat under CEQA.

Special-status Plant Species

The CNDDB reports an occurrence of robust spineflower (*Chorizanthe robusta* var. *robusta*) approximately 2 km south of the project site. In addition, the CNDDB reports occurrences of Congdon's tarplant (*Centromadia parryi* ssp. *congdonii*), Indian valley bush mallow (*Malacothamnus aboriginum*), and Gabilan Mountains manzanita (*Arctostaphylos gabilanensis*) within 5 miles of the project site. The CNDDB presents an occurrence of Lemmon's jewelflower (*Caulanthus coulteri* var. l*emmonii*) approximately 10 miles from the project site. The CNDDB presents an occurrence of Jolon's clarkia (*Clarkia jolonensis*) approximately 1.25 east of the project site. The CNDDB does not report the presence of any special-status plant species within or immediately adjacent to proposed project boundaries. Please note that the CNDDB also presents that Monterey spineflower (*Chorizanthe pungens* var. *pungens*) critical habitat is present within 2 km of the project site. DD&A biologists did not observe any special-status plant species within the study site. The only plant species with the potential to occur within the project boundaries, Lemmon's jewelflower and Jolon's clarkia, are discussed below. The following plant species are discussed due to their known or potential presence in the vicinity of the project site and/or their "high profile" local status. Please note that no other special-status plant species are anticipated within project boundaries for the species-specific reasons provided in Appendix A.

Robust spineflower

The robust spineflower is a Federal Endangered species. Robust spineflower is a small annual plant originally found throughout the central coast of California but is currently limited to seven known populations, all occurring in Santa Cruz and Monterey Counties. The robust spineflower is a wiry, annual herb with large notched, white to pinkish flowers growing in a dense cluster. The shrub grows in a variety of postures, from erect to spreading or growing flat along the ground. This species is endemic to sandy soils along the central coast. Robust spineflower is believed to have been extirpated in four of the seven counties where it formerly occurred and is threatened in the remaining areas. Robust spineflower

occurs primarily in clay-rich valley soils that flood in winter and dry hard in summer. Habitats within much of the historic range of this species have been converted to agriculture or urban expansion. This is an annual herb which typically blooms between April and September.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 1.75 km south of the project site (Figure 3). The project site does not support appropriate sandy soils for this species. DD&A biologists did not identify any robust spineflower within project boundaries, and did not identify appropriate habitat within project boundaries. This species is not present at the Miravale III site.

Monterey spineflower

Monterey spineflower is Federal Threatened species. This species is also recognized as rare by the CNPS as a List 1B species. According to the CNDDB and USFWS records, the species occurs from the Monterey Peninsula northward along the coast to southern Santa Cruz County and inland to the Salinas Valley. The CNDDB lists 21 populations, the largest population occurring on the former Fort Ord lands. Monterey spineflower grows in coastal dunes, coastal scrub, and further inland on sandy soils derived from ancient stabilized dunes. This species tends to occur more often on bare, sandy patches where there is little vegetation cover. Dispersal of seeds is facilitated by the spines that help attach the seeds to passing animals. The preference of these species for sandy substrate allows seedlings to establish in areas that are relatively free from competing species. The blooming period is typically from April through June (USFWS, 1995).

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 3 km south of the project site, and Monterey spineflower critical habitat is present within 1.5 km of the site (Figure 3). The project site does not support appropriate sandy soils for this species. The DD&A biologists did not identify any Monterey spineflower within project boundaries, and no appropriate habitat is present. This species is not present within Miravale III project boundaries.

Congdon's tarplant

Congdon's tarplant is a California State Species of Special Concern. Congdon's tarplant is an erect to prostrate, summer-flowering annual herb. Typically, growth begins in mid- to late-spring. The first-formed leaves are often thin, with lower ones often divided into narrow lobes. Secondary clusters of stiff, spine-tipped leaves are soon produced along the main stem and branches. Flowering begins in mid summer and may continue into early autumn. The tiny yellow flowers are borne in small, stalkless, daisy-like flower heads along the upper branches. Each flower head is surrounded by a cluster of rigid, spine-tipped bracts. As the plants gradually dry up and die in autumn, the seed heads shatter. Historically this species was distributed from Contra Costa and Solano counties south to San Luis Obispo County. Annual herb; blooms June-November.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 3 km northeast of the project site (Figure 3). DD&A biologists did not identify this species within project boundaries, and this site does not contain appropriate habitat (flood-prone clayey and/or alkaline soils) for this species. This species is not present within Miravale III project boundaries.

Lemmon's jewelflower

Lemmon's jewelflower is a CNPS List 1 B species. Lemmon's jewelflower is an annual herb associated with open, grassy areas; on hillside slopes and in fields, canyons, and arroyos. Leaves basal with toothed to wavy edge. Flowers contain 5 sepals, and 8 petals. Typical soils include alkaline, shaley clay, sandstone talus, and decomposed serpentine. This species is predominantly found within Valley Grassland community, occasionally in Pinyon-Juniper Woodland, and grows at elevations between 256 - 3904 feet. Blooms March - May.

Species potential presence within project boundaries:
As this species is associated with valley grassland communities, and was not identifiable at the time of the site assessments, it is possible that this species occurs within project boundaries but was not identified. For this reason, it is recommended that a Spring-time (March-May) floristic survey of appropriate portions of the site be conducted to assess the presence/absence of this species within project boundaries.

Jolon's clarkia
Jolon's clarkia is a CNPS List 1 B species. The CNDDB presents the nearest occurrence of Jolon's clarkia approximate 1.25 miles east of the proposed project site. Jolon's clarkia is an annual herb associated with cismontane woodlands, chaparral, scrub, and riparian woodland habitats and edges. Jolon's clarkia is generally less than 2 feet tall, has glabrous and glaucous stems, and pink to lavender inflorescence flecked with red; seeds are grey. This species is generally found between 60-2165 feet elevation, and blooms April to June.

Species potential presence within project boundaries:
The project site does not support or contain cismontane woodlands, chaparral, scrub, or riparian woodland habitats. Jolon's clarkia is assumed to be absent from the Miravale III site given a lack of appropriate habitat for this species.

Indian valley bush mallow

Indian valley bush mallow is California State Species of Special Concern and is a CNPS List 1B species. This species is known to occur in San Diego County, Fresno County, Monterey County, and San Benito Counties. Bush mallow is an herbaceous shrub typically associated with montane chaparral and lower montane coniferous forest. Indian valley bush mallow exhibits a tendency to grow in minor rocky outcrops within a relatively diverse chaparral flora, at elevations ranging from 150-1700 meters. Shrub species; booms April-October.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 4 km southeast of the project site (Figure 3). DD&A biologists did not identify this species within project boundaries, and the project site does not support or contain any chaparral or coniferous forest. This species is not present within project boundaries.

Pinnacles buckwheat

Pinnacles buckwheat (*Eriogonum nortonii*) is a CNPS List 1B species. Pinnacles buckwheat is typically associated with chaparral and valley/foothill grasslands habitats, often with sandy soils, and may be observed on recent burn sites. The elevational distribution of this species is approximately 300-900 meters. Pinnacles buckwheat is an annual herb that typically blooms between May and June.

Species potential presence within project boundaries:

The CNDDB reports several occurrence records of this species associated with Pinnacles National Park, approximately 6 km to the northeast of the Miravale III project site. DD&A biologists did not identify this species within project boundaries. The Miravale project site is located well below the 300 meters in elevation (the lower threshold of Pinnacles buckwheat), and appropriate habitat for this species is not present. This species is not present within Miravale III project boundaries.

Bistlecone fir

Bristlecone fir (*Abies bracteata*) is a CNPS List 1b species. Bristlecone fir is a rare species, endemic to the bottoms of rocky canyons on the west slope of the Santa Lucia Mountains near Monterey and reaches sizes of 90-150 feet tall. This tree has a slender, spire-like form. The bark is reddish-brown with wrinkles, lines and resin vesicles ('blisters'). The branches of this tree (evergreen) are typically downswept.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 5 km southwest of the project site. DD&A biologists did not observe this species within project boundaries. The project site is not located within or adjacent to the Santa Lucia Mountains. No rocky canyons are present, and this conspicuous species was not observed during site assessments. This species is not present within project boundaries.

Gabilan Mountains manzanita

Gabilan mountains manzanita (*Arctostaphylos gabilanensis*) is a CNPS List 1B species. This species of manzanita is endemic to chaparral and chaparral/pine woodland habitats of the Gabilan Mountains of California, along the borders of San Benito and Monterey counties.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 4.5 km north of the Miravale III project site. DD&A biologists did not identify this species within project boundaries. The proposed project site does not contain chaparral and/or pine woodlands, and this species was not observed during the site assessment. This species is not present within Miravale III project boundaries.

Special-status Wildlife Species

The CNDDB reports occurrences of the following special-status species within 10 km of the project site: big-eared kangaroo rat (*Dipodomys elephantinus*), American badger, Salinas pocket mouse, Western spadefoot (*Spea hammondii*), Western burrowing owl, California tiger salamander, and California red-legged frog (*Rana draytonii*), San Joaquin whipsnake (*Masticophis flagellum* ssp. *ruddocki*), and a variety of bat and raptor species. Please note that the CNDDB also reports that California tiger salamander critical habitat is present approximately 3 miles northeast of the project site. The following species are assessed for their potential presence/absence within project boundaries (also see Appendix A). Please note that no other special-status wildlife species included in Appendix A are anticipated within project boundaries for the species-specific reasons provided in Appendix A.

American badger

The American badger is a California State Species of Special Concern. Badgers occupy a diversity of habitats within California. The principal requirements seem to be sufficient food, friable soils, and relatively open, uncultivated grounds. Grasslands, savannas, and mountain meadows near timberline are preferred. Badgers feed primarily of burrowing rodents, such as gophers, squirrels, mice, and kangaroo rats, as well as some insects and reptiles. Badgers also break open bee hives to eat both the brood and honey.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 3.5 km south of the project site. DD&A and Biosearch biologists observed a badger emerge from an onsite den on July 11, 2007. In addition, DD&A and Biosearch observed badger burrows/dens in multiple locations of the grassland portions of the site and noted the presence of "badger diggings" in both grassland and fallow agricultural portions of the site. American badger are therefore known to be present within project boundaries.

Salinas pocket mouse

The Salinas pocket mouse is a California State Species of Special Concern. This species occurs in the Salinas Valley from the vicinity of Soledad south to the vicinity of Hog Canyon near San Miguel. The subspecies was originally described from near Arroyo Seco, approximately 5 mouths to the south of the proposed Miravale III project site. Conversion of natural habitats has occurred throughout much of the range of the subspecies, including in the vicinity of the nearest reported occurrence of this species, and habitat connectively between these sites is virtually non-existent. Little information is available about the specific life history of this species as it has been captured infrequently since initially described in 1937. It has been found in grassland, savannah, and scrub habitats, typically associated with sandy soils. This subspecies is nocturnal and spends its days below ground in burrows. It is a granivore that feeds on the seeds of grasses, shrubs, and forbs. The species typically breeds between March to July and becomes inactive during the fall and winter months.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of Salinas pocket mouse approximately 6.5 km south of the project site. DD&A contracted Biosearch to initiate a small mammal trapping study in the mixed grassland portion of the site to determine the presence/absence of Salinas pocket mouse and Big-eared kangaroo rat (Appendix B). Presence of the pocket mouse subspecies was confirmed on September 1, 2006 when a male Salinas pocket mouse was trapped in grassland habitat in the northeast corner of the site. Based on the results of this trapping effort, Salinas pocket mouse are known to occur in the mixed grassland/foothill portions of the project site (also refer to Appendix B).

Big-eared kangaroo rat

The Big-eared kangaroo rat is a California State Species of Special Concern. One of the largest kangaroo rats overall, big-eared kangaroo rats have the longest ears of any kangaroo rat species. This species lives only in the southern part of the Gabilan Range in San Benito and Monterey Counties. Due to brush fires, and human-related habitat encroachment, this species is considered on the decline. Big-eared kangaroo rats are typically associated with chaparral covered slopes. Predators of this species include owls, foxes, and coyotes.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 5 km east of the project site. However, the proposed project site does not contain appropriate habitat for this chaparral-associated species. DD&A contracted Biosearch to initiate a small mammal trapping study in the mixed grassland portion of the site to determine the presence/absence of Salinas pocket mouse. No big-eared kangaroo rats were trapped in the course of the study (nor would they be anticipated given a lack of chaparral habitat). Based on the results of the small mammal trapping study undertaken by BioSearch, and a lack of appropriate habitat, big-eared kangaroo rats are not anticipated within project boundaries.

San Joaquin kit fox

The San Joaquin kit fox is a federal Endangered and state Threatened species. Its present range extends from the southern end of the San Joaquin Valley, north to Stanislaus County along the east, and along the interior Coast Range valleys and foothills to central Contra Costa County. The kit fox typically inhabits valley alkaline scrub, valley and foothill grasslands, and open oak woodlands of low to moderate relief. Kit foxes are known to occupy human-altered habitats such as vineyards, orchards, and petroleum fields, where denning opportunities and suitable prey are available. Kit foxes are thought to be weak excavators and largely dependent on rodent burrows, which they enlarge as den sites. Studies of kit fox in the northern part of their range support this presumption, as kit foxes are largely dependent on California ground squirrel (*Spermophilus beecheyi*) burrowing for the creation of den sites. Man-made features, such as culverts in roadbeds and pipes, are frequently used in developed landscapes in the southern range of the kit fox. In the course of a year, up to 70 different dens may be used by a single individual. Mating occurs from December to February, with pups born between February and late March. Pups emerge above ground, and are fed primarily by the male adult, at approximately one month old. Pups are fed 4 to 5 months, after which, the pups begin to forage independently. Juveniles disperse as far as 19 kilometers away from natal dens. Home ranges vary in size, depending on prey availability. Average home range is approximately 500 hectares.

Species potential presence within project boundaries:
The CNDDB reports several occurrences of San Joaquin kit fox approximately 10 km east of the project site (Figure 3). In addition, the CNDDB reports the presence of SJKF critical habitat within 10 km of the Miravale III site. DD&A and BioSearch biologists mapped the presence of California ground squirrel burrow "clusters" throughout the mixed grassland potions of the site and in portions of the fallow and active agricultural portions of the site; many of the burrows observed were of appropriate size to support this species. In addition, one active "natal den" was mapped and recorded by the Biosearch biologists.

The Miravale III project site is located within the historic distribution of SJKF and represents an encroachment in the foothills of the Gabilan Range (a known corridor for this species). Biosearch wildlife biologists prepared a "San Joaquin Kit Fox Early Evaluation Report" of the project site for USFWS review (Appendix C). Based on USFWS Ventura review of this early evaluation report, protocol-level SJKF northern-range protocol-level surveys were recommended (pers. comm. Roger Root, USFWS). A determination of San Joaquin kit absence from the proposed project site could only be supported by completing the protocol for this species and having a negative finding. Rather than completing protocol-level surveys for this species, the City of Soledad is assuming SJKF presence.

Pallid bat

The pallid bat (*Antrozous pallidus*) is a California State Species of Special Concern and is a year round resident in California. This species of bat occurs in a wide variety of habitats including grasslands, shrublands, arid desert areas, oak savanna, coastal forested areas, and coniferous forests of the mountain regions of California and forests ranging from sea level up through mixed conifer forests. Pallid bats are most common in open, dry habitats with rocky areas for roosting. Day roosts of this species include caves, crevices, mines, and occasionally in hollow trees and buildings. This species seems to prefer rocky outcrops, cliffs, and crevices with access to open habitats for foraging. Pallid bats make use of similar structures for night roosting and will use more open sites such as eaves, awnings, and open areas under bridges for feeding roosts. Pallid bats feed on large insects (20 to 70 mm in length). Foraging takes place over open ground, at heights generally not greater than 7.5 feet, although prey is most often caught on the ground. Jerusalem crickets, scorpions and beetles make up most of the diet of pallid bats in central California. Copulation occurs in the fall, October through December. Females store the sperm, and ovulation occurs in the following spring. Parturition timing is determined by local climate, and embryonic development usually

takes about 9 weeks with birth occurring in May or June. Twins are the norm in northern California, but in other areas, they are known to have triplets. Maternity colonies range from 20 to 200 individual adult bats. Males roost in much smaller groupings (Hermanson and O'Shea 1983).

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10km of the project site, but occurrences of this species often go unreported. Pallid bats are known to occur at Pinnacles National Park, approximately 17 km northwest of the Miravale III project site. DD&A biologists did not observe or identify any pallid bats while onsite (site assessments were conducted during daylight, and identification typically requires acoustic recordings and associated software). However, pallid bats (and other general bat species) are considered potentially present within and/or adjacent to the Miravale III project site given the mixed availability of appropriate foraging (active and fallow agricultural lands, mixed grasslands) and roosting habitat (trees, rocky outcrops, barns, out-building).

Townsend's big-eared bat

Townsends' big-eared bat (*Corynorhinus townsendii townsendii*) are a federal species of concern and California State Species of special concern. The Townsend's big-eared bat is a year round resident in California occurring from low desert to mid-elevation montane habitats. It is found primarily in rural settings from inland deserts to coastal redwoods, oak woodland of inner Coast Ranges and Sierra foothills, and low to mid-elevation mixed coniferous-deciduous forests.

Townsend's big-eared bats typically roost during the day in caves and mines, but can roost in buildings that provided suitable shelter and conditions. Night roosts are in more open settings and included bridges, rock crevices, and trees. It hibernates in mixed sex aggregations of a few to several hundred individuals. Hibernation is more prolonged in colder areas. This species arouses periodically and moves to alternative roosts, and actively forages inland drinks throughout the winter. A single young is born per year between May and July. Females form maternity colonies of 35-200 individuals, while males roost individually. Townsend's big-eared bats feed primarily on small moths that are gleaned from vegetation.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10km of the project site. Pallid bats are known to occur at Pinnacles National Park, approximately 17 km northwest of the Miravale III project site. DD&A biologists did not observe or identify any bats while onsite (site assessments were conducted during daylight and identification typically requires acoustic recordings and associated software). Big-eared bats (and other bat species) are considered potentially present within and/or adjacent to the Miravale III project site given the mixed availability of appropriate foraging habitat (active and fallow agricultural lands, mixed grasslands) and roosting habitat (trees, rocky outcrops, barns, out-building).

Western mastiff bat
Western mastiff bats (*Eumops perotis*) are a California State Species of Special Concern. Mastiff bats are an uncommon resident in southeastern San Joaquin Valley and Coastal Ranges from Monterey County southward through southern California. This species occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, annual and perennial grasslands, palm oases, chaparral, desert scrub, and urban environments. This species ss reliant on crevices in cliff faces, high buildings, trees, and tunnels for roosting. When roosting in rock crevices, Mastiff bats require a vertical face to drop off and take flight. Nursery roosts may be in tight rock crevices at least 35 inches deep and 2 inches wide. Suitable habitat for this species consists of extensive open areas with abundant roost locations provided by crevices in rock outcrops and buildings. Insects are caught in flight, generally from ground to tree-level.

Species potential presence within project boundaries:
The CNDDB reports occurrences of Western Mastiff bats approximately 6 miles east and northeast of the project site. Western mastiff bats are considered potentially present within and/or adjacent to the Miravale III project site given the mixed availability of appropriate foraging habitat (active and fallow agricultural lands, mixed grasslands) and roosting habitat (rocky outcrops).

Western spadefoot

Western spadefoot are a California State Species of Special Concern. Western spadefoots are distributed throughout the Central Valley and adjacent foothills, and may be quite common where it occurs. In the Coast Ranges, it is found from Point Conception, Santa Barbara County, south to the Mexican border. Elevations of occurrence extend from near sea level to 1360-meters. Rarely found on the surface, spadefoots spend most of the year in underground burrows, which they may construct themselves or may improve (started by small mammals). Breeding and egg deposition occur almost exclusively in shallow, temporary pools formed by heavy winter rains. Egg masses are attached to plant material or the upper surfaces of submerged rocks. Tadpoles consume planktonic organisms and algae but are also carnivorous and may consume dead aquatic larvae of amphibians (including cannibalism). Recently metamorphosed juveniles seek refuge in the immediate vicinities of breeding ponds.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 5km northwest of the project site. DD&A biologists did not observe any adult spadefoot within project boundaries nor did we observe any larvae present at the "reservoir" (breeding season "ends" in May) in the course of three rounds of aquatic sampling for CTS. However, the project site is within the range of spadefoot and marginally appropriate breeding habitat is present at the onsite reservoir and associated fringe wetlands. As such, spadefoots are potentially present within project boundaries (note: spadefoots "typically" breed in ephemeral pools).

California tiger salamander

California tiger salamander were listed as a federally Threatened species on August 4, 2004 (69 FR 47211-47248), and are also a designated California state species of special concern. Critical Habitat was designated for CTS on August 23, 2005 (70 FR 49379-49458), and went into effect on September 22, 2005. CTS are a large, stocky salamander that inhabits grasslands and oak savanna habitats in the valleys and low hills of central and coastal California. Adults spend most of their lives underground, typically in burrows of ground squirrels and other animals (69 FR 3064-3094). During winter rains between November and February, adults emerge from underground retreats to breed (Stebbins, 2003). Adults may travel long distances between upland sites and breeding sites, and above-ground activity may occur under suitable environmental conditions through May. During breeding migrations, individuals are sometimes found under surface objects such as rocks and logs. CTS persist in disjunct remnant vernal pool complexes in Sonoma County and Santa Barbara County, in vernal pool complexes and isolated stockponds scattered along a narrow strip of rangeland on the fringes of the Central Valley from southern Colusa County south to northern Kern County, and in sag ponds and human maintained stockponds in the coast ranges from the San Francisco Bay Area south to the Temblor Range. Tiger salamanders breed and lay eggs primarily in vernal pools and other temporary rainwater ponds following relatively warm rains in November to February. Adults have been found more than 2 km (1.24 miles) from breeding sites (69 FR 3064-3094). Permanent human-made ponds are sometimes utilized if predatory fishes are absent; streams are rarely used for reproduction. Males typically spend 6-8 weeks at breeding ponds, while females typically spend only 1-2 weeks (Loredo et al. 1996). Eggs are laid singly or in clumps on both submerged and emergent vegetation and on submerged debris in shallow water (Stebbins, 1972; Jennings and Hayes, 1994). In years of below average rainfall, or when rains occur late in the season, females may forego

breeding (Trehnam et al. 2000). The California tiger salamander has been eliminated from an estimated 55 to 58 percent of its documented historic breeding sites. Currently, about 150 known local populations of California tiger salamanders are extant.

Species potential presence within project boundaries:
The CNDDB reports several occurrences of this species approximately 4.5 km north of the project site. In addition, the CNDDB reports the presence of CTS critical habitat within 4.5 km of the project site. Upland grassland habitat surrounding the pond represents appropriate estivation habitat for CTS. Tiger salamander larvae and paedomorphs were routinely detected at the onsite reservoir in the course of protocol-level surveys (aquatic sampling only) for this species (see below).

Brad Shaffer of U.C. Davis reports that multiple introductions on non-native tiger salamanders occurred in the nearby city of Gonzales, and that this portion of the Salinas Valley is a known "epicenter" of non-native genes in Monterey County (David Keegan, pers. comm.). The Shaffer Lab conducted genetic testing on 23 larval CTS tissue samples collected at the reservoir and reports that these animals range between highly hybridized to completely non-native (note: only 22 samples were successfully analyzed). The "nativeness" of these animals is summarized by the Shaffer Lab Report (Appendix E) via a Hybrid Index Score (HIS). HIS can range from 0.00 (pure native) to 1.00 (pure non-native). For the samples collected from the onsite reservoir, HIS values ranged from 0.8889-1.00 (i.e., 89-100% non-native). No genotyped individual can be described as "pure native." As such, coordination with USFWS regarding ESA jurisdiction over onsite hybrid/non-native tiger salamanders was initiated by DD&A on November 6, 2007. USFWS Ventura subsequently determined that tiger salamanders known to occur at Pond 1 (onsite reservoir) are not included in the species "California tiger salamander" and are not subject to regulation under ESA or the jurisdiction of USFWS (USFWS Ventura concurrence letter presented in Appendix I).

California red-legged frog

California red-legged frogs are federally Threatened and are a California State Species of Special Concern. This species has been extirpated from 70 percent of its former range and now is found in coastal drainages of central California from Marin County, California, south to northern Baja California, Mexico and in isolated drainages in the Sierra Nevada northern Coast, and northern Transverse Ranges (USFWS 1996). Populations of California red-legged frogs have declined due to exotic aquatic predators, habitat degradation from agricultural and grazing practices, a decrease in water quality from human manipulation of habitats, and water diversion. It is estimated that 50 percent of the historical populations in the Coast Ranges have disappeared. California red-legged frogs are known to use and breed in marshy habitats, springs, both natural and artificial ponds, and slack water pools of rivers and streams (Stebbins 2003). In addition, California red-legged frogs are known to occur and reproduce in tidally influenced coastal marshes under certain conditions (Smith and Reis 1996). Juvenile red-legged frogs appear to have different habitat needs than adults. Juvenile frogs were recorded mostly from sites with shallow water and limited shoreline or emergent vegetation. It is important that there be small one-meter breaks in the vegetation or clearings in the dense riparian cover to allow juveniles to sun themselves, forage, and also have close escape cover from predators. Tadpoles have different habitat needs. In addition to vegetation cover, Jennings and Hayes (1988) note that tadpoles use mud. It is speculated that red-legged frog larvae are algae grazers; however, foraging larval ecology remains unknown (Jennings, Hayes, and Holland 1993). As California red-legged frogs have been observed to move up to 3 miles overland in non-riparian habitats, a site assessment usually includes the known presence of frogs within two to five miles. Critical Habitat for California red-legged frogs has been designated by the United States Fish and Wildlife Service.

Species potential presence within project boundaries:
The CNDDB reports several occurrences of this species approximately 8 km northeast of the project site. In addition, the CNDDB reports the presence of CRLF critical habitat approximately 10 km west of the project site. DD&A biologists did not observe any CRLF within project boundaries; however, observation of this species during daylight hours is relatively unlikely unless adults are present at pond margins. No CRLF larvae have been encountered at any of the onsite agricultural basins and/or the "reservoir" in the course of three aquatic sampling efforts for CTS. However, given the presence of potential breeding habitat at the onsite reservoir and associated upland/estivation habitat, combined with the fact that the project site is located within the historic range of this species, CRLF are considered potentially present within project boundaries.

Coast horned lizard

The coast horned lizard (*Phrynosoma coronatum frontale*) is a California State Species of Special Concern. Horned lizards occur in valley-foothill hardwood, conifer, and riparian habitats, as well as in coastal scrub, pine-cypress, juniper, chaparral, and annual grassland habitats. This species generally inhabits open country, especially sandy areas, washes, flood plains, and wind-blown deposits in a wide variety of habitats. Coast horned lizards rely on camouflage for protection and will often lay motionless when approached. Horned lizards often bask in the early morning on the ground or on elevated objects, such as low boulders or rocks. This lizard is active between April and October, with mating occurring during April (Jennings and Hayes 1994). The young hatch in July and August. Predators and extreme heat are avoided by burrowing into loose soil. Periods of inactivity and winter hibernation are spent burrowed into the soil or under surface objects. Little is known about the habitat requirements for breeding and egg-laying of this species. Prey species include ants, beetles, wasps, grasshoppers, flies, and caterpillars.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10 km of the project site. However, this species has been observed in Stonewall Canyon, 4.3 km (2.7 miles) east of the site (David Laabs, pers. comm.). DD&A biologists did not observe this species during our site assessments. As horned lizards are known to occur in grasslands with open areas, the mixed grassland/rocky outrcop portions of the project site represent potential habitat for this species. Given the availability of relatively undisturbed appropriate habitat for this species in the foothill portions of the site, it is anticipated that this species may be present at the project site.

San Joaquin coachwhip

The San Joaquin coachwhip (a.k.a. San Joaquin whipsnake) is a California State Species of Special Concern. Coachwhips seek cover in rodent burrows, bushes, trees, and rock pies. They hibernate in soil or sand approximately 0.3 m (1 ft) below the surface, sometimes at the bases of plants. Little is known about nest sites. In desert regions, coachwhips may be attracted to water to drink or ambush prey. Open terrestrial habitats are preferred, but coachwhips will occasionally climb trees and bushes to bask, seek prey, or take cover. Diet consists of rodents, lizards and eggs, snakes (including rattlesnakes), birds and eggs, young turtles, insects, and carrion. Coachwhips search actively for prey, with their heads elevated. They pole their heads in burrows, or climb trees, using both vision and olfaction to detect prey (Stebbins 1985). Coachwhips are diurnal. Mating occurs in April and May, eggs are laid in June and July, and the frist young appear in late August to early September.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 8 miles south of the Miravale III project site. DD&A biologists did not observe this species during our site assessments. As coachwhips are known to occur in grasslands with open areas, the mixed grassland, rocky outcrop, and ruderal agricultural portions of the project site represent potential habitat for this species. Due to the availability of relatively undisturbed appropriate habitat for this species in the foothill portions of the site, it is anticipated that this species may be present at the project site.

Black-legless lizard

The black legless lizard (*Anniella pulchra* ssp. *nigra*), is a California State Species of Special Concern. Black-legless lizards and silvery legless lizards (*Aniella pulchra* ssp. *pulchra*) are each found within Monterey County, and while color patterns mark phenotypic differences in these two subspecies (with BLL being much darker dorsally and bright yellow ventrally), genetic testing regarding speciation is inconclusive at this time along the central coast of California. Both black-legless and silvery-legless lizards are a fossorial (burrowing) species that typically inhabits sandy or loose (friable) soils. They forage on invertebrates beneath the leaf litter or duff layer under bushes, trees, wood, and rocks, and slash in appropriate habitats. Habitats known to support this species include (but are not limited to) coastal dunes, valley and foothill grasslands, chaparral, and coastal scrub. The mating season for this sub-species is believed to begin late Spring or early Summer, with 1-4 live young born between September and November. The diet of these species consists primarily of native ants and probably overlaps to some extent with that of juvenile alligator lizards and perhaps some other salamanders. This species may be preyed upon by alligator lizards, snakes, birds, and small mammals.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10 km of the project site, but occurrences of this species often go unreported. Appropriate habitat for this species is present in the foothill/grassland portions of the site, particularly where sandy and/or friable soils are supported. Given the availability of relatively undisturbed and appropriate habitat for this species in the foothill portions of the property, it is anticipated that this species may be present at the project site.

Western burrowing owl

Burrowing owls are a California State Species of Special Concern. Burrowing owls are a year round resident of open, dry grassland and desert habitats and of grass, forb and open shrub stages of pinyon-juniper and ponderosa pine habitats. In general, burrowing owls frequent open grasslands and shrublands with perches and burrows. Burrowing owls use rodent burrows (often California ground squirrel) for roosting and nesting cover. These burrows are lined with excrement, pellets, debris, grass, and feathers (occasionally are unlined). Pipes, culverts, and nest boxes may be substituted for burrows in areas where burrows are not available. Breeding occurs from March through August, with the peak occurring in April and May. This species is semicolonial and is among the most gregarious owls in North America. Burrowing owls eat mostly insects, but small mammals, reptiles, birds, and carrion are also taken. This species usually hunts from a perch, hovers, hawks, dives, and hops after prey on the ground. Conversion of grassland to agriculture, poisoning of ground squirrels, and other forms of habitat destruction have led to the reduction in their numbers in the recent decades.

Species potential presence within project boundaries:
The CNDDB reports an occurrence of this species approximately 5 km northwest of the project site. On January 18, 2007 (non-breeding season), DD&A and Biosearch biologists documented the presence of 2 burrowing owls and multiple active dens/burrows in the grassland/foothill and fallow agricultural portions of the site (Appendix F). One adult burrowing owl and several occupied (or frequently utilized) burrows

were observed in the southeastern fallow-agricultural portion of the site during the second protocol-level survey. In addition, an adult burrowing owl was observed emerging from a burrow near the center of the Miravale III project site (slightly east of center) during the second survey, within an active agricultural portion of the site (grape production). Breeding season protocol-level surveys for this species did not identify the presence of any burrowing owls or active dens/burrows, but additional dens occupied in the non-breeding season were noted (assumed abandoned based on the presence of old white wash and/or pellets). Although an onsite grower related that burrowing owls had been observed in active agricultural portions of the site during the breeding season as recently as June 2006, the recent removal of grazing from grassland portions of the site may have reduced overall breeding season habitat quality for this species. Based on these observations, Western burrowing owls are known to utilize various habitats within the Miravale III project site during the non-breeding season.

Tricolored blackbird

The tricolored blackbird (*Agelaius tricolor*) is a California State Species of Special Concern. They nest in freshwater marshes, stock ponds, and willow thickets. They prefer dense cattails, tules, and rushes where they can build deep cup nests. They breed in large colonies of 50-100+ pairs, from April to mid-May. During fall and winter, tricolored blackbirds are nomadic and may be observed in pastures, grasslands, cattle pens, and marshes throughout the county (Roberson and Tenney 1993).

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10 km of the project site, but the species likely occurs within that offset. DD&A biologists have not observed this species in any portion of the Miravale III project site (red-winged blackbirds observed at the reservoir and fallow agricultural portions of the site). DD&A biologists have been onsite several times during the nesting season for this species (i.e. during aquatic sampling for CTS), and no tricolored blackbirds have been observed at any time. Emergent vegetation at the onsite reservoir is likely insufficient to support tricolored blackbird breeding (a colonial nester).

Bank swallow

The bank swallow (*Riparia riparia*) is a state Threatened species. Bank swallows are primarily found in riparian and other lowland habitats in California west of the deserts during the spring-fall period. Formerly a more common breeder in California, approximately 110-120 colonies remain within the state. This species forages by hawking insects over open riparian areas, brushland, grassland, wetlands, water, and cropland. Bank swallows feed on a wide variety of aerial and terrestrial, soft-bodied insects including flies, bees, and beetles. Bank swallows generally use holes dug in cliffs and river banks for cover but occasionally roost on logs, shoreline vegetation, and telephone wires. Colonies range in size from 10-1500 nesting pairs, averaging approximately 100-200 nesting pairs. Bank swallows require fine-textured, sandy banks, or cliffs to dig a horizontal nesting tunnel and burrow. Nests are almost always near water and are lined with grasses and other plant material and feathers. Burrows are 2.5 to 5.5 cm wide and up to 140 cm deep. A small chamber at the end of the burrow contains the nest.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of bank swallow within 10 km of the project site. However, as previously noted, an earthen cliff is present immediately east of the onsite reservoir. During an initial site visit, DD&A biologists observed this cliff to be inundated with small mammal burrows and possibly some avian nesting sites, however, no bank swallows were observed. DD&A subcontracted Don Roberson (Monterey Bay Ornithologist and author) to assess the site. The following language was supplied by Mr. Roberson following the site visit:

”Yesterday, 10 Aug 2006, I (Don Roberson) participated in a site survey at the pond on Mirravale II property located at 121.19.4W, 36.27.29N. Specifically, I considered whether the burrows in hard-bank cliffs along the south and east sides of the pond might have been made or used by Bank Swallows, a California Threatened Species. The date of this inspection (10 August) was too late in the season for Bank Swallows to be present (typically April-July only at breeding sites), and none were observed in the vicinity. [Several Barn Swallows were foraging over the pond.] After a physical inspection of the site, I am confident these burrows were not made or used by Bank Swallows.

Compared to known current and recent colonies of Bank Swallows in Monterey County in the vicinity of King City, the cliffs at the Miravale pond are (a) much too low in height (only 10-12' high maximum) and (b) lack smooth-faced soft-soil vertical cliff faces required by Bank Swallows. The vertical faces of the banks are irregular and all appear to be composed of rather hard material.

More importantly, the vast majority of the burrows are too large to have been made or used by Bank Swallows, which have typical dimensions of 1.5 inches by 2 inches. Even the smaller burrows I inspected had entrances measuring 3-4 inches by 6-8 inches. Further, the burrows were too deep for Banks Swallows and, in the only ones in which nesting material was discovered via flashlight, that material was composed solely of grasses, stems, and other woody debris and did not include any feathers, which are used in all Bank Swallow nests. None of the burrows appeared to be used by birds at all; it is my opinion they are mammal (i.e., rodent) burrows.”

Given the lack of available nesting habitat throughout the site, bank swallows are not present within project boundaries.

White-tailed kite

The white-tailed kite is listed as a California fully protected species. In addition, this species is protected under both federal and state laws and regulation, including the Migratory Bird Treaty Act (1918, as amended) and CDFG Fish and Game Code Section 3503.5. This bird usually nests in trees along riparian areas, and in oak savannah. During egg development, the male does all the hunting while the female kite incubates the eggs and broods the nestlings. They prefer nest trees with adjacent open fields for hunting. They build their large, stick nests atop large closed-canopy trees such as live oak. The favored prey of the white-tailed kite is voles and mice. Nesting occurs from April through July. In the fall and winter, kites form communal roosts (Roberson and Tenney 1993).

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10 km of the Miravale III location; however, this species certainly occurs within that offset. Appropriate foraging habitat for this species is present throughout the mixed grassland and fallow agricultural portions of the site; however, typical nesting habitat is sparse. DD&A and BioSearch biologists have consistently observed white-tailed kites foraging over mixed grassland and fallow agricultural portions of the site during site assessments conducted in preparation of this report. White-tailed kites are assumed present, or occasionally present, within project boundaries.

Northern harrier

The northern harrier is a California State Species of Special Concern. This raptor is an uncommon permanent resident in open grasslands, marshy areas, and edges of estuaries in Monterey County (Roberson and Tenney 1993). Nesting begins in late March with young fledged during June and July.

They build nests of sticks and grass on the ground hidden by tall grass or reeds. Harriers hunt a variety of prey, including other birds and small mammals.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10km of the Miravale III location; however, northern harriers certainly occur within that offset. DD&A and BioSearch biologists consistently observed Northern harriers foraging over the mixed grassland, fallow agricultural, and active agricultural portions of the site during our site assessments and field surveys. Appropriate foraging habitat for this species is present throughout the site, and this species is assumed present, or occasionally present, within project boundaries. Potential nesting habitat for this species is present in the grassland portions of the site.

Golden eagle

Golden eagles (*Aquila chrysaetos*) are a California fully protected species and are an uncommon permanent resident and migrant throughout California, except in the center of the Central Valley. This species ranges from sea level up to 3800 m (0-11,500 ft). Golden eagles are associated with rolling foothills and mountain terrain, wide arid plateaus deeply cut by streams and canyons, open mountain slopes, and cliffs and rock outcrops. Nests are built on cliffs of all heights and in large trees in open areas. Alternative nest sites are maintained, and old nests are reused. Breeding occurs from late January through August, with peak activity between March and July. This species generally preys upon lagomorphs and rodents, but also takes other mammals, birds, reptiles, and some carrion. Hunting is carried out in open terrain such as grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10 km of the project site. However, Biosearch biologists monitor a known golden eagle nest in Stonewall Canyon, 3.9 km (2.4 miles) east of the site (Laabs, pers, com.). Appropriate foraging habitat for this species is present throughout the site (particularly the grasslands), and this species is anticipated to occur (or occasionally occur) within project boundaries. Nesting eagles are not anticipated within project boundaries given the lack of appropriate nesting habitat for this species.

Merlin

The merlin (*Falco columbarius*) is a California State Species of Special Concern. This bird is a rare to uncommon spring and fall transient and winter visitor, occurring in California between late September to mid-April (Small 1994). They do not nest in California. Wintering individuals occur in a variety of habitats, including riparian, open woodlands, grasslands, agricultural fields, tidal estuaries, marshes, and developed areas. Merlins prey primarily on small birds but also take small mammals and insects.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10 km of the project site, although occurrences of California species of special concern often go unreported. DD&A biologists did not observe this species during our site assessments. Although this species does not breed in Monterey County, appropriate wintering hunting/foraging habitat for this species is present throughout the project site. No resident merlins are present at the project site, but it is anticipated that this species may occasionally hunt/forage within project boundaries during the winter.

Prairie Falcon

The prairie falcon (*Falco mexicanus*) is a California State Species of Special Concern. This falcon is an uncommon permanent resident and migrant that ranges from southeastern deserts northwest along the inner-coast Ranges and Sierra Nevada. Generally distributed from annual grasslands to alpine meadows, the species is associated primarily with perennial grasslands, savannas, rangeland, some agricultural fields, and desert scrub areas. Prairie falcons mainly prey upon small mammals, some small birds, and reptiles. Prey is taken in the air and on the ground in open areas. Prairie falcons require sheltered cliff ledges for cover. Nests are generally a scrape on the sheltered ledge of a cliff overlooking a large, open area. Nests are sometimes built on old raven or eagle stick nests on cliffs, bluffs, or rocky outrcops. Aerial courtship displays occur near the nest site.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within 10 km of the project site, but observations of California species of special concern often go unreported. DD&A biologists did not observe this species during our site assessments. Although appropriate nesting habitat is not present within or immediately adjacent to the Miravale III project site, appropriate hunting/foraging habitat for this species is present throughout the project site (particularly the grasslands and fallow agricultural portions). While nesting falcons are not anticipated within or adjacent to project boundaries, this species may occasionally hunt/forage within project boundaries.

Coopers Hawk
Cooper's hawks *(Accipiter cooperii)* are a California species of special concern. Cooper's hawks are a breeding resident throughout most of the wooded portions of the state. This species ranges from sea level to above 2700 m (0-9000 ft). Dense stands of live oak, riparian, deciduous, or other forest habitats near water are used most frequently. This species is seldom found in areas without dense tree stands, or patchy woodland habitat. Cooper's hawks nest in deciduous trees in crotches 3-23 m (10-80 ft), but usually 6-15 m (20-50 ft) above the ground, and in second-growth conifer stands as well as in deciduous riparian areas. Breeding occurs between March and August, with peak activity May through July. Prey for this species includes small birds (especially young during the nesting season), small mammals, and some reptiles and amphibians. Cooper's hawks hunt in broken woodland and habitat edges. Cooper's hawks are fairly common as migrants.

Species potential presence within project boundaries:
The CNDDB report several occurrences of Cooper's hawk approximately 8-10 miles east to northeast of the Miravale III project site. Please note, however, that DD&A biologists did not observe this species during our site assessments. Appropriate nesting habitat for this species is not present within or adjacent to the project site. Marginally appropriate foraging habitat is present, but this species hunts more commonly along forest edge habitats. While Coopers' hawks are not anticipated to nest within or adjacent to Miravale III project boundaries, this species may occasionally hunt/forage within project boundaries.

Loggerhead shrike

The loggerhead shrike is a California State Species of Special Concern. Loggerhead shrikes are a common resident and winter visitor in lowlands and foothills throughout California though rare on coastal slopes north of Mendocino County and occurring only in winter). The highest densities of this species generally occur in open-canopied valley foothill hardwood, valley foothill hardwood-conifer, valley foothill riparian, pinyon-juniper, juniper, desert riparian, and Joshua tree habitats. This species prefers open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches. Prey items include large insects, small birds, mammals, amphibians, reptiles, fish, carrion, and various other invertebrates. Shrikes often search for prey from a perch, making short predatory flights, and may impale prey on

thorns, sharp twigs, barb wire, or force it into a crotch to feed on or to cache for later feeding. Shrikes typically build their nest on a stable branch in a densely-foliated shrub or tree, usually well-concealed.

Species potential presence within project boundaries:
The CNDDB does not report any records of this species within 10km of the project site. Scattered trees and shrubs, which could be used as nesting sites for the species, are present in the foothills area and surrounding the residences onsite. The project site supports appropriate foraging habitat for this species. Two loggerhead shrikes were observed foraging over fallow agricultural and mixed grassland portions of the site by DD&A and BioSearch biologists on January 1, 2007. The species was also observed in several locales in the eastern portion of the site on July 11, 2007. Loggerhead shrikes are known to occur within project boundaries. Project build-out would result in the loss of all available foraging and nesting habitat for this species.

California horned lark

California horned larks (*Eremophila alpestris*) are a California State Species of Special Concern. Horned larks are a common to abundant resident in a variety of open habitats, and are frequently found in grasslands with low, sparse vegetation. This species builds a grass-lined cup nest in a depression on the ground, generally in the open. Breeding occurs between March and July, with peak activity occurring in May. Horned larks often form large flocks which forage and roost gregariously after breeding. This species eats mainly insects, snails, and spiders during the breeding season, and add grass and forb seeds (as well as other plant material) to their diet seasonally.

Species potential presence within project boundaries:
The CNDDB does not report any occurrences of this species within (or immediately adjacent to) project boundaries, but observations of this species often go unreported. Appropriate nesting and foraging habitat for this species is present within project boundaries, particularly as associated with fallow agricultural and mixed grasslands habitats. No horned larks have been observed onsite during site visits thus far. Given the presence of appropriate habitat, however, this species is deemed potentially present within project boundaries.

Thresholds of Significance:

In accordance with CEQA Guidelines, a project impact would be considered significant if the project would:

- have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service;

- have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service;

- have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance;

- conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan; or

- impede the use of native wildlife nursery sites or directly harm nesting species protected under the provisions of the Migratory Bird Treaty Act.

Impacts and Mitigation:

The proposed project would represent a significant and unavoidable impact to on federally listed species; San Joaquin kit fox. Hybridized/non-native tiger salamanders known to occur at Pond 1 (onsite reservoir) are not jurisdictional under ESA and impacts to this species do not require mitigation (pers. comm. Doug Cooper, USFWS Ventura). If it is determined that California red-legged frog are present onsite (protocol-level surveys required below), the project would represent a significant and unavoidable impact to this species.

The proposed project would represent a significant and unavoidable impact to several California species of special concern: American badger, Salinas pocket mouse, black-legless lizards (if present), coast-horned lizard (if present), and western spadefoot (if present),

The proposed project would represent a potentially significant impact to several other California species of special concern, but these impacts can be reduced to less-than-significant with implementation of the measures presented below. These species include: nesting birds and raptors (other than burrowing owl), bats (pallid, Townend's big-ear, Western Mastiff), San Joaquin coachwhip, burrowing owl, golden eagle, merlin, white-tailed kite, northern harrier, loggerhead shrike, and California horned lark.

Impacts to Sensitive Habitats

Development of the proposed project has the potential to directly impact sensitive habitat types, including 0.17 acres of wetlands. According to the US Army Corps of Engineer's Wetland Delineation Manual (1987), wetlands are defined as "[t]hose areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." As detailed above, a wetlands assessment was conducted to determine whether on-site aquatic features (i.e. agricultural ponds) contained characteristics consistent with wetlands. The wetlands identified on-site exist as a thin band of emergent vegetation on the fringe of four small man made reservoirs/ponds used in conjunction with routine agricultural operations. It is assumed that this resource satisfies the soils, vegetation and hydrologic criteria set forth by the U.S. Amy Corps of Engineers (USACOE) for wetlands. However, the USACOE does not regulate wetlands that are hydrologically isolated and geographically distinct from other jurisdictional resources in the vicinity. The individual aquatic features are not contiguous with other jurisdictional wetlands and/or waters of the U.S and do not have any hydrologic connectivity or abut any permanent water body. As a result, the fringe wetlands identified on site are not under the Jurisdiction of the USACOE. Further, impacts to these wetlands would not be in conflict with federal regulation.

The function and value of these man-made wetland resources are marginal as a result of ongoing disturbance from agricultural uses. In addition, the value of the existing reservoir located in the uplands portions of the site as wildlife habitat is limited as it supports a non-native predatory amphibian; the barred tiger salamander. This salamander is known to prey on native special status amphibian species such as the California tiger salamander and the California red-legged frog when present. In addition, hybridization between the non-native barred salamander and the native tiger salamander has been identified by the U.S. Fish and Wildlife Service as a significant threat to the native California tiger salamander.

Although development of the proposed project would impact approximately 0.17 acres of fringe wetlands of marginal habitat value, impacts are considered to be less-than-significant as development of the proposed project would entail the construction of a number of aquatic resources as a component of golf course development, and storm water drainage facilities. More specifically, as identified in Section 5.1.3 of the Specific Plan, two of the existing retention ponds would be converted to storm water facilities as part of project development. While formal plans have not been submitted at this time for development of the golf course, future on-site ponds and other resources would significantly exceed the size of the existing on-site aquatic resources.

In summary, development of the proposed project would result in the removal of existing on-site agricultural ponds and reservoirs to facilitate new urban uses on the predominately undeveloped project site. These wetlands are not considered to be jurisdictional for the reasons identified above and the project would provide suitable replacement wetlands through the construction of various stormwater drainage facilities and ponds associated with the golf course. Impacts to wildlife and other sensitive species associated with the removal of on-site aquatic features are addressed in greater detail below. *Based on this analysis, development of the proposed project would result in a less-than-significant impact on a wetland.*

General Impacts to Vegetation

Impact The proposed project would represent temporary and permanent impacts to all habitats and the vast majority of vegetation within project boundaries and will result in the removal of 3 or more oak trees. Temporary impacts to vegetation included grubbing and grading associated with development of the site; permanent impacts include the conversion of open vegetated areas to

urban housing through placement of structures, homes, roads, driveways, etc. *This is a less-than-significant impact with implementation of the following measures.*

Mitigation

1. A Forest Management Plan shall be prepared by a qualified professional forester; this plan must be approved by the City of Soledad.

2. Trees and vegetation not planned for removal shall be protected during construction to the maximum extent feasible. This shall include the use of exclusionary fencing of herbaceous and shrubby vegetation, such as hay bales, and protective wood barriers for trees. Only certified weed-free straw shall be used to avoid the introduction of non-native, invasive species.

3. Following construction, the disturbed areas that are proposed as parks and native landscaping areas shall be restored to pre-project contours to the maximum extent feasible and revegetated using locally-occurring native species and native erosion control seed mix.

4. Protective fencing shall be placed so as to keep construction vehicles and personnel from impacting vegetation adjacent to the project site outside of work limits.

5. Grading, excavating, and other activities that involve substantial soil disturbance shall be planned and carried out in consultation with a qualified hydrologist, engineer, or erosion control specialist, and shall utilize standard erosion control techniques to minimize erosion and sedimentation to native vegetation.

6. No construction equipment shall be serviced or fueled outside of designated staging areas.

Impacts to Special-Status Plant Species

Lemmon's jewelflower, a California species of special concern, is the only special-status plant species deemed potentially present within project boundaries. All other special-status plant species are eliminated for the species-specific reasons provided within this document, and in Appendix A.

Impact The presence/absence of jewelflower has not been determined at this time, but appropriate habitat is present within project boundaries. This species could be permanently impacted by proposed grading, excavation, and other activities that may result in the permanent loss or disturbance of individual jewelflowers and/or jewelflower habitat. *This impact is considered less-than-significant given implementation of the mitigation below.*

Mitigation

7. A qualified botanist shall be retained to conduct preconstruction surveys for Lemmon's jewelflower during the typical flowering season of this species (March-May), to determine the presence/absence of this species. If no Lemmon's jewelflower is present, no additional mitigation is required. If Lemmon's jewelflower is present, a qualified biologist shall prepare a mitigation plan to be approved by CDFG prior to initiation of construction. The Monterey County Planning and Building Department shall be provided verification of CDFG concurrence and satisfaction prior to issuance of grading permits.

Impacts to Special-Status Wildlife Species

Based on a review of project plans, background literature, and extensive field surveys, two listed species are documented to occur or have the potential to occur within the site: California tiger salamander (federally threatened), San Joaquin Kit fox (federally endangered). In addition, appropriate habitat is present for the federally threatened California red-legged frog and the project site is within the historic range of this species.

One California fully protected species is known to occur onsite; white-tailed kite. In addition, the following California species of special concern may occur, or are known to occur onsite: American badger; Salinas pocket mouse; pallid bat; Townsend's big-eared bat; Western Mastiff bat; black legless lizard; Western spadefoot; coast horned lizard; San Joaquin coachwhip; burrowing owl; Golden eagle; merlin; prairie falcon; white-tailed kite; northern harrier; loggerhead shrike; and California horned lark.

General Impacts:

Impact Project development would fragment (i.e., divide and disrupt) virtually all existing wildlife habitat on the site, and would represent an urban encroachment into the foothills of the Gabilan Range (an important wildlife corridor). The ongoing presence of homes, roads, cars, people, firearms, pets, etc. would adversely impact any wildlife currently utilizing the site, particularly in the grassland portions of the site (i.e. deer, coyote, fox, jackrabbits, squirrels, and raptors). Comparable development is present immediately south of the proposed project, but does not extend into the grassland/foothill portions of the site. *This fragmentation of habitat is considered a significant impact that can be partially reduced by implementation of the required mitigation below; however, cannot be fully mitigated without project redesign. Therefore, the fragmentation of habitat is considered a significant, unavoidable impact of the project as currently designed.*

Mitigation

8. Prior to approval of each final map, the applicant shall prepare and submit draft Covenant, Conditions, and Restrictions (CC&Rs) applicable to that phase that shall include the following;
   a) restrict installation fencing to the immediate vicinity of residences, and where fencing is placed adjacent to open space areas and areas of natural, undisturbed habitat, fences shall be installed such that a six inch space is left between the bottom of the fence and the surface of the ground;
   b) prohibit off-road vehicle use;
   c) prohibit illegal discharge of firearms;
   d) prohibit the installation of road medians throughout the development.

   These CC&Rs shall be reviewed and approved by the City of Soledad prior to approval of each final map.

Mammals

Impact Suitable foraging/dispersal habitat for San Joaquin kit fox species is present throughout project boundaries, with potential denning habitat present in the annual grassland, rocky outcrop, and fallow agricultural portions of the site (see Early Evaluation Report in Appendix C). The vast majority of the habitats present within project boundaries would be directly impacted by the proposed project (grubbing and grading, construction phase impacts, permanent placement of structures and impermeable surfaces, etc.). Impacts proposed in the grassland portions of the site will likely result in kit fox abandonment of the property due to ongoing disturbance. For this reason, the project is assumed to have a significant and unavoidable adverse affect on San Joaquin kit fox (i.e. direct mortality, loss of habitat, loss of dens, etc.). *This impact may be reduced by implementation of the following mitigation measures; however, the impact will not be reduced to a less-than-significant level without USFWS consultation. Please note that the following measures are consistent with direction from USFWS on other projects, but greater or lesser measures may be required by the regulatory agencies (possibly including completion of protocol-level surveys to determine utilization of the site and/or project redesign).*

Mitigation

9. The applicants shall enter into consultation with USFWS and CDFG and shall provide evidence of their compliance with applicable requirements of the federal Endangered Species Act and California Endangered Species Act prior to the issuance of building permits.

10. Pre-construction surveys for kit fox dens shall be required for all development phases of the future project. Pre-construction surveys shall be conducted by a qualified biologist no less than 14 days and no more than 30 days prior to the start of any ground disturbing activities to locate kit fox den sites. In addition to pre-construction surveys, a qualified biologist, meeting the required qualifications described in the *U.S. Fish and Wildlife Service Standardized Recommendations for the Protection of the San Joaquin Kit Fox Prior to Ground Disturbance*, June 1999 (USFWS Recommendations for SJKF), shall be on-site to monitor construction activities for the San Joaquin kit fox. In the event that an active kit fox den is found, then the standard mitigation actions outlined in the USFWS Recommendations for SJKF, are recommended to avoid possible take of kit fox during future construction activities. These actions are general in nature; therefore, site specific strategies for the project site shall be based upon consultation with USFWS and CDFG, as stated above in Mitigation Measure #10. To ensure compliance with this mitigation measure, prior to issuance of any grading permits, the Planning and Building Inspection Department (PBID) shall be furnished with written correspondence from a qualified wildlife biologist documenting that no active kit fox den sites nor kit fox individuals were found on the site. If active kit fox den sites are found and/or kit fox individuals are observed during the survey, the applicant will be required to comply with all mitigation actions required by USFWS and CDFG and the County PBID shall monitor implementation of those actions.

Impact Multiple badger dens and badger diggings were observed in the vicinity of the onsite reservoir and within other portions of the annual grassland habitat. An adult badger was observed emerging from an onsite den by Biosearch biologists. Badger diggings were also observed in fallow agricultural portions of the site, demonstrating badger utilization of these areas as foraging habitat. Therefore, construction activities in grassland portions of the site have the potential to impact badger dens, and construction within fallow agricultural portion of the site will impact badger foraging habitat. Project-related construction activities (i.e. grading, excavation, development, etc.) may result in a permanent loss or disturbance of American

badgers and their habitat. *Given the proposed build-out of the project site and impacts to the vast majority of the grassland habitat, impacts to this species are considered significant and unavoidable impact. Mitigation is presented to reduce these impacts as much as feasible; greater or lesser measures may be required by CDFG.*

Mitigation

11. The applicant shall retain a qualified biologist to conduct focused preconstruction surveys for potential American badger dens. These surveys shall be conducted no sooner than 2 weeks prior to the start of construction. Surveys for badger dens may be conducted at the same time as burrowing owl surveys. Depending on the results of these surveys, one or more of the following measures shall be implemented.

    - If the qualified biologist determines that potential dens are inactive, the biologist shall excavate these dens by hand with a shovel to prevent badgers from re-using them during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities.
    - If the qualified biologist determines the presence of active dens, the location of these dens shall be documented and reported to CDFG. Avoidance of active dens, particularly natal dens, is the preferred approach; Impacts to active badger dens shall be avoided by establishing a 100-meter exclusion zones around all active badger dens, within which construction related activities shall be prohibited until denning is complete and/or the den is abandoned. A qualified biologist shall monitor each den once per week in order to track the status and inform the project sponsor of when a den area has been abandoned.
    - If avoidance of an active badger den is not feasible, the biologist shall coordinate with CDFG on the appropriate way to evict/exclude badgers from their dens. Please note that special consideration of natal dens is required given the low likelihood that excluded young would survive; a CDFG depredation permit would be required to disrupt a natal den. For non-natal dens, CDFG has permitted badgers to be gradually excluded from their dens by placement of soil, sticks, and debris at den entrances, incrementally increasing the degree of blockage over a period of three to five days (please note that blockage cannot trap/entomb badgers). After the monitoring biologist determines that badgers have stopped using active dens within the project boundary, the dens shall be hand-excavated with a shovel to prevent re-use during construction. If hand excavation is not practical, careful excavation with an excavator may occur provided that the biologist is onsite to monitor these activities. Please note that eviction of onsite badgers will reduce construction phase impacts to this species, but given the large home ranges and territoriality of this species, emigration to alternative habitats may not be feasible without inter/intra specific competition (energetic stress possibly resulting in mortality). CDFG may require that appropriate onsite or adjacent habitat be conserved to allow relocation of excluded animals within their home range.

Impact Three special-status bat species may be present onsite (pallid bat, Townsend's big-eared bat, Western Mastiff bat); several other bat species may also be present. Removal of onsite trees (i.e. Eucalyptus and Tamarisk trees lining San Vicente Road, oaks in the northeast corner of the site), removal of onsite buildings, and development of the site (including encroachment/disruption of rocky outcrops) may result in direct impacts to bats and/or bat roosts (day, night, foraging, and maternity) and would remove the vast majority of onsite foraging habitat for these species. *This impact is considered less-than- significant with implantation of the following mitigation.*

Mitigation

12. A qualified bat specialist shall conduct site surveys to characterize bat utilization of the site and species composition present (techniques utilized to be determined by the biologist). Based on the results of these surveys, one or more of the following shall occur.

    - If it is determined that bats are not present at the site, no additional mitigation is required.
    - If it is determined that bats are utilizing the site and would likely be impacted by the proposed project, preconstruction surveys shall be conducted no more than 30 days prior to modification, demolition, or removal of onsite buildings and/or any other occupied habitat. If no bat or bat sign are observed in the course of preconstruction surveys, then demolition/removal of buildings and/or construction initiation may proceed. If bat and/or bat sign are observed during the preconstruction surveys, the biologists shall determine if disturbance will jeopardize a maternity roost, or another type of roost (foraging, day, night).
    - If a single bat and/or only adult bats are roosting, demolition or removal of the structure can proceed after the bats have been safely excluded from the roost. Exclusion techniques shall be determined by the biologist and depend on the type utilization; the biologist shall prepare a mitigation plan for provision of alternative habitat to be approved by CDFG and the City.
    - If an active maternity roost is detected, work in the vicinity of the roost (and/or demolition of the structure) shall be postponed until the qualified biologist monitoring the roost(s) determines that the young have fledged and are no longer dependent on the roost. The monitor shall ensure that all bats have left the building and or area of disturbance prior to initiation of construction and/or demolition activities. *If disruption of a maternity roost cannot be avoided, a depredation permit would be required.*

Impact Salinas pocket mouse are known to occur onsite; presence was confirmed on September 1. As the vast majority of the onsite grassland habitat will be converted to residential usage, and the remaining portions will be fragmented from surrounding habitat and subject to ongoing disturbance (cars, lights, noise, sound, vibration, etc.), significant impacts to this species are anticipated (direct and indirect mortality). *This would represent a significant and unavoidable impact. The following mitigation is presented to reduce this impact as much as feasible.*

Mitigation

13. The applicant shall contract a qualified biologist to coordinate with CDFG and prepare a mitigation and monitoring plan for Salinas pocket mouse. Verification of CDFG concurrence/approval shall be submitted to the City of Soledad prior to initial grubbing and grading of the site.

Special-Status Avian Species

The following special-status avian species were observed foraging within the project site: Western burrowing owl, Northern harrier, white-tailed kite, loggerhead shrike, and Northern harrier. In addition, golden eagle, merlin, prairie-falcon, horned lark, and to a lesser extent, Coopers hawk have the potential to utilize the site for foraging. Golden eagles, merlins, and prairie falcons have specific nesting habitat requirements (e.g., sheltered cliffs and/or large trees supporting cavities) or are known to only nest in certain geographic regions of California outside of the Monterey Bay region (e.g., Merlins), which are not present within the project site. Therefore, no suitable nesting habitat for these species occurs within the project site. However, suitable breeding habitat is present for burrowing owl, northern harrier, white-

tailed kite, and loggerhead shrike. The project would result in the loss of foraging and/or nesting habitat for any avian species utilizing the site.

Raptors and their nests are protected by both federal and state regulations (MBTA and CDFG Code Sections 30503 and 3503.5), which protect birds of prey and their eggs and nests. Construction disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by CDFG. Any loss of fertile raptor eggs or nesting raptors, or any activities resulting in raptor nest abandonment, will constitute a significant impact. Construction activities such as tree removal or site grading that disturb any nesting raptors (or other avian species) on-site or immediately adjacent to the site will constitute a significant impact.

Impact Tree removal (i.e., Eucalyptus and Tamarisk trees along San Vicente Road and oaks in the northeast corner of the site) and disturbance associated with construction of the proposed project would likely impact any nesting birds and/or raptors present within project boundaries (harassment, stress, brood-less, nest abandonment, injury, mortality).

Per the CDFG Guidelines, impacts to burrowing owls are defined as disturbance or harassment within 160 feet of occupied burrows, destruction of burrows and burrow entrances, and degradation of foraging habitat adjacent to occupied burrows. In addition, the project would require grading, grubbing, tree removal, excavation, and other activities that may result in a permanent loss or disturbance of raptors and migratory birds and their habitat. *This would represent a potentially significant impact that can be reduced to a less-than-significant level with implementation of the following mitigation measures.*

Mitigation

14. Burrowing owls are known to occupy burrows in mixed grassland, active agricultural, and fallow agricultural portions of the Miravale site during the non-breeding season (breeding season utilization not observed in the course of protocol-level surveys). A qualified biologist shall conduct preconstruction surveys to locate active breeding and/or wintering burrowing owls (depending on season) no more than 30 days prior to the start of construction. If ground disturbing activities are delayed or suspended for more than 30 days after the preconstruction survey, the site shall be resurveyed. The survey shall conform to the CDFG 1995 Staff Report protocol. Wherever burrows are identified, impact avoidance and mitigation measures shall be implemented (previously mapped burrow locations may not be occupied and/or new burrows may be occupied).

14a) Impact Avoidance is the preferred approach:

- Breeding Season:
  If active nests are found, then no ground-disturbing activities will be permitted within 250 feet of an active burrow during the breeding season (February 1 to August 31).

- Winter Season:
  If active burrows are found during winter months (September 1 through January 31), ground disturbing activities can proceed no closer than 160 feet from active burrows.

- Avoidance also requires that a minimum of 6.5 acres of foraging habitat be permanently reserved contiguous with occupied burrow site for each pair of breeding burrowing owls (with or without dependent young) or single unpaired resident bird.

14b) If active nests or burrows are found that cannot be avoided, the following mitigation measures would apply:

On-Site Passive relocation shall be implemented if the above avoidance measures cannot be met. Passive relocation is defined as encouraging owls to move from occupied burrows to alternate natural or artificial burrows that are beyond 160 feet from the impact zone, and that are within or contiguous to a minimum of 6.5 acres of foraging habitat for each pair of relocated owls. The land utilized for relocation shall be acquired and permanently protected at a location acceptable to CDFG. Existing unsuitable burrows shall be enhanced (enlarged or cleared of debris) or new burrows created (by installing artificial burrows) at a ratio of 2:1 on the protected lands site. Relocation of owls shall only be implemented during the non-breeding season. A time period of at least one or more weeks is necessary to accomplish the passive relocation methods, and allow the owls to move and acclimate to alternative burrows.

- If the qualified biologist determines that dens may be occupied burrows shall not be disturbed during the nesting season (February 1 through August 31) unless a qualified biologist approved by CDFG verified through non-invasive methods that either: 1) the birds have not begun egg-laying and incubation; or 2) that juveniles from the occupied burrows are foraging independently and are capable of independent survival.

- On-site habitat shall be preserved in a conservation easement and managed to promote burrowing owl use of the site.

- The applicant shall provide funding for long-term management and monitoring of the protected lands (if applicable). The monitoring plan shall include success criteria, remedial measures, and an annual report to CDFG.

Off-site If the project will reduce suitable habitat on-site below the threshold level of 6.5 acres per relocated pair or single bird, the habitat shall be replaced off-site. Off-site habitat must be suitable burrowing owl habitat, as defined in the Burrowing Owl Survey Protocol[1], and the site approved by the CDFG. Land shall be purchased and/or placed in a conservation easement in perpetuity and managed to maintain suitable habitat The land shall be funded by the applicant for long-term management and monitoring of the protected lands. The monitoring plan shall include success criteria, remedial measures, and an annual report to CDFG. Off-site mitigation shall use one of the following ratios:

- Replacement of occupied habitat with occupied habitat: 1.5 times 6.5 (9.75) acres per pair or single bird.

- Replacement of occupied habitat with occupied habitat: 1.5 times 6.5 (9.75) acres per pair or single bird.

- Replacement of occupied habitat contiguous to currently occupied habitat: 2 times 6.5 (13.0) acres per pair or single bird.

[1] In accordance with the Staff Report on Burrowing Owl Mitigation (Dept. of Fish and Game, 10/1995) and Burrowing Owl Survey Protocol and Mitigation Guidelines (The California Burrowing Owl Consortium, 1993).

- Replacement of occupied habitat with suitable occupied habitat: 3 times 6.5 (19.5) acres per pair or single bird.

- Alternatively, credits at an approved mitigation bank may be purchased.

15. If project activities will initiate during the typical avian nesting season (February 15– August 1), a qualified biologist shall conduct focused preconstruction surveys no more than 14 days prior to initiation of construction activities for nesting birds, including (but not limited to) white-tailed kite, northern harrier, loggerhead shrike, and horned lark, in all areas that may provide suitable nesting habitat within 300 feet of the construction area. If active nests are found, a suitable construction buffer shall be established by a qualified biologist, and no work shall occur within that buffer until August 1 when young are assumed fledged. Alternatively, a qualified biologist can conduct weekly nest checks to gauge nestling/fledgling status, and construction may proceed once fledglings have dispersed from the nest provided written concurrence from CDFG. No active nest shall be impacted or removed without a depredation permit from CDFG, and a depredation permit will not be issued for impacts to Fully Protected Species such as the white-tailed kite. For activities that occur outside of the nesting season (generally September 1 through February 14), preconstruction surveys are not required. If construction is initiated outside of the nesting season and continues into the nesting season, preconstruction surveys are required if construction will occur in areas not previously accessed and/or disturbed (>300 feet from previous construction activities).

16. A preconstruction survey shall be conducted no more than 14 days prior to modification, demolition, or removal of onsite buildings. If no owls or other nesting birds are observed, then demolition or removal may proceed. If barn owls (or any other nesting birds) are observed during the preconstruction survey, a determination shall be made on whether birds are roosting or nesting. If a single owl is roosting, demolition or removal of the structure can proceed after the owl has been persuaded to move from the roost area. Non-invasive techniques include light shining into the roost space for one or two nights and days. If barn owls (or other nesting avian species) are found to be actively nesting in the barn, work on or demolition of the structure shall be postponed until one of the following conditions have been met: 1) a qualified biologist monitoring the nest determines that the owls have abandoned the nest without any outside interference or 2) a qualified biologist monitoring the nest has determined that the young have fledged and are capable of relocating and using another roost site. Once the young have fledged, non-invasive techniques may be used to encourage the owls to leave the barn. Under either scenario, the monitor shall ensure that all owls have left the building prior to construction or demolition activities. The barn owl nesting period is typically between February 15 and July 15.

Reptiles and Amphibians

Protocol-level aquatic surveys began in May 2007 to determine the presence or absence of CTS at the onsite aquatic resources. The onsite reservoir was documented to support tiger salamander larvae on May 8, 2007 (personal observation, David Keegan). Please note that genetic testing of tissue collected from onsite tiger salamander larvae and/or paedomorphs was conducted by the Shaffer Lab of U.C. Davis; onsite tiger salamanders are highly hybridized to completely non-native (89-100% non-native). Coordination with USFWS regarding ESA jurisdiction over hybrids/non-native was initiated by DD&A in November of 2007; USFWS subsequently concurred that onsite tiger salamanders are not the regulated species "California tiger salamander" and are not subject to the jurisdiction of USFWS (USFWS Ventura concurrence letter presented in Appendix I). Given the presence of marginally appropriate habitat, both

California red-legged frog and Western spadefoot may likewise be present within project boundaries; these species would likely be associated with the same aquatic resources and surrounding upland habitats as the non-native/invasive tiger salamander.

Impact The presence of California red-legged frog and/or Western spadefoot has not been determined at this time. The project as currently designed would fill the onsite reservoir to establish home-sites, removing a potential breeding resource for these species. Pond 3 would likewise be permanently filled as a result of the proposed project. If CRLF or spadefoot are present, proposed impacts to onsite agricultural basins (particularly the reservoir) would result in direct impacts to these species including "take." (i.e. loss of individuals and habitat, loss of a breeding resource, direct mortality, etc.). In addition, grading and other earthmoving activities proposed would represent an adverse affect on upland estivation habitat for these species, if present. *Therefore, the proposed project would represent a significant and unavoidable impact to federal and state regulated wildlife species (if present,) as currently designed. However, implementation of the mitigation measures identified below will reduce these impacts as much as feasible; greater or lesser measures may be required by USFWS.*

Mitigation

17. Protocol-level CRLF surveys (USFWS, August 2005) shall be completed at each aquatic resource present within project boundaries. Protocol-level CRLF surveys would likely detect Western spadefoot, if present. If it is determined that CRLF are present, the applicant shall coordinate with the USFWS to determine the appropriate course of action per the requirements of the federal ESA (e.g., applying for an Incidental Take Permit [Section 7 and/or 10 depending on lead agency]) and implementing the permit requirements. Any mitigation and avoidance measures required by USFWS for potential impacts to CRLF (if applicable) would likewise reduce impacts to Western spadefoot given their overlapping habitat characteristics. If it is determined that spadefoot are present, but CRLF are not, coordination with CDFG regarding appropriate mitigation to reduce impacts to this species shall be required.

Impact Proposed development of the majority of the onsite grassland habitat and fragmentation of remaining grassland habitat represents a significant impact to coast horned lizards, black-legless lizards, and San Joaquin coachwhip (and other wildlife species). *Given the lack of unaffected portions of the grassland habitat for conservation of these species, this is considered a significant and unavoidable impact. The following mitigation is presented to reduce this impact as much as feasible; greater or lesser measures may be recommended by CDFG.*

Mitigation

18. The applicant shall retain a qualified biologist to conduct a construction monitoring program for black legless lizards, coast horned lizards, and San Joaquin coachwhip which shall include procedures for capture and release. The biologist shall remain on-site during initial grading activities to salvage and relocate these species that may be uncovered during earthmoving activities. Recovered individuals shall be placed in appropriate habitat outside of the project site in accordance with the MOU with CDFG. The biologist shall walk alongside the grading equipment in each new area of disturbance, and shall have the authority to halt construction temporarily if necessary to capture and relocate an individual. Any individual captured in the grading zone shall be relocated as soon as possible to adjacent suitable habitat outside of the area of impact, pursuant to the MOU.

19. The applicant shall conduct an employee education program for construction crew and City staff prior to construction activities. A biological monitor shall meet with the construction crew at the onset of construction to educate the construction crew on the following: 1) the appropriate access route in and out of the construction area; 2) how biological monitor will examine the area and agree upon a method which will ensure the safety of the monitor during such activities, 3) the special-status species that may be present; 4) the specific mitigation measures that will be incorporated into the construction effort; and 5) the proper procedures if a special-status animal or any other animal is encountered within the project site.

20. A representative shall be appointed by the City who will be the contact source for any employee or contractor who may inadvertently kill or injure a special-status species or find one dead, injured, or trapped. The representative shall be legally responsible to notify USFWS and CDFG immediately in the event that "take" of any special-status wildlife species occurs. The representative shall be identified during the Employee Education Program and his/her contact information shall be provided to USFWS and CDFG. It is imperative that this individual will be present onsite every day and will be accessible to regulatory agency personnel.

21. All food-related and other trash shall be disposed of in closed containers and removed from the project area at least once a week during the construction period, or more often if trash is attracting avian or mammalian predators. Construction personnel shall not feed or otherwise attract wildlife to the area. These instructions to the construction crew shall be reiterated during the employee education program and during update meetings with construction crews. The instructions shall also be posted conspicuously on the site.

Summary and Conclusion:

DD&A was contracted to provide environmental services for the proposed Miravale Phase III Specific Plan in the City of Soledad, CA. In an effort to analyze the potential biological issues associated with the proposed project, DD&A prepared this Preliminary Biological Assessment to identify any sensitive or special-status habitats, plants or animals potentially present within development boundaries. Based on a review of the Vesting Tentative Map for the proposed project and multiple site visits by qualified biologists and specialist subconsultants, DD&A has determined that the Miravale III project site may support one special-status plant species: Lemmon's jewel flower. As Lemmon's jewel flower is a California State Species of Special Concern, impacts to this species should be provided planning consideration under CEQA. Therefore, it is recommended that Spring-time floristic surveys occur within portions of the project site supporting appropriate habitat for this species (mixed grassland/rocky outcrop). If Lemmon's jewel flower is present, a mitigation and monitoring plan shall be prepared by a qualified biologist and approved by CDFG prior to disturbing areas supporting this species.

In addition, DD&A has determined that two biologically sensitive and/or regulated habitat present within project boundaries; fringe wetlands associated with the onsite reservoir and agricultural basins, and the mixed grassland habitat due to its value for a suite of listed and/or special-status wildlife species. Although a wetland delineation was not conducted at the agricultural basins, a preliminary wetland assessment suggests that fringe wetlands are present. Please note that these fringe wetlands are not likely jurisdictional to ACOE given the current regulation of Section 404 of the Clean Water Act; wetland delineations must be conducted at these sites prior to impacting them. Additional mitigation is presented.

DD&A biologists have also identified a number of special-status wildlife species which are now known and/or assumed present within project boundaries, including; San Joaquin kit fox, American badger, Salinas pocket mouse Western burrowing owl, White-tailed kite, Northern harrier, and loggerhead shrike.

In addition, DD&A identified the presence of highly hybridized to non-native tiger salamander at the onsite reservoir; USFWS subsequently determined that these tiger salamanders are not subject to regulation under ESA.

Finally, DD&A has identified a number of special-status wildlife species which may be present (or occasionally present) within project boundaries based on the available habitat and/or reported occurrences of these species in the vicinity of the project site, including: pallid bat, Townsend's big-eared bat, Western Mastiff bat, Cooper's hawk, golden eagle, merlin, California horned lark, California red-legged frog, Western spadefoot, black-legless lizard, coast horned lizard, and San Joaquin coachwhip.

This Biological Assessment presents mitigation measures intended to reduce impacts to special-status species, but significant impacts to a variety of special-status wildlife species are anticipated even with implementation of mitigation. Impacts to federally listed species will require consultation/coordination with USFWS and/or CDFG in order to satisfy ESA and CESA. USFWS and CDFG site-specific recommendations would supersede the measures presented in this document as these regulatory agencies are responsible for administering ESA and CESA.

Appendix A. Table of Special-status Species Potentially Present in the Project Vicinity. Sources: USFWS Listed Species in Monterey County, CNDDB occurrences from Soledad quad and all surrounding quads, published and unpublished data, and personal knowledge.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
MAMMALS			
Antrozous pallidus Pallid bat	--/CSC	A wide variety of habitat are utilized, including grasslands, shrublands, woodlands, and forest from sea level up through mixed conifer forests. Most common in open, dry habitats with rocky areas for roosting. Also relatively common on bridges.	**Medium.** No CNDDB occurrences within 10 miles of the project site. Appropriate foraging habitat and marginally appropriate roosting habitat is present within project boundaries.
Dipodomys elephantinus big-eared kangaroo rat	--/ CSC	Chaparral covered slopes of the southern part of the Gabilian Range, in the vicinity of the Pinnacles. Forages under shrubs and in open burrows for cover and nesting.	**Not Present.** Appropriate habitat not present. Species not captured during onsite small mammal trapping study.
Enhydra lutris nereis southern sea-otter	FT/	Found in nearshore marine habitats environments of California from Ano Nuevo to Point Sal. Often associated with giant kelp and bull kelp, these opportunistic foragers eat mainly abalones, sea urchins, crabs, and clams.	**Not Present.** Habitat absent.
Eumops perotis californicus Western mastiff-bat	FSC/ CSC	Many open habitats including conifer and deciduous woodlands, coastal scrub, grassland, and chaparral. Roost in crevices in cliff faces, high buildings, trees, and tunnels.	**Unlikely.** No CNDDB occurrences of this species within 10 miles of the project site. The project site supports marginally appropriate foraging and roosting habitat for this species.
Neotoma fuscipes luciana Monterey dusky-footed woodrat	--/ CSC	Dense chaparral, oak and riparian woodland, and in mixed coniferous forest that has a well developed understory. Prefers fairly moist habitat but is also found in drier habitats such as pinyon-juniper woodland.	**Not Present.** Appropriate habitat not present. No woodrat nests observed.
Perognathus inornatus psamnophilus Salinas pocket mouse	FSC/ CSC	Typically found in grasslands and blue oak savanna, needs friable soils.	**Present.** One male was captured during onsite small mammal sampling, and appropriate habitat is

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			present in foothill portions of the site.
Taxidea taxus American badger	--/CSC	dry, open grasslands, fields, and pastures	**Present.** CNDDB reports an occurrence of this species approximately 6 miles south of the project site. Appropriate habitat is present in foothill portions of the site. American badger dens observed near onsite reservoirs and in foothill habitats.
Vulpes macrotis mutica San Joaquin Kit fox	FE/ ST	Open, level areas with loose-textured soils supporting scattered, shrubby vegetation with little human disturbance. Live in annual grasslands or grassy open stages dominated by scattered brush, shrubs, and scrub.	**Present.** The CNDDB reports the presence of SJKF critical habitat within 2 km of project boundaries. Appropriate denning habitat is present in foothill portions of the site. Active and fallow agricultural lands may provide foraging and dispersal habitat for this species. This species is assumed present.
BIRDS			
Accipiter cooperii Cooper's hawk	--/ CSC	Resident throughout most of the wooded portion of the state. Dense stands of live oak, riparian deciduous, or other forest habitats near water used most frequently. Seldom found in areas without dense tree stands, or patchy woodland habitats.	**Low.** No CNDDB occurrences of this species within 10 miles of the project site. Appropriate nesting habitat not present within project boundaries.
Accipiter striatus sharp-shinned hawk	--/ CSC	Uses dense stands in close proximity to open areas. Roosts in intermediate to high-canopy forest. Nests in dense, even-aged, single-layered forest canopy. Winters in woodlands.	**Low.** No CNDDB occurrences of this species within 10 miles of the project site. Appropriate nesting habitat not present within project boundaries.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
Agelaius tricolor tricolored blackbird	--/ CSC	Nest in colonies in dense riparian vegetation, along rivers, lagoons, lakes, and ponds. Forages over grassland or aquatic habitats.	**Low.** No CNDDB occurrences within 10 miles of the project site. No tric's observed at the onsite reservoir and/or ag lands during multiple site visits by qualified biologists (Pers. Obs. David Keegan)
Aquila chrysaetos golden eagle	--/CSC	Use rolling foot-hills, mountain terrain, wide arid plateaus deeply cut by streams and canyons, open mountain slopes, cliffs, and rocky outcrops. Nest in secluded cliffs with overhanging ledges as well as large trees.	**Medium.** No CNDDB occurrences within 10 miles of the project site, however, appropriate foraging habitat is present throughout the project site. No nesting habitat present.
Athene cunicularia Western burrowing owl	FSC/ CSC	Burrows are protected. Require open grassland habitats with low-growing vegetation and abandoned burrows. Prefers these areas assoc. with some raised perches.	**Present.** No CNDDB occurrences within 10-miles of the project site, however, DD&A and Biosearch biologists have observed several burrowing owls and occupied burrows in the course of protocol-level surveys for this species.
Brachyramphus marmoratus marbled murrelet	FT/	Occur year-round in marine subtidal and pelagic habitats from the Oregon border to Point Sal. Partial to coastlines with stands of mature redwood and Douglas-fir. Requires dense mature forests of redwood and/or Douglas-fir for breeding and nesting.	**Not Present.** No appropriate habitat.
Buteo swainsoni Swainson's hawk	FSC/ ST	Generally found associate with plains, range, open hills, and sparse trees.	**Unlikley,** No CNDDB occurrences within 10-miles of the project site. This species typically forages in the vicinity of nesting habitat. No nesting habitat present within

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			or adjacent to the project site.
Circus cyaneus Northern harrier	--/ CSC	Generally found in flat open areas with tall, dense grasses, shrubs, and edges for cover and breeding. Use tall grasses in wetlands or at wetland borders for nesting.	**Present.** No CNDDB occurrences within 10-miles of the project site, however, appropriate foraging habitat is present, and one individual was observed foraging over foothill portions of the site.
Charadrius alexandrinus nivosus Western snowy plover	FT/ CSC	Sandy beaches on marine and estuarine shores, also salt pond levees and the shores of large alkali lakes. Requires sandy, gravelly or friable soil substrate for nesting.	**Not Present.** No habitat present.
Eremophila alpestris California horned lark	---/CSC	Variety of open habitats, usually where large trees and/or shrubs are absent. Found from grasslands along the coast to deserts at sea-level and alpine dwarf-shrub habitats are higher elevations. Builds open cup-like nests on the ground.	**Medium.** No CNDDB occurrences, but this species is often not reported. Appropriate habitat for this species is present within project boundaries, but none have been observed.
Elanus leucurus white-tailed kite	--/ CFP	Open groves, river valleys, marshes, and grasslands. Prefer such area with low roosts (fences etc.). Nest in shrubs and trees adjacent to grasslands.	**Present.** No CNDDB occurrences within 10-miles of the site, however, appropriate foraging habitat is present throughout grassland portions of the site, and DD&A and Biosearch biologists have observed this species within proposed development boundaries.
Falco columbarius Merlin	--/CSC	Uses a variety of habitats in both winter and during migration.	**Low.** No CNDDB occurrences within 10-miles of the site, however, appropriate foraging habitat is present throughout grassland portions of

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			the site. This species does not nest within Monterey County.
Falco peregrinus American Peregrine Falcon	FE/SE	Forages for other birds over a variety of habitats. Breeds primarily on rocky cliffs.	**Unlikely** No CNDDB occurrences within 10-miles of the site. No appropriate nesting habitat. Project site is >30 miles from the coast.
Riparian riparia bank swallow	--/ ST	Nest colonially in sand banks. Found near water; fields, marshes, streams, and lakes.	**Not Present.** Appropriate nesting habitat is not present within the project site or immediate vicinity (pers. comm. Don Roberson).
Sterna antillarum browni California least tern	FE/ SE	Sea beaches, bays; large rivers, bars.	**Not Present.** Appropriate habitat not present.
Vireo bellii pusillus Least Bell's vireo	FE/SE	Riparian habitats. Breed in willow riparian forest supporting a dense, shrubby understory. Oak woodland with a willow riparian understory is also used in some areas, and individuals sometimes enter adjacent chaparral, coastal sage scrub, or desert scrub habitats to forage.	**Not Present.** Appropriate habitat not present.
REPTILES AND AMPHIBIANS			
Ambystoma californiense California tiger salamander	FT/ CSC	Annual grassland and grassy understory of valley-foothill hardwood habitats in central and northern California. Need underground refuges and vernal pools or other seasonal water sources.	**Present.** CTS Critical Habitat is present within 5km of project boundaries. CTS occurrence records within 6 km. Project site is within historic distribution of the species, and DD&A biologists confirmed CTS breeding at the onsite Reservoir in the course of aquatic sampling for this species.
Gambelia silus blunt-nosed leopard lizard	FE/ SE	Suitable habitat for this species includes sparsely vegetated scrub and grassland habitats in areas of low topographic relief. In areas of high relief, distribution, distribution is usually confined	**Unlikely.** No CNDDB occurrences within 10-miles of the project site**.** Marginally appropriate habitat

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
		to broad sandy washes. Found on alkali flats, large washes, arroyos, canyons, and low foothills from 100-3000ft.	present, but none observed during multiple site visits.
Masticophis flagellum ssp. *ruddocki* *San Joaquin coachwhip*	--/ CSC		
Phrynosoma coronatum frontale Coast horned lizard	--/ CSC	Associated with open patches of sandy soils in washes, chaparral, scrub, and grasslands.	**Medium.** No CNDDB occurrences within 10-miles of the site, however, appropriate habitat is present throughout the fallow and grassland portions of the site.
*Rana aurora draytoni*i California red-legged frog	FT/ CSC	Lowlands and foothills in or near permanent or late-season sources of deep water with dense, shrubby, or emergent riparian vegetation. During late summer or fall adults are known to utilize a variety of upland habitats with leaf litter or mammal burrows.	**Low.** CRLF Critical Habitat is present within 10 km of project boundaries. CRLF occurrence records within 7 km. Project site is within historic distribution of the species, and supports appropriate aquatic breeding habitat and associated upland habitat at the "reservoir" and surrounding foothills. However, no CRLF eggs, larvae, or adults have been observed onsite in the course of multiple breeding season site visits by qualified biologists (David Keegan, Pers. Obs.).
Scaphiopus hammondii Western spadefoot	--/ CSC	Grasslands with shallow temporary pools are optimal habitats for the Western spadefoot. Occur primarily in grassland habitats, but can be found in valley and foothill woodlands. Vernal pools are essential for breeding and egg laying.	**Low.** CNDDB reports one occurrence of this species within 6 km of the site. Project site is within historic distribution of the species, and supports appropriate aquatic breeding habitat and associated upland

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
			habitat at the "reservoir" and surrounding foothills. However, no WST eggs, larvae, or adults have been observed onsite in the course of multiple breeding season site visits by qualified biologists (David Keegan, Pers. Obs.).
Taricha torosa torosa coast range newt	CSC	Occurs mainly in valley-foothill hardwood, valley-foothill hardwood-conifer, coastal scrub, and mixed chaparral but is known to occur in grasslands and mixed conifer types. Seek cover under rocks and logs, in mammal burrows, rock fissures, or man-made structures such as wells. Breed in intermittent ponds, streams, lakes, and reservoir.	**Unlikely.** No CNDDB occurrences within 10-miles of the project site**.** Coast range newts are only known from locations south of Salinas River in Monterey County. Salinas River is >2.5 miles south of project site.
FISH			
Eucyclogobius newberryi tidewater goby	FE/ CSC	Brackish water habitats, found in shallow lagoons and lower stream reaches.	**Not Present.** No navigable waters present.
Oncorhynchus mykiss irideus Steelhead-Central California Coast.	FT/ CSC	Coastal perennial and near perennial streams, with suitable spawning and rearing habitat and no major barriers.	**Not Present.** No navigable waters present.
INVERTEBRATES			
Branchinecta conservatio Conservancy fairy shrimp	FE/	Require ephemeral pools with no flow. Grasslands of the northern two-thirds of the Central Valley, spanning a north-south distance of about 300 km, at elevations of 5-145 meters. Require ephemeral pools with no flow.	**Not Present.** No appropriate aquatic habitat present.
Branchinecta longiantenna longhorn fairy shrimp	FE/ none	Require ephemeral pools with no flow. Restricted distribution; Eastern edge of the Central Coast Mountains Region. Require ephemeral pools, typically associated with clear to turbid, clay and grass-bottomed pools.	**Not Present.** No appropriate aquatic habitat present.
Branchinecta lynchii vernal pool fairy shrimp	FT/ --	Require ephemeral pools with no flow. Associated with vernal pool/grasslands from near Red	**Not Present.** No appropriate aquatic habitat present.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
		Bluff (Shasta County), through the central valley, and into the South Coast Mountains Region. Require ephemeral pools with no flow.	
Danaus plexippus Monarch butterfly	--/--	Overwinters in coastal California using colonial roosts generally found in Eucalyptus, pine and acacia trees. Overwintering habitat for this species within the Coastal Zone represents ESHA. Local ordinances often protect this species as well.	**Not Present.** Appropriate habitat (groves and microclimate) present.
Euphilotes enoptes smithi Smith's blue butterfly	FE/--	Most commonly associated with coastal dunes and coastal sage scrub plant communities in Monterey and Santa Cruz Counties. Plant hosts are *Erigonum latifolium* and *E. Parvifolium.*	**Not Present.** Obligate host plants not present.
Linderiella occidentalis California linderiella fairy shrimp	FSC/	Ephemeral ponds with no flow. Generally associated with hardpans.	**Not Present.** No appropriate aquatic habitat present.
PLANTS			
Abies bracteata Bristlecone fir	--/1B	Endemic to the Santa Lucia Mountains.	**Not Present.** No fir present.
Arctostaphylos gabilanensis Gabilan Mountains manzanita	--/1B	Endemic to chaparral and chaparral/pine woodland habitats of the Gabilan Mountains of California, along the borders of San Benito and Monterey counties.	**Not Present.** No manzanita present.
Astragalus tener var. *tener* alkali milk-vetch	-- / SE / 1B	Playas, valley and foothill grassland (adobe clay), vernal pools/ alkaline; elevation 1-60 meters. Annual herb, blooms March-June.	**Not Present.** No appropriate habitat.
Caulanthus coulteri var. lemmoniii Lemmon's jewel flower	--/1B	Open, grassy areas; on hillside slopes and in fields, canyons, and arroyos. Soils include alkaline soils, shaley clay, sandstone talus, and decomposed serpentine. Predominantly found within Valley Grassland community, occasionally in Pinyon-Juniper Woodland. 80 - 1600 m. Annual herb; blooms March-May.	**Medium.** Marginally appropriate habitat present in the mixed grassland/rocky outcrop portions of the project site, and not identifiable at the time of the DD&A site assessments. Spring-time floristic survey or preconstruction survey recommended.

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
Centromadia parryi ssp. *congdonii* Congdon' tarplant	-- / -- /1B	Valley and foothill grassland (alkaline); elevation 1-230 meters. Annual herb, blooms June-November	**Not Present.** Lack of appropriate soils (lack of heavy soils).
Chorizanthe pungens var. pungens Monterey spineflower	FT/ 1B	Chaparral (maritime), cismontane woodland, coastal dunes, coastal scrub, valley and foothill grassland/ sandy; elevation 3-450 meters. Annual herb, blooms April-June.	**Not Present.** Lack of appropriate habitat (lack of sandy soils).
Chorizanthe robusta var. robusta robust spineflower	FE/ 1B	Cismontane woodland (openings), coastal dunes, coastal scrub/ sandy or gravelly; elevation 3-300 meters. Annual herb, blooms April-September.	**Not Present.** Lack of appropriate habitat (lack of sandy soils).
Clarkia jolonensis Jolon clarkia	-- / -- / 1B	Cismontane woodland, chaparral, coastal scrub, and riparian woodland.	**Not Present.** Lack of appropriate habitat (dunes, sandy/gravelly soils, etc.).
Cupressus goveniana ssp. goveniana gowen cypress	FT/ 1B	Closed cone coniferous forest, chaparral (maritime); elevation 30-300 meters. Tree (evergreen).	**Not Present.** Conspicuous species not present.
Eriogonum nortonii pinnacle buckwheat	FSC/ 1B	Chaparral, valley and foothill grassland/ sandy, often on recent burns; elevation 300-975 meters. Annual herb, blooms May-June.	**Not Present.** Conspicuous species not present.
Erysimum menziesii ssp. menziesii Menzie's wallflower	FE/ SE/ 1B	Coastal dunes. Perennial herb, blooms March-June.	**Not Present.** Appropriate habitat not present.
Holocarpha macradenia Santa Cruz tarplant	FT/ SE	Coastal prairies, valley foothill grasslands/ often clay. Annual herb, blooms June-October	**Not Present.** No mesic sites. No soils (lack of clay).
Layia carnosa Beach layia	FE/ SE/ 1B	Coastal dunes., coastal scrub (sandy; elevation 0-60 meters. Annual herb, blooms March-July.	**Not Present.** Appropriate habitat not present.
Lembertia congdonii	FE/ 1B	Chenopod scrub, valley and	**Not Present.**

Species	Status (USFWS/ CDFG/ CNPS)	General Habitat	Potential Occurrence within Project Vicinity
San Joaquin wollythreads		foothill grassland (sandy); elevation 60-800 meters. Annual herb, blooms February-May	No habitat. No soils (lack of sandy soils).
Lupinus tidestromii Tidestrom's lupine	FE/SE/1B	Coastal dunes; elevation 0-100 meters. Perennial herb (rhizomatous), blooms April-June.	**Not Present.** Appropriate habitat not present.
Malacothamnus aboriginum indian valley bush mallow	FSC/ 1B	Chaparral, cimontane woodland/ rocky.	**Not Present.** Appropriate habitat not present.
Malacothrix saxatilis var. arachnoidea Carmel Valley macothrix	FSC/ 1B	Chaparral (rocky); elevation 25-335 meters. Perennial herb (rhizomatous), blooms March-December.	**Not Present.** Appropriate habitat not present.
Navarretia negelliformis ssp. radians shining navarretia	FSC/ 1B	Cismontane woodland, valley foothill grasslands, vernal pools	**Not Present.** Appropriate habitat not present.
Potentilla hickmanii Hickman's cinqufoil	FE/ SE / 1B	Coastal bluff scrub, closed cone coniferous forests, meadows(vernally mesic), marshes and swamps (freshwater). Perennial herb, blooms April-August.	**Not Present.** Appropriate habitat not present.
Yadon's rein orchid *Piperia yadonii*	FE/-- 1B	Sandy soils in coastal bluff scrub, closed-cone coniferous forest, and maritime chaparral. Annual.	**Not Present.** Appropriate habitat not present.
Plagiobothrys uncinatus Hooked popcorn flower	--/1B	Chaparral, Cismontane woodlands, Valley-foothill grasslands.	**Not Present.** No mesic habitat.
Texosporium sancti-jacobi woven-spored lichen	FSC/1B	Found in arid to semi-arid grasslands, shrublands, or savannas. Parent materials are noncalcareous, including basalt, granite, and mixed alluviums. Soils developed on these parent materials vary greatly, from very fine textured soils on basalt to sandy loams, to soils with a very high content of fine or coarse sand. Soil depth varies greatly.	**Not Present.** Appropriate habitat not present.

Unlikely: The project area and/or immediate vicinity do not provide suitable habitat for a part particular species. Project area is outside of the species range.

Low Potential: Project area and/or immediate vicinity provides only limited habitat for a particular species. The known range for a particular species may be outside of the project area.

Medium Potential: The project area and/or immediate vicinity provide suitable habitat for a particular species, though there are no known sightings in the area.

High potential: The project area and/or immediate vicinity provide ideal habitat conditions for a particular species and/or the species is known to occur in the area.

SALINAS POCKET MOUSE SURVEY
MIRAVALE III SUBDIVISION,
SOLEDAD, MONTEREY COUNTY

Introduction

The Salinas pocket mouse (*Perognathus inornatus psammophilus*) is designated as a Species of Special Concern by the California Department of Fish and Game (CDFG). Suitable habitat for the subspecies is present on a portion of the proposed Miravale III subdivision north of Soledad in Monterey County, and the subspecies has been recorded from the vicinity. This document provides the results of a live-trapping survey to determine the presence of the subspecies onsite in 2006.

Study Area

The Miravale III project site is situated at the northern edge of Soledad in Monterey County, California (Figure 1). It covers 920 acres and is bisected by San Vicente Road. The majority of the site is currently in agricultural production including vineyards and row crops. This area is flat and bisected by numerous dirt roads.

The eastern edge of the site is hilly, and has not been disked. This portion of the site supports grassland habitat and covers approximately 160 acres. Elevations range between 400 feet and 740 feet above sea level.

The sampling area was restricted to the hills along the eastern edge of the site (Figures 2-4). The portion of the site on the floor of the Salinas Valley does not provide suitable habitat for the Salinas pocket mouse due to ongoing agricultural operations.

Wildlife habitats to the north and east are relatively undisturbed and support grassland, oak savannah and scrub habitats. Lands to the west are in agricultural production, while lands to the south have been converted to residential use.

Salinas Pocket Mouse

The Salinas pocket mouse (*Perognathus inornatus psammophilus*) occurs in the Salinas Valley from the vicinity of Soledad south to the vicinity of Hog Canyon near San Miguel (Williams 1986; Best 1993; Williams, et al. 1993). The subspecies was originally described from near Arroyo Seco, approximately 5 miles to the south of the project site. Conversion of natural habitats has occurred throughout much of the range of the subspecies. It is designated as a Species of Special Concern by the California Department of Fish and Game (CDFG 2006).

Little is known of the natural history of the subspecies. It has been captured infrequently since it was described in 1937. It has been found in grassland, savannah and scrub habitats, typically with sandy soils (Williams 1986).

P. inornatus is nocturnal and spends its days below ground in burrows. It is a granivore that feeds on the seeds of grasses, shrubs and forbs. The species typically breeds between March to July and becomes inactive during the fall and winter months (Best 1993).

The Salinas pocket mouse is currently one of three subspecies of the San Joaquin pocket mouse, *P. inornatus*. There is a considerable degree of uncertainty regarding the taxonomy of the species, and it is likely that there is more than one species included within *Perognathus inornatus* as it is currently comprised (Best 1993; Williams, et al. 1993; Laabs and Allaback, unpub. data). It has been suggested that *P. i. psammophilus* is synonymous with *P. i. neglectus* from the San Joaquin Valley and Carrizo Plain. Resolving the systematic status of the Salinas pocket mouse in regards to the other members of the species complex has been identified as a key element in formulating a management strategy for the subspecies (Williams 1986).

Methods

Live-trapping was conducted by wildlife biologists David Laabs and Mark Allaback with assistance from wildlife biologist David Keegan between 29 August 2006 and 1 September 2006. Eight trap transects consisting of 25 Sherman live-traps (12" x 3.5" x 3") each with 10 meter spacing between traps were established throughout the site (Figure 2). We opted to use transect trapping since the purpose of the sampling was to generate a species inventory rather than gather data regarding relative abundance or density (Jones, et al. 1996). The transect locations were chosen to sample representative micro-habitats on the site. Traps were set and baited for three consecutive nights and checked on the following morning beginning at sunrise.

All small mammals captured were identified to species, and their age and sex were recorded. All individuals were marked with ink to identify if they had been captured previously. The number of new individuals captured per trap-night was used as an index of abundance for each species.

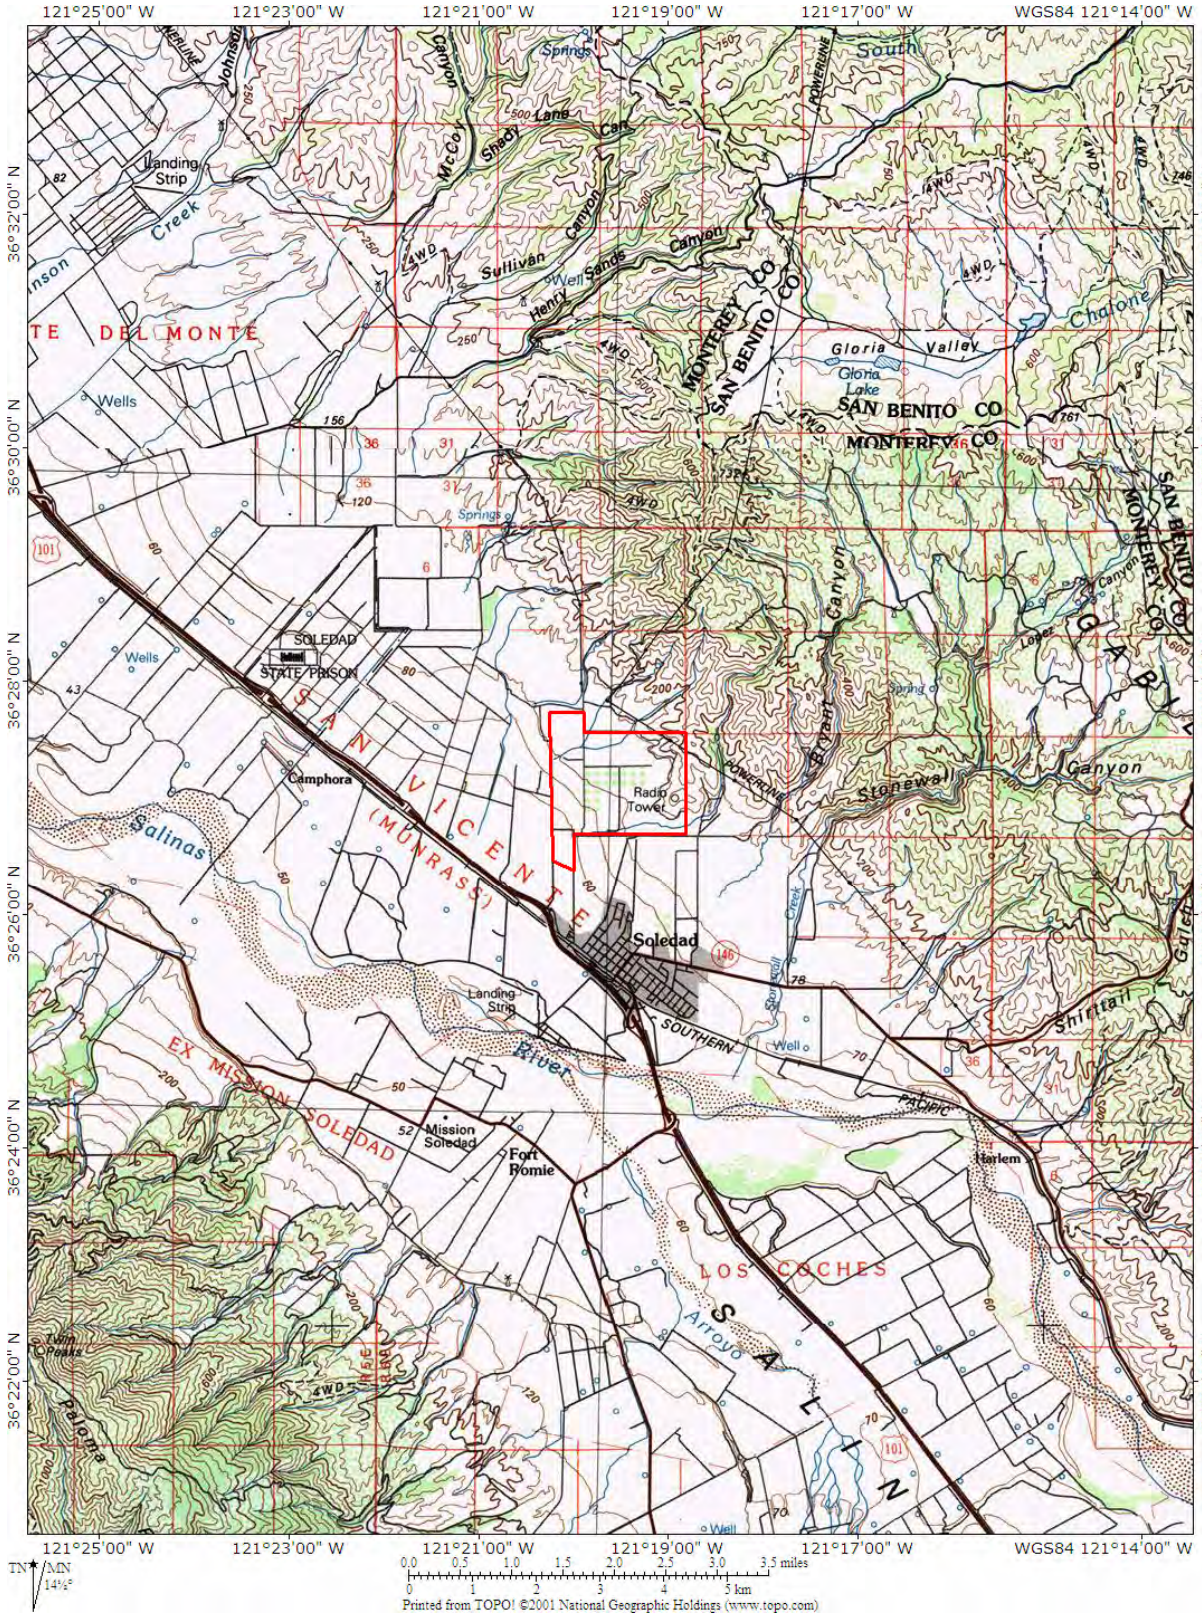

Figure 1. Location of Miravale III project site, Soledad, Monterey County

Results

Two hundred traps were opened for three consecutive nights for a total of 600 trap-nights. Sixty-two individuals belonging to five species were captured. Thirty-three recaptures of three species were made.

A single adult male Salinas pocket mouse was captured on 1 September 2006 in the northeastern part of the site (Figure 2). The capture location was midway up a south-facing slope at an elevation of 520 feet (Figures 3 and 4). Positive identification was made based on a unicolored, un-crested tail, smooth pelage and overall measurements. The individual was collected alive to allow for future chromosomal analysis.

The most common species was the California pocket mouse (*Chaetodipus californicus*), which was captured on all 8 transects and accounted for 59.7% of all individuals (Table 1). The deer mouse (*Peromyscus maniculatus*) was captured on 6 of the 8 transects and accounted for 19.4% of all individuals. The Heermann's kangaroo (*Dipodomys heermanni*) rat was captured on 4 of the 8 transects and accounted for 17.7% of all individuals. A single western harvest mouse (*Reithrodontomys megalotis*) was captured (1 of 8 transects; 1.6% of total individuals).

Small mammals were captured on all eight transects. Capture frequency varied greatly between transects, ranging from one individual to 22 individuals per transect (Table 1). Those transects situated on south-facing slopes supported more small mammals than those on north- or west-facing slopes. The presence of rock outcrops also appeared to contribute to higher capture frequencies.

Other small mammals observed or detected by sign onsite were California ground squirrel (*Spermophilus californicus*), Botta's pocket gopher (*Thomomys bottae*) and California vole (*Microtus californicus*).

Family/				Transect #						#/trap	%
Species	1	2	3	4	5	6	7	8	Total	-night	Total
Heteromyidae											
Dipodomys heermanni	3	5	0	0	0	1	0	2	11	0.018	17.7

Total	7	12	2	1	4	22	5	9	62	0.103	100.0

Table 1. Results of nocturnal small mammal trapping by transect.

Discussion

The Salinas pocket mouse was detected in the northeastern corner of the Miravale III project site. Suitable habitat is present throughout the undisked grassland portion of the site. Although typically associated with sparse vegetation, *P. inornatus* is also known to occupy dense grassland.

The development of the Miravale III subdivision as currently designed would result in the loss of approximately 160 acres of habitat for the Salinas pocket mouse. Direct loss of habitat and individuals would occur within the project footprint. Indirect impacts to grassland areas adjacent to the completed project are expected, resulting from habitat fragmentation and the introduction of cats and other human disturbance.

The active agricultural fields that cover the western part of the site no not provide habitat for the Salinas pocket mouse. Those fields onsite that are fallow have only been so for approximately five years, and it is not expected that they would have been re-colonized over such a short time period.

The Salinas pocket mouse has been observed infrequently since its description in the late 1930s. The subspecies was captured at Camp Roberts in 1994, approximately 50 miles south of the project site near the southern edge of the range of the subspecies (CNDDB). To our knowledge, this is the first time detection of the subspecies in the northern part of its range in over 50 years.

There is a considerable amount of confusion in the literature concerning the genus *Perognathus* in Central California. The most recent literature suggests that the subspecies *psammophilus* may be synonymous with the subspecies *neglectus*, which is found along the western edge of the San Joaquin Valley and on the Carrizo Plain (Best 1993; Patton and Rogers 1993). No genetic studies have been made of *psammophilus*, due to the lack of recent specimens from the Salinas Valley. The karyotype (diploid chromosome number) has not been determined (Patton and Rogers 1993), further inhibiting efforts to clarify the genetic affiliations within the species group.

The most critical needs for the subspecies are protection of habitat and additional information regarding its genetic affiliation (Williams 1986). Therefore, avoidance of grassland habitat is recommended. Furthermore, it is recommended that the specimen obtained during this study be analyzed to determine its karyotype. Additional specimens would be required for a more comprehensive phylogenetic analysis to determine its relatedness to other members of the species group.

SAN JOAQUIN KIT FOX EARLY EVALUATION,
MIRAVALE III SUBDIVISION
MONTEREY COUNTY, CALIFORNIA

SUMMARY

This document provides an early evaluation of habitat suitability for the federally-endangered and state-threatened San Joaquin kit fox (*Vulpes macrotis mutica*) at the site of a proposed subdivision north of Soledad in Monterey County, California. This evaluation follows guidelines disseminated by the United States Fish and Wildlife Service for the species in the northern part of its range.

The Miravale III Project site covers approximately 920 acres along the eastern edge of the Salinas Valley. The proposed project consists of a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units, 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. The project also proposes three school sites, a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas.

The project site is near the northern edge of the range of the San Joaquin kit fox in the Salinas Valley. The species has been observed within 2 miles of the project site, although it has not been observed in the vicinity in over 20 years.

The eastern part of the site, covering approximately 140 acres, supports grassland habitat, which is suitable habitat for the San Joaquin kit fox. The majority of the project site, approximately 780 acres, is on the floor of the Salinas Valley and is currently used for row crops and vineyards. These habitats are known to be used by San Joaquin kit fox, particularly when they are in proximity to grassland habitats. Potential fox dens and a suitable prey base are present, particularly in the eastern portion of the site.

SAN JOAQUIN KIT FOX EARLY EVALUATION,
MIRAVALE III SUBDIVISION
MONTEREY COUNTY, CALIFORNIA

1.0 INTRODUCTION

The proposed Miravale III subdivision covers approximately 920 acres near Soledad in Monterey County, California. Denise Duffy & Associates (Monterey, California) is preparing an Environmental Impact Report for the project. The present evaluation was prepared to provide the United States Fish and Wildlife Service (USFWS) with the information necessary to determine if the project site provides suitable habitat for the San Joaquin kit fox and whether focused surveys are recommended (USFWS 1999a).

2.0 STUDY AREA

The Miravale III projects site is situated within unincorporated lands immediately north of Soledad in Monterey County, California (Figure 1). The project site is situated at the eastern edge of the Salinas Valley approximately 1.7 miles from the Salinas River. The bulk of the site is on a gently sloping plain. The eastern part of the site is situated in the foothills of the Gabilan Range (Figure 2). The 920-acre project site is situated between San Vicente Road and Orchard Lane, and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east.

3.0 METHODS

Methods conform to those detailed in the early evaluation requirements provided by USFWS (1999a). Reconnaissance-level field surveys were performed between 29 August and 17 October 2006. The project area was surveyed by vehicle and foot to identify wildlife habitats. Habitat features for San Joaquin kit fox, including prey availability and den potential, were evaluated. Aerial photos of the site and of surrounding areas were reviewed.

A record search of the California Natural Diversity Data Base (CNDDB 2006) for the Soledad 7.5' series quadrangle and the eight surrounding quadrangles was conducted. The results of previous biological investigations in the area were reviewed. Scientists with experience working in the region were contacted (Johnson, pers. comm.; Mori, pers. comm.; Orloff, pers. comm.; Root, pers. comm.).

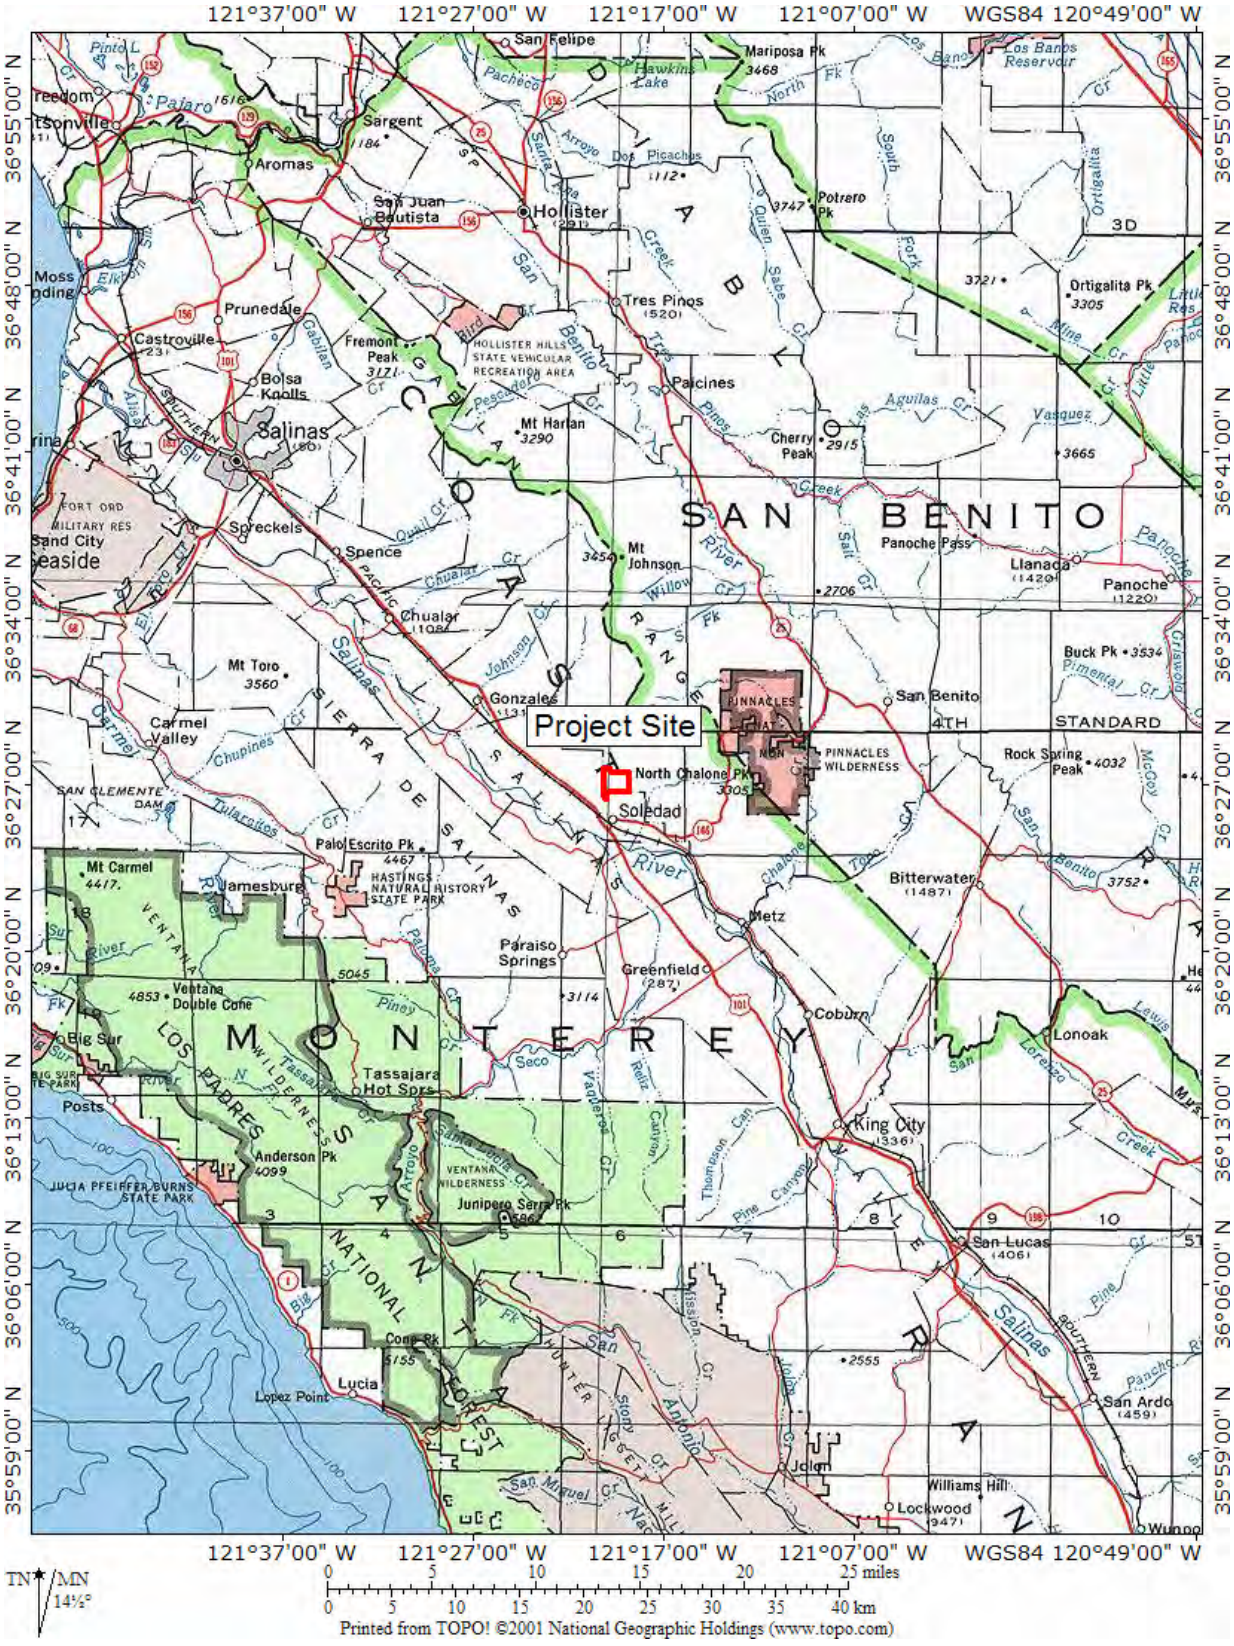

Figure 1. Miravale III project site vicinity map.

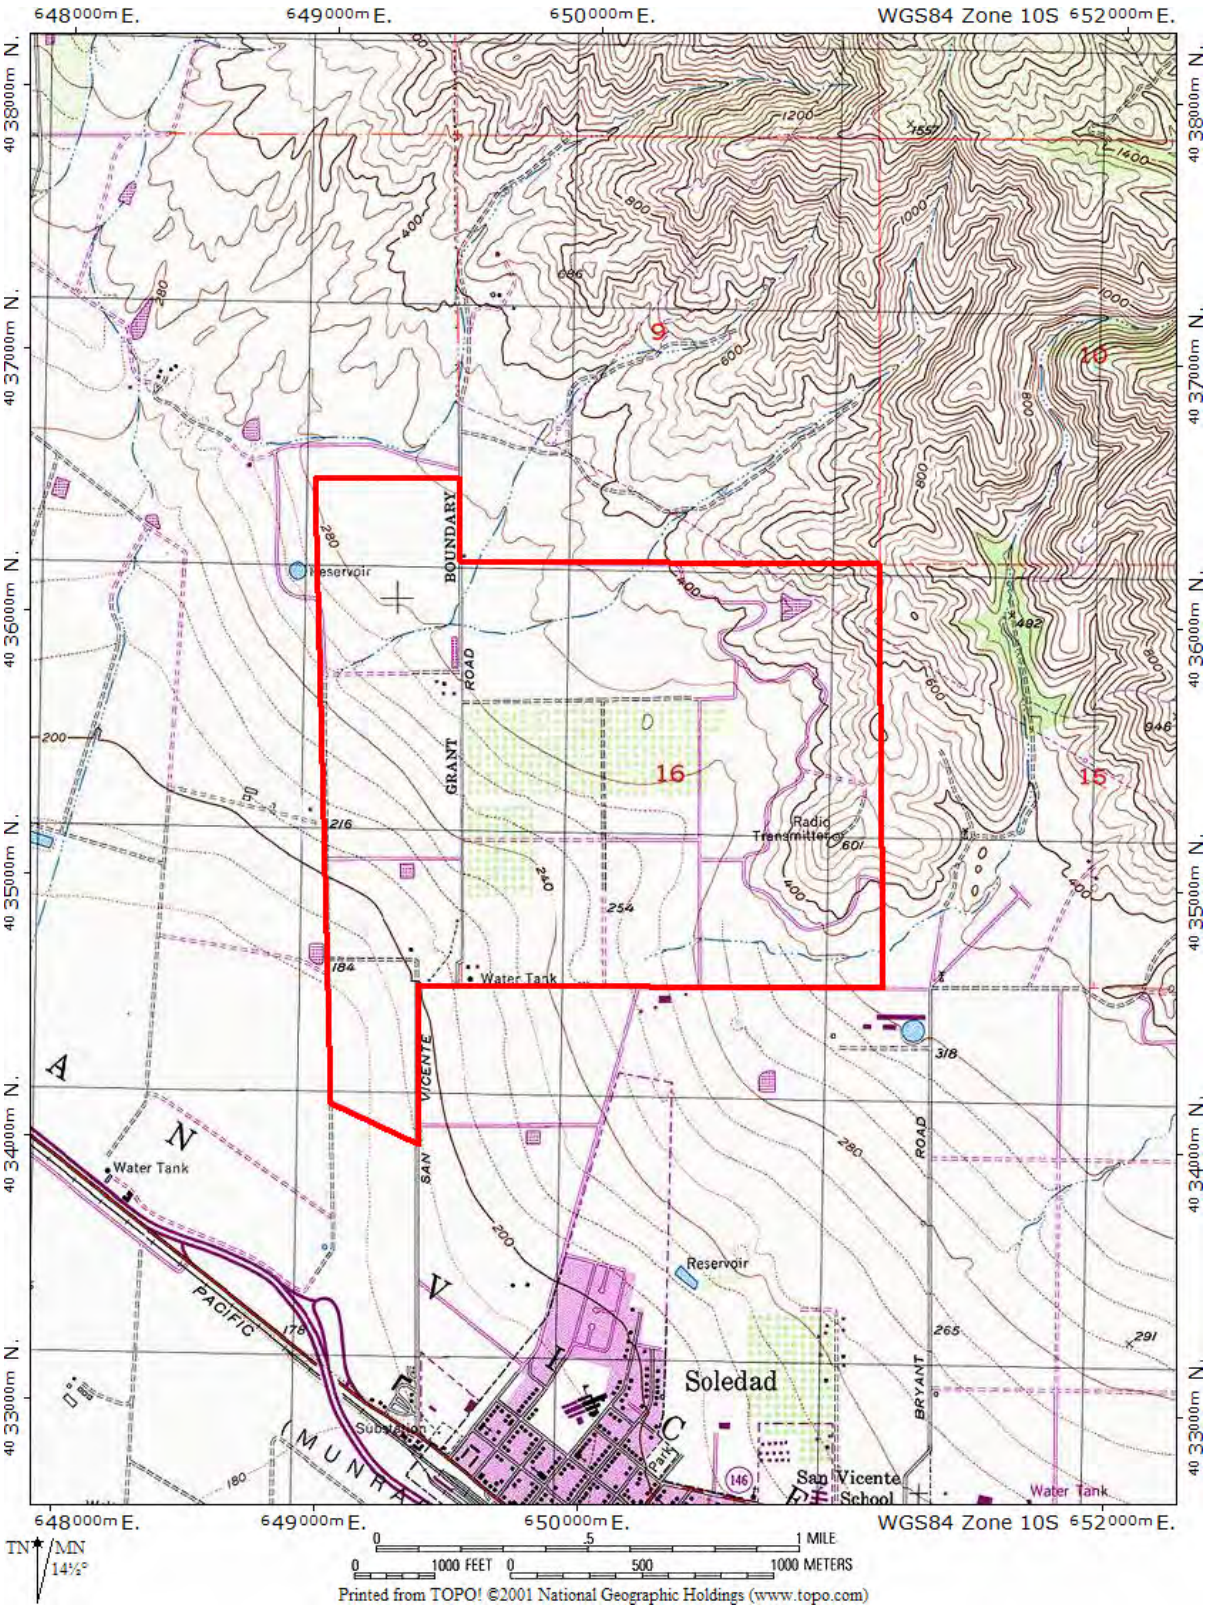

Figure 2. Miravale III San Joaquin kit fox early evaluation study area.

4.0 RESULTS

An analysis of the habitat suitability for the San Joaquin kit fox at the Miravale III site is provided below. Information is included regarding the proposed project, the known sightings from the vicinity, the vegetation communities onsite and in the vicinity, and the presence of specific habitat features for the San Joaquin kit fox.

4.1 San Joaquin Kit Fox Natural History. The San Joaquin kit fox (*Vulpes macrotis mutica*) occurs in the arid and semi-arid habitats of the San Joaquin Valley and the adjacent foothills of the coastal ranges, Sierra Nevada and Tehachapi Mountains. The species is also known to occur in the interior coastal ranges in Monterey, San Benito and Santa Clara Counties. San Joaquin kit fox primarily inhabit grassland and chenopod scrub habitats (USFWS 1998). Oak savanna is also utilized (Reese, et al. 1992). In portions of their range, they utilize habitats that have been altered by human activities, including agricultural and urban areas.

The San Joaquin kit fox often occurs in loose-textured soils, although it is found in virtually every soil type. The species requires dens for shelter, temperature regulation and reproduction and an individual may use up to 20 different dens (Hall 1983). San Joaquin kit fox that inhabit areas with non-friable soils depend largely on dens dug by other species, notably California ground squirrel (*Spermophilus beecheyi*) and American badger (*Taxidea taxus*) (Hall 1983). Wherever soils are more friable, kit fox dig deep and complex burrow systems (Morrell 1972). Suitable topography usually consists of low to moderate hills with slopes of less than 40 degrees (Morrell 1972), with the average slope at den sites ranging from 0 to 22 degrees (O'Farrell 1983, Orloff, et al. 1986). Light to moderate grazing may increase the suitability of grassland habitats for the San Joaquin kit foxes and its prey (Jensen 1972; Orloff, et al. 1986). Most San Joaquin kit fox dens are located on flat terrain or on the lower slopes of hills (O'Farrell 1983). Natal and pupping dens (used for birthing and rearing pups) are generally found in flatter terrain. The species will also readily use man-made structures such as culverts and pipes (O'Farrell 1983).

San Joaquin kit fox are opportunistic feeders that will prey on ground squirrels (*Spermophilus* and *Ammospermophilus*), rabbits (*Lepus* and *Sylvilagus*), kangaroo rats (*Dipodomys*), pocket mice (*Perognathus*) and other small mammals, birds, reptiles and insects, depending on their availability (Laughrin 1970; Morrell 1972; McGrew 1979; Hall 1983).

Severe declines in San Joaquin kit fox populations were initially attributed to intensive fur-trapping and coyote poisoning campaigns. Large scale agricultural development began in the San Joaquin Valley in the mid-1800s. More recently, urbanization, oil and gas production, mineral development, use of pesticides and rodenticides, shooting, and mortality by road-kill have been significant factors contributing to habitat loss and the species' decline (O'Farrell 1983). The San Joaquin kit fox is listed as Threatened by CDFG and as Endangered by USFWS. The status of the species was determined to be declining as of 2003 (CDFG 2005).

4.2 Project Description. The project consists of the development and implementation of the Miravale Phase III Specific Plan. The Specific Plan calls for a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units, 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. Conceptual plans include a variety of residential types, including apartments, townhouses, and attached homes on small and large lots. The project also proposes three school sites (2 elementary schools and 1 middle school), a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas, including parks, playgrounds, and a trail system.

The project site is currently zoned by Monterey County for farmland and permanent grazing uses and is currently being used for agricultural cultivation. Large portions of the site are currently fallow.

4.3 San Joaquin Kit Fox Occurrences Within 10 Miles. The San Joaquin kit fox has been observed at six locations within 10 miles of the project site. These records are from along Metz Road approximately 1.9 miles SE, 2.4 miles SE and 3.7 miles SE, near Miners Gulch, approximately 6.9 miles SE, near the mouth of Arroyo Seco, approximately 7.2 miles south and along Metz Road near Greenfield, approximately 8.1 miles SSE (USFWS 1998; Johnson, pers. comm.). Five of these observations were made prior to 1975, while the sixth was made prior to 1986 (USFWS 1998; Johnson, pers. comm.).

More recent observations have been made near Bitterwater, approximately 15 miles ESE, including an observation in 1993 (CNDDB 2006; Mori. pers. comm.). The species has been observed regularly in the vicinity of King City, approximately 20 miles SE (Mori, pers. comm.; Orloff, pers. comm.; CNDDB 2006).

All of the localities listed above are south of the project site, and no observations of the species have been recorded in the Salinas Valley north of Soledad. The project site is situated just north of the range of the species as delineated by the Natural Diversity Data Base.

4.4 Vegetation Communities. The western part of the site, approximately 780 acres, is situated on the floor of the Salinas Valley and has been converted to agricultural uses. This currently includes vineyards, row crops and fallow fields. A row of eucalyptus trees and tamarisk is present along San Vicente Road. Two clusters of residences and outbuildings with associated non-native trees are present.

The eastern part of the site, covering approximately 140 acres, is situated in the foothills of the Gabilan Range, and supports grassland habitat. This portion of the site was grazed with cattle until recently. Vegetative cover is sparser on the south facing slopes. Small rock outcrops are scattered throughout this area. A small amount of freshwater marsh habitat is present around a permanent pond in the northeastern corner of the site.

4.5 Habitat Connectivity. Potential habitat for the San Joaquin kit fox is present in proximity to the project site (Figure 3). To the northwest and southeast, grassland, oak savanna and open scrub habitats are present along the fringes of the Salinas Valley. These habitats are relatively unbroken along a narrow band in the foothills to occupied San Joaquin kit fox habitat to the southeast.

To the west and south, much of the valley itself has been converted to agricultural uses. The species is known to occupy certain agricultural settings, particularly where they are in proximity to grassland and scrub habitats. The City of Soledad is adjacent to the south of the project site. It is not anticipated that the species would occur in such a dense urban setting.

4.6 San Joaquin Kit Fox Habitat Suitability. The site supports potential habitat for the species, particularly the grassland habitat in the eastern portion of the site. The species is also known to use agricultural areas including fallow fields, row crops and vineyards, particularly where these areas area adjacent to grassland habitats (Knapp 1978).

Potential San Joaquin kit fox den sites are present on the project site. California ground squirrel colonies were observed during reconnaissance surveys in the grassland portion of the site and along dirt roads in the vineyards. Some of these burrows are large enough to be used by San Joaquin kit fox. American badgers, which dig burrows that can be used by San Joaquin kit fox, are present in the grassland portion of the site. In addition, culverts of appropriate size are present that could be used as atypical dens (see USFWS 1999a).

Reconnaissance surveys, along with a small mammal trapping survey conducted in August 2006 (Biosearch Associates 2006) determined that a variety of suitable San Joaquin kit fox prey is present in the grassland portion of the site including California ground squirrels, California pocket mice (*Chaetodipus californicus*), San Joaquin pocket mice (*Perognathus inornatus*), Heermann's kangaroo rats (*Dipodomys heermanni*), deer mice (*Peromyscus maniculatus*), western harvest mice (*Reithrodontomys megalotis*), California voles (*Microtus californicus*), desert cottontails (*Sylvilagus audubonii*) and black-tailed jackrabbits (*Lepus californicus*). Prey availability is reduced in the portions of the site that are under active cultivation.

4.7 Impact Analysis and Mitigation Recommendations. The Miravale III project is conceptual at this time, and a comprehensive analysis of impacts is premature. As currently constituted, the project would result in direct and indirect impacts to potential San Joaquin kit fox habitat near the northern edge of its historic range in the Salinas Valley.

If the Service determines that the project would result in take of the San Joaquin kit fox, the project proponent would need to initiate consultation with the Service to determine appropriate project modifications to protect the species, including avoidance, minimization, restoration, preservation, and/or compensation. The Service may also determine that a protocol-level field survey for the species is appropriate.

5.0 DISCUSSION

The Miravale III project site is near the northern edge of the range of the federally-endangered and state-threatened San Joaquin kit fox in the Salinas Valley (Figure 4). San Joaquin kit fox were observed in the vicinity of the project site in the 1970s and 1980s. The current status of the species near Soledad is unclear, however, and no observations have been made near Soledad in the last 20 years (CNDDB 2006; Orloff, pers. comm.; Johnson, pers. comm.). The species has been observed in recent years in the vicinity of Bitterwater, approximately 15 miles ESE and near King City, approximately 20 miles to the SE (CNDDB 2006; Mori, pers. comm. Orloff, pers. comm.).

Suitable habitat is present at the Miravale III project site for the San Joaquin kit fox. The eastern part of the site supports annual grassland, which is a preferred habitat for the species. The western part of the site is in agricultural production (vineyards, row crops, fallow fields), and should be considered potential habitat given the proximity of grassland habitats.

Potential den sites for the San Joaquin kit fox, including those dug by California ground squirrels and American badger, as well as artificial den sites such as culverts, are present on the site. A wide variety of native prey species are also available, particularly in the eastern portion of the site. Suitable San Joaquin kit fox habitat extends along the edge of the Salinas Valley between the site and extant populations to the southeast.

APPENDIX 1. Vertebrate species observed or detected by sign at the Miravale III Project Site, August - October 2006.

Amphibia	**Amphibians**
Hylidae	Tree Frogs
Pseudacris regilla	Pacific treefrog
Reptilia	**Reptiles**
Phrynosomatidae	Spiny Lizards
Sceloporus occidentalis	Western fence lizard
Uta stansburiana	Side-blotched lizard
Aves	**Birds**
Ardeidae	Herons, Egrets and Bitterns
Ardea herodias	Great blue heron
Cathartidae	American Vultures
Cathartes aura	Turkey vulture
Accipitridae	Hawks, Kites and Eagles
Circus cyaneus	Northern harrier
Buteo jamaicensis	Red-tailed hawk
Falconidae	Falcons and Caracaras
Falco sparverius	American kestrel
Columbidae	Pigeons and Doves
Zenaida macroura	Mourning dove
Tyrannidae	Tyrant Flycatchers
Sayornis nigricans	Black phoebe
Sayornis saya	Say's phoebe
Laniidae	Shrikes
Lanius ludovicianus	Loggerhead shrike
Corvidae	Jays, Magpies and Crows
Corvus brachyrhynchos	American crow
Mimidae	Mimic thrushes
Mimus polyglottos	Northern mockingbird
Sturnidae	Starlings
Sturnus vulgaris	European starling (introduced)
Emberizidae	Sparrows
Passerculus sandwichensis	Savannah sparrow
Icteridae	Blackbirds
Agelaius phoeniceus	Red-winged blackbird
Euphagus cyanocephalus	Brewer's blackbird
Sturnella neglecta	Western meadowlark
Fringillidae	Finches
Carpodacus mexicanus	House finch
Mammalia	**Mammals**
Leporidae	Rabbits and hares
Sylvilagus audubonii	Desert cottontail
Lepus californicus	Black-tailed jackrabbit

Sciuridae	Squirrels
Spermophilus beecheyi	California ground squirrel
Geomyidae	Pocket gophers
Thomomys bottae	Botta's pocket gopher
Heteromyidae	Kangaroo rats and pocket mice
Chaetodipus californicus	California pocket mouse
Perognathus inornatus	San Joaquin pocket mouse
Dipodomys heermanni	Heermann's kangaroo rat
Muridae	Mice, rats and voles
Peromyscus maniculatus	Deer mouse
Microtus californicus	California vole
Reithrodontomys megalotis	Western harvest mouse
Canidae	Foxes, Wolves and relatives
Canis latrans	Coyote
Mustelidae	Weasels, Skunks and Relatives
Taxidea taxus	American badger
Suidae	Pigs
Sus scrofa	Wild pig (introduced)

CALIFORNIA TIGER SALAMANDER HABITAT ASSESSMENT, MIRAVALE III SUBDIVISION, MONTEREY COUNTY, CALIFORNIA

SUMMARY

This document presents a habitat assessment for the federally-threatened California tiger salamander (*Ambystoma californiense*) at the proposed 920-acre Miravale III project site located north of the City of Soledad in Monterey County. The information provided conforms to habitat assessment guidelines issued by the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Game (CDFG).

The project site is within the range of the California tiger salamander. There are no known occurrences within 5 kilometers, although the species has been recorded from five locales within 10 kilometers.

A permanent pond in the northeast corner of the site provides potential aquatic habitat for the California tiger salamander and is surrounded by appropriate upland habitat. A variety of burrowing mammals inhabit the nearby grasslands, providing potential underground refugia.

Three agricultural ponds are present in the western part of the site. These ponds have highly variable water levels and are all situated more than 1 km from undisturbed upland habitat. Lands surrounding these ponds are used for row crops year-round. These factors greatly reduce their potential as breeding sites for the California tiger salamander.

Northern Monterey County is known to support California tiger salamander populations that have hybridized to varying degrees with non-native tiger salamanders (*Ambystoma tigrinum*). Determination of the genetic status of any tiger salamanders captured at the site should therefore be conducted prior to formulating a mitigation strategy.

CALIFORNIA TIGER SALAMANDER HABITAT ASSESSMENT,
MIRAVALE III SUBDIVISION,
MONTEREY COUNTY, CALIFORNIA

INTRODUCTION

The California tiger salamander is listed as threatened by the U.S. Fish and Wildlife Service (USFWS 2004). This document provides a habitat assessment for the 920-acre Miravale III project site located north of the City of Soledad. A description of the aquatic and upland habitats onsite, a general description of upland habitats within 2 km (2.1 miles), and the known California tiger salamander localities within 5 km (3.1 miles) are provided.

STUDY SITE

The Miravale III projects site covers 920 acres and is situated within unincorporated lands immediately north of Soledad in Monterey County, California (Figure 1). The project site is situated at the eastern edge of the Salinas Valley approximately 1.7 miles from the Salinas River. The bulk of the site is on the gently sloping valley floor, and is in agricultural production. The eastern part of the site is situated in the foothills of the Gabilan Range and supports mostly undisturbed grassland. The project site is situated between San Vicente Road and Orchard Lane and is surrounded by agricultural land to the north and west, an existing residential subdivision to the south, and undeveloped foothills of the Gabilan Mountain Range to the east.

The proposed project consists of the development and implementation of the Miravale Phase III Specific Plan. The Specific Plan calls for a mixed-use development including 1,470 single-family residential units, 2,730 multi-family residential units, 120 hotel rooms, 275,000 square feet of retail commercial space and an 18-hole golf course. Conceptual plans include a variety of residential types including apartments, townhouses, and attached homes on small and large lots. The project also proposes three school sites, a fire and police substation, a recycled water plant, and approximately 75 acres of open space and recreation areas.

The project site is currently zoned by Monterey County for farmland and permanent grazing uses and is currently being used for agricultural cultivation. Large portions of the site are fallow.

METHODS

Methodology follows the interim guidance on conducting site assessments for the California tiger salamander (USFWS and CDFG 2003). Current range maps for the species were reviewed. A record search of the California Natural Diversity Data Base (CNDDB 2006) for the Soledad 7.5' series quadrangle and the eight surrounding quadrangles was conducted. Previous biological investigations in the area were reviewed.

Researchers with experience in the area were contacted for information regarding locality records.

Reconnaissance-level field surveys were performed between 29 August and 18 October 2006. The project area was surveyed by vehicle and foot and wildlife habitats were identified. Information regarding habitat characteristics of California tiger salamanders was reviewed, and compared with onsite conditions. Aerial photos of the site and of surrounding areas were analyzed. Adjacent land use and wildlife habitats were determined.

CALIFORNIA TIGER SALAMANDER

The California tiger salamander (*Ambystoma californiense*) is a large, stocky salamander that inhabits grassland and oak savanna habitats in the valleys and low hills of central and coastal California. Adults spend most of their lives underground, typically in burrows of ground squirrels and other animals (USFWS 2003). During winter rains between November and February, adults emerge from underground retreats to breed (Stebbins 2003; Loredo and Van Vuren 1996). Adults may travel long distances between upland sites and breeding sites, and above-ground activity may occur under suitable environmental conditions through May. Adults have been found more than 2 km (1.2 miles) from breeding sites (USFWS 2003). Males typically spend 6-8 weeks at breeding ponds, while females typically spend only 1-2 weeks (Loredo and Van Vuren 1996). In years of below average rainfall, or when rains occur late in the season, females may forego breeding (Trenham, et al. 2000).

California tiger salamanders breed primarily in vernal pools and semi-permanent, quiet waters. After hatching in two to three weeks, larvae are 10-15 mm (0.4-0.6 inches, total length). Hatchlings forage primarily on zooplankton, while larger larvae feed mostly on frog tadpoles and invertebrates (Anderson 1968). Metamorphosis into the adult form involves a process in which the gills recede, the legs become robust, the eyes become well developed, and the adult spot pattern emerges. Metamorphosis typically occurs from May - July at approximately 100-125 mm (3.9-4.9 inches, total length). Length and weight may vary at metamorphosis because larvae can either accelerate development rapidly in response to drying ponds or delay development to take advantage of ponds that hold water longer. Larvae will desiccate and die if ponds in which they are developing dry out before metamorphosis is complete (Feaver 1971). The number of larvae that reach metamorphosis is highly variable (Trenham, et al. 2000). In addition to a variety of ecological factors, the number of larvae that transform appears to be related to the timing and amount of rainfall during the previous winter (Loredo and Van Vuren 1996).

Immediately following transformation, juvenile California tiger salamanders appear to seek the closest cover they encounter, including temporary cover such as cracks in the earth, debris or deeper refugia such as ground squirrel holes (Loredo, et. al. 1996). Juveniles that survive the arid summer disperse farther from the breeding sites during summer and fall rains and do not return to the ponds until they are sexually active (Stebbins 2003). Although individuals may become reproductive in 2-3 years, they

typically do not breed until they are 4-5 years old and rarely live longer than 10 years in the wild (Trenham, et. al. 2000).

California tiger salamanders in Monterey County are part of the Central Coast Range population of the species, which includes southern Santa Cruz County, Monterey County, northern San Luis Obispo County and portions of western San Benito, Fresno and Kern Counties. California tiger salamanders within this population are allied with one another genetically and are at least partially isolated from other populations (Shaffer, et al. 1993).

RESULTS

Range of California Tiger Salamander in Relation to Project Site.

The Miravale III project site is within the range of the California tiger salamander (Zeiner, et al. 1988; Stebbins 2003; USFWS & CDFG 2003).

California Tiger Salamander Localities Within 5 Kilometers of Project Site.

There are no known records of California tiger salamanders from the project site or within 5 kilometers of the site (CNDDB 2006). However, five localities are known from within 10 kilometers. The nearest records are from West Gloria Lake, 6.3 km NE and East Gloria Lake, 6.6 km NE. There are also two records from Williamson Valley, 8.8 km NNE and 9.2 km NNE. And finally, the species has been recorded from the Johnson Canyon Landfill, 9.6 km NW of the project site (CNDDB 2006). There is habitat connectivity along the fringe of the Salinas Valley between the project site and the Johnson Canyon Landfill record.

At least three of the records noted above are of California tiger salamander populations that have hybridized to varying degrees with non-native tiger salamanders (*Ambystoma tigrinum*) (Shaffer, et al. 1993; CNDDB 2006).

Habitats Onsite and Within 2 Kilometers.

Aquatic Habitats. There are four ponds on the site (Figure 2). One is a permanent pond in the northeast corner of the site, while the other three ponds are active agricultural ponds in the western part of the site.

Pond 1 is situated in the northeast corner of the site at an elevation of 450 feet (Figures 3 and 4). The pond covers approximately 1.6 acres. Emergent vegetation is present in approximately 5% of its surface. It is permanent and is impounded with a large berm. The depth is unknown but estimated at greater than six feet. Uplands surrounding Pond 1 are primarily grassland. Water from Pond 1 is pumped for agricultural use, so water levels may fluctuate.

Pond 2 is an agricultural pond located along San Vicente Road in the northwest part of the site (Figures 5 and 6). It covers approximately 0.5 acres and is situated at 280 feet above sea level. It is ephemeral and sandy soils indicate it does not hold water well. An

inlet pipe delivers water. No emergent vegetation is present at the pond. Upland habitats surrounding Pond 2 are in active agricultural production on three sides. Residences and farm buildings are situated to the south. The nearest grassland habitat is approximately 1.0 km to the northeast. Burrowing mammals are largely absent from the area surrounding Pond 2.

Pond 3 is an agricultural pond located in the western part of the site at an elevation of 215 feet (Figures 7 and 8). It covers approximately 0.7 acres. It held water in October of 2006. Approximately 2% of the surface area supports emergent vegetation. Water levels are expected to be highly variable and the pond is dependent on piped water to fill. Upland habitats surrounding Pond 3 are in active agricultural production on all sides. The Miravale II subdivision is located approximately 0.4 km to the south. The nearest grassland habitat is approximately 1.3 km to the east. Burrowing mammals are largely absent from the area surrounding Pond 3.

Pond 4 is a small agricultural pond in the southwestern corner of the site (Figures 9 and 10). It covers approximately 0.1 acres and is situated at 180 feet above sea level. It held water in October of 2006. There was no emergent vegetation. Water levels are expected to be highly variable and the pond is dependent on piped water to fill. Upland habitats surrounding Pond 4 are in active agricultural production on all sides. The Miravale II subdivision is located approximately 0.3 km to the east. The nearest grassland habitat is approximately 1.8 km to the northeast. Burrowing mammals are largely absent from the area surrounding Pond 4.

There are numerous ponds within 2 km of the project site (Figure 11). Most of these ponds are agricultural ponds to the west and northwest and are surrounded by upland habitats that are generally considered unsuitable for California tiger salamanders. A small stock pond situated 0.5 miles north of the site is surrounded by grassland and appears to be suitable habitat from aerial photographs. Two other ponds, 0.6 miles NE and 0.8 miles NNE, are also adjacent to some grassland habitat and may provide suitable aquatic habitat. A pond 0.1 miles SE appears to be permanent, supports a considerable amount of emergent vegetation, and may provide suitable aquatic habitat for the species.

Upland Habitats. The western part of the Miravale III project site, covering approximately 780 acres, is currently in agricultural production (Figure 2). A mixture of row crops, vineyards and fallow fields are present. San Vicente Road, which is paved, crosses the site. Numerous dirt roads divide the property into fields. A row of eucalyptus trees and tamarisk is present along San Vicente Road. Two clusters of residences and outbuildings are present.

The eastern part of the site, covering approximately 140 acres, is situated in the foothills of the Gabilan Range, and supports grassland habitat. This portion of the property was grazed with cattle until recently. Vegetative cover is sparser on the south facing slopes. Small rock outcrops are scattered throughout this area. Burrowing mammals including California ground squirrels (*Spermophilus californicus*), Botta's pocket gophers (*Thomomys bottae*), and Heermann's kangaroo rats (*Dipodomys heermanni*) are present

in the grasslands surrounding Pond 1. Diggings by American badger (*Taxidea taxus*) were also observed nearby.

Offsite areas within 2 km to the west and south of the site are in agricultural production and are not expected to provide terrestrial habitat for California tiger salamanders (Figure 11). The City of Soledad directly to the south is also not expected to support the species. Land to the north and east are relatively undisturbed and support grassland, oak savannah and scrub habitats.

DISCUSSION

The project site is within the range of the California tiger salamander. Although there are no known occurrences within 5 kilometers, the species inhabits five locales within 10 kilometers, and there is habitat connectivity between the site and a known California tiger salamander record to the northwest.

A pond in the northeast part of the site provides appropriate aquatic habitat for the California tiger salamander. The upland habitat surrounding the pond is grassland and suitable underground refugia are present, including those dug by ground squirrels, pocket gophers and kangaroo rats. At least three ponds within 5 km offsite to the northwest and southeast also provide potential breeding habitat.

The bulk of the site has been in agricultural production for many years and as such provides only marginal habitat for the California tiger salamander. Upland over-summering habitat is largely absent because fields are regularly disked and burrowing mammals are actively controlled. Although three ponds are present in this part of the site, they are all more than 1.0 km from suitable upland over-summering habitat. Moreover, they are subject to rapid shifts in water level, which greatly reduces their potential as breeding habitat.

Northern Monterey County is known to support California tiger salamander populations that have hybridized to varying degrees with non-native tiger salamanders (*Ambystoma tigrinum*) (Shaffer, et al. 1993). Intentional stocking of non-native tiger salamanders as fish bait occurred in several parts of the state, but was particularly widespread in the upper Salinas Valley. The conservation implications of introduced non-native tiger salamanders include competitive exclusion, hybridization, and non-viable offspring, all of which could result in local extirpation of California tiger salamander breeding populations (USFWS 2003). Currently, the USFWS protects hybrids but not non-native tiger salamanders. Determination of the genetic status of any tiger salamanders captured at the site should therefore be conducted prior to formulating a mitigation strategy.

Appendix E. Shaffer Lab Genetic Analysis Report

Miravale III project site salamander genotyping 20 August 2007

Jarrett R. Johnson and H. Brad Shaffer
Section of Evolution and Ecology, University of California, Davis CA, 95616, USA

Methods

We received tail tips (N=24) from larvae collected by Mark Allaback (Biosearch, Inc.) and David Keegan (Denise Duffy & Assoc., Inc.) in "Pond 1" at the Miravale III project site 3.73 km NNE of Soledad, CA (Fig. 1) on 25 June 2007. Tissues arrived preserved in 95% ethanol and were assigned HBS tissue catalogue #'s (108896-108919). We extracted DNA from each tissue sample for genotyping analyses using standard extraction techniques (Palumbi 1996). Individual tissue samples were genotyped for one mitochondrial single nucleotide polymorphism (SNP) locus (Dloop) and up to 9 nuclear SNP loci (Contig325, Dlx3, FoxG1b, Gnat2, Gnat1, HoxB13, HoxD8, Slc4a4, WNT1; Voss et al. 2001) identified as diagnostic between *A. tigrinum* and *A. californiense* through previous restriction-fragment-length polymorphism (RFLP) analyses (Fitzpatrick and Shaffer 2004). Genotyping was performed using the Victor^3 plate reader (Perkin-Elmer) to perform fluorescence polarization (FP) analysis to score each individual's genotype at each locus. FP is a standard technique for the analysis of SNP loci (Xiao and Kwok 2003) and is more efficient, reliable and cost effective than RFLP analyses. At each SNP locus each individual was scored as 'aa' if homozygous for native (*Ambystoma californiense*) alleles, 'gg' if homozygous for introduced (*A. tigrinum mavortium*) alleles, or 'ga' if heterozygous. Because the *mavortium* hybridization began in the 1950s (Riley et al. 2003) and has been ongoing for at least 20 generations, individuals may be any combination of homozygotes and heterozygotes for each locus. Because the 10 loci analyzed here are know to be on separate genetic linkage groups (Voss et al. 2001), the total percentage of native and non-native alleles summed across loci provides a reasonable estimate of the "nativeness" of a given breeding site.

Results

Raw data are presented in Appendix 1 and genotypic frequency data are presented in Table 1. Our data indicate that Pond 1 at Miravale III contains low levels of native alleles at some nuclear loci. We detected no native alleles for the single mitochondrial locus, and several nuclear loci are completely homozygous for introduced alleles. Five of nine nuclear loci show higher frequencies of native alleles in the form of heterozygous genotypes. We summarize the "nativeness" of each individual as its Hybrid Index Score, or HIS, calculated for each individual as: [# non-native alleles]÷[total number of alleles]. HIS can range from 0.00 (pure native) to 1.00 (pure non-native). For the Miravale individuals, HIS values ranged from 0.89 – 1.00 (i.e., 89-100% non-native; Table 2) indicating that no genotyped individual can be described putatively as "pure native" based on the 10 loci we investigated.

Conclusions

We conclude that the genotypes of salamanders present at Pond 1 from the Miravale III project site are comprised primarily of introduced alleles. Our data suggest that this site has been subjected to invasion by introduced tiger salamanders and that extensive

hybridization has occurred. The observed levels of native California Tiger Salamander genotypes indicate that this site may 1) have historically supported native individuals, 2) be adjacent to sites containing native individuals, or 3) be the result of colonization by hybrid individuals whose lineages originated from sites containing native individuals. Given the location of this site within the Salinas Valley, which has historically contained native CTS populations, we feel that the most likely alternative is (1), and that Pond 1 was historically a pure CTS population that has been invaded by non-native genotypes.

Appendix F. Burrowing Owl Survey Report (Biosearch)

Miravale III project site salamander genotyping 20 August 2007

Jarrett R. Johnson and H. Brad Shaffer
Section of Evolution and Ecology, University of California, Davis CA, 95616, USA

Methods

We received tail tips (N=24) from larvae collected by Mark Allaback (Biosearch, Inc.) and David Keegan (Denise Duffy & Assoc., Inc.) in "Pond 1" at the Miravale III project site 3.73 km NNE of Soledad, CA (Fig. 1) on 25 June 2007. Tissues arrived preserved in 95% ethanol and were assigned HBS tissue catalogue #'s (108896-108919). We extracted DNA from each tissue sample for genotyping analyses using standard extraction techniques (Palumbi 1996). Individual tissue samples were genotyped for one mitochondrial single nucleotide polymorphism (SNP) locus (Dloop) and up to 9 nuclear SNP loci (Contig325, Dlx3, FoxG1b, Gnat2, Gnat1, HoxB13, HoxD8, Slc4a4, WNT1; Voss et al. 2001) identified as diagnostic between *A. tigrinum* and *A. californiense* through previous restriction-fragment-length polymorphism (RFLP) analyses (Fitzpatrick and Shaffer 2004). Genotyping was performed using the Victor^3 plate reader (Perkin-Elmer) to perform fluorescence polarization (FP) analysis to score each individual's genotype at each locus. FP is a standard technique for the analysis of SNP loci (Xiao and Kwok 2003) and is more efficient, reliable and cost effective than RFLP analyses. At each SNP locus each individual was scored as 'aa' if homozygous for native (*Ambystoma californiense*) alleles, 'gg' if homozygous for introduced (*A. tigrinum mavortium*) alleles, or 'ga' if heterozygous. Because the *mavortium* hybridization began in the 1950s (Riley et al. 2003) and has been ongoing for at least 20 generations, individuals may be any combination of homozygotes and heterozygotes for each locus. Because the 10 loci analyzed here are know to be on separate genetic linkage groups (Voss et al. 2001), the total percentage of native and non-native alleles summed across loci provides a reasonable estimate of the "nativeness" of a given breeding site.

Results

Raw data are presented in Appendix 1 and genotypic frequency data are presented in Table 1. Our data indicate that Pond 1 at Miravale III contains low levels of native alleles at some nuclear loci. We detected no native alleles for the single mitochondrial locus, and several nuclear loci are completely homozygous for introduced alleles. Five of nine nuclear loci show higher frequencies of native alleles in the form of heterozygous genotypes. We summarize the "nativeness" of each individual as its Hybrid Index Score, or HIS, calculated for each individual as: [# non-native alleles]÷[total number of alleles]. HIS can range from 0.00 (pure native) to 1.00 (pure non-native). For the Miravale individuals, HIS values ranged from 0.89 – 1.00 (i.e., 89-100% non-native; Table 2) indicating that no genotyped individual can be described putatively as "pure native" based on the 10 loci we investigated.

Conclusions

We conclude that the genotypes of salamanders present at Pond 1 from the Miravale III project site are comprised primarily of introduced alleles. Our data suggest that this site has been subjected to invasion by introduced tiger salamanders and that extensive

hybridization has occurred. The observed levels of native California Tiger Salamander genotypes indicate that this site may 1) have historically supported native individuals, 2) be adjacent to sites containing native individuals, or 3) be the result of colonization by hybrid individuals whose lineages originated from sites containing native individuals. Given the location of this site within the Salinas Valley, which has historically contained native CTS populations, we feel that the most likely alternative is (1), and that Pond 1 was historically a pure CTS population that has been invaded by non-native genotypes.

Monterey, California 93940

Subject: Regulatory Status of the Tiger Salamander Population at Pond 1 of the Miravale III project site in Soledad, Monterey County, California

Dear Mr. Keegan,

This letter is in response to your correspondence, dated November 6, 2007, and received in our office on the same day, requesting our concurrence that the population of tiger salamanders currently occupying the agricultural water storage basins on the subject property is not subject to protection under the Endangered Species Act of 1973, as amended (Act). In your letter, you provided to us a report (Johnson and Shaffer 2007) detailing genetic analysis of the tiger salamander population at Pond 1 of the Miravale III project site. Your request for concurrence that the subject population of tiger salamanders is not protected under the Act is based on this genetics report.

The U.S. Fish and Wildlife Service's (Service) responsibilities include administering the Act, including sections 7, 9, and 10. Section 9 of the Act prohibits the taking of any federally listed endangered or threatened species. Section 3(18) of the Act defines take to mean to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Service regulations (50 CFR 17.3) define harm to include significant habitat modification or degradation which actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Harassment is defined by the Service as an intentional or negligent action that creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering. The Act provides for civil and criminal penalties for the unlawful taking of listed species. Exemptions to the prohibitions against take may be obtained through coordination with the Service in two ways: through interagency consultation for projects with Federal involvement pursuant to section 7 or through the issuance of an incidental take permit under section 10(a)(1)(B) of the Act.

On August 3, 2004, the Service published a final rule listing the California tiger salamander (*Ambystoma californiense*) as threatened range-wide, which included down-listing the previously federally endangered Sonoma and Santa Barbara distinct population segments (69 Federal Register (FR) 47212). On August 19, 2005, U.S. District Judge William Alsup vacated the

Service's down-listing of the Sonoma and Santa Barbara populations from endangered to threatened. Therefore, the Sonoma and Santa Barbara populations of the California tiger salamander are listed as endangered, and the Central California populations (including those occurring in Monterey County) are listed as threatened.

In the 1940s and 1950s, bait dealers from the Salinas Valley in Monterey County imported thousands of barred tiger salamander (*Ambystoma tigrinum mavortium*) larvae from Texas and other parts of the southwestern United States (Riley et al. 2003). Many of the non-native barred tiger salamanders were released in the hope of establishing harvestable populations in central California because they attain larger size prior to metamorphosis and can be available further into the summer than native California tiger salamanders. As a result of these introductions, non-native tiger salamanders established reproductive populations within dispersal distance of populations of California tiger salamanders.

One of the primary threats to the California tiger salamander is hybridization with non-native tiger salamanders in areas where the non-native salamanders were introduced and established viable populations (69 FR 47212). Hybridization between California tiger salamanders and non-native tiger salamanders results in introgression (i.e., the exchange of genetic material between different species or sub-species). Depending on the degree and extent of introgression (i.e., the number of reproductive generations between hybrid salamanders), certain populations of California tiger salamanders may become populations of salamanders with primarily non-native genes. Such genetic change has been characterized as a kind of extinction (Rhymer and Simberloff 1996), and may result in a population with fundamentally altered ecological function (Ellstrand and Schierenbeck 2000).

The August 3, 2004, listing rule for the California tiger salamander identified hybridization with non-native salamanders as a serious threat to the species in the Central Coast region of California (69 FR 47239). Research indicates that within this region, many Monterey County populations of the California tiger salamander are compromised by non-native genes to varying degrees (Fitzpatrick and Shaffer 2007). We noted in the listing rule, the difficulty in distinguishing between native California tiger salamanders and hybrid salamanders, and that the best way to identify hybrid or introgressed individuals at this point appears to be through the use of sophisticated molecular genetic techniques. Consistent with the August 4, 2003, listing rule, it is our intention to evaluate long-term conservation implications for each taxon separately on a case-by-case basis where introgressive hybridization may have occurred. Because hybridization in the Central California population of the California tiger salamander has been identified as a primary threat, determining the level of hybridization that receives regulatory protection, and identifying conservation strategies to reduce this threat, should be considered within the framework of recovery actions and should include consideration of implications on local and regional conservation of the California tiger salamander.

As outlined in your November 6, 2007, letter and the August 20, 2007, genetics report, Dr. H. Bradley Shaffer of the University of California at Davis conducted genetic analysis of larval salamanders from Pond 1 on the subject property. To evaluate the genetics of the salamander population at the subject property, Dr. Shaffer and a colleague analyzed tissue from 23 larval

salamanders from the site (Johnson and Shaffer 2007). Dr. Shaffer then genotyped individual tissue samples for one mitochondrial single nucleotide polymorphism (SNP) locus (Dloop) and up to nine nuclear SNP loci (Contig325, D1x3, FoxG1b, Gnat2, and Gnat1, HoxB13, HoxD8, S1c4a4, WNT1; (Voss et al. 2001)). Through previous research, Dr. Shaffer and his colleagues have identified diagnostic differences between *Ambystoma tigrinum* and *A. californiense* at each of these loci (Fitzpatrick and Shaffer 2004).

At each SNP locus, each individual was scored as 'aa' if it was homozygous for native alleles, 'gg' if it was homozygous for introduced alleles, or 'ga' if it was heterozygous, with one copy each of a native and introduced allele. These data were summarized, for each gene, as the total frequencies of each genotype. Dr. Shaffer then calculated a Hybrid Index score , for each individual and for the total population, by tallying the proportion of alleles (pooled across individuals and genes) that are native, using the formula Hybrid Index = (total number of native alleles)/(total number of alleles). This Hybrid Index score is one way of summarizing the overall level of "nativeness" of a sample of animals from a pond, and can range from 0.00 (pure native) to 1.00 (pure non-native) (Johnson and Shaffer 2007).

Using these methods, Dr. Shaffer calculated a Hybrid Index score ranging from 0.89 to 1.00 for each of the 23 individuals, and an overall Hybrid Index score for the population of 0.93. Only 8 of the 23 individuals contained any native alleles. For the 10 genetic loci analyzed, none of the 23 larval salamanders that Dr. Shaffer sampled were found to be pure California tiger salamanders. As a result of these investigations, Dr. Shaffer (Johnson and Shaffer 2007) concluded that, "the genotypes of salamanders present at Pond 1 from the Miravale III project site are comprised primarily of introduced alleles." Dr. Shaffer went on to say, "this site has been subjected to invasion by introduced tiger salamanders and that extensive hybridization has occurred."

We have carefully reviewed the information you provided, including the results of genetic investigations conducted on the tiger salamanders from Pond 1 on the subject property. Following our review, we conclude that none of the individual tiger salamanders which comprise the salamander population at Pond 1 of the subject property are the listed entity under the Act (i.e., California tiger salamanders). Therefore, tiger salamanders utilizing Pond 1 on the subject property are not afforded the protections of the Act.

If you have any questions regarding this letter, please contact Douglass Cooper of my staff at (805) 644-1766, extension 272.

Sincerely,

David M. Pereksta
Assistant Field Supervisor

INTRODUCTION

In July 2006 Archaeological Consulting was authorized by Denise Duffy of Denise Duffy & Associates to prepare a Preliminary Archeological Reconnaissance report for the proposed Miravale Phase III subdivision, located north of Soledad, Monterey County, California.

As part of our methodology in the preparation of this report, we have conducted: 1) a background records search at the Northwest Regional Information Center of the California Historical Resources Information System, located at Sonoma State University, Rohnert Park; and 2) a field reconnaissance of the project area. The following report contains the results of these investigations as well as our conclusions and recommendations.

PROJECT LOCATION AND DESCRIPTION

The project area is located along both sides of San Vicente Road, immediately north and west of the existing Soledad city limits in Monterey County, California (see Map 1). East of the road the project area includes Section 16 of Township 17 S. Range 6 E. West of the road the project area includes a small section of the historic San Vicente Rancho, including Assessor's Parcels (APNs) 257-091-009 and 257-081-005, -023, -024, -025 and -026. The Universal Transverse Mercator Grid (UTMG) coordinates for the approximate corners of the project area are as follows: NW 6.4905/40.3630, NE 6.5120/40.3602, SE 6.5120/40.3540 and SW 6.4945/40.3385 on the USGS 7.5 minute Soledad Quadrangle (1955, photorevised 1981). The project proposes a major subdivision of the 920 acre project area (see Map 2).

At the time of the field reconnaissance the project area west of San Vicente Road was under cultivation in row crops and soil visibility was very good. Portions of Section 16 were planted in grapes and soil visibility in the tended vineyards was also good (see Figure 1). Most of the flatter part of Section 16 was fallow, with remnants of former vineyards in some areas (see Figure 2).

Vegetation consisted of dry grasses and weeds which varied in density. Soil visibility was generally good to fair in the fallow areas. The steeper slopes in the northeastern part of Section 16, no longer in use as pasture, were vegetated in dry grasses and weeds which greatly limited soil visibility to ranch roads, animal trails and burrows (see Figure 3). Overall, ground surface visibility was considered adequate for the purposes of this reconnaissance.

PROJECT METHODOLOGY

The methodology used in the preparation of this report included two primary steps, as follows:

Background Research

The background research for this project included an examination of the archaeological site records, maps, and project files of the Northwest Regional Information Center of the California Historical Resources Information System, located at Sonoma State University, Rohnert Park, California. In addition, our own extensive files and maps were examined for supplemental information, such as rumors of historic or prehistoric resources in the general project area.

The Regional Information Centers have been established by the California Office of Historic Preservation as the local repository for all archaeological reports which are prepared under cultural resource management regulations. The background literature search at the appropriate Regional Information Center is required by state guidelines and current professional standards. Following completion of the project, a copy of the report must be deposited with that organization.

These literature searches are undertaken to determine if there are any previously recorded archaeological resources within the project area, and whether the area has been included in any previous archaeological research or reconnaissance projects.

Field Reconnaissance

The field reconnaissance was conducted by Mary Doane, Patrick Cave and Gina Kay on several days between August 29 and September 14, 2006. The survey consisted of a "general surface reconnaissance" of all project areas which could reasonably be expected to contain visible cultural resources, and which could be viewed without major vegetation removal or excavation. The crew made contour transects on the slopes and straight line transects in the flatter areas. The numerous bedrock outcrops on the slopes were examined for evidence of utilization (see Figure 4).

RESULTS OF THE RECONNAISSANCE

Background Research

The search of the files at the Northwest Regional Information Center found that there are no previously recorded archaeological sites and only one recorded historic cultural resource located within one kilometer of the project area. No previous surveys have included any portion of the project area. In addition, the California Inventory of Historical Resources (March 1976), California Historical Landmarks, and the National Register of Historic Places were checked for listed cultural resources which might be present in the project area; none were found. The 1915 USGS Soledad 15 Minute Quadrangle map depicts a structure or structures in the southwest corner of Section 16 (see Map 3, Figures 5 and 6).

The project area lies within the currently recognized ethnographic territory of the Esselen linguistic group. The Esselen were one of the least populous groups in the state, and one of the least known. They are often considered the first California group to become culturally extinct. Discussions of this group and their territorial boundaries can be found in Breschini, Haversat, and Hampson (1983), Kroeber (1925), Hester (1978), and other sources. In brief, the Esselen followed a generalized hunting and gathering subsistence pattern with partial dependence on the natural acorn crop. Habitation is considered to have been sedentary to

semi-sedentary and occupation sites can be expected most often at the confluence of streams, other areas of similar topography along streams, or in the vicinity of springs. These original sources of water may no longer be present or adequate. On the coast, Esselen sites are found at the north and south banks of virtually every stream within their territory. Also, resource gathering and processing areas, and associated temporary campsites, are frequently found on the coast and in other locations containing resources utilized by the group. Factors which influence the location of these sites include the presence of suitable exposures of rock for bedrock mortars or other milling activities, ecotones, the presence of specific resources (oak groves, quarries, game trails, trade routes, etc.), proximity to water, and the availability of shelter. Temporary camps or other activity areas can also be found along ridges or other travel corridors. On the interior, rock art sites are also found in some remote areas.

Field Research

None of the materials frequently associated with prehistoric cultural resources in this area (dark midden soil, fire-altered or broken rocks, bones or bone fragments, flaked or ground stone, shell fragments, bedrock mortar outcrops, etc.) were observed during the field survey. Overall, the soil was light in color and contained sparse natural pebbles and some cobbles, especially in the seasonal watercourses running from the northeastern hills.

In addition to the old farm house and barn, segments of the historic section boundary fence remain standing on the northern property line in the hilly northeast quadrant of the project area (see Figure 7). Square cut nails were found in the redwood fencing in the few remaining parts of the original fence. Most of the perimeter fence has been repaired or replaced with more modern materials. There was no other evidence of other potentially significant historic period archaeological resources in the project area. Some ceramics and glass were seen in various parts of Section 16, but no concentrations indicative of an historic trash feature were noted.

CONCLUSIONS AND RECOMMENDATIONS

Based upon the background research and the surface reconnaissance, we have concluded that the proposed project area does not contain surface evidence of potentially significant archaeological resources. Potential historic resources, other than the historic fenceline remnants in the upper northeast part of Section 16, are located in the southwestern corner of Section 16. Because of this we make the following recommendations:

1. The proposed subdivision project should not be delayed for archaeological reasons.

2. The house and barn in the southwest corner of Section 16 should be evaluated for historical significance by a qualified structural historian or historic architect.

Because of the possibility of unidentified (e.g., buried) cultural resources being found during construction, we recommend that the following standard language, or the equivalent, be included in any permits issued within the project area:

- If archaeological resources or human remains are accidentally discovered during construction, work shall be halted within 50 meters (150 feet) of the find until it can be evaluated by a qualified professional archaeologist. If the find is determined to be significant, appropriate mitigation measures shall be formulated and implemented.

APPENDICES

Appendix A: DPR 523 Form (prepared by K. Seavey, October 2006)
Appendix B: Monterey County Mitigation Monitoring Plan

1. EXECUTIVE SUMMARY

The Miravale Phase III Specific Plan project applies to the 920-acre project site located within unincorporated lands of Monterey County on the northern edge of the City of Soledad. The project proposes "a mixed-use development consisting of approximately 1,470 single-family residential units, 2,230 multi-family residential units, 500 senior housing units, 120 hotel rooms, 250,000 square feet of retail commercial space, and an 18-hole golf course...The project also proposes three school sites (2 elementary schools and 1 middle school), a fire and police substation, and approximately 255 acres of open space and recreation areas, including parks, playgrounds, a trail system, and a public golf course."[1]

A historical resource, known as the Morris Lorentzen House, is located in this project area. This resource is eligible for listing in the California Register of Historical Resources, and such properties are considered historical resources under the California Environmental Quality Act (CEQA). JRP Historical Consulting, LLC (JRP) prepared this CEQA Impacts Analysis to assist the project proponent in identification of potential impacts on the historical resource. This impacts analysis considered two possible project scenarios regarding the Lorentzen House: Scenario 1) relocation of the building to a suitable site, or Scenario 2) demolition of the building in whole or in part. A preferred project scenario for the Lorentzen House had not yet been identified when this analysis was conducted.

Both scenarios would cause a substantial adverse change; however Scenario 1 could be mitigated to a less than significant level under CEQA, if the appropriate mitigation is implemented. The demolition proposed under Scenario 2 will also require implementation of mitigation, but cannot be mitigated to a less than significant level.

This report recommends mitigation to address the identified impacts. Mitigation measures and conditions proposed for both scenarios include: professional qualification standards; mitigation monitoring and reporting; consultation with interested parties; and recordation of the property to Historic American Buildings Survey (HABS) standards. In addition, the recommendations include mitigation measures specific to each scenario. Mitigation measures recommended for Scenario 1 are: relocation in accordance with state and federal guidelines for such actions; application of protective measures before, during, and after relocation; repair of inadvertent damage; and development of a re-use plan. Mitigation measures recommended for Scenario 2 are: an update of the surveys of remaining David Jacks Corporation houses in the Salinas Valley, including inventory and evaluation of remaining resources; videography of the interior and exterior of the Lorentzen House prior to demolition; and preparation and installation of an interpretive exhibit addressing the history of these houses in the region, with a focus upon the Lorentzen House.

2. PREVIOUS SURVEYS AND DESCRIPTION OF RESOURCES

2.1. Previous Architectural Surveys

In October 2006, preservation consultant Kent Seavey prepared a California Department of Parks and Recreation (DPR) 523 form for the Morris Lorentzen House at 32945 San Vicente Road, north of the City of Soledad, California (Figures 1 and 2, and DPR 523 form in **Appendix A**). This form included a description and evaluation of the property and concluded that the building is eligible for listing in the California Register of Historical Resources (CRHR) under Criterion C as an example of a type, period, and method of construction important in the history of agricultural development by the David Jacks Corporation in the Salinas Valley. The building dates to between 1907 and 1921 and was moved to its current location in the late 1930s to an older house that burned down.

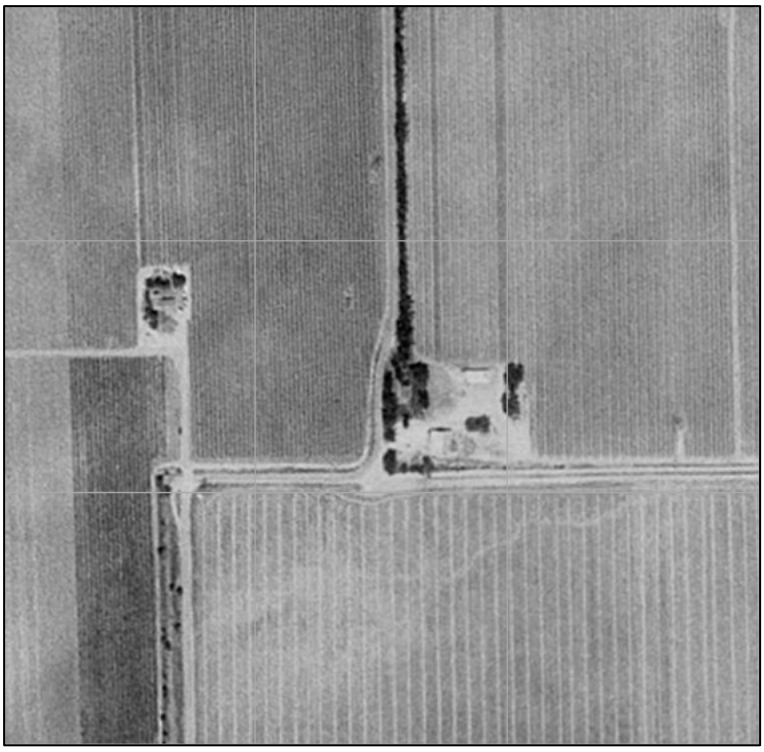

Figure 2. 1994 aerial view of Lorentzen House property (at center), prior to subdivision of land to the south. (For view of subdivided land, see Figure 1).

2.2. Description of Resources

Physical Description

The Morris Lorentzen House is a two-story, wood-framed, front gable residence with a rectangular plan. The building makes spare use of ornament and is an example of what some architectural historians call the National Folk Gable-Front style. The roof is clad in composition shingles and has narrow boxed eaves with a plain wood fascia at the gable ends, while channel rustic siding with corner boards clad the walls. A one-story hipped roof porch appears at the front and a shed roof porch extends from the rear. Most windows are simple wood frame 1/1 double-hung sash, but aluminum frame sliding windows have been added in several of the original openings. The other structures on the parcel do not date to the same time period as the house and are not contributing elements of the property. For additional description of the residence, please refer to the inventory form in **Appendix A**.

Morris Lorentzen House, July 2007.

Historic Architectural Context

The architectural importance of the Morris Lorentzen House lies in its association with the David Jacks Corporation (DJC) and the influential role that the company played in the agricultural development of the Salinas Valley in the early twentieth century. DJC was incorporated in 1907, by the children and heirs of David Jacks. The company owned thousands of acres of irrigated farmland and dairies throughout the Salinas Valley – land Jacks acquired over several decades

prior to his death in 1909. The company was formed to manage the leasing of these extensive holdings. DJC provided its lessees with a basic farmstead consisting of a house, barn, and granary "prefabricated in Monterey" and shipped to the nearest rail terminal for construction on each farm.[2]

DJC reportedly established more than sixty farms in this manner between 1908 and 1915 including the building now known as the Morris Lorentzen House. Descendents of the previous owners suspect that the house was originally constructed on a farm near Gonzales. Lorenz Lorentzen, owner of a hardware store in Gonzales, purchased the farm property on San Vicente Road in 1928 from the Nels Nielsen estate. If Lorenz Lorentzen ever lived at the property, he did so after 1930 because he reported his primary residence was in Gonzales at the time of the US Census that year. Lorentzen died in 1940 and his brother Morris Lorentzen, a farmer from the Greenfield area, took over operation of the property on San Vicente Road. The DJC house was moved to the property in the late 1930s to replace the Nielsen house when it burned down in a fire (**Figure 2**). The DJC house was reportedly from Gonzales, but it is not known if the Lorentzen family lived in it when it was a DJC house at its previous location.[3]

In 1904, the Arroyo Seco Improvement Company bought 7,000 acres of the Arroyo Seco Rancho. They secured water rights and began constructing canals. The following year, they sold out to the California Home Extension Association, who laid out Clark Colony, now Greenfield. Land was sold for $37.50 per acre, including water. Pictured is Morris Lorentzen irrigating his farm near Cherry Avenue. (Courtesy of Helen McDonald.)

Morris Lorentzen at his farm in Greenfield in 1904. (Clovis, *Salinas Valley*, 2005)

[2] "David Jacks Co., Inc., is a Family Affair," *Oakland Tribune* (August 15, 1907): 10; Seavey, "Morris Lorentzen House, DPR523 Form, October 2006; Breschini, 1*0,000 Years on the Salinas Plain*, 55.

[3] US Census, Population Schedules: 1910, 1920, 1930, Monterey County; Seavey, "Morris Lorentzen House, DPR523 Form, October 2006; Margaret E. Clovis, *Images of America: Salinas Valley* (Arcadia Publishing, 2005), 73.

The Monterey County Parks and Recreation Department surveyed farms and ranches in the Salinas Valley between the Soledad area on the south and Salinas and identified more than about a dozen farmsteads that appear to include DJC buildings. According to historian Kent Seavey, "most were found on the Former Los Coches Rancho, at the southern edge of Soledad," and the residences are generally described as one-and-one-half-story residences with a basic structure 26' x 32' in plan exclusive of the porches. The buildings also share the general spatial arrangement of windows at both the gable ends and side wall. The overall massing, scale, and fenestration of these buildings are character-defining features of DJC housing.[4] The Morris Lorentzen House is generally typical of the DJC house form, except that it has more windows.

3. IMPACTS ANALYSIS AND RECOMMENDED MITIGATION MEASURES

3.1. Impacts Analysis

The impacts analysis presented in this section considers of two possible project scenarios regarding the Lorentzen House: Scenario 1) demolition of the building in whole or in part, or Scenario 2) relocation of the building to a suitable site. A preferred project had not yet been identified when this study was conducted.

CEQA requires that California public agencies identify the significant environmental impacts of their actions and either avoid those impacts, or mitigate those impacts. This impacts analysis was prepared to assist the project proponent, lead and local agencies, as well as the general public, to understand the potentially significant impacts that may be caused by the project, and if such impacts are identified, how those impacts may be avoided and/or minimized.

The California Code of Regulations, beginning with 15064.5(b), defines significant impacts for historical resources as follows:

> *(1) Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.*
>
> *(2) The significance of an historical resource is materially impaired when a project:*
>
> > *(A) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or*

[4] Seavey, "Morris Lorentzen House, DPR523 Form, October 2006.

> *(B) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or*
>
> *(C) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.*
>
> *(3) Generally, a project that follows the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (1995), Weeks and Grimmer, shall be considered as mitigated to a level of less than a significant impact on the historical resource.*
>
> *(4) A lead agency shall identify potentially feasible measures to mitigate significant adverse changes in the significance of an historical resource. The lead agency shall ensure that any adopted measures to mitigate or avoid significant adverse changes are fully enforceable through permit conditions, agreements, or other measures.*

The California Register recognizes "Special Considerations" for certain resource types, including moved buildings (emphasis added):

> *The State Historical Resources Commission encourages the retention of historical resources on site and discourages the non-historic grouping of historic buildings into parks or districts. However, it is recognized that moving an historic building, structure, or object is sometimes necessary to prevent its destruction. Therefore, a moved building, structure, or object that is otherwise eligible may be listed in the California Register if it was moved to prevent its demolition at its former location and if the new location is compatible with the original character and use of the historical resource. An historical resource should retain its historic features and compatibility in orientation, setting, and general environment.*[5]

[5] OHP, "California Environmental Quality Act (CEQA) and Historical Resources," *Technical Assistance Series No. 1* (March 2006), 29.

The City of Soledad General Plan also includes guidance regarding historical resources, including policies regarding Land Use:

> *L52 -- Historically or architecturally significant buildings shall not be demolished or substantially changed in outward appearance in a way that diminishes the historical character, unless doing so is necessary to remove a threat to health and safety and other means to avoid the threat are infeasible.*

City of Soledad General Plan Conservation Goals:

> *7 -- To preserve historic resources within and surrounding the City.*
>
> *8.5 -- The city shall amend the zoning ordinance to include the following or similar language: The demolition or remodel of buildings considered to be of historic, cultural or architectural significance shall not occur unless the following findings can be made.*
>
> *Remodel or Alteration, The proposed remodel or alteration does not adversely affect the historic, cultural or architectural significance of the building or site.*
>
> *Demolition, The demolition of the building does not adversely affect the historic, cultural, or architectural character of the City of Soledad, or the building presents a clear hazard to occupants or to the public, which can not be feasibly corrected through restoration.*[6]

In consideration of these regulations, policies and guidelines, this impacts analysis concludes that the Scenario 1 project would cause a substantial adverse change to the historical resource; however, this action could be mitigated to a less than significant level with the appropriate mitigation (see Section 3.2, below).

The Scenario 2 project would cause a substantial adverse change to the historical resource. This action cannot be mitigated to a less than significant level, and requires the appropriate mitigation to help reduce the impacts (see Section 3.2, below).

3.2. Recommended Mitigation Measures

The mitigation measures presented in this section considered two possible project scenarios: Scenario 1) demolition of the building in whole or in part, or Scenario 2) relocation of the building to a suitable site. Both scenarios would cause a substantial adverse change, however Scenario 1 could be mitigated to a less than significant level.

[6] City of Soledad. *General Plan*. Prepared by Crawford, Multari & Clark (2005), *II-34*, VIII-8, VIII-14.

- Scenario 1. Relocation of the Lorentzen House. The appropriate mitigation for relocation of the building would be to conduct the relocation project in accordance with the following guidelines and codes: 1) California State Historic Resources Commission "Special Considerations" for moved buildings; 2) the *Secretary of the Interior's Standards for Rehabilitation* (National Park Service, 1992); and 3) the California Historical Building Code. Implementation of this scenario under these conditions would reduce the adverse change caused by relocation to a less than significant level under CEQA.

- Scenario 2. Demolition of the building, in whole or in part. This type of project would cause a significant adverse change under CEQA, which is a significant impact on the environment. Mitigation is required to help reduce this impact [see 15064.5(b)(4), above], although demolition of a historic resource cannot be reduced to a less than significant level under CEQA.

The considerations and recommended mitigation measures related to these scenarios are presented below, beginning with those mitigation activities and specifications that will be conducted under either scenario. Once a preferred project is identified, the project proponent will consult with interested parties and the lead agency regarding implementation of Scenario 1, or Scenario 2. The mitigation measures ultimately selected may be based upon the proposed mitigation measures presented in this section, and/or may include additional mitigation proposed by interested parties during consultation.

The following considerations and mitigation measures apply to treatment of the Lorentzen House regardless of the final project description or scenario selected:

- Professional Standards. All activities regarding historical architectural resources and historic preservation carried out as part of this project would be carried out by or under the direct supervision of persons meeting, at a minimum, the Secretary of the Interior's professional qualifications standards (48 FR 44738-9) in these disciplines.

- Monitoring. Once the project scenario regarding the Lorentzen House is selected, the mitigation measures applying the scenario (described below) will be set forth in a Mitigation Monitoring and Reporting Plan (MMRP). The format and content of the MMRP will be determined by the lead Agency, the City of Soledad. The City may refer to the Monterey County guidelines for such plans, which are "intended to guide project-specific mitigation. monitoring and/or reporting programs … for various aspects of mitigation monitoring, reporting, and enforcement in order to ensure full compliance with conditions of project approval." Please see Appendix B for a copy of: County of Monterey, "Mitigation Monitoring and/or Reporting Program, Pursuant to Public Resources Code §21081.6, and CEQA Guidelines §15097."

- Coordination. The project proponent will coordinate with and inform interested parties, including, but not limited to the Soledad Historical Society and the Monterey County

Historical Society, regarding the status of its compliance with the mitigation measures set forth in the MMRP, as necessary.

- Recordation to Historic American Buildings Survey (HABS) standards. Prior to the start of any project work, the project proponent would ensure that the Lorentzen House property was recorded and documented in accordance with the Level II recordation standards of the Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) program. This level of recordation would include:

  - archival reproduction of any existing historic images of the property and grounds;
  - archival reproduction of any existing maps, sketches, or drawings of the house;
  - production of measured architectural plans and drawings;
  - production of large-format photographs of exterior and interior views of the house, and exterior views of house and current setting, including relationship to non-eligible outbuildings;
  - narrative history and description of the property (based on the narrative provided in the Seavey (2006) evaluation of the property, and the Monterey County survey(s) of similar properties.

  The original archival set of recordation documents and photograph prints will be submitted to the Soledad Historical Society (or its designee), and archival quality photocopies of the documentation set will be provided to the following interested parties and local repositories: Monterey County Historical Society; Monterey County Libraries (Soledad and Salinas branches); and UC Santa Cruz Library Special Collections Department. The project proponent would ensure that this recordation documentation was prepared prior to carrying out any other treatment and would make the content of the document available for other mitigation measures, such as the preparation of interpretive material.

Scenario 1. Mitigation for Relocation

- Relocation of House. The project proponent would ensure that the design and implementation of the relocation project would be consistent with the *Secretary of the Interior's Standards for* Rehabilitation *and Illustrated Guidelines for Rehabilitating Historic Buildings (U.S. Department of the Interior, National Park Service, 1992),* the California Historical Building Code, and the MMRP for the project. A relocation plan would be included in the MMRP and would be developed in accordance with the general recommendations of *Moving Historic Buildings*, a publication of the National Park Service. Specifically, it discusses planning, research, and recording prior to the move; and addresses the siting, foundation construction, building reassembly, and restoration work after a successful move. See: John Obed Curtis, *Moving Historic Buildings*, Heritage Conservation and Recreation Service, Publication No. 9, US Department of Interior (1979).

- Protective Measures. The project proponent will develop and implement measures to protect the character-defining features of the Lorentzen House building from damage by the relocation project. The features include, but are not limited to scale, massing, and layout of the house, as well as siding and wood frame fenestration. Protective measures will be prepared in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992), the California Historical Building Code, *Moving Historic Buildings*, and the MMRP for the project.

- Repair of Inadvertent Damage. The project proponent will ensure that any inadvertent damage to the character-defining features of the Morris Lorentzen House resulting from the rehabilitation project was repaired in accordance with the *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (U.S. Department of the Interior, National Park Service, 1992) and California Historical Building Code, and the MMRP for the project. The condition of the building will be photographed as part of the proposed recordation document and/or video documentation, prior to the start of the relocation scenario, and this will help to establish the baseline condition for assessing inadvertent damage.

Scenario 2. Demolition of the Lorentzen House.

- Survey of remaining David Jacks Corporation Houses in the Salinas Valley. The project proponent will ensure that a resurvey, including current photography, inventory and evaluation forms (DPR523 Forms) is done for the remaining houses in the valley. The survey will specifically address DJC houses in and around Soledad, such as the Merrill Farms building, as well as investigating potential resources located south of Soledad, which may not have been previously surveyed. This survey will provide additional and/or updated information on the remaining DLC houses in the Salinas Valley and will be conducted in coordination with Monterey County Department of Parks and Recreation, so as to not duplicate inventory and recordation efforts.

- Interpretive exhibits. The project proponent will consult with interested parties about their interest in permanent or temporary interpretive exhibits describing the history of the Lorentzen House and other David Jacks Corporation houses. Interested parties to be consulted include, but are not limited to, the Soledad Historical Society and the Monterey County Historical Society. If consultation results in agreement between the project proponent and these parties concerning the nature and extent of the exhibits, the project proponent will produce and install the exhibits. The interpretive exhibit will utilize the images, narrative history, drawings or other material produced for the HABS mitigation described above. The interpretive exhibits may be in the form of, but are not necessarily limited to: plaques or markers, interpretive display panels, and or printed material for dissemination to the public. If consultation does not result in agreement between the project

proponent and the interested parties, the project proponent could seek an alternative Monterey County location for the interpretive exhibits. Appropriate alternative locations would be determined at that time.

- Documentary Videography. At least 30 days prior to commencing any work on the Morris Lorentzen House property, the project proponent would produce video documentation of the Lorentzen House property. This video documentation would include footage of the exterior and interior of the building, as well as the grounds of the property. The video documentation would be submitted to the Soledad Historical Society (or its designee) and a copy of the video documentation would be provided to interested parties upon request. The project proponent would make the videography available for other mitigation measures described above.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

A one-and-one-half-story wood-framed gable-front vernacular residence, rectangular in plan, resting on a concrete foundation. The exterior wall cladding is a medium-width rustic wood siding, with simple corner-boards. The one-story, full-width, hipped-roof porch across the south facing facade has been partially enclosed on its east and west sides, and below the porch rail, with a horizontal rustic wood siding slightly wider than that found on the main building block. A one-story, full-width, enclosed shed-roofed porch across the rear (north) elevation has always been enclosed. The steep-pitched gable-front roof has slightly overhanging eaves with closed soffits and a simple facia. The roof is covered in composition shingles, as are the hipped-roof of the front (south) porch, and shed-roofed (north) rear porch. Fenestration is irregular, with a combination of single and paired 1/1 double-hung wood sash, and several aluminum sliding windows. The latter features occupy the original window openings primarily on the rear (north) elevation. Two small, horizontal hopper type windows appear in the building envelope. One centered on the ground floor of the east side-elevation, and the second centered on the upper floor of the west side-elevation. Each denotes the location of interior bathrooms.

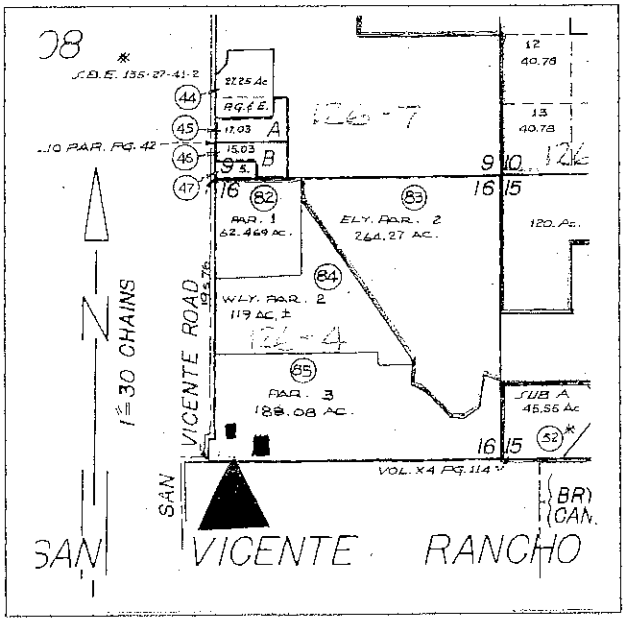
(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)



The Morris Lorentzen House is significant under California Register criterion 3, in the area of architecture as a basically intact example of a David Jacks Corporation prefabricated farm house from the first decade of the twentieth century.
Between about 1908 and 1915 Monterey's Jacks family corporation had designed and constructed a series of up to sixty-six ranches and dairies in the Salinas Valley between Chualar and King City on 30,000 acres of the vast land holdings acquired by David Jacks during the nineteenth century. The small tenant farms were developed as rental income property for the Jacks family heirs. The Jacks Corporation installed electric water pumps for wells on each farmsite, which consisted of a house, barn and grainery, prefabricated in Monterey and shipped to terminals near the farmsteads.
The Jacks Corporation gable-front residence design has been described in American architectural style books as a type of national folk house, or basic homestead house, deriving its form from the Greek Revival movement of the 1830s to 1850s. The popularity of the building shape persisted with the expansion of the national railroad network becoming a dominant folk form until well into the twentieth century.
In a 2001 survey of agriculturally related historic resources funded by the Monterey County Parks Department about a dozen Jacks farmsites with houses were identified, in various states of repair. Most were found on the former Los Coches Rancho, at the southern edge of Soledad. As described in the survey, the one-and-one-half-story Jacks houses were of similar design, and pre-cut at an unidentified Monterey mill. The
basic building block measures 26' wide by 32' deep. The four-room over four-room interior layout determines the exterior form. Each house has 6' deep covered full-width porches on the front and rear gable ends, making the the over-all footprint of the house 26' by 44'.

(This space reserved for official comments.)

P3 The south facing facade is characterized by its symmetrical appearance. There are three glazed bays, set between the square posts on either side of the of the principal entry on the front porch, with two evenly spaced vertical double-hung wood sash windows, having narrow louvered wood shutters, on the upper floor. These elements visually balance the slightly offset entry, which is reached by a straight run of open concrete steps, with its simple metal pipe railing on the east side of the feature. The residence was moved to this location just before WWII to replace the original farm house, which was destroyed in a fire.
The subject property is sited in a stand of mature trees of varying species in a natural landscape setting that has not been maintained. It is located on open farmland at the NE edge of Soledad, near a modern housing development.
There is a large, undated wood-framed storage barn just SE of the residence. Basically square in plan, resting on mud sills. The exterior wall cladding is vertical flush board-siding. The low-pitched gable-front roof is covered in corrugated sheet metal. There is a massive, square entry opening centered in the north (front) elevation, with evidence of former sliding wood doors on the side bays, and on the rear (north) elevation. This feature is in fair condition. It is similar to many barns of its type in the region and not specifically significant.

B10. The spatial arrangement of windows in the gables and side elevations is a character-defining feature of the Jacks house form. There are two vertical double-hung, wood sash windows symmetrically set in the upper floor on both gable ends. On one side elevation, there are two vertical double-hung, wood-sash windows placed one-quarter distance from each corner of the main building block. A single window of the same type is found centered in the building envelope on the upper floor, immediately under the eaves, denoting the location of the interior stairway. The opposing side-elevation is generally characterized by two ground floor windows , matching those described, with no window in the upper floor.
The Morris Lorentzen House, which meets the general Jacks House specifications, has four windows along the ground floor of the east side-elevation, rather than two. The spacing to the first window from the SW corner of the main building block is consistent with the standard Jacks pattern, with a second window about 2' further along the building envelope. The paired windows at the rear of the house on this elevation are separated by a single mullion. All windows are 1/1 double-hung wood sash. In examining photographs of other Jacks houses in the area, at least one, the Pershall home on Doud Road, south of Soledad, has a similar set of paired windows. This suggests that there was some leeway for variation in the original building designs. Based on available sources, these Jacks houses could be constructed by the Jacks Corporation for their tenants for $800 each. Of the approximately one dozen Jacks houses surveyed in the area in 2001, the Merrill Farms building, on Highway 101 in Soledad, and the Lorentzen house appear to be the most intact examples of this now rare building type.
The Lorentzen Ranch was originally part of the Rancho San Vicente, two leagues in the Salinas Valley first granted December 16, 1835 to Francisco Soto, then to Francisco Figuroa in September, 1836. Figuroa sold the property to Estevan Munras in September of 1850. In June of 1865, the rancho, now 19,979 acres, was patented to the Munras heirs. The rancho extended from Gloria Road in the north to Soledad in the SE, and from the Salinas plain to the foothills of the Gabilan Range. In 1873 Catalina Manzaneli de Munras, widow of Estevan Munras established the town of Soledad on the rancho, having given the Southern Pacific Railroad a right-of-way across the property in December of 1872. Soledad became the SPRR railhead until 1886. The landscape setting of the region was described in 1875 as "a very dry plain with few trees." It was principally an area of dry farming east of the Salinas River, and later, dairying on the west side. Danish immigrant Nels J. Nielsen purchased 640 acres of the subject property from the Munras interests on October 7, 1913 and began dry farming cereal crops, and established a 200 acre almond orchard. After Nielsen's passing in 1927, the ranch was sold to Lorenz Lorentzen, owner of the Gonzales Hardware & Grocery Company, on December 4, 1928. Morris Lorentzen operated the ranch until his passing in 1967.
According to Lorentzen family members, the original Nielsen farmhouse burned down just before WWII (no exact date was given), and the Jacks house was moved to its current location, possibly from the Gonzales area.
The David Jacks family was one of the largest landholders in Monterey County at the beginning of the twentieth century. Under the leadership of David Jacks son, Will Jacks, the David Jacks Corporation made a significant contribution to the up building of the central Salinas Valley in the first two decades of the new century by investing in the irrigation of 30,000 acres of valley land for tenant farming, and by providing the tenant farmers with a basic farmstead from which to develop their crops. The vernacular farmhouse design provided by the Jacks Corporation for their tenants was once a common sight along the Salinas Valley, with as many as 60 examples present. By 1975 as few as 23 of these housing units could be found, and by the 2000 Monterey County Parks survey of agriculturally Related historic resources only a dozen were identified. The remaining Jacks farm houses, once plentiful, are now rare. They embody the distinctive characteristics of a type and period of regional construction specific to the Salinas Valley, and qualify thematically for listing in the California Register. The Morris Lorentzen House, as a little altered example of the building type, qualifies for individual listing in the California Register for its type and period of regional construction. The California Register allows moved properties to qualify for listing based on their significance and potential to yield information important to the history of a local area. The subject property clearly has this potential.

Appendix B:
Monterey County Mitigation Monitoring Plan

County of Monterey
Mitigation Monitoring and/or Reporting Program
Pursuant to Public Resources Code §21081.6
and CEQA Guidelines §15097

I. PURPOSE.

A. The CEQA Guidelines in Title 14, Chapter 3, Section 15000 *et seq*., of the California Code of Regulations, contain provisions for local agencies' monitoring and reporting of mitigation measures imposed on projects for which a mitigated negative declaration ("MND") or an environmental impact report ("EIR") has been prepared pursuant to the California Environmental Quality Act (Public Resources Code Section 21000 *et seq*., "CEQA"). On December 5, 2000 the Monterey County Board of Supervisors adopted Ordinance No. 04087, thereby incorporating into the Monterey County Code the existing State CEQA Guidelines and as they may be amended from time to time. Ordinance No. 04087 became effective on January 5, 2001.

B. This Mitigation Monitoring and/or Reporting Program ("Program") fulfills the requirements of CEQA and the CEQA Guidelines for monitoring and/or reporting of implementation of mitigation measures imposed under CEQA, and provides detailed procedures to be followed by County land use departments. This Program is intended to guide project-specific mitigation monitoring and/or reporting programs and sets forth the responsibilities of County land use departments for various aspects of mitigation monitoring, reporting, and enforcement in order to ensure full compliance with conditions of project approval.

II. IMPLEMENTATION RESPONSIBILITIES.

A. Planning and Building Inspection Department. The Planning and Building Inspection Department ("P&BI"), through the Director of Planning and Building Inspection ("Director") and his duly appointed subordinates, shall have the primary responsibility for implementation, compliance, and enforcement of this Program. If the Director finds that there is reasonable cause to believe that non-compliance with this Program exists, he or she shall take such measures as necessary or expedient, pursuant to existing enforcement provisions of the Monterey County Code, to enforce and secure compliance with the provisions of this Program.

B. Mitigation Monitoring and Reporting Program Supervisor. A Mitigation Monitoring and Reporting Program Supervisor ("MMRPS") within the P&BI may assist the Director in implementing this Program. The County may charge reasonable fees to recover the cost of the Program. Such fees shall be imposed to recover the costs of implementation and enforcement of mitigation measures that require field inspection, continuous or long-term monitoring, or the preparation and/or review of reports by County staff. Any such fees shall be approved by the Board of Supervisors before being imposed.

C. Other County Land Use Departments. All departments, officials, and public employees of the County, involved in processing, reviewing, recommending, or approving applications for permits or land use entitlements for projects requiring an MND or an EIR, including the Department of Public Works ("DPW"), the Environmental Health Division ("EHD") of the Health Department, and the Monterey County Water Resources Agency ("MCWRA"), shall implement,

enforce, and assist the Director in implementing and enforcing, the provisions of this Program as set forth herein. Each of the foregoing County land use departments shall report to the Director regarding each and every project's compliance with conditions of approval and CEQA mitigation measures imposed, as provided herein. For purposes of this Program, the foregoing departments shall be referred to as "responsible land use departments."

1. Where a particular CEQA mitigation measure or condition of project approval recommended by a County land use department is imposed, the recommending responsible land use department shall be primarily responsible for ensuring that the mitigation measure or condition of approval is fully implemented in accordance with the procedures and timelines, if any, specified in the Mitigation Monitoring and/or Reporting Plan ("MMRP") adopted at the time of project approval.

2. When a project applicant has fulfilled all requirements associated with a mitigation measure or measures imposed as a condition of project approval, the responsible land use department which recommended the condition and which was given the responsibility to monitor and/or report on condition compliance, shall fill out a "Verification of Condition Compliance/Non-Compliance Form" ("VCCNC") prepared by the P&BI. The VCCNC shall specify the project name and number, and condition/mitigation measure number, as well as provide a description of the mitigation measure, the date the condition was satisfied, how it was satisfied, and the County employee or officer of the responsible land use department who deemed the condition satisfied. The responsible land use department completing the VCCNC shall promptly forward the VCCNC to the P&BI. The P& BI shall enter a print copy of the VCCNC in the P&BI's official files and in the Department's computerized project tracking system, if any. A copy of the VCCNC shall be filed in the originating responsible land use department's project file.

3. In the event the applicant has not fully complied or refuses to comply with a mitigation measure or condition of approval within the schedule or reporting deadline(s) specified in the MMRP adopted as a condition of project approval, or within a reasonable time if no timeline is specified, the responsible County land use department that recommended the mitigation measure or condition shall promptly fill out a VCCNC which provides detailed information about the mitigation measure and the basis for finding that the applicant has failed to comply with the mitigation measure; and how compliance could be achieved within a specific date or schedule. The land use department involved shall promptly forward the VCCNC to the P&BI, which shall then decide whether to take any of the actions specified in Section III.D.2 herein.

4. In the event any type of action, including a Code enforcement action, is taken by the Director pursuant to the VCCNC, all documentation associated with corrective enforcement shall be incorporated in the P&BI's official project files. The files shall reflect the final action taken by the County to achieve compliance with this Program.

5. Each responsible land use department shall maintain a file for each project for which that department has recommended a condition of approval or CEQA mitigation measure which is later incorporated into an MMRP. The file shall contain all communications, records, and documents pertaining to each project's compliance with conditions of approval and CEQA mitigation measures imposed.

D. Program Availability. The Director shall provide a copy of this Program with the attached *Agreement to Implement a Mitigation Monitoring and/or Reporting Plan*, to County staff, project applicants, attorneys, consultants working on behalf of project applicants, and any member of the public requesting a copy. P&BI may consider other means of making this Program available to the public. Copies of these documents shall also be available to the public at the Planning and Building Inspection Department's public counter.

E. Revisions to the Program. Any revisions to this Program of a substantial nature shall be submitted to the Board of Supervisors for approval.

III. PROCEDURES.

A. Procedures to ensure that mitigation measures identified in an EIR or an MND are imposed as enforceable conditions at the time of project approval.

1. Findings and Conditions of Project Approval. Findings and conditions of project approval recommended by P&BI and each land use department named in Paragraph II.C, herein, and approved by any County decision-making body pursuant to an MND or an EIR, shall be in accordance with the *Monterey County Planning and Building Department Standard Conditions of Approval, Findings and Evidence* adopted July, 1994 and updated December, 1998.

2. Agreement to Implement a Mitigation Monitoring and/or Reporting Plan. Each applicant for a project approved pursuant to an MND or an EIR shall be required to enter into an Agreement (attached herewith) with the County to implement an MMRP for the project so approved.

3. Mitigation Measures. The MMRP shall list every mitigation measure approved by the decision-making body that adopted the MND or certified the EIR. The MMRP shall be prepared by P&BI staff and incorporated within the report recommending project approval to the decision-making body. Each mitigation measure shall be clearly written and include the following, as applicable:

a. A schedule for implementation of each mitigation measure. If a mitigation measure requires continuous or frequent (e.g. annual/daily) monitoring, the frequency and duration of required monitoring shall be specified (e.g. for five years/during construction);

b. The standard or measure used to determine the adequacy of the mitigation (e.g. a threshold adopted by a state or regional agency, General Plan policy, Monterey County Code or regulation);

c. Identification of the person or agency responsible for carrying out the field inspection, monitoring of a mitigation measure, or preparation of a report on the status of a mitigation measure or final approval;

d. The County department responsible for carrying out the implementation, monitoring, and reporting tasks required under each mitigation measure imposed;

e. If a consultant is assigned the task of monitoring or reporting, the consultant's area of expertise (e.g. licensed engineer, certified arborist) shall be specified in the MMRP. Consultants shall be qualified professionals, and their qualifications shall be presented to County P& BI staff as soon as they are selected by the project applicant.

B. Procedures to ensure compliance with the mitigation monitoring and reporting requirements of CEQA.

1. Once the Director of Planning and Building Inspection or his duly appointed subordinate determines that a project is not categorically exempt and will require certification of an EIR or adoption of an MND, County P&BI staff shall:

a. Provide a copy of the Program to the applicant or consultant.

b. Work with the MMRPS and the responsible land use departments to ensure that mitigation measures developed by any consultant(s) or by County staff are adequately and clearly written to mitigate significant impacts to the environment. Measures shall be written so that the effectiveness can be monitored and quantified, and the mitigation measure can be enforced.

1) The MMRPS and/or appropriate P & BI and responsible land use departments staff shall attend project scoping meetings, or meetings specially convened for the particular project, including Interdepartmental Review (IDR) to provide guidance and direction on working with the requirements of Public Resources Code §21081.6 and CEQA Guidelines, §15097.

2) The MMRPS and/or appropriate P&BI and responsible land use department staff shall work with consultants and responsible agencies, as required, to ensure compliance with the Program.

3) Projects with an Initial Study that result in a Mitigated Negative Declaration or with an underlying EIR requiring certification shall be reviewed by appropriate P&BI and responsible land use department staff and, as necessary, by the Office of County Counsel to determine that the mitigation measures are enforceable before recommending the project to the Minor Subdivision Committee, Subdivision Committee, Zoning Administrator, Planning Commission, or Board of Supervisors.

2. P&BI staff shall provide training, as necessary, to those staff responsible for the preparation of a MMRP, and/or agencies/or individuals and consultants who either prepare mitigation measures or must provide field inspections, monitoring or the preparation and/or review of reports related to Public Resources Code §21081.6 and CEQA Guidelines, §15097.

C. Procedures to ensure that mitigation monitoring or reporting programs are imposed and adopted at the time of project approval.

1. No recommendation for approval shall be delivered to the Minor Subdivision Committee, Subdivision Committee, Zoning Administrator, Planning Commission, or Board of Supervisors for any project requiring a Mitigation Monitoring and/or Reporting Plan pursuant to CEQA unless a copy of the MMRP is attached. No such MMRP shall be submitted to the Minor

Subdivision Committee, Subdivision Committee, Zoning Administrator, Planning Commission, or Board of Supervisors unless P & BI staff has approved it.

2. County P & BI staff shall ensure that any final resolution of the Minor Subdivision Committee, Subdivision Committee, Zoning Administrator, Planning Commission, or Board of Supervisors approving a project based upon an MND or an EIR, contains language which specifies adoption of the Mitigation Monitoring and/or Reporting Plan for the project.

D. Procedures to ensure that mitigation measures identified in an EIR or MND and incorporated into a mitigation monitoring or reporting program are fully and consistently enforced through permit conditions and compliance relating thereto, agreement, or other acceptable and legal measures.

1. No project requiring a Mitigation Monitoring and/or Reporting Plan pursuant to CEQA, shall be recommended to the Minor Subdivision Committee, Subdivision Committee, Zoning Administrator, Planning Commission, or Board of Supervisors unless it also includes, as a condition of project approval, that the project applicant agree to enter into an *Agreement to Implement a Mitigation Monitoring and/or Reporting Plan* (see attachment). This Agreement shall be executed and recorded by the applicant no later than sixty (60) days after project approval or prior to the issuance of the first ministerial permit or commencement of construction on the project, whichever event occurs first. In no event shall an applicant be deemed to have fully satisfied all conditions of approval of a project unless this Agreement has been executed and recorded.

2. If the applicant fails to comply with any adopted mitigation measure, or an adopted Mitigation Monitoring and/or Reporting Plan, County P&BI staff shall issue a "Stop Work Order," a "Notice of Violation," or a notice of County's intent to pursue a Code Enforcement action. An applicant who desires to remedy the non-compliance shall be given an opportunity to consult with the P&BI to determine the extent of the violation and to take any necessary remedial action.

3. The project applicant shall consult with P&BI within 15 days of the issuance of a "Stop Work Order," a "Notice of Violation," or a notice of County's intent to pursue a Code Enforcement action. Failure of the applicant to take remedial action to the satisfaction of the Director shall result in Code Enforcement action through the Environmental Health Division or through any appropriate County law enforcement agency.

AGREEMENT TO IMPLEMENT A MITIGATION MONITORING and/or REPORTING PLAN

IN ACCORDANCE with Section 21081.6 of the California Public Resources Code, and Section 15097 of Title 14, Chapter 3 of the California Code of Regulations, this Agreement is made by and between the County of Monterey, a political subdivision of the State of California (herein "COUNTY"), and _____ (herein "OWNER"), upon the following facts and circumstances:

A. OWNER is the owner of certain real property located_____ _____ _____ more particularly described in "Exhibit 1", attached hereto and incorporated herein by reference.

B. On _____[DATE], pursuant to County Resolution No. _____, subject to the conditions listed therein, the _____ _____

[GOVERNING BODY: MONTEREY COUNTY BOARD OF SUPERVISORS **or** MONTEREY COUNTY PLANNING COMMISSION **or** MONTEREY COUNTY ZONING ADMINISTRATOR **or** MONTEREY COUNTY MINOR SUBDIVISION COMMITTEE]

did_____

[ADOPT A MITIGATED NEGATIVE DECLARATION **or** CERTIFY AN EIR]

approving a _____ Permit, File No. PLN_____, and adopted a Mitigation Monitoring and/or Reporting Plan (hereafter "the Plan"). The Plan is attached hereto as "Exhibit 2" and incorporated herein by reference. Resolution No. _____ is on file in the Department of Planning and Building Inspection.

C. As required by the California Environmental Quality Act, the Owner agrees to implement a Mitigation Monitoring and/or Reporting Plan.

NOW, THEREFORE, in consideration of the County's above-referenced _____

[ADOPTION OF A MITIGATED NEGATIVE DECLARATION **or** CERTIFICATION OF AN EIR] and approval of a _____ Permit, File No. PLN_____, OWNER agrees as follows:

1. Mitigation Monitoring and/or Reporting Plan. OWNER hereby agrees to implement the Plan attached hereto as "Exhibit 2".

1.01 Cost of Monitoring and/or Reporting. At OWNER'S sole cost and expense, OWNER shall be responsible for the monitoring and/or reporting as may be required by the Plan.

1.02 Alternative Mitigation Measure(s). If, for any reason, any mitigation measure specified in the Plan cannot be implemented due to factors beyond the control of the Owner and/or County, the Director of the County Department of Planning and Building Inspection may, after good faith negotiation with OWNER, recommend substitution of another mitigation measure at a noticed public hearing before the decision-making body which originally approved the Permit herein.

2. Binding Effect. This Agreement shall be construed as a covenant running with the land and shall bind and benefit COUNTY, its successors and assigns, and OWNER and its successors in interest.

3. Specific Performance. The parties acknowledge that the obligations of OWNER under this AGREEMENT are unique and that, in the event of a breach of this AGREEMENT by Owner, the remedy of damages or any other remedy may be inadequate to fulfill the purpose of this AGREEMENT. Therefore, the parties agree that in addition to any other remedies available to COUNTY, COUNTY shall be entitled to the remedy of specific performance.

4. Severability. In the event any provision of this Agreement is found to be invalid or unenforceable, such determination shall not affect the validity and enforceability of any other provision of this AGREEMENT.

5. Interpretation. It is agreed by the parties that this AGREEMENT has been arrived at through negotiation and neither party is to be deemed the party which prepared this Agreement for the purposes of California Civil Code Section 1654.

6. Amendments. This AGREEMENT may be amended only by a written document signed by the parties.

7. Recordation. Upon execution of this Agreement, the parties shall cause recordation thereof with the Monterey County Recorder's Office.

8. Mitigation Monitoring Fee. Upon execution of this Agreement, the OWNER shall pay the requisite $840 mitigation monitoring fee, pursuant to the Board of Supervisors' adopted fee schedule.

IN WITNESS WHEREOF, the party(ies) hereto have executed this Agreement on the day and year set out opposite his/her/their respective signature(s).

Suite #5
Monterey, CA 93940

Dear Ms. Guzman:

Thank you for the opportunity to prepare a Phase One Historic Review for the County of Monterey for the property at 32945 San Vicente Rd. (APN #417-151-085) in Soledad.

The subject property is a one-and-one-half-story wood-framed gable-front vernacular residence, rectangular in plan, resting on a concrete foundation. The exterior wall cladding is a medium-width rustic wood siding, with simple corner-boards.

The one-story, full-width, hipped-roof porch across the south facing facade has been partially enclosed on its east and west sides, and below the porch rail, with a horizontal rustic wood siding slightly wider than that found on the main building block. A one-story, full-width, enclosed shed-roofed porch across the rear (north) elevation has always been enclosed.

The steep-pitched gable-front roof has slightly overhanging eaves with closed soffits and a simple facia. The roof is covered in composition shingles, as are the hipped-roof of the front (south) porch, and shed-roofed (north) rear porch.

Fenestration is irregular, with a combination of single and paired 1/1 double-hung wood sash, and several aluminum sliding windows. The latter features occupy the original window openings primarily on the rear (north) elevation. Two small, horizontal hopper type windows appear in the building envelope. One centered on the ground floor of the east side-elevation, and the second centered on the upper floor of the west side-elevation. Each denotes the location of interior bathrooms.

The south facing facade is characterized by its symmetrical appearance. There are three glazed bays, set between the square posts on either side of the of the principal entry on the front porch, with two evenly spaced vertical double-hung wood sash windows, having narrow louvered wood shutters, on the upper floor. These elements visually balance the slightly offset entry, which is reached by a straight run of open concrete steps, with its simple metal pipe railing on the east side of the feature.

The subject property is sited in a stand of mature trees of varying species in a natural landscape setting that has not been maintained. It is located on open farmland at the NE edge of Soledad, near a modern housing development.

There is a large, undated wood-framed storage barn just SE of the residence. Basically square in plan, resting on mud sills. The exterior wall cladding is vertical flush board-siding. The low-pitched gable-front roof is covered in corrugated sheet metal. There is a massive, square entry opening centered in the north (front) elevation, with evidence of former sliding wood doors on the side bays, and on the rear (north) elevation. This feature is in fair condition. It is similar to many barns of its type in the region and not specifically significant in the context of the Lorentzen (Jacks) House.

The Lorentzen Ranch was originally part of the Rancho San Vicente, two leagues in the Salinas Valley first granted December 16, 1835 to Francisco Soto, then to Francisco Figuroa in September, 1836. Figuroa sold the property to Estevan Munras in September of 1850. In June of 1865, the rancho, now 19,979 acres, was patented to the Munras heirs. The rancho extended from Gloria Road in the north to Soledad in the SE, and from the Salinas plain to the foothills of the Gabilan Range.

In 1873 Catalina Manzaneli de Munras, widow of Estevan Munras established the town of Soledad on the rancho, having given the Southern Pacific Railroad a right-of-way across the property in December of 1872. Soledad became the SPRR railhead until 1886. The landscape setting of the region was described in 1875 as "a very dry plain with few trees." It was principally an area of dry farming east of the Salinas River, and later, dairying on the west side.

Danish immigrant Nels J. Nielsen purchased 640 acres of the subject property from the Munras interests on October 7, 1913 and began dry farming cereal crops, and established a 200 acre almond orchard.

After Nielsen's passing in 1927, the ranch was sold to Lorenz Lorentzen, owner of the Gonzales Hardware & Grocery Company, on December 4, 1928. Morris Lorentzen operated the ranch until his passing in 1967.

According to Lorentzen family members, the original Nielsen farmhouse burned down just before WWII (no exact date was given), and the Jacks house was moved to its current location, possibly from the Gonzales area.

The California Environmental Quality Act (CEQA), PRC Sec. 21084.1 requires all properties fifty years of age or older to be reviewed for potential historic significance. Criteria for that significance is addressed in PRC Sec. 5024.1(a). It asks, generally, did any event of importance to the region, state or nation occur on the property ? Did anyone of great importance to the region, state or nation occupy the property during the productive period of their lives ? Does the building represent an important architectural type, period or method of construction, or is it a good example of the work of a noted architect or master-builder ? The criteria also asks if the property is likely to yield information significant to the understanding of the areas history.

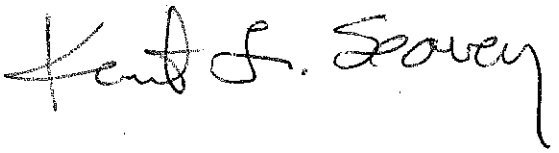
The Morris Lorentzen House is significant under California Register criterion 3, in the area of architecture as a basically intact example of a David Jacks Corporation prefabricated farm house from the first decade of the twentieth century.

Between about 1908 and 1915 Monterey's David Jacks family corporation had designed and constructed a series of up to sixty-six ranches and dairies in the Salinas Valley between Chualar and King City on 30,000 acres of the vast land holdings acquired by David Jacks during the nineteenth century. The small tenant farms were developed as rental income property for the Jacks family heirs. The Jacks Corporation installed electric water pumps for wells on each farmsite, which consisted of a house, barn and grainery, prefabricated in Monterey and shipped to terminals near the farmsteads.

The Jacks Corporation gable-front residence design has been described in American architectural style books as a type of national folk house, or basic homestead house, deriving its form from the Greek Revival movement of the 1830s to 1850s. The popularity of the building shape persisted with the expansion of the national railroad network becoming a dominant folk form until well into the twentieth century.

In a 2001 survey of agriculturally related historic resources funded by the Monterey County Parks Department about a dozen Jacks farmsites with houses were identified, in various states of repair. Most were found on the former Los Coches Rancho, at the southern edge of Soledad. As described in the survey, the one-and-one-half-story Jacks houses were of similar design, and pre-cut at an unidentified Monterey mill.

The basic building block measures 26' wide by 32' deep. The four-room over four-room interior layout determines the exterior form. Each house has 6' deep covered full-width porches on the front and rear gable ends, making the the over-all footprint of the house 26' by 44'.



The spatial arrangement of windows in the gables and side elevations is a character-defining feature of the Jacks house form. There are two vertical double-hung, wood sash windows symmetrically set in the upper floor on both gable ends. On one side elevation, there are two vertical double-hung, wood-sash windows placed one-quarter distance from each corner of the main building block. A single window of the same type is found centered in the building envelope on the upper floor, immediately under the eaves, denoting the location of the interior stairway. The opposing side-elevation is generally characterized by two ground floor windows , matching those described, with no window in the upper floor.

The Morris Lorentzen House, which meets the general Jacks House specifications, has four windows along the ground floor of the east side-elevation, rather than two. The spacing to the first window from the SW corner of the main building block is consistent with the standard Jacks pattern, with a second window about 2' further along the building envelope. The paired windows at the rear of the house on this elevation are separated by a single mullion. All windows are 1/1 double-hung wood sash. In examining photographs of other Jacks houses in the area, at least one, the Pershall home on Doud Road, south of Soledad, has a similar set of paired windows. This suggests that there was some leeway for variation in the original building designs. Based on available sources, these Jacks houses could be constructed by the Jacks Corporation for their tenants for $800 each. Of the approximately one dozen Jacks houses surveyed in the area in 2001, the Merrill Farms building, on Highway 101 in Soledad, and the Lorentzen house appear to be the most intact examples of this now rare building type.

The vernacular farmhouse design provided by the Jacks Corporation for their tenants was once a common sight along the Salinas Valley, with possibly as many as 60 examples present. By 1975 as few as 23 of these housing units could be found, and by the 2000 Monterey County Parks survey of agriculturally Related historic resources only a dozen were identified. The remaining Jacks farm houses, once plentiful, are now rare. They embody the distinctive characteristics of a type and period of regional construction specific to the Salinas Valley, and qualify thematically for listing in the California Register.

The Morris Lorentzen House, retains sufficient integrity as a good representitive example of the building type to qualify for individual listing in the California Register, for its type and period of regional construction. The California Register allows moved properties to qualify for such listing based on their significance and potential to yield information important to the history of a local area. The subject property clearly has this potential.

Respectfully Submitted,

P3 The south facing facade is characterized by its symmetrical appearance. There are three glazed bays, set between the square posts on either side of the of the principal entry on the front porch, with two evenly spaced vertical double-hung wood sash windows, having narrow louvered wood shutters, on the upper floor. These elements visually balance the slightly offset entry, which is reached by a straight run of open concrete steps, with its simple metal pipe railing on the east side of the feature. The residence was moved to this location just before WWII to replace the original farm house, which was destroyed in a fire.
The subject property is sited in a stand of mature trees of varying species in a natural landscape setting that has not been maintained. It is located on open farmland at the NE edge of Soledad, near a modern housing development.
There is a large, undated wood-framed storage barn just SE of the residence. Basically square in plan, resting on mud sills. The exterior wall cladding is vertical flush board-siding. The low-pitched gable-front roof is covered in corrugated sheet metal. There is a massive, square entry opening centered in the north (front) elevation, with evidence of former sliding wood doors on the side bays, and on the rear (north) elevation. This feature is in fair condition. It is similar to many barns of its type in the region and not specifically significant.

B10. The spatial arrangement of windows in the gables and side elevations is a character-defining feature of the Jacks house form. There are two vertical double-hung, wood sash windows symmetrically set in the upper floor on both gable ends. On one side elevation, there are two vertical double-hung, wood-sash windows placed one-quarter distance from each corner of the main building block. A single window of the same type is found centered in the building envelope on the upper floor, immediately under the eaves, denoting the location of the interior stairway. The opposing side-elevation is generally characterized by two ground floor windows , matching those described, with no window in the upper floor.
The Morris Lorentzen House, which meets the general Jacks House specifications, has four windows along the ground floor of the east side-elevation, rather than two. The spacing to the first window from the SW corner of the main building block is consistent with the standard Jacks pattern, with a second window about 2' further along the building envelope. The paired windows at the rear of the house on this elevation are separated by a single mullion. All windows are 1/1 double-hung wood sash. In examining photographs of other Jacks houses in the area, at least one, the Pershall home on Doud Road, south of Soledad, has a similar set of paired windows. This suggests that there was some leeway for variation in the original building designs. Based on available sources, these Jacks houses could be constructed by the Jacks Corporation for their tenants for $800 each. Of the approximately one dozen Jacks houses surveyed in the area in 2001, the Merrill Farms building, on Highway 101 in Soledad, and the Lorentzen house appear to be the most intact examples of this now rare building type.
The Lorentzen Ranch was originally part of the Rancho San Vicente, two leagues in the Salinas Valley first granted December 16, 1835 to Francisco Soto, then to Francisco Figuroa in September, 1836. Figuroa sold the property to Estevan Munras in September of 1850. In June of 1865, the rancho, now 19,979 acres, was patented to the Munras heirs. The rancho extended from Gloria Road in the north to Soledad in the SE, and from the Salinas plain to the foothills of the Gabilan Range. In 1873 Catalina Manzaneli de Munras, widow of Estevan Munras established the town of Soledad on the rancho, having given the Southern Pacific Railroad a right-of-way across the property in December of 1872. Soledad became the SPRR railhead until 1886. The landscape setting of the region was described in 1875 as "a very dry plain with few trees." It was principally an area of dry farming east of the Salinas River, and later, dairying on the west side. Danish immigrant Nels J. Nielsen purchased 640 acres of the subject property from the Munras interests on October 7, 1913 and began dry farming cereal crops, and established a 200 acre almond orchard. After Nielsen's passing in 1927, the ranch was sold to Lorenz Lorentzen, owner of the Gonzales Hardware & Grocery Company, on December 4, 1928. Morris Lorentzen operated the ranch until his passing in 1967.
According to Lorentzen family members, the original Nielsen farmhouse burned down just before WWII (no exact date was given), and the Jacks house was moved to its current location, possibly from the Gonzales area.
The David Jacks family was one of the largest landholders in Monterey County at the beginning of the twentieth century. Under the leadership of David Jacks son, Will Jacks, the David Jacks Corporation made a significant contribution to the up building of the central Salinas Valley in the first two decades of the new century by investing in the irrigation of 30,000 acres of valley land for tenant farming, and by providing the tenant farmers with a basic farmstead from which to develop their crops. The vernacular farmhouse design provided by the Jacks Corporation for their tenants was once a common sight along the Salinas Valley, with as many as 60 examples present. By 1975 as few as 23 of these housing units could be found, and by the 2000 Monterey County Parks survey of agriculturally Related historic resources only a dozen were identified. The remaining Jacks farm houses, once plentiful, are now rare. They embody the distinctive characteristics of a type and period of regional construction specific to the Salinas Valley, and qualify thematically for listing in the California Register. The Morris Lorentzen House, as a little altered example of the building type, qualifies for individual listing in the California Register for its type and period of regional construction. The California Register allows moved properties to qualify for listing based on their significance and potential to yield information important to the history of a local area. The subject property clearly has this potential.

Proposed Subdivisions
San Vicente Vineyard and Hambey Ranch Properties
APNs 417-151-082, -083, -084, & -085, 257-101-051
Soledad, Monterey County, California

Dear Mr. Agha:

At your request, we have completed our geologic report for the above referenced project. The purpose of our investigation was to provide a geologic characterization of the subject properties and to identify potential geologic hazards relevant to subdivision of the properties and construction of approximately 3500 residential units. This investigation is intended to satisfy Monterey County requirements for a geologic report for the project.

The results of our investigation indicate that the proposed development of both properties is acceptable with respect to geologic hazards. Our investigation indicates that the properties may be subject to landsliding, flooding, liquefaction, and seismic shaking hazards. In our opinion, the risks associated with these potential hazards can be reduced to "ordinary risk", as defined in Appendix A, provided that the recommendations contained in this report are followed.

We recommend that you make this report available to the design professionals assisting you on this project. Please contact us if you have any questions.

Sincerely,
Nolan Associates

Jeffrey M. Nolan
Principal Geologist

EXECUTIVE SUMMARY

INTRODUCTION

This report presents the results of our preliminary geologic hazards investigation for two proposed subdivisions located north of the City of Soledad, Monterey County, California (Figure 1, Site Location Map). The subject properties include the 634 acre San Vicente Vineyard parcel on San Vicente Road and the 280 acre Hambey Ranch parcel on Bryant Road. The purpose of our investigation was to evaluate geologic hazards on the subject properties to provide for prudent development of residential housing and associated facilities.

Based on discussions with you, we understand that the two proposed subdivisions will include approximately 3500 residential units, a density of about four units per acre. We have not reviewed any proposed tentative maps or specific project plans for this investigation. It is our understanding that the subdivision will be provided water by on-site wells and that sewage will be disposed of in shallow leachfield trenches after secondary treatment in a package plant. The subject properties are presently being used for agricultural production.

SCOPE OF INVESTIGATION

Work performed during this study included:

1) Review of pertinent geologic literature and published geologic maps for the subject sites.

2) Examination of 6 sets of aerial photographs for the area ranging in age from 1937 to 1989.

3) Geologic reconnaissance mapping of the subject property, including construction of two geologic cross sections.

4) Analysis of data and preparation of this report summarizing our findings and recommendations.

CONCLUSIONS

1. Based on the information gathered and analyzed, it is our opinion that both of the properties are geologically suitable for residential development, provided that the recommendations contained in this report are properly implemented.

2. The properties are not located in an Alquist-Priolo special studies zone. No known or suspected active faults are mapped across the proposed development area and we did not identify any evidence for faulting on the properties during our site investigation. Therefore, we are of the opinion that the potential for surface ground rupture due to faulting is low on the subject properties.

3. There is a potential for strong seismic shaking at the site if a large earthquake occurs on the nearby Rinconada or related fault. Such an earthquake is expected to produce mean peak horizontal ground accelerations (randomly oriented horizontal component) of about 0.5g for sites underlain by deep soil (more than 40 feet of alluvium) and 0.28g to 0.38g for rock sites.

   These expected ground motions are based on a deterministic evaluation of seismic hazards. In our opinion, insufficient information is available on the activity of the Rinconada fault to provide for a valid probability assessment, although we are of the opinion that the probability of a large earthquake on the Reliz-Rinconada fault during the economic lifetime of a typical residential structure is low. Ground motion values estimated for the other principal seismogenic sources in the area, the San Andreas fault and the San Gregorio-Hosgri fault, are in the range of 0.07g to 0.1g for rock sites and 0.13g to 0.19g for soil sites. Large earthquakes on these faults are considered to be more likely than on the Reliz-Rinconada fault.

4. The potential hazard due to seismically induced liquefaction on the site is judged to be low for older alluvium (Qoa, Plate 1) and low to moderate for younger alluvium (Qa, Plate 1).

5. The likelihood of landsliding affecting the two proposed subdivisions is very low, with the exception of sites on or immediately adjacent to the steep slopes on the eastern margin of the San Vicente property. The lack of evidence for previous landsliding on these slopes indicates that the granitic bedrock is a competent slope forming material. However, we did identify several very steep, v-shaped drainages that could conduct debris flows during intense rainstorms. Evidence for past debris flows at these sites is equivocal, but for conservatism, we have made recommendations for setbacks for residential structures from the mouths of these steep drainages, as summarized in the Recommendations section, below.

6. The potential for flooding of the proposed subdivisions is low, provided that adequate drainage provisions are implemented for the ephemeral drainage courses shown on Plate 1.

RECOMMENDATIONS

Based on the results of our investigation, we make the following recommendations:

1) The mean peak horizontal acceleration (randomly oriented component) that should be considered in dynamic or psuedostatic analyses for the project is 0.5g for deep soil sites and 0.38 g for rock sites. For design purposes, a repeatable high ground acceleration (RHGA) of 0.33g (soil) or 0.25g (rock) may be used for project design if the project engineer considers the RHGA to be a more appropriate design value.

   It is important that recommendations regarding seismic shaking be used in the design for any proposed development. Even with adequate design and construction, some damage to structures may occur during a great earthquake. However, the damage due to high intensity shaking may be

reduced by careful placement and construction of the structure. Past experience has shown that the quality of design and construction is far more important than the precise evaluation of ground motion parameters.

Many of the risks associated with earthquakes are not due to structural failure. Most injuries result from falling debris, overturned furniture, the disruption of utilities, and fires that occur as a result of broken utility lines, overturned gas stoves, etc. Large appliances (i.e. refrigerators, freezers, pianos, wall units, water heaters, etc.) should be firmly attached to the floor or to structural members of walls.

2) We recommend that the project geotechnical engineer prepare a quantitative assessment of liquefaction and seismically induced settlement potential once a development plan is chosen, with specific reference to areas underlain by younger alluvium.

3) We recommend that residential structures be set back 100 feet from the mouths of steep drainages identified as potential debris flow hazards on Plate 1. The recommended setbacks are indicated on Plate 1.

4) We recommend that any natural drainages on the subject properties be channelized and conducted across the development sites in appropriately engineered structures. We recommend that all drainage from improved surfaces such as walkways, patios, roofs and driveways be collected in impermeable gutters or pipes and carried to neighborhood storm sewers or natural drainages. At no time should any concentrated discharge be allowed to spill directly onto the ground adjacent to a proposed building site. Any water landing on paved areas should not be allowed to flow towards a proposed building site. The control of runoff is essential for control of erosion and prevention of ponding water against building foundations.

5) We recommend that any embankment dams on the properties be evaluated for stability if they are to remain in use following development of the properties. Stability evaluations should include psuedostatic or dynamic stability analyses using peak horizontal ground motions recommended in 1), above.

6) This report is issued with the understanding that it is the duty and responsibility of the owner, or of his representative or agent, to ensure that this report is provided to and brought to the attention of the architect, engineer(s) and general contractor for the project, and that all recommendations made in the report are incorporated into the plans and specifications, and that the necessary steps are taken to see that the contractor and subcontractors carry out the report's recommendations in the field.

7) We recommend that our firm be provided the opportunity for a general review of the final design and specifications in order that our recommendations may be properly interpreted and implemented in the design and specification. If our firm is not accorded the privilege of making the recommended review we can assume no responsibility for misinterpretation of our recommendations.

PRELIMINARY GEOLOGIC HAZARDS INVESTIGATION
PROPOSED SUBDIVISIONS
SAN VICENTE VINEYARDS
AND HAMBEY RANCH PROPERTIES
APNS 417-151-082, -083, -084, & -085,
257-101-051
MONTEREY COUNTY, CALIFORNIA

INTRODUCTION

This report presents the results of our preliminary geologic hazards investigation for two proposed subdivisions located north of the City of Soledad, Monterey County, California (Figure 1, Site Location Map). The subject properties include the 634 acre San Vicente Vineyard parcel on San Vicente Road and the 280 acre Hambey Ranch parcel on Bryant Road. The purpose of our investigation was to evaluate geologic hazards on the subject properties to provide for prudent development of residential housing and associated facilities.

Based on discussions with you, we understand that the two proposed subdivisions will include approximately 3500 residential units, a density of about four units per acre. We have not reviewed any proposed tentative maps or specific project plans for this investigation. It is our understanding that the subdivision will be provided water by on-site wells and that sewage will be disposed of in shallow leachfield trenches after secondary treatment in a package plant. The subject properties are presently being used for agricultural production.

SCOPE OF INVESTIGATION

Work performed during this study included:

1) Review of pertinent geologic literature and published geologic maps for the subject sites.

2) Examination of 6 sets of aerial photographs for the area ranging in age from 1937 to 1989.

3) Geologic reconnaissance mapping of the subject property, including construction of two geologic cross sections.

4) Analysis of data and preparation of this report summarizing our findings and recommendations.

REGIONAL GEOLOGY

The subject sites are situated on the eastern flank of the Salinas Valley and are bounded to the east by the foothills of the Gabilan Range, a granitic massif that forms a portion of the Coast Ranges Physiographic Province of California. The Coast Ranges Province consists of a series of coastal mountain chains paralleling the pronounced northwest-southeast structural grain of central California geology.

The Gabilan Range and adjacent portions of the Salinas Valley are underlain by a large, northwest-trending, fault bounded, elongate prism of granitic and metamorphic basement rocks, known collectively as the Salinian Block. The Salinian Block is separated from contrasting basement rock types to the northeast and the southwest by the San Andreas and the Sur-Nacimiento fault systems, respectively (Figure 2, Regional Geologic Map). Overlying the granitic basement rocks on the Salinian Block is a sequence of dominantly marine sediments of Paleocene to Pliocene age and non-marine sediments of Pliocene to Pleistocene age, all of which show evidence of uplift and deformation.

In the study area, only alluvial deposits of Quaternary age are exposed at the surface. These deposits are in depositional contact with granitic basement exposed in the foothills of the Gabilan Range (Figure 2 and Plate 1, Site Geologic Map). Older sedimentary units crop out to the south and west in the Salinas valley and may occur at depth in the vicinity of the subject properties. These units include marine shales of the Monterey Formation, of Miocene age, marine sandstones and siltstones of the Pancho Rico Formation, of Pliocene age, and heterogeneous non-marine sediments of the Paso Robles Formation, of Plio-Pleistocene age.

REGIONAL FAULTING

Throughout the late Cenozoic Era (approximately the past 25 million years), central California has been dominated by tectonic forces associated with lateral or "transform" motion between the North American and Pacific crustal plates, producing a complex system of northwest-trending faults (the San Andreas Fault system). These faults show horizontal displacements measured in tens or hundreds of miles. Uplift, deformation, erosion, and subsequent re-deposition of sedimentary rocks have been driven primarily by the northwest-directed, horizontal (strike-slip) movement of the plates and the associated southwest to northeast-oriented compressive stress. The region continues to be characterized by moderate to high rates of tectonic and seismic activity (Figure 3, Regional Seismicity).

Active or potentially active faults which may impact the site (Buchanan-Banks et al., 1978; Jennings, 1975; Greene, 1977;), include the Reliz, Rinconada, King City, San Gregorio-Hosgri

and San Andreas fault zones (Figures 2 & 3). These faults are discussed in the following sections. Locations of epicenters associated with these faults are shown in Figure 3. Smaller northwest trending faults are also present in the Santa Lucia Mountains, on the western side of the Salinas Valley. These faults include the Tularcitos and Palo Colorado faults (Fiugure 3). The seismic potential of these faults has been little studied since they occur in an area that is sparsely populated. They are not generally associated with significant historic seismicity and and do not appear to have been a source of any large earthquakes in historic times.

Reliz, Rinconada, and King City Faults

The Reliz, Rinconada and King City faults, as mapped by Durham (1974), Dibblee (1976) and Jennings (1975) are roughly parallel to the San Andreas fault zone and skirt the eastern foothills of the Santa Lucia Mountains for almost the entire length of the Salinas Valley. These faults have been considered to be one structure by some researchers (Dibblee, 1976). The alignment and total length of the fault zone cited by different researchers therefore depends on whether the Reliz and King City faults are included with the Rinconada fault system as a single seismogenic structure or are considered separately. Wesnousky (1986) included the Reliz fault as part of the Rinconada fault and cited a length of 136 kilometers for the structure. Dibblee (1976) included the King City fault with the Reliz and Rinconada faults and cited a length of 190 kilometers for the entire structure. The Reliz fault passes about six miles west of the proposed development. We consider the Reliz and Riconada faults to be linked and will refer to them here collectively as the Rinconada fault.

The King City Fault (Ross and Brabb, 1973) extends northwestward from the northern-most mapped portion of the Reliz fault along the southwest side of the Salinas Valley, separating the tectonically elevated Sierra de Salinas and other portions of the Santa Lucia Mountains from the Salinas valley (Jennings, 1992; Figures 2 and 3). Northwest from the Sierra de Salinas, it extends into Monterey Bay. Since the Santa Lucias are considered to be Plio-Pleistocene in age, this hypothesis would have much of the vertical component of displacement on this fault occurring as late as early to mid-Pleistocene. To our knowledge, the King City fault is not exposed at the ground surface and no geologic evidence for Quaternary activity on the King City fault has been observed in the 40,000 to 100,000 year old sand dune fields that cover the fault in the area of the city of Marina or in the alluvial fans that cover the inferred fault trace in the Salinas Valley. Green (1973) found no evidence for activity on any offshore faults that might connect with the King City fault (Green, 1973). Ross and Brabb (1973), some of the early proponents for the King City fault, considered it to be older than Miocene. We are of the opionion that the King City fault, is not a significant seismogenic source for this project.

Geologic evidence suggests that the Rinconada fault is a high angle, right-lateral, strike-slip fault which has experienced cumulative offset of up to 40 miles since the Miocene age (Dibblee, 1976). No historic earthquakes have been reported on this fault, though it is considered potentially active. Hart (1985) did not consider the Rinconada fault to show sufficient evidence of Holocene activity to be included in the state's Alquist-Priolo active fault mapping program, although this does not preclude youthful activity on the fault. Mapping along the fault by Hart (1985) revealed offset drainages, anomalous ridges, and other geomorphic features that could result from active faulting, but he did not observe any offset or disturbance of Holocene deposits across the trace of the fault. Wesnousky (1986) has calculated that the Rinconada fault is capable of generating a magnitude 7.6 (M_w) earthquake. This magnitude earthquake is estimated to have a recurrence interval of about 1900 years according to Wesnousky (1986).

San Andreas Fault

The San Andreas fault is active and represents the major seismic hazard in northern California (Jennings, 1975; Buchanan-Banks et al., 1978). The main trace of the San Andreas fault trends northwest-southeast and extends over 700 miles from the Gulf of California through the Coast Ranges to Point Arena, where the fault extends offshore.

Geologic evidence suggests that the San Andreas fault has experienced right-lateral, strike-slip movement throughout the latter portion of Cenozoic time, with cumulative offset of hundreds of miles. Surface rupture during historic earthquakes, fault creep, and historic seismicity confirm that the San Andreas fault is highly active today.

Historic earthquakes along the San Andreas fault and its eastern branches have caused significant seismic shaking in the Monterey County area. There were large earthquakes along the San Andreas fault in 1838, 1865 and 1890 (Sykes and Nishenko, 1984). The most intense earthquake to have affected this area was the great San Francisco earthquake of April 18, 1906. This 8.3 magnitude temblor caused severe seismic shaking and structural damage to many buildings in Northern California, including Santa Cruz, Santa Clara, San Mateo, and Monterey Counties. (Lawson, 1908). The recent magnitude 7.1 Loma Prieta earthquake (October 17, 1989) caused seismic shaking as intense as that of 1906 in parts of the Santa Cruz Mountains.

A common measure of the intensity of ground shaking is the Modified Mercalli Intensity Scale (Table 1), a subjective measure of the effect of ground shaking on man, man-made structures, and the earth's surface. Intensity varies with distance from the causative fault, but can also vary greatly with local geologic setting. Lawson et al. (1908) lists a Mercalli Intensity of about VI to VII for the site as a result of the 1906 earthquake, although it should be emphasized that this estimate is based on a small number of field observations in an area sparsely populated in 1906.

TABLE 1: MODIFIED MERCALLI INTENSITY SCALE

The modified Mercalli scale measures the intensity of ground shaking as determined from observations of an earthquake's effect on people, structures, and the Earth's surface. This scale assigns to an earthquake event a Roman numeral from I to XII as follows:

I	Not felt by people, except rarely under especially favorable circumstances.
II	Felt indoors only by persons at rest, especially on upper floors. Some hanging objects may swing.
III	Felt indoors by several. Hanging objects may swing slightly. Vibration like passing of light trucks. Duration estimated. May not be recognized as an earthquake.
IV	Felt indoors by many, outdoors by few. Hanging objects swing. Vibration like passing of heavy trucks; or sensation of a jolt like a heavy ball striking the walls. Standing automobiles rock. Windows, dishes, doors rattle. Wooden walls and frame may creak.
V	Felt indoors and outdoors by nearly everyone; direction estimated. Sleepers wakened. Liquids disturbed, some spilled. Small unstable objects displaced or upset; some dishes and glassware broken. Doors swing; shutters, pictures move. Pendulum clocks stop, start, change rate. Swaying of tall trees and poles sometimes noticed.
VI	Felt by all. Damage slight. Many frightened and run outdoors. Persons walk unsteadily. Windows, dishes, glassware broken. Knickknacks and books fall off shelves; pictures off walls. Furniture moved or overturned. Weak plaster and masonry cracked.
VII	Difficult to stand. Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary buildings; considerable in badly designed or poorly built buildings. Noticed by drivers of automobiles. Hanging objects quiver. Furniture broken. Weak chimneys broken. Damage to masonry; fall of plaster, loose bricks, stones, tiles, and unbraced parapets. Small slides and caving in along sand or gravel banks. Large bells ring.
VIII	People frightened. Damage slight in specially designed structures; considerable in ordinary substantial buildings, partial collapse; great in poorly built structures. Steering of automobiles affected. Damage or partial collapse to some masonry and stucco. Failure of some chimneys, factory stacks, monuments, towers, elevated tanks. Frame houses moved on foundations if not bolted down; loose panel walls thrown out. Decayed pilings broken off. Branches broken from trees. Changes in flow or temperature of springs and wells. Cracks in wet ground and on steep slopes.
IX	General panic. Damage considerable in specially designed structures; great in substantial buildings, with some collapse. General damage to foundations; frame structures, if not bolted, shifted off foundations and thrown out of plumb. Serious damage to reservoirs. Underground pipes broken. Conspicuous cracks in ground; liquefaction.
X	Most masonry and frame structures destroyed with their foundations. Some well-built wooden structures and bridges destroyed. Serious damage to dams, dikes, embankments. Landslides on river banks and steep slopes considerable. Water splashed onto banks of canals, rivers, lakes. Sand and mud shifted horizontally on beaches and flat land. Rails bent slightly.
XI	Few, if any masonry structures remain standing. Bridges destroyed. Broad fissures in ground; earth slumps and landslides widespread. Underground pipelines completely out of service. Rails bent greatly.
XII	Damage nearly total. Waves seen on ground surfaces. Large rock masses displaced. Lines of sight and level distorted. Objects thrown upward into the air.

Geologists have recognized that the San Andreas fault can be divided into segments that have earthquakes of different characteristic sizes and recurrence intervals associated with them. A study by the Working Group on California Earthquake Probabilities (WGCEP) (Agnew et al, 1988) defines several fault segments in the site region and assigns different expected events and recurrence intervals to each segment.

The Central Creeping segment, located about 15 miles northeast of the properties, is the closest segment of the San Andreas fault zone to the site. It is marked by continuous creep, at a rate of approximately 30 to 34 mm/year (Agnew et al, 1988). There is no historical evidence for large magnitude earthquakes on this segment. Since the creep rate is about the same as the long term creep rate for the San Andreas fault, the central creeping segment is not considered to be a source for large magnitude earthquakes (Agnew et al, 1988), although small to moderate size earthquakes (magnitude 4-6) are considered possible. There have been a few historical events in this size range spatially associated with this segment of the San Andreas fault (Figure 3).

San Gregorio-Hosgri Fault Zone

The San Gregorio-Hosgri fault zone, as mapped by Greene (1977) and Weber (1981), is a 250 mile long fault that skirts the coastline of Central California northward from Point Arguello to Point Reyes. For most of this length, the fault is offshore, passing onshore only briefly at Point San Simeon in San Luis Obispo County, Point Sur in Monterey County, and Point Ano Nuevo and Pillar Point in San Mateo County. Northward from Pillar Point, it passes offshore again, to connect with the San Andreas fault near Bolinas.

The landward extension of the San Gregorio fault at Point Año Nuevo shows evidence of Late Pleistocene (Jennings, 1975; and Buchanan-Banks et al., 1978) and Holocene displacement (Weber, et. al., 1979). Although stratigraphic offsets indicate a history of horizontal and vertical displacements, the San Gregorio is considered predominantly right-lateral strike slip by most researchers (Greene, 1977; Weber and LaJoie, 1974; and Graham and Dickinson, 1978). Estimates of cumulative strike-slip (horizontal) offset on the fault ranges up to 90 miles (Clark et al, 1984).

In addition to stratigraphic evidence for Holocene activity, the historic seismicity in the region is partially attributed to the San Gregorio fault zone (Greene, 1977). Due to inaccuracies of epicenter locations, the magnitude 6+ earthquakes of 1926, tentatively assigned to the Monterey Bay fault zone, may have actually occurred on the San Gregorio fault zone (Greene, 1977; Tuttle, 1985).

In summary, the San Gregorio-Hosgri fault zone must be considered active. Weber and Cotton (1981) present evidence suggesting that recurrence intervals for earthquakes that produce surface ground rupture (magnitude 7.1 to 7.9 based on possible surface rupture length) within the San Gregorio fault system is 6,000 years or less. Weber's latest data indicates a recurrence interval for surface ground rupture of about 500 to 600 years (Weber, 1990). Wesnousky (1986) suggests a maximum probable earthquake of M_w 7.7 for the San Gregorio portion of the fault, and a magnitude (M_w) of 7.8 for the Hosgri portion of the fault.

SITE GEOLOGIC SETTING

Topography

The subject properties are located on a broad, gently sloping alluvial fans at the foot of the western slope of the Gabilan Range on the east side of the Salinas Valley, with the eastern-most portion of the San Vicente Vineyard property extending onto the foothills of the Gabilan range (Figure 1 and Plate 1). The alluvial fans abut flat lying fluvial deposits of the Salinas River southwest of the subject properties (Figure 1). Elevation on the subject properties ranges from 200 and 600 feet above sea level. The land to the east of the property is rugged ridge-and-valley topography that rises rapidly to elevations greater than 2000 feet. Surface slopes on the alluvial portion of the subject parcels are approximately 5 to 8% gradient. Steep slopes on the eastern portion of the San Vicente Vineyards property range up to about 70% gradient.

Drainage

Drainage of surface water in the vicinity of the proposed sites generally occurs by overland sheet flow towards shallow drainage courses on the two properties (Plate 1). The drainages are ephemeral and it is unlikely that substantial surface flow occurs except during periods of high rainfall. We did not observe seeps, springs or any other evidence of high groundwater levels on the subject properties during our site reconnaissance or aerial photo review. We did not observe surface flow or standing water in any of the drainages.

The natural drainage channels crossing the properties are only slightly incised and there is little indication of significant erosion on the properties. There are two earth embankment dams on the properties used for water storage. One is located in the northeast corner of the San Vicente Vineyards property and one is located in the northeastern portion of the Hambey Ranch property. The two earth embankments are depicted as artificial fill on Plate 1.

Earth Materials

The most recent regional scale geologic mapping in the vicinity of the property has been accomplished principally by Dibblee (1972). The geologic map by Dibblee depicts only Quaternary age alluvium in this portion of the Salinas Valley. These alluvial sediments were separated into two separate map units by Dibblee (1972), **older alluvium** (Qoa) and **alluvium** (Qa). The Qoa encompasses alluvial fans and older depositional surfaces along the margins of the valley. The Qa includes the more recent deposits of the Salinas River and the larger tributary drainages. For our geologic mapping, we retained these map units, but have subdivided the older alluvium (Qoa) into sub-units representing individual alluvial fans (Qoa_1, Qoa_2, and Qoa_3 on Plate 1)

The alluvial sediments lap onto granitic rock exposed in the foothills of the Gabilan Range east and north of the subject properties. The granitic rocks are classified a granodiorite and are generally fractured and highly weathered in outcrop. Our geologic map of the property depicts a few isolated granitic outcrops on the San Vicente property (Plate 1). These outcrops were interpreted on the basis of surface relief observed on older aerial photos (1937, 1949, and 1956 vintage) and are not now visible in the field. In our opinion, it is possible that the low relief associated with these outcrops was removed by grading for agricultural purposes.

No subsurface information was obtained for the subject properties. Therefore, the thickness of the alluvial sediments on the subject properties depicted on cross sections A-A' and B-B' are approximate.typical for this portion of the valley

Faulting

There are 34 faults of known or suspected Quaternary age activity within a one hundred mile radiuus of the site. These faults are summarized in Table 2. The nearest mapped fault considered to be potentially active is the northwest trending Rinconada fault, located approximately 6 miles west-southwest of the subject properties (Burkland and Associates, 1974; Durham, 1974; Dibblee, 1976). Other active faults of significance to the project include the San Andreas fault, located about 12.5 miles northeast of the project site, and the San Gregorio fault, located about 28 miles southwest of the site.

There are many faults located within the Santa Lucia Mountains west of the subject property. The recently published fault map of California by Hart (1992) depicts these faults as pre-Quaternary in age. However, since the Santa Lucia range is considered to be Plio-Pleistocene in age, it is likely that many of these faults are also of Quaternary vintage. In our opinion, the pre-Quaternary activity assessment is probably a result of the lack of research study of the these faults, both because of their remoteness from population centers and the inaccessibility of the terrain.

There are no mapped faults depicted on or adjacent to the subject properties by any of the published geologic maps reviewed for this study. We reviewed five sets of stereographic aerial photos spanning the time period of 1937 to 1989. We observed no evidence for tonal or topographic lineaments that would indicate the presence of faulting on the subject properties.

TABLE 2

FAULTS WITHIN 100 MILE RADIUS OF THE SITE
Grouped according to known or suspected age of most recent movement

1. Faults with Historic Movement.
   - San Andreas
   - Calaveras

   - Coyote Creek
   - Silver Creek
   - Evergreen

GEOLOGIC HAZARDS

Seismic Shaking

The closest and most important faults to the subject properties with respect to seismic shaking are the San Andreas, San Gregorio-Hosgri, and Reliz-Rinconada faults (Figure 2). These faults are either active or are considered potentially active, as discussed previously in this report.

There are two methods for estimating seismic ground motions, deterministic and probabilistic. A deterministic approach estimates the magnitude of the most severe shaking that can be expected at a particular site, without regard for how likely such shaking is to occur. A probabilistic analysis evaluates a range of ground motions, and specifies a probability for each level of shaking intensity. The probabilistic evaluation allows one to select a specified risk level for design which may be adequate for the structure, without having to design for a more severe, but unlikely ground motion level.

While the probabilistic analysis represents a more sophisticated approach to seismic design, there may not be enough information available on active faults in a given region to make it a reliable design criterion. In the study area, the present rate of activity on the Rinconada fault is unknown. The fault was reviewed as part of the California Department of Mines and Geology program to evaluate active faults (Hart, 1985). That study determined that the fault was not "sufficiently active" to be included in the state's Alquist Priolo seismic hazard mapping program. Hart (1985) states:

> "As much as 35 miles and 11 miles of right-lateral displacement are reported since early Miocene and early Pliocene time, respectively. Major displacement of undetermined magnitude also has occurred since Plio-Pleistocene time and apparently has continued into late Quaternary time (Dibblee, 1976). Evidence of late Quaternary displacement is indirect but fairly strong, judging form the preponderance of right-laterally deflected drainages and other well-defined, large-scale geomorphic features observed on aerial photographs. Also, older alluvial fans of probably late Pleistocene age appear to be truncated northwest of Williams Hill, although faults were not exposed in gullies incised into that unit where it is crossed by the mapped trace.
>
> The general lack of ephemeral, small-scale geomorphic features (e.g. sidehill benches, offset minor drainages, scarplets or sharp tonals in young alluvium) normally associated with active strike-slip faults suggests that the fault has been inactive during Holocene time or that the fault has had a relatively low slip rate in Holocene time. Evidence of historic activity was not observed in the field; nor is it adequately supported by the recorded seismicity from 1969 to 1984."

Since Holocene activity on this fault has not been ruled out, it is our opinion that it must be considered potentially active for the purpose of evaluating seismic risk to the proposed subdivisions. Although the lack of youthful geomorphic features along the fault indicates that the

rate of activity on the fault is low, the probability of movement is the near future cannot be reliably assessed without specific movement history information for the fault. Therefore, we have not attempted a probabilistic seismic risk assessment. The following section presents a deterministic seismic risk assessment for the subject property.

For the purpose of evaluating deterministic ground motion parameters for the site, we have considered three seismic sources: the Rinconada fault, the San Gregorio-Hosgri fault and the San Andreas fault. While other faults or fault zones in this region may be active, their potential contribution to deterministic seismic hazards at the site is masked by these larger and/or closer faults. Table 3 shows the expected or maximum credible magnitude of earthquake, estimated recurrence interval, and the distance from the site for each of these fault systems. The reference sources used for data in Table 3 are shown in the footnotes.

Expected earthquakes are assigned to faults whose behavior is well enough understood that a likely earthquake magnitude can be assigned with a fair degree of confidence. Maximum credible magnitudes, (the largest earthquake that can reasonably be expected to occur on a fault), are assigned to faults whose behavior is poorly constrained. The maximum credible earthquake may be significantly larger than the one that will actually occur.

Also shown on Table 3 are expected on-site accelerations from the expected or maximum credible earthquakes. These accelerations are based on attenuation relationships derived from the analysis of historical earthquakes. Because the historical data can be interpreted in different ways, there are a number of different attenuation relationships available. We have employed two recent attenuation relationships in deriving the acceleration values listed in Table 3. The table lists site accelerations for sites underlain by hard bedrock and sites underlain by deep soils. Accelerations for rock sites tend to be smaller than those for deep soil sites because the loose soil layer amplifies ground motions in the frequency range that is relevant to structures. For the subject properties, the rock site accelerations will apply to areas directly underlain by granite or with only a thin soil cover; deep soil site accelerations apply to sites underlain by more than 40 feet of alluvium.

It should be noted that the acceleration values listed in Table 3 are only average values. We therefore caution that the listed values are to be used only as approximations, rather than as precise predictions. Actual measured "free-field" accelerations may be larger.Based on the results listed in Table 3, the largest predicted mean peak horizontal accelerations at the site are about 0.5g for soil sites from the postulated event on the Rinconada fault. The lack of evidence for recent activity on the Rinconada Fault suggests that this event is unlikely to affect the project during its economic lifetime (50-100 years). However, due to the lack of specific movement history information for the Rinconada fault and the other potentially active faults in the region, seismic ground motions of this magnitude should be considered for this project.

TABLE 3

SUMMARY OF FAULT DATA

Fault	Maximum Credible or Expected Earthquake Magnitude (ML)	Estimated Recurrence Interval (Years)	Distance From Site (Miles)	Estimated Mean Peak Horizontal Ground Acceleration At Site ROCK Site (g)	Estimated Mean Peak Horizontal Ground Acceleration At Site SOIL Site (g)
San Andreas Creeping Segment	6.0**	?	12.5	0.08(3) 0.07(4)	0.14(3) 0.13(4)
San Gregorio-Hosgri	7.8(1)	852(1)	28	0.09(3) 0.10(4)	0.14(3) 0.19(4)
Reliz-Rinconada	7.6(1)	1883(1)	6	0.38(3) 0.28(4)	0.49(3) 0.50(4)

**- estimated maximum credible event for the creeping segment of the fault, based on a consideration of historic seismicity for the region

Ploessel and Slossen (1974) indicate that repeatable high ground accelerations (RHGA) are a more important parameter for seismic design than the peak acceleration. Their work indicates that RHGA are approximately two-thirds of the peak acceleration. This suggests that the maximum credible earthquake on the Rinconada fault would generate an RHGA of approximately 0.33g at the site.

Landsliding Hazard

The only steep slopes on the subject property where landsliding is likely to occur are situated on the easternmost portion of the San Vicente Vineyard property (Plate 1). These slopes are underlain by granitic rock, which is typically resistant to landsliding. During our site reconnaissance and aerial photo inspection of the subject properties we observed no evidence for previous landsliding. However, we did observe several very steep, v-shaped drainage swales on the San Vicente property. These drainages had fan shaped deposits of alluvium located at their mouths that may be the site of debris flow type landslide deposits during intense rainstorms.

Flooding Hazard

Both of the proposed subdivisions are located outside the 100-year and 500-year flood zones shown on the Federal Emergency Management Agency Flood Insurance Rate Map (FEMA, 1984). Therefore, we do not consider either site to be at risk of flooding. We note, however, that shallow drainage swales cross portions of both properties. There is a potential for flow along the axes of these channels during heavy precipitation.

Liquefaction Hazard

Soil liquefaction occurs as a result of strong seismic shaking of loose, saturated sediments. It typically occurs in the youngest river deposits adjacent to river banks, although it can and does occur in other environments. Based on observations from previous large earthquakes (Youd and Hoose (1978), there is a low likelihood that older alluvium (Qoa, Plate 1) will liquefy during an earthquake, and an elevated potential for the younger alluvium (Qa, Plate 1) to liquefy.

Hazards pertaining to earth embankment dams

The two earth embankment dams observed on the properties are being used to retain water for agricultural uses. Failure of either of these embankement dams could result in inundation of any structures located downstream. Unless these embankment dams are to be removed as part of the site development, they should be evaluated for stability, including stability under seismic shaking intensities expected at the sites.

CONCLUSIONS

1. Based on the information gathered and analyzed, it is our opinion that both of the properties are geologically suitable for residential development, provided that the recommendations contained in this report are properly implemented.

2. The properties are not located in an Alquist-Priolo special studies zone. No known or suspected active faults are mapped across the proposed development area and we did not identify any evidence for faulting on the properties during our site investigation. Therefore, we are of the opinion that the potential for surface ground rupture due to faulting is low on the subject properties.

3. There is a potential for strong seismic shaking at the site if a large earthquake occurs on the nearby Rinconada or related fault. Such an earthquake is expected to produce mean peak horizontal ground accelerations (randomly oriented horizontal component) of about 0.5g for sites underlain by deep soil (more than 40 feet of alluvium) and 0.28g to 0.38g for rock sites.

   These expected ground motions are based on a deterministic evaluation of seismic hazards. In our opinion, insufficient information is available on the activity of the Rinconada fault to provide for a valid probability assessment, although we are of the opinion that the probability of a large earthquake on the Reliz-Rinconada fault during the economic lifetime of a typical residential structure is low. Ground motion values estimated for the other principal seismogenic sources in the area, the San Andreas fault and the San Gregorio-Hosgri fault, are in the range of 0.07g to 0.1g for rock sites and 0.13g to 0.19g for soil sites. Large earthquakes on these faults are considered to be more likely than on the Reliz-Rinconada fault.

4. The potential hazard due to seismically induced liquefaction on the site is judged to be low for older alluvium (Qoa, Plate 1) and low to moderate for younger alluvium (Qa, Plate 1).

5. The likelihood of landsliding affecting the two proposed subdivisions is very low, with the exception of sites on or immediately adjacent to the steep slopes on the eastern margin of the San Vicente property. The lack of evidence for previous landsliding on these slopes indicates that the granitic bedrock is a competent slope forming material. However, we did identify several very steep, v-shaped drainages that could conduct debris flows during intense rainstorms. Evidence for past debris flows at these sites is equivocal, but for conservatism, we have made recommendations for setbacks for residential structures from the mouths of these steep drainages, as summarized in the Recommendations section, below.

6. The potential for flooding of the proposed subdivisions is judged to be low, provided that adequate drainage provisions are implemented for the ephemeral drainage courses depicted on Plate 1.

RECOMMENDATIONS

Based on the results of our investigation, we make the following recommendations:

1) The mean peak horizontal acceleration (randomly oriented component) that should be considered in dynamic or psuedostatic analyses for the project is 0.5g for deep soil sites and 0.38 g for rock sites. For design purposes, a repeatable high ground acceleration (RHGA) of 0.33g (soil) or 0.25g (rock) may be used for project design if the project engineer considers the RHGA to be a more appropriate design value.

   It is important that recommendations regarding seismic shaking be used in the design for any proposed development. Even with adequate design and construction, some damage to structures may occur during a great earthquake. However, the damage due to high intensity shaking may be reduced by careful placement and construction of the structure. Past experience has shown that the quality of design and construction is far more important than the precise evaluation of ground motion parameters.

   Many of the risks associated with earthquakes are not due to structural failure. Most injuries result from falling debris, overturned furniture, the disruption of utilities, and fires that occur as a result of broken utility lines, overturned gas stoves, etc. Large appliances (i.e. refrigerators, freezers, pianos, wall units, water heaters, etc.) should be firmly attached to the floor or to structural members of walls.

2) We recommend that the project geotechnical engineer prepare a quantitative assessment of liquefaction and seismically induced settlement potential once a development plan is chosen, with specific reference to areas underlain by younger alluvium.

3) We recommend that residential structures be set back 100 feet from the mouths of steep drainages identified as potential debris flow hazards on Plate 1. The recommended setbacks are indicated on Plate 1.

4) We recommend that any natural drainages on the subject properties be channelized and conducted across the development sites in appropriately engineered structures. We recommend that all drainage from improved surfaces such as walkways, patios, roofs and

driveways be collected in impermeable gutters or pipes and carried to neighborhood storm sewers or natural drainages. At no time should any concentrated discharge be allowed to spill directly onto the ground adjacent to a proposed building site. Any water landing on paved areas should not be allowed to flow towards a proposed building site. The control of runoff is essential for control of erosion and prevention of ponding water against building foundations.

5) We recommend that any embankment dams on the properties be evaluated for stability if they are to remain in use following development of the properties. Stability evaluations should include psuedostatic or dynamic stability analyses using peak horizontal ground motions recommended in 1), above.

6) This report is issued with the understanding that it is the duty and responsibility of the owner, or of his representative or agent, to ensure that this report is provided to and brought to the attention of the architect, engineer(s) and general contractor for the project, and that all recommendations made in the report are incorporated into the plans and specifications, and that the necessary steps are taken to see that the contractor and subcontractors carry out the report's recommendations in the field.

7) We recommend that our firm be provided the opportunity for a general review of the final design and specifications in order that our recommendations may be properly interpreted and implemented in the design and specification. If our firm is not accorded the privilege of making the recommended review we can assume no responsibility for misinterpretation of our recommendations.

If any unexpected variations in soil conditions, or if any unanticipated geologic conditions are encountered during construction, or if the proposed project will differ from that discussed or illustrated in this report, Nolan Associates should be notified so that supplemental recommendations can be given. Our conclusions and recommendations shall not be considered valid unless the changes are reviewed and the conclusions in this report are modified or verified in writing by a representative of Nolan Associates.

INVESTIGATIVE LIMITATIONS

1) Our services consist of professional opinions and recommendations made in accordance with generally accepted engineering geology principles and practices. No warranty, expressed or implied including any implied warranty of merchantability or fitness for the purpose is made or intended in connection with our services or by the proposal for consulting or other services, or by the furnishing of oral or written reports or findings. If the client desires assurances against project failures, he or she agrees to obtain appropriate insurance through his or her own insurance broker.

2) The analysis and recommendations submitted in this report are based on the geologic information derived from the steps outlined in the introduction section of this report. The information is derived from necessarily limited natural and artificial exposures. Consequently, the conclusions and recommendations should be considered preliminary.

3) The conclusions and recommendations noted in this report are based on probability and in no way imply the site will not possibly be subjected to ground failure or seismic shaking so intense that structures will be severely damaged or destroyed. The report does suggest that development of the proposed project at the noted site, in compliance with the recommendations noted in the report, is an acceptable risk.

4) The findings of this report are valid as of the present date. However, changes in the conditions of property and its environs can occur with the passage of time, whether they be due to natural processes or to the works of man. In addition, changes in applicable or appropriate standards occur whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated, wholly or partially, by changes outside our control. Therefore, the conclusions and recommendations contained in this report cannot be considered valid beyond a period of two years from the date of this report without review by a representative of this firm.

Sincerely,

NOLAN ASSOCIATES

APPENDIX A
SCALE OF ACCEPTABLE RISKS DUE TO GEOLOGIC HAZARDS

SCALE OF ACCEPTABLE RISKS FROM SEISMIC GEOLOGIC HAZARDS

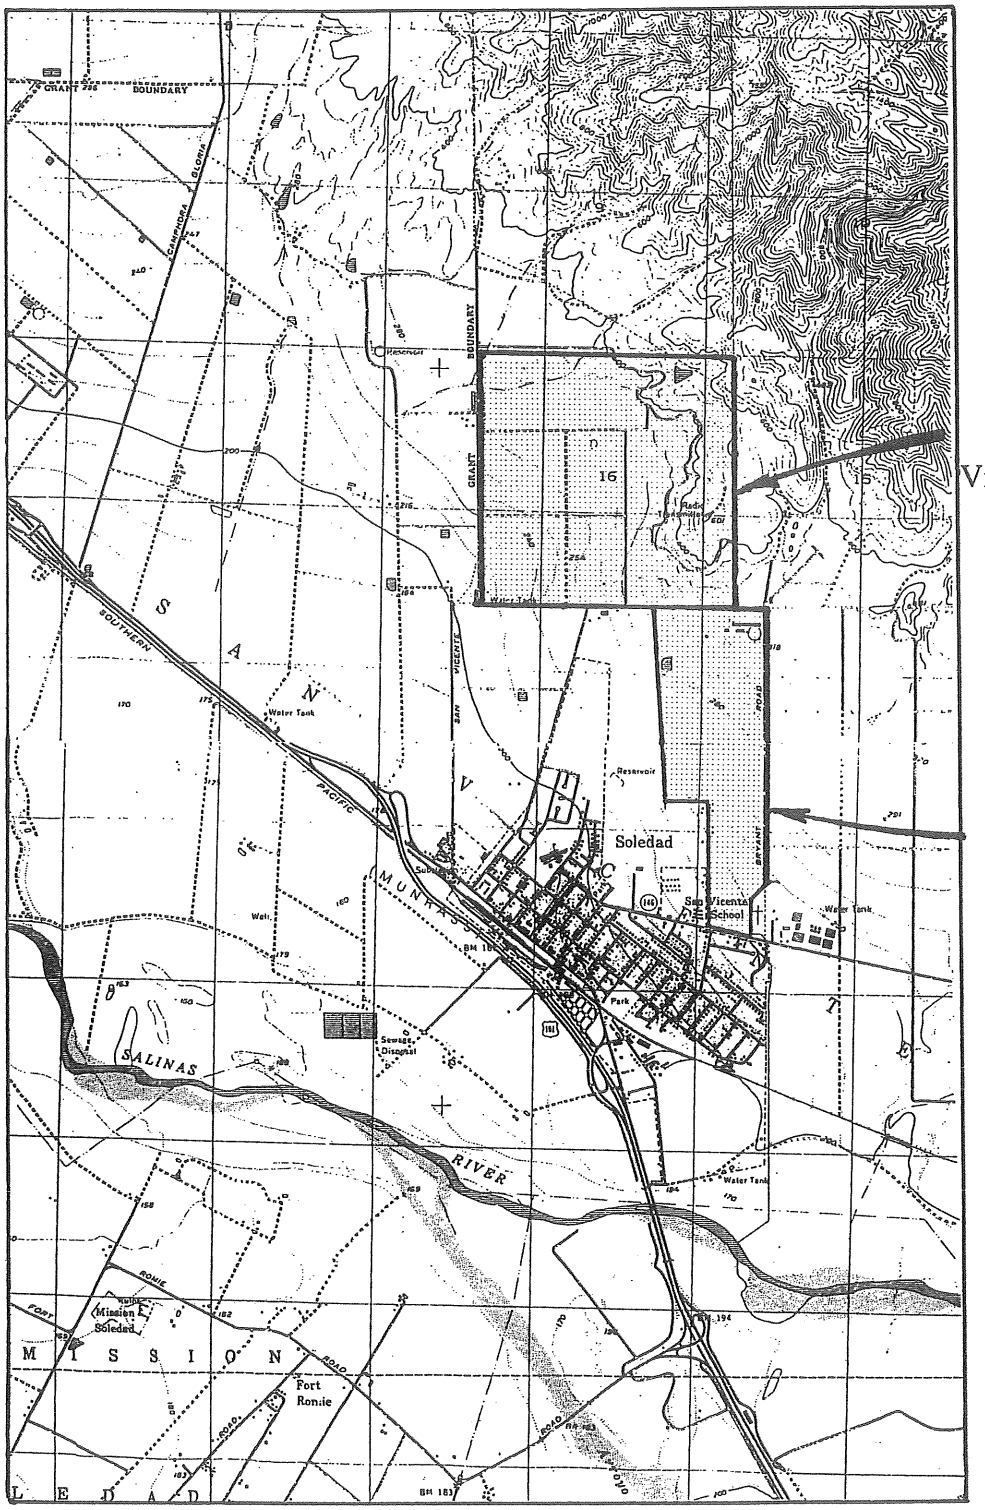
Level of Acceptable Risk	*Kinds of Structure*	*Extra Project Cost Probably Required to Reduce Risk to an Acceptable Level*
Extremely low[1]	*Structures whose continued functioning is critical, or whose failure might be catastrophic: nuclear reactors, large dams, power intake systems, plants manufacturing or storing explosives or toxic materials.*	*No set percentage (whatever is required for maximum attainable safety).*
Slightly higher than under "Extremely low" level.[1]	*Structures whose use is critically needed after a disaster: important utility centers; hospitals; fire, police and emergency communication facilities; fire station; and critical transportation elements such as bridges and overpasses; also dams.*	*5 to 25 percent of project cost.*[2]
Lowest possible risk to occupants of the structure.[3]	*Structures of high occupancy, or whose use after a disaster would be particularly convenient: schools, churches, theaters, large hotels, and other high rise buildings housing large numbers of people, other places normally attracting large concentrations of people, civic buildings such as fire stations, secondary utility structures, extremely large commercial enterprises, most roads, alternative or non-critical bridges and overpasses.*	*5 to 15 percent of project cost.*[4]
An "ordinary" level of risk to occupants of the structure.[3,5]	*The vast majority of structures: most commercial and industrial buildings, small hotels and apartment buildings, and single family residences.*	*1 to 2 percent of project cost, in most cases (2 to 10 percent of project cost in a minority of cases).*[4]

[1] Failure of a single structure may affect substantial populations.

[2] These additional percentages are based on the assumptions that the base cost is the total cost of the building or other facility when ready for occupancy. In addition, it is assumed that the structure would have been designed and built in accordance with current California practice. Moreover, the estimated additional cost presumes that structures in this acceptable risk category are to embody sufficient safety to remain functional following an earthquake.

[3] Failure of a single structure would affect primarily only the occupants.

[4] These additional percentages are based on the assumption that the base cost is the total cost of the building or facility when ready for occupancy. In addition, it is assumed that the structures would have been designed and built in accordance with current California practice. Moreover the estimated additional cost presumes that structures in this acceptable-risk category are to be sufficiently safe to give reasonable assurance of preventing injury or loss of life during and following an earthquake, but otherwise not necessarily to remain functional.



[5] "Ordinary risk": Resist minor earthquakes without damage: resist moderate earthquakes without structural damage, but with some non-structural damage; resist major earthquakes of the intensity or severity of the strongest experienced in California, without collapse, but with some structural damage as well as non-structural damage. In most structures it is expected that structural damage, even in a major earthquake, could be limited to repairable damage. (Structural Engineers Association of California)

Source: Meeting the Earthquake, Joint Committee on Seismic Safety of the California Legislature, Jan. 1974, p.9.

SCALE OF ACCEPTABLE RISKS FROM NON-SEISMIC GEOLOGIC HAZARDS[6]

Risk Level	Structure Type	Risk Characteristics
Extremely low risks.	*Structures whose continued functioning is critical, or whose failure might be catastrophic: nuclear reactors, large dams, power intake systems, plants manufacturing or storing explosives or toxic materials.*	*1. Failure affects substantial populations, risk nearly equals nearly zero.*
Very low risks.	*Structures whose use is critically needed after a disaster: important utility centers; hospitals; fire, police and emergency communication facilities; fire station; and critical transportation elements such as bridges and overpasses; also dams.*	*1. Failure affects substantial populations. Risk slightly higher than 1 above.*
Low risks.	*Structures of high occupancy, or whose use after a disaster would be particularly convenient: schools, churches, theaters, large hotels, and other high rise buildings housing large numbers of people, other places normally attracting large concentrations of people, civic buildings such as fire stations, secondary utility structures, extremely large commercial enterprises, most roads, alternative or non-critical bridges and overpasses.*	*1. Failure of a single structure would affect primarily only the occupants.*
"Ordinary" risks.	*The vast majority of structures: most commercial and industrial buildings, small hotels and apartment buildings, and single family residences.*	*1. Failure only affects owners /occupants of a structure rather than a substantial population.* *2. No significant potential for loss of life or serious physical injury.* *3. Risk level is similar or comparable to other ordinary risks (including seismic risks) to citizens of coastal California.* *4. No collapse of structures; structural damage limited to repairable damage in most cases. This degree of damage is unlikely as a result of storms with a repeat time of 50 years or less.*
Moderate risks.	*Fences, driveways, non-habitable structures, detached retaining walls, sanitary landfills, recreation areas and open space.*	*1. Structure is not occupied or occupied infrequently.* *2. Low probability of physical injury.* *3. Moderate probability of collapse.*

[6] Non-seismic geologic hazards include flooding, landslides, erosion, wave runup and sinkhole collapse

Dear Mr. Agha:

1. INTRODUCTION

1.1 Purpose

a. This report presents the results of our preliminary soil and foundation investigation for the EIR phase of the proposed Miravale Residential Development, Soledad, Monterey County, California.

b. The purpose of our investigation is to evaluate the proposed development with respect to the geotechnical conditions present, and to provide preliminary geotechnical design parameters and recommendations for development of the site. Conclusions and recommendations related to site suitability, grading, foundations, slabs-on-grade, retaining structures, and pavements are presented herein.

c. We have reviewed the following items in connection with the preparation of this report:

i. Preliminary Map, Miravale Subdivision, A Resubdivision Of Parcels 1,2,3,4 & 6, Of 19, Survey Page 76, (MS 95-004), Sheets 1 and 2 of 2, Scale 1 inch : 200 Feet, Stamp Dated October 12, 1995, Prepared By Bestor Engineers, Inc.

ii The Referenced Geologic Report.

d. Detailed, final grading, foundation, structural, and architectural plans are unavailable as of the date of this report. The intention, as we understand it, is to use the findings and recommendations of this report as a basis for developing such plans.

e. We have coordinated our investigation with that conducted by Nolan Associates in order to ensure adequate Geotechnical/Geologic interface throughout our investigation.

1.2 Proposed Development

a. Based on our review of the Preliminary Site Plans itemized in 1.c.i above and our discussions with the parties involved, it is our understanding that the subject project consists of the construction of a residential development on 2 parcels north and east of Soledad. According to the materials reviewed, the project is composed of one roughly rectangular parcel consisting of 260± acres and a roughly square parcel consisting of 640± acres. These parcels are currently in agricultural use including vineyards and row crops.

b. The plan further indicates that the proposed development is to be bordered on the north, south and west by undeveloped parcels and on the east by lightly developed residential tracts. The site is currently occupied by several, single story, wood-frame structures and related improvements related to the former uses. It is our understanding that these buildings and other improvements are to be removed during the grading phase of this project.

c. Anticipated construction consists of 1 and 2 story, single family residences, apartments, and public use structures composed of wood frame or masonry walls, wood roof joists, and slab-on-grade or wood floors. Exact wall, column and foundation loads are unavailable, but are expected to be typical of such construction.

d. Also anticipated is the construction of the attendant paved streets and drive areas, utilities, retaining structures (if required), sewage treatment facilities, schools, light commercial structures, detention ponds, police and fire facilities, library, individual septic systems on a few selected estate lots, concrete flatwork, and associated landscape improvements.

e. Our review of the conceptual layout shown on The Preliminary Subdivision Map indicates that a moderate amount of grading will be associated with the project as currently envisioned. Maximum cuts and fills are expected to be 20± and 10± feet respectively.

1.3 Scope of Services

The scope of services provided during the course of our investigation included:

a. Review of pertinent published and unpublished geologic literature and previous reports pertinent to the site, available in our files or provided by you.

b. Field exploration consisting of:

i. 26 borings drilled to depths of 11.5 to 51.5 feet in the proposed development area. The deeper borings were placed in the areas discussed as potential locations for septic disposal leach fields.

ii. Percolation testing in 8 locations. Test locations were chosen so as to provide percolation rates in areas considered representative of overall site conditions.

The field exploration was coordinated between representatives of the Project Geologist and the Geotechnical Consultant in the interest of economy and to assure adequate geologic / geotechnical interface throughout the investigation.

c. Logging the boring(s) by our Field Engineer.

d. Obtaining in-situ and bulk samples for classification and laboratory testing.

e. Laboratory testing of selected samples considered representative of site conditions, in order to ascertain or derive relevant engineering properties.

f. Geotechnical/Geologic analyses of field and laboratory data.

g. Assessment of project impacts and recommended mitigation measures.

h. Preparation of a Geotechnical Consultation report (4 copies) presenting our findings, conclusions and recommendations.

1.4 Authorization

This investigation, as outlined in our Proposal dated August 9, 1995, was performed in accordance with your written authorization of August 15, 1995.

2. FIELD EXPLORATION PROGRAM

Details of the field exploration, including the logs of borings, are presented in Appendix A.

3. LABORATORY TESTING PROGRAM

Laboratory testing was performed on relatively undisturbed and bulk samples considered representative of subsurface conditions. Details of the laboratory testing program are presented in Appendix B. Test results are presented on the boring logs and in Appendix B.

4. GEOLOGY AND SEISMICITY

Geology and Seismicity are discussed in detail in the Geology Report prepared for the site by Nolan Associates. See reference.

5. PERCOLATION TESTING

Percolation testing was performed at eight locations considered representative of the range of subsurface conditions present on the subject site. Testing was performed in accordance with Monterey County Guidelines, as discussed with representatives of The Monterey County Environmental Health Department. Details of the percolation testing program, including test results, are presented in Appendix D.

6. SITE DESCRIPTION

6.1 Location

The site is composed of 2 parcels, the San Vicente vineyard parcel, located on San Vicente Road, approximately 1 mile north of Soledad, and the Hambey Ranch parcel located on Bryant Road northeast of Soledad in unincorporated Monterey County. The project location is shown on the Location Map, Appendix A, Figure A-1.

6.2 Surface Conditions

a. San Vicente Vineyards Parcel:

i. The San Vicente Vineyards parcel is composed of two primary landforms, the valley floor and the foothills of the Gabilan Mountains. These landforms are in different uses.

ii. The valley floor is currently in agricultural use as a vineyard operated by Mirasou Winery. This portion of the parcel is generally gently sloping from northeast to southwest. Gradients are slight, averaging less than 10%. Two natural drainages are present in this area, one in the north central portion and one in the south eastern portion. The southwest corner of the parcel is currently occupied by the farm houses associated with the vineyards. Vegetation consists of vines, a few trees along the western parcel boundary and scattered grass and bushes.

iii. The foothill portion of the parcel is used as open range for cattle. This portion of the parcel slopes, steeply in some locations, generally from east to west. This portion of the property is characterized by bedrock outcrops, steep drainages, and a small cattle watering pond near the northeast corner of the parcel. Vegetation is sparse, consisting primarily of grass and scattered low brush.

iv. The proposed lots lie mostly on the gently sloping valley floor terrain on the western portion of the parcel, with select lots and ranchettes occupying the more steeply sloping topography (See Plate 1).

b. Hambey Ranch Parcel:

i. The Hambey Ranch Parcel is currently in agricultural use, planted with row crops. This portion of the parcel is generally gently sloping from northeast to southwest. Gradients are slight, averaging less than 10%. Other than the crops which are planted on this parcel, vegetation is sparse.

ii. The proposed single family residences are to occupy the northern portion of the Hambey Ranch Parcel with the southern portions proposed for apartments and light commercial use.

6.3 Subsurface Conditions

a. The results of our subsurface investigation indicate that the site possesses two primary subsurface profiles. The foothill portion of the site is characterized by a thin layer (usually less than 5 feet) of colluvium and slope wash which is underlain by granitic bedrock. This bedrock is generally weathered in the upper 3 to 4 feet, becoming less weathered with increasing depth. The valley floor portions, which include the western portion of the San Vicente Vineyards parcel and the entire Hambey Ranch parcel, are underlain by alluvium/colluvium. This material extends to the full depth of our investigation in the valley floor areas.

b. Alluvium/Colluvium:

i. The alluvial/colluvial soil which forms the surface layer in the valley floor areas is generally composed of an orange-brown mixture sand derived from weathering and erosion of the foothill granitic bedrock, and varying proportions of silt and clay. This material is generally loose to very dense, slightly moist to wet, nonplastic to medium plastic, and is of low to medium expansivity. The material in the valley floors is generally considered compressible. Additionally, the results of our laboratory testing indicates that the loose surficial material in the central and west valley floor areas (the areas represented by Borings 3, 9, and 13) possess an undesirably high collapse potential.

ii. The colluvial soil which forms the topsoil overlying the bedrock in the foothill areas generally is composed of a relatively thin veneer of angular, coarse grained sand and gravel with minor silt and clay components. This material is generally medium dense, dry to very slightly moist, nonplastic, of low expansivity, and considered to be slightly to moderately compressible.

c. Bedrock:

Underlying the colluvium and slope wash in the foothill areas, the material encountered consisted of granitic bedrock. These materials are generally hard to very hard, dry to slightly moist, nonplastic to slightly plastic, of low to moderate expansivity, with the exception of scattered deposits of highly expansive clay, and are considered only slightly compressible. The bedrock encountered is generally fractured and weathered near the surface, with reduced fracturing and weathering as depth increases. These materials are discussed in detail in the site geology report. (See Reference.)

d. Complete soil profiles for each boring are presented on the Logs of Borings, Appendix A, Figures A-3 through A-26. Boring locations are shown on the Boring Location Plan, Appendix A, Plate 1.

6.4 Groundwater

Static groundwater was not encountered during the course of our field investigation. Perched water was encountered at a depth of 16 feet in boring B-1 and at a depth of 30 feet in Boring B-10. Presumably the moisture contents and/or the elevation of subsurface perched water in these locations may vary with seasonal fluctuations in precipitation and irrigation.

6.5 Liquefaction

a. A quantitative liquefaction analysis was performed for the subject site using Liquefy2, a computer program for the empirical prediction of earthquake-induced liquefaction potential based on cyclic stress ratios developed by Seed and others in 1985.

b. The analysis performed was based on the subsurface profile of the southwest portion of the San Vicente Vineyards Property where perched water was encountered at a depth of 16 feet during our subsurface exploration. The profile analyzed is shown on the log of boring B-1. This portion of the subject site is considered to be the critical case.

c. Based on the results of our analysis, the potential for liquefaction to occur and cause damage to the proposed development is considered to be low.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 General

a. Based on the results of our review of the Preliminary Subdivision Map, we consider that development of the site is geotechnically compatible with the known geotechnical conditions, provided the recommendations of this report are incorporated into the project plans and specifications.

b. The recommendations included herein are provided for preliminary design and planning of grading and construction with regard to the aforementioned 200-scale Preliminary Subdivision Map. These recommendations are subject to review when detailed final grading plans become available, during grading when actual conditions are exposed, and after grading when the as-graded conditions are known.

c. The primary geotechnical conditions affecting the proposed development are:

i. The relatively thick alluvial/colluvial deposits underlying the valley floor areas of the site. These deposits, in their in situ condition are considered compressible under the proposed structural loads. It is anticipated that overexcavation and recompaction of these materials will be necessary prior to the placement of improvements.

ii. The collapsible nature of the alluvial/colluvial deposits underlying the valley floors in the south-central and western portions of the Vicente Vineyards parcel. It is anticipated that overexcavation and recompaction of these materials will be necessary in order to mitigate the potential adverse impacts of these materials within structural areas.

iii. The stability of existing and proposed cut and fill slopes.

iv. Areas near the mouths of steep drainages on the eastern portion of the San Vicente Vineyards parcel identified by the Project Geologist as potential debris flow areas requiring either the imposition of structural setbacks or further area-specific analysis.

v. The presence of a small cattle watering lake retained by an earth dam in the northeast corner of the San Vicente Vineyards parcel. It is our understanding that this feature is to be removed during the grading phase of the current project.

vi. The presence of scattered deposits of highly expansive clay in the foothill portion of the San Vicente Vineyards parcel.

vii. The presence of relatively shallow perched water in the southwestern portion of the San Vicente Vineyards parcel which may impact proposed septic disposal.

d. General geotechnical considerations applicable to site grading and preliminary recommendations for the proposed construction are discussed below:

7.2 Grading and Earthwork

7.2.1 General

Grading should be accomplished in accordance with the recommendations presented herein, and the grading requirements of the County of Monterey. Care should be excersized during removal operations adjacent to existing structures including roadways, stormdrains, and residences, including their adjoining slopes.

7.2.2 Site Preparation

a. Prior to grading, the site should be stripped and cleared of any vegetation, uncompacted fill, debris and/or existing structures. Excavations resulting from the removal of vegetation, uncompacted fill, debris or any buried obstructions should be backfilled with properly compacted fill.

b. Although none were observed during this investigation, abandoned wells, underground facilities such as cesspools, septic tanks, utilities, pipes or underground storage tanks may exist at the site. Should any such facilities be discovered prior to or during grading, recommendations will be given for their safe removal and proper backfilling of resulting voids. Removal of underground tanks is subject to state law as regulated by County or City Health and/or Fire Department agencies. If storage tanks containing hazardous or unknown substances are encountered, the proper authorities must be notified prior to any attempts at removing such objects.

7.2.3 Preparation of Existing Soils

a. All undocumented fill soils and debris should be removed in their entirety.

b. The results of our field exploration indicate the presence of scattered deposits of highly expansive clay soils, particularly in the eastern portions of the San Vicente Vineyards parcel where the valley floor transitions into the foothills. Where encountered, these materials should be removed from beneath proposed improvements.

c. The extent and depths of removal should be determined by the Geotechnical Consultant during grading operations.

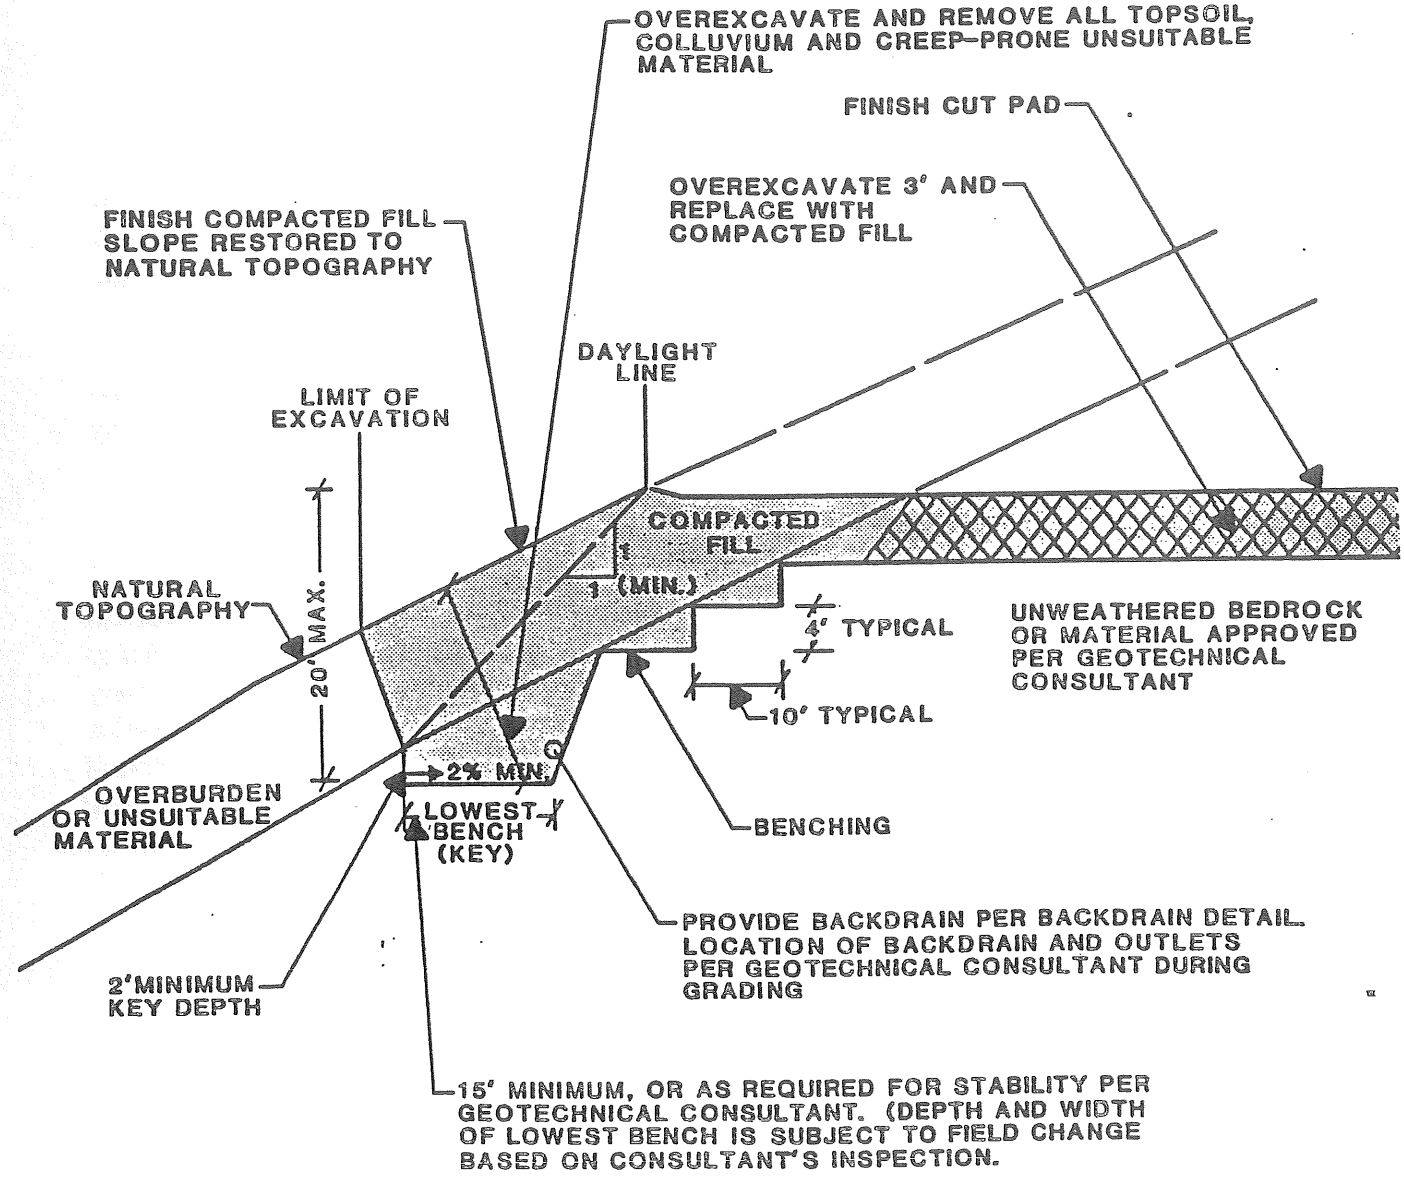
7.2.4 Pad Preparation

7.2.4.1 Valley Floor Areas:

a. The results of our field investigation and laboratory testing indicate that the near-surface soils on the subject site at the typical bearing elevation of structures founded on conventional, shallow, spread and pad footings are composed of a mixture of loose to medium dense silt with some clay and sand. This soil is considered somewhat compressible in its in situ condition. In order to ensure uniform compression characteristics and to obviate any potential for differential settlements, site preparation, consisting of overexcavation and recompaction of the near-surface soils will be required prior to placement of new fills, pavements, slabs, and structures. Beneath the footings of structures founded on conventional, shallow, spread and pad footings, the native subgrade should be reworked to a depth sufficient to provide a zone of compacted fill whose width and depth, measured from the footing bottom, is equal to twice the width of the footing base, or to a depth of 5 feet below existing grade, whichever is greater. These depths are subject to review during grading.

b. The zone of reworked material beneath footings shall extend laterally beyond the edge of the footing a distance equal to the depth of overexcavation under the footing, with at least 5 feet beyond the perimeter footings.

7.2.4.2 Foothill Areas:



a. Based on our review of the Preliminary Subdivision Map, and our discussions with representatives of Bestor Engineering, the Project Civil Engineers, it is our understanding that development of the foothill portions of the subject project will generally result in the formation of mass graded cut and cut/fill transition pads and several custom ranchette lots. Recommendations for the construction of the mass graded lots are presented below. It is anticipated that grading for the custom ranchette lots will be minimal. Recommendations for the custom lots should be provided by the Geotechnical Consultant on a case by case basis prior to development.

b. Cut Pads

After excavation to proposed pad grade, portions of the cut pads are anticipated to expose unsuitable soils due either to the presence of oversize rocks, or soils with inconsistent expansion/compression characteristics. We recommend that for planning purposes, overexcavation and recompaction of a minimum of 3 feet of these soils be anticipated. Actual overexcavation requirements should be evaluated by the Geotechnical consultant as the lots are brought to finish grade.

c. Daylight Cut Lots

If the proposed grading will create cut lots above descending natural slopes, the outer surficial zone along the daylight cut line should be stabilized by the construction of daylight shear keys. Daylight shear keys should be constructed in accordance with the detail provided in Figure 1. The actual dimensions of the shear key should be determined when conditions are exposed during grading, based on the slope inclination and thickness of surficial deposits on the slope. It is anticipated that at a minimum, the shear keys will be 5 feet wide and 3-5 feet deep.

Tharp & Associates Geotechnical Consultants	TYPICAL DETAIL	Figure
	DAYLIGHT SHEAR KEY	1

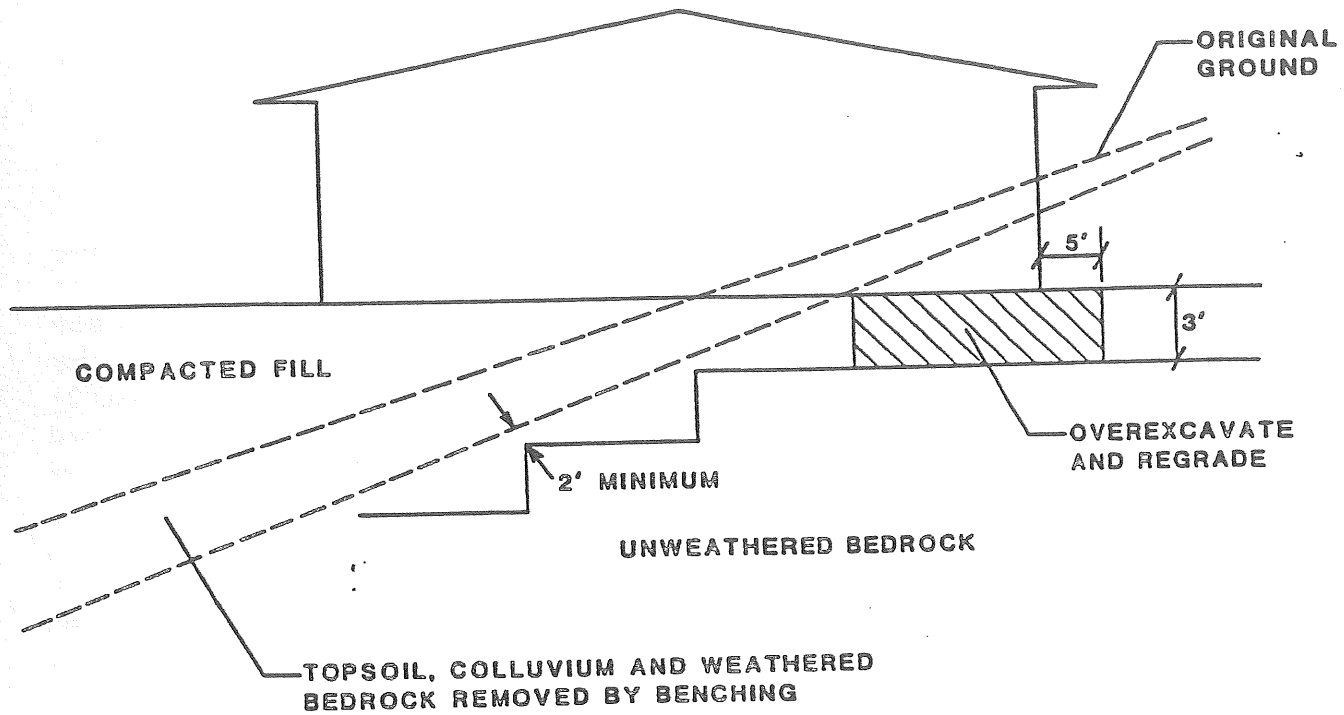
c. Transition Pads

i. Our review of the Preliminary Subdivision Map indicates that grading, as proposed, will probably result in a transition (bedrock/fill) condition on some lots, particularly in the lower elevations of the foothills.

ii. The building pads on cut/fill transition lots should be overexcavated a minimum of 3 feet below finish grade, and reworked to include placement of compacted fill in accordance with the Transition Lot Detail provided in Figure 2.

d. Fill Pads

i. Prior to placement of fill materials, the native colluvium and weathered bedrock beneath areas to recieve fill should be excavated to a depth where firm material is encountered. It is anticipated that the depth of excavation required will not exceed 2± feet, subject to review during grading. The exposed surface should then be moisture conditioned, and compacted prior to placement of fill materials.



ii. Fill pads constructed on natural slopes must be constructed per the recommendations for placement of fill-over-native materials presented herein. See subparagraph 7.2.9.c. and Figure 3.

7.2.4.3 General (All Areas):

a. Prior to placing fill the exposed surface should be scarified to a depth of 6 to 8 inches, moisture conditioned, and compacted.

b. Due to the fact that the depth of reworking will be dependent of the final foundation dimensions, depths of embedment, slab and pavement grades etc., our office should be provided with a copy of the final, approved plans prior to the commencement of earthwork operations. The depths of reworking required are subject to review by the Geotechnical Consultant during grading when subsurface conditions become exposed.

CUT/FILL LOT (TRANSITION)

Tharp & Associates Geotechnical Consultants	TYPICAL DETAIL	Figure
	TRANSITION LOT	2

c. Settlements may need to be evaluated should the planned grades result in the ground surface being raised 3 or more feet above the existing grades in Valley Floor areas and 10 feet or more in Foothill areas. Should this occur, some additional reworking of existing materials may be required.

d. The depths of overexcavation should be reviewed by the Geotechnical Consultant during the actual construction. Any surface or subsurface obstructions, or questionable material encountered during grading, should be brought immediately to the attention of the Geotechnical Consultant for proper processing as required.

7.2.5 Subgrade Below Slabs-On-Grade

The native subgrade beneath slabs-on-grade shall be overexcavated and recompacted to a depth of 2 feet below the bottom of the baserock or to a depth of 3 feet below existing grade, whichever is greater. This zone of reworking shall extend a minimum of 5 feet laterally beyond the slab footprint.

7.2.6 Subgrade Below Pavements

In pavement areas the native subgrade should be reworked to a depth sufficient to provide a zone of compacted fill extending at least 12 inches below the original ground surface and should result in at least 12 inches of reworked material below the aggregate base course. This zone of reworking should extend laterally a minimum of 5 feet beyond the pavement.

7.2.7 Oversize Rock/Rock Disposal

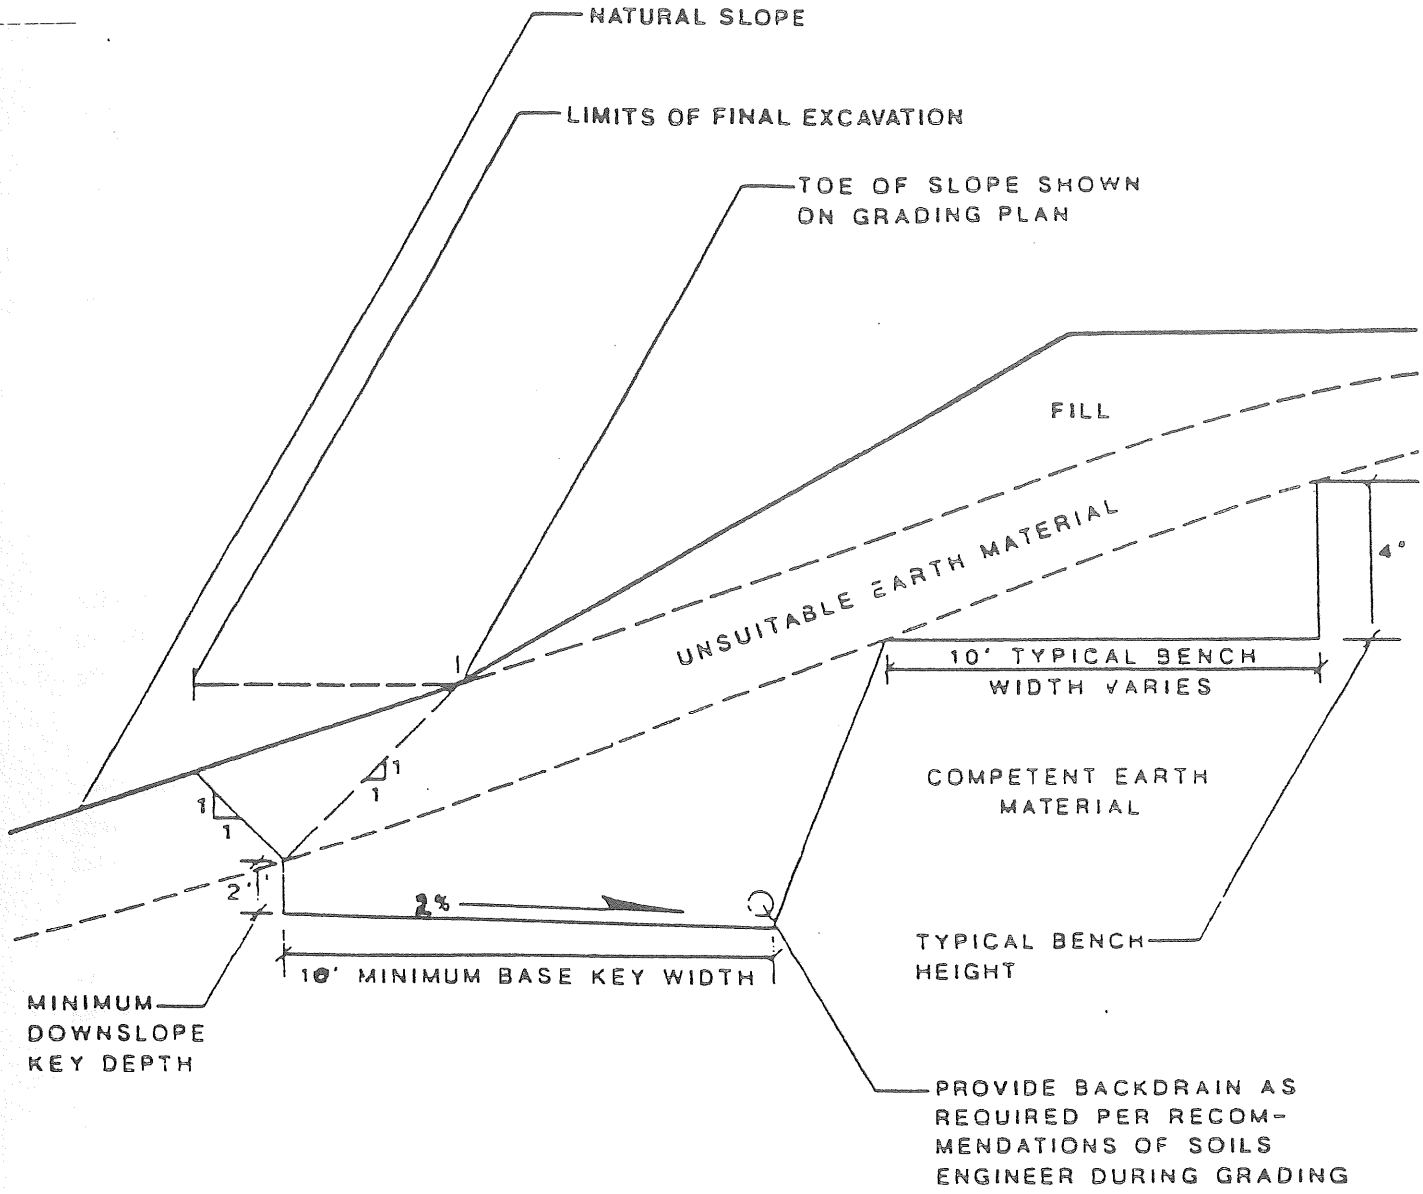
a. Based on the subsurface exploration and observations of natural exposures, significant quantities of oversized rock may be generated during grading, particularly in areas of deeper bedrock cuts in the foothill areas.

b. Structural fills should not contain material over 12 inches in maximum dimension and nothing larger than 4 inches should be placed within 1 foot of finish grade.

c. Oversized rock should not be used in the fill areas within the influence zone of structural improvements.

7.2.8 Fill Material

a. With the exception of the scattered pockets of highly expansive clay, the on-site colluvial/alluvial soils are considered suitable for use as compacted fill, provided they are free of vegetation, and organic matter exceeding 3%, debris and oversized material (greater than 12 in). In addition, no oversized material greater than 4 in should be placed within 1 ft of any footings or slabs.



b. Imported fill, if required, should be of expansivity not greater than medium and be free of vegetation, and organic matter exceeding 3%, debris and oversized material (greater than 12 in).

7.2.9 Compaction and Method of Fill Placement

a. With the exception of the upper 12 inches of subgrade beneath paved areas, all fill soils should be placed in 6- to 8-in thick loose lifts, brought to near-optimum moisture content and compacted to a minimum 90% relative compaction. In the upper 6 inches of subgrade beneath paved areas, all fill soils should be placed in 6- to 8-in thick loose lifts, brought to near-optimum moisture content and compacted to a minimum 95% relative compaction.

b. Base course beneath pavements and slabs-on-grade should be placed in 6- to 8-in thick loose lifts, brought to near-optimum moisture content and compacted to a minimum 95% relative compaction.

c. When placing fill in horizontal lifts over areas sloping steeper that 5:1 (horizontal:vertical), keys and benches should be excavated into the adjacent slope as shown on the corresponding typical detail in Figure 3. Keying and benching should be sufficient to provide at least 10-ft wide benches with a minimum 4-ft vertically between benches within competent natural ground or engineered fill. No fill should be placed in an area subsequent to keying and benching until the area has been observed by the geotechnical consultant. Material generated by the benching operation should be moved sufficiently away from the bench area to allow for the recommended observation of the bench prior to the placement of fill.

WHERE NATURAL SLOPE GRADIENT IS 5:1 OR LESS, BENCHING IS NOT NECESSARY. HOWEVER, FILL IS NOT TO BE PLACED ON COMPRESSIBLE OR UNSUITABLE MATERIAL.

Tharp & Associates Geotechnical Consultants	TYPICAL KEY AND BENCH DETAIL FILL OVER NATIVE SLOPE	Figure 3

d. Fill should be tested for compliance with the recommended relative compaction and moisture conditions. Field density testing should conform to ASTM D 1556, 2922 and/or 2937. Tests should be taken at approximately every 2 vertical ft and for every 1,000 yd^3 of fill placed. Base course below paved areas should be tested a minimum of every 150 linear feet of pavement. All fill found not to be in conformance with the grading recommendations should be removed or otherwise handled as recommended by the geotechnical consultant.

7.2.10 Shrinkage and Subsidence/Settlement

a. Based on analyses of the subsurface soil conditions, the on-site alluvial soils can be estimated to shrink on the order of 10% to 15% for initial planning purposes. The on-site bedrock can be expected to bulk on the order of 2%.

b. These factors do not include clearing/grubbing/stripping volummes, or losses due to handling. These factors can be reviewed periodically during grading, based on actual surveyed and volummetric data, if requested.

c. Subsidence due to the placement of fill and the movement of construction equipment is expected to be 1 inch. This is an estimate, subject to confirmation during grading.

d. Postgrading total and differential settlements under spread and continuous footings are expected to be within tolerable limits. Additional vertical movements due to the footings loads are expected to be no greater than 1 inch, and differential movements are expected to be no greater than 1/2 inch for the anticipated spacings and loads. These preliminary estimates should be reviewed by the Geotechnical Consultant when foundation plans and loads for the proposed structures are available.

7.2.11 Excavating Conditions

a. Valley Floor Areas:

We anticipate that excavation of on-site materials in the valley floor areas may be accomplished with standard earthmoving or trenching equipment.

b. Foothill Areas:

In foothill areas we anticipate that the materials in the upper 3 to 5 feet may be excavated using standard earthmoving equipment. However, below these depths, concretionary or cemented zones may be encountered in the weathered bedrock materials requiring specialized excavating equipment, and resulting in over-sized materials requiring disposal off-site or other special handling. If excavation of the very hard unweathered, crystalline, granite bedrock materials is necessary, blasting may be required.

c. Static groundwater was not encountered during the course of our field investigation and is not expected to affect grading operations. However, perched water was encountered at a depth of 16 feet in boring B-1 and at a depth of 30 feet in Boring B-10. This may result in wet conditions, particularly after periods of above normal precipitation, in the areas in the southwest portion of the San Vicente Vineyards parcel if the depth of excavations performed in connection with the construction of retention/detention ponds approaches the elevation of the perched water tables encountered.

7.2.12 Cut and Fill Slopes

a. Fill Slopes

i. All fill slopes should be constructed with engineered fill meeting the minimum density requirements of this report and have a gradient no steeper than 2:1 (horizontal:vertical). Fill slopes should not exceed 15 feet in vertical height unless specifically reviewed by the Geotechnical Consultant . Where the vertical height exceeds 15 feet, intermediate benches must be provided. These benches should be at least 6 feet wide and sloped to control surface drainage. A lined ditch should be used on each bench.

ii. Fill slopes shall be benched and keyed into the native slopes by providing a base keyway whose minimum width is 10 feet and which is sloped negatively at least 2% back into the slope. The depth of keyways will vary, depending on the materials encountered, but at all locations shall be at least 2 feet into firm material. This keyway should be combined with intermediate benching as required. Refer to Figure No. 3 for general details.

iii. If a fill slope is to be placed above a cut slope, the toe of the fill slope should be set back at least 8 feet horizontally from the top of the cut slope. A lateral surface drain should be placed in the area between the cut and fill slopes.

iv. Fill slopes should either be over built laterally a minimum of at least 3 ft and cut back to a firm and unyielding surface or backrolled to achieve same at no greater than 4-ft vertical intervals. Feathering of fill over the tops of slopes should not be permitted.

b. Cut Slopes

i. Foothill Areas:

Cut slopes in the foothill area shall not exceed a 1.5:1 (horizontal:vertical) gradient and a 15 foot vertical height unless specifically reviewed by the Geotechnical Consultant . Where the vertical height exceeds 15 feet, intermediate benches must be provided. These benches should be at least 6 feet wide and sloped to control surface drainage. A lined ditch should be used on each bench.

ii. Valley Floor Areas

Slopes cut in connection with construction of the detention ponds in the valley floor areas may be constructed as follows:

- Cut slopes less than 15 feet high should not exceed a slope inclination of 1.5:1 (Horizontal : Vertical).
- Cut slopes between 15 and 20 feet high should not exceed a slope inclination of 2:1 (Horizontal : Vertical).
- Cut slopes between 20 and 30 feet high should not exceed a slope inclination of 2.5 :1 (Horizontal : Vertical).

iii. Cut slopes exceeding a height of 20 feet should be reviewed by the Geotechnical Consultant on an individual basis.

c. General

i. In order to maintain stable slopes at the recommended gradients, it is important that any seepage forces and accompanying hydrostatic pressure encountered be relieved by adequate drainage. Drainage facilities may include subdrains, gravel blankets, rockfill surface trenches or horizontally drilled drains. Configurations and type of drainage will be determined by the Geotechnical Consultant during the grading operations.

ii. The surfaces of all cut and fill slopes should be worked to reduce erosion. This work, as a minimum, should include track rolling of the fill slopes and effective planting of all slopes. The protection of the slopes should be installed as soon as practicable so that a sufficient growth will be established prior to inclement weather conditions. It is vital that no slope be left standing through a winter season without the erosion control measures having been provided.

iii. The above recommended gradients do not preclude periodic maintenance of the slopes, as minor sloughing and erosion may take place.

7.2.13 Expansive Soils

a. The expansion potential of the proposed pad subgrade soils is anticipated to be low to medium.

b. Additional expansion tests should be performed at the completion of grading in order to verify that post grading expansivities conform to tested values.

7.2.14 Sulfate Content

Based on the results of our laboratory testing and on experience in the vicinity we anticipate the sulfate content of the subsurface soils to be less than 0.2 percent. Type II cement is therefore considered adequate for concrete in contact with on-site soil. This should be verified by additional sulfate content testing performed at the completion of grading.

7.2.15 Utility Trenches

a. Bedding material should consist of sand with an SE not less than 30, which may then be jetted. (Jetting may not be effective if adequate drainage is not available.)

b. Existing soils may be utilized for trench backfill, provided they are free of organic materials and rocks over 6 inches in diameter.

c. Backfill of all exterior and interior trenches should be compacted to achieve a relative compaction of not less than 90 percent, the compaction standard being obtained per ASTM: D 1557. Care should be taken not to damage utility lines.

d. Alternatively, backfill may be jetted if sand of an SE not less than 30 is used. (Jetting may not be effective if adequate drainage is not available.)

e. Trenches should be capped with 1.5± feet of relatively impermeable soil.

f. Jetting in trenches adjacent to buildings or slopes should be carried out only under the specific approval of the Geotechnical Consultant.

g. Trenches should be located so as not to impair the bearing capacity or cause settlement under foundations. As a guide, trenches subparallel to foundations should be clear of a 45-degree plane extending outward and downward from the edge of the foundations.

h. The walls of temporary construction trenches are expected to be stable when excavated nearly vertical, with only minor sloughing, provided the total depth does not exceed about 4 feet. Shoring of excavation walls or flattening of slopes may be required, if greater depths are necessary.

i. All work associated with trench shoring must conform to the State of California Safety Code.

7.3 Stability of Slopes

7.3.1 General

a. The subject site consists of relatively flat agricultural lands and neighboring foothills. Bedrock cuts are anticipated in the foothill areas and cut slopes in alluvium/colluvium are anticipated in the valley floor areas in connection with the construction of the proposed detention ponds. Slope stability calculations were performed for cases considered representative of the ranges of conditions in each of these areas, including the critical conditions.

b. Slopes considered representative of the proposed postconstruction configurations were analyzed for both static and pseudostatic (earthquake) cases. Repeatable high ground accelerations (RHGA) of 0.33g for deep soils and .25g for rock sites were used for the pseudostatic cases in accordance with the recommendations of the Project Geologist. See Reference.

c. The results of our analyses indicate that the proposed cut slopes, if constructed of appropriate materials, at the recommended inclinations, will generally possess Factors of Safety against overall and surficial instability, in excess of the values of 1.5 and 1.2 for the static and pseudostatic cases respectively, considered the minimum standard of practice in Monterey County. Some buttressing of specific cut slopes may be required as addressed below.

d. The exposed surfaces of all cut slopes should be evaluated during the initial stages of grading, with recommendations regarding the need for buttressing or stabilization fills made at that time based on exposed geologic conditions.

e. Methodology and results of the slope stability analyses are presented in Appendix C.

7.3.2 Detention Pond Cut Slopes

a. The stability of cut slopes in the detention pond areas was analyzed for configurations considered representative of site conditions. The pond cut slopes were modeled under rapid draw down effects that would occur when the pond drains. This is considered the critical case.

b. Material properties chosen for these analyses are conservatively based on laboratory test results for soil types considered representative of those encountered in areas proposed for the detention ponds. Shear parameters are based on saturated strengths and can be found in Appendix B and on the Boring Logs.

c. The proposed slopes were analyzed to determine the maximum stable cut slope height at several slope inclinations. Although not anticipated at this time, cut slopes exceeding a height of 20 feet should be reviewed on a case-by-case basis. The results of the analyses are presented in Table 1.

Table 1

Detention Pond Cut Slopes

Slope Inclination	Maximum Stable Height, ft.	Static Factor of Safety	Pseudostatic Factor of Safety
1.5:1	15	1.6	1.6
2:1	20	1.6	1.5
2.5:1	30	1.5	1.3

7.3.3 Foothill Area Bedrock Cuts

a. Anticipated bedrock cuts in the foothill area were analyzed for a slope inclination of 1.5:1 and a maximum slope height of 50 feet.

b. The cut slopes analyzed were conservatively modeled to include a water table perched on the unweathered bedrock underlying the surficial materials. This configuration represents the anticipated wet weather conditions and is considered the critical case.

c. Material properties chosen for these analyses are based on laboratory test results for the samples taken from borings in the foothills vicinity. Shear parameters are based on saturated strengths and can be found in Appendix B and on the Boring Logs.

7.3.4 Surficial Stability

Surficial slope stability analyses, assuming submergence of the upper 3 feet, were performed for typical slopes considered representative of proposed project conditions. The results of these analyses indicate that the anticipated cut slopes on the subject project, if constructed at the recommended inclinations of 1.5:1, 2:1, and 2.5:1(H:V) or less, possess a factor of safety in excess of the value of 1.5 considered the standard of practice in Monterey County. The results of our surficial stability analyses are presented in Appendix C, Figures C-3.1, 3.2 and 3.3.

7.3.5 Natural Slopes

Qualitative stability of the natural slopes adjacent to the subject site and the potential for landsliding has been addressed in the Geologic Report prepared for the site by Nolan Associates. See Reference. Quantitative analyses should be performed in cases where modifications to the setbacks recommended by the Project Geologists are desired.

7.3.6 Maintenance of Slopes

a. General

Maintenance of slopes is important to their long-term performance. The following is a list of recommended procedures provided as a guide for slope maintenance.

b. Slope Protection

i. All slope drainage should be provided in accordance with the Uniform Building code, Chapter 70, latest edition.

ii. Consideration should be given to berms, concrete v-ditches, or drainage swales at top of all slopes.

iii. Slopes should be planted with appropriate drought-resistant vegetation as recommended by a landscape architect.

iv. Slopes should not be over-irrigated. Heavy ground cover combined with over watering is a primarily source of surficial slope failures.

v. At no time should water be allowed to flow unchecked over the slope face.

vi. Animal burrows can serve to collect normal sheet flow on slopes and cause rapid and destructive erosion, and should be controlled or eliminated.

vii. In no instance should roof drainage, yard drainage, or water from swimming pools or other sources be diverted to flow onto graded or natural slopes.

viii. Modifications to slopes, including all placement of fill materials or excavations that steepen or otherwise modify the designed or natural slope angle, should not be attempted by the unadvised homeowner. All modifications to slope should be made under the direction of approval of the Geotechnical Consultant.

ix. Erosion control and slope maintenance measures should be maintained throughout the life of the project.

7.4 Subsurface and Surface Drainage

7.4.1 Subsurface Drainage

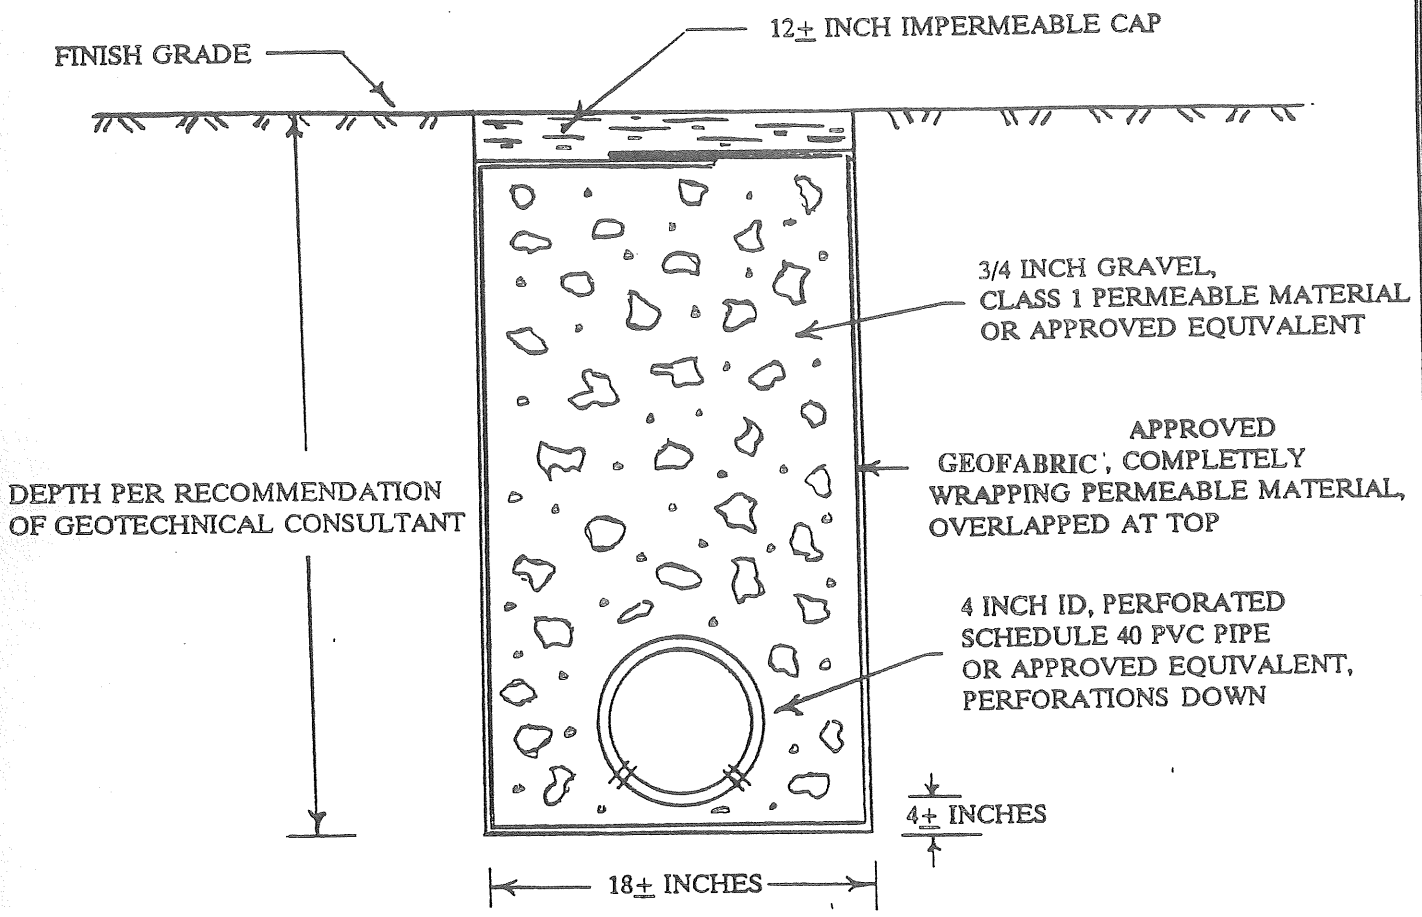
a. It is anticipated that subdrains will be required in the bottom of any canyon fills, in the keyways of all fill slopes and behind all retaining walls.

b. Typical specifications regarding subdrain installation are presented in Figure 4.

c. Final determination of the need for drainage devices should be made by the Geotechnical Consultant during grading.

7.4.2 Surface Drainage/Drainage Device Maintenance

a. Pad drainage should be at a gradient of a minimum of 2% away from foundation areas.



b. Drainage patterns established at the time of grading should be maintained throughout the life of the project.

c. Graded berms, swales, area drains, terrace drains and brow ditches are designed to carry surface water from pad and slope areas and should not be blocked or destroyed.

d. Water should not be allowed to pond in pad areas. Roof drains should outlet to proper drainage devices.

e. Sources of uncontrolled water, such as leaky water pipes, drains, etc., should be repaired.

f. The natural surface drainage features discharging onto the subject site in the north central and southeastern portions of the San Vicente Vineyards parcels should be collected in lined channels and discharged to suitable locations.

Tharp & Associates Geotechnical Consultants	**RECOMMENDED SUBDRAIN CONFIGURATION** TYPICAL DETAIL	Figure 4

7.4.3 Detention/Retention Ponds

a. The results of our field exploration and laboratory testing indicate that the material in the area of the proposed retention/detention ponds is composed of alluvial/colluvial deposits of sand derived from decomposed granitic bedrock with varying clay and silt contents.

b. Based on the results of the percolation testing performed, and our experience with similar materials in the area, an infiltration rate of 1.5 inches per hour may be assumed for preliminary design purposes. This value should be verified at the conclusion of rough grading when subsurface conditions become exposed.

7.5 Foundations

7.5.1 General

a. The foundation recommendations contained herein are for those buildings to be founded on the mass-graded pad areas. Foundation recommendations for structures to be located on the larger custom lots should be provided on a case-by-case basis in connection with the selection of specific building envelopes on these lots. The proposed structures, of the type anticipated, located on the mass-graded lots, may be founded on conventional, shallow, spread and pad footings. The criteria presented below should be adopted.

b. At the time we prepared this report, the grading plans and foundation details had not been completed and the locations of the structures had not been finalized. We request an opportunity to review these items during the design stages to determine if supplemental recommendations will be required.

c. Due to the anticipated difficulty in excavating portions of the foothill areas, pier and grade beam foundation systems may be economically attractive for structures constructed in these areas. Such foundation systems are considered geotechnically suitable. Recommendations for pier and grade beam systems may be provided upon request if their use proves advantageous.

7.5.2 Conventional Shallow Foundations

a. Footing widths should be based on the allowable bearing value but not less than 12 inches for 1 story and 15 inches for 2 story structures. Footing depths should be at least 12 inches for 1 story and 18 inches for 2 story sections. Should local building codes require deeper embedment of the footings or wider footings, the local codes must apply.

b. Footing excavations must be checked by the Geotechnical Consultant before steel is placed and concrete is poured to insure bedding into proper material. Excavations should be thoroughly wetted down just prior to pouring concrete.

c. The allowable bearing capacity may be determined from the following equation:

$$q_a ll = 500 + 700D + 250B$$

where:

$q_a ll$	=	allowable bearing capacity (lb/ft^2)
D	=	Depth of embedment (ft) measured from the lowest adjacent grade.
B	=	minimum footing width (ft)

d. The allowable bearing capacity used should not exceed 3000 lbs/ft^2.

e. The minimum recommended depth of embedment is 2 feet for exterior wall footings.

f. The allowable bearing capacity values above may be increased by one-third in the case of short duration loads, such as those induced by wind or seismic forces.

g. The allowable bearing capacity values above apply to both square pad footings and shallow strip footings, although they are slightly conservative for the pad footing case.

h. Bearing capacities should be re-evaluated when loads have been obtained and footings sized.

i. In computing the pressures transmitted to the soil by the footings, the embedded weight of the footing may be neglected.

j. The footings should contain steel reinforcement as determined by the Project Structural Engineer in accordance with applicable UBC or ACI Standards. As a minimum, steel in continuous footings should be as follows:

   i. With Very High expansivity soil - 4x#4 bars, 2 on top and 2 at the bottom.

   ii. With High expansivity soil - 2x#4 bars, 1 on top and 1 at the bottom.

k. In the event that as-graded subgrade soils under the proposed residences are of medium or greater expansivity, a concrete moisture cutoff barrier, consisting of a tie beam or thickened slab edge extending to a corresponding minimum depth of 24 inches below the lowest adjacent final grade, should be provided between exterior individual footings.

l. Foundations adjacent to downslopes should be located at a depth such that the horizontal setback of the leading edge of the bottoms of footings from the competent face of the slope is 1/2 x slope height, and at least 6 feet. The distance need not exceed 15 feet.

m. In the event that footings are founded in structural fill consisting of imported materials, the allowable bearing capacities will depend on the type of these materials and should be re-evaluated.

n. Embedment depths should not be allowed to be affected adversely, such as through erosion, softening, digging, etc.

o. Planter areas should not be sited adjacent to walls. In addition, measures should be implemented to contain irrigation water and prevent it from seeping into walls and under foundations, or into the slope areas.

p. Footing excavations should be observed and foundation plans and loads should be reviewed by the Geotechnical Consultant.

q. Total and differential settlements under spread and continuous footings are expected to be within tolerable limits.

7.6 Slabs-On-Grade

a. Concrete floor slabs may be founded on reworked existing soils or compacted fill. The subgrade should be proof-rolled just prior to construction to provide a firm, relatively unyielding surface, especially if the surface has been loosened by the passage of construction traffic.

b. If a floor covering that would be critically affected by moisture is to be used, a 10-mil plastic vapor barrier is recommended. This sheeting should be covered with 2 inches of sand.

c. The subgrade should be presoaked as follows;

i.	Highly expansive soil -	5 percentage points above optimum, or to 125% of optimum, whichever is greater; to 2 feet depth.
ii.	Medium expansive soil -	5 percentage points above optimum, or to 125% of optimum, whichever is greater; to 1.5 feet depth
iii.	Low or Very Low expansive soil -	4 percentage points above optimum, or to 120% optimum, whichever is greater; to 1 foot depth

d. The expansivity of the on-site soils is generally considered to be Medium, subject to confirmation at the conclusion of mass grading.

e. Slabs should be at least 4 inches thick (nominal). Joints should be provided per usual practice.

f. Slabs should be underlain by a minimum 4 inches of granular base.

g. Steel should be provided in slabs-on-grade per the recommendations of the Structural Engineer, with a minimum as follows:

i. With Very High expansivity soil -
6x6-W2.9xW2.9 WWF, supported on chairs

ii. With less expansive soil -
6x6-W1.4xW1.4 WWF

h. Bearing capacities should be re-evaluated when loads have been obtained and footings sized.

i. In computing the pressures transmitted to the soil by the footings, the embedded weight of the footing may be neglected.

j. The footings should contain steel reinforcement as determined by the Project Structural Engineer in accordance with applicable UBC or ACI Standards. As a minimum, steel in continuous footings should be as follows:

   i. With Very High expansivity soil - 4x#4 bars, 2 on top and 2 at the bottom.

   ii. With High expansivity soil - 2x#4 bars, 1 on top and 1 at the bottom.

k. In the event that as-graded subgrade soils under the proposed residences are of medium or greater expansivity, a concrete moisture cutoff barrier, consisting of a tie beam or thickened slab edge extending to a corresponding minimum depth of 24 inches below the lowest adjacent final grade, should be provided between exterior individual footings.

l. Foundations adjacent to downslopes should be located at a depth such that the horizontal setback of the leading edge of the bottoms of footings from the competent face of the slope is 1/2 x slope height, and at least 6 feet. The distance need not exceed 15 feet.

m. In the event that footings are founded in structural fill consisting of imported materials, the allowable bearing capacities will depend on the type of these materials and should be re-evaluated.

n. Embedment depths should not be allowed to be affected adversely, such as through erosion, softening, digging, etc.

o. Planter areas should not be sited adjacent to walls. In addition, measures should be implemented to contain irrigation water and prevent it from seeping into walls and under foundations, or into the slope areas.

p. Footing excavations should be observed and foundation plans and loads should be reviewed by the Geotechnical Consultant.

q. Total and differential settlements under spread and continuous footings are expected to be within tolerable limits.

7.6 Slabs-On-Grade

a. Concrete floor slabs may be founded on reworked existing soils or compacted fill. The subgrade should be proof-rolled just prior to construction to provide a firm, relatively unyielding surface, especially if the surface has been loosened by the passage of construction traffic.

b. If a floor covering that would be critically affected by moisture is to be used, a 10-mil plastic vapor barrier is recommended. This sheeting should be covered with 2 inches of sand.

c. The subgrade should be presoaked as follows;

i.	Highly expansive soil -	5 percentage points above optimum, or to 125% of optimum, whichever is greater; to 2 feet depth.
ii.	Medium expansive soil -	5 percentage points above optimum, or to 125% of optimum, whichever is greater; to 1.5 feet depth
iii.	Low or Very Low expansive soil -	4 percentage points above optimum, or to 120% optimum, whichever is greater; to 1 foot depth

d. The expansivity of the on-site soils is generally considered to be Medium, subject to confirmation at the conclusion of mass grading.

e. Slabs should be at least 4 inches thick (nominal). Joints should be provided per usual practice.

f. Slabs should be underlain by a minimum 4 inches of granular base.

g. Steel should be provided in slabs-on-grade per the recommendations of the Structural Engineer, with a minimum as follows:

i. With Very High expansivity soil -
6x6-W2.9xW2.9 WWF, supported on chairs

ii. With less expansive soil -
6x6-W1.4xW1.4 WWF

iii. It is necessary that the mesh be properly positioned in the middle of the slab to control cracking. In our experience, proper positioning of welded wire fabric is usually not achieved in practice, due to adequate care not being taken. In these circumstances consideration should be given to utilizing the equivalent rebar, supported on chairs.

iv. Low slump concrete should be used to minimize shrinkage cracking. The concrete should be cured properly.

v. If hooking of fabric is employed on this project, it shall be at the Contractor's discretion, and the contractor shall be solely responsible for placing the fabric uniformly at mid-depth of the slab.

h. The recommendations presented in Subsections 7.5 and 7.6 above which refer to very highly expansive soils are provided as a contingency measure should the expansion potential of the subgrade soils after mass gradeing be other than that previously tested.

i. The FFL should be at least 6 inches above highest adjacent grade.

j. i. The utilization of post-tensioned concrete slabs may be considered in lieu of conventional concrete slabs. There are inherent advantages with this system, especially the characteristics that the propagation or widening of cracks that may otherwise develop is inhibited. Additional geotechnical recommendations for post-tensioned slabs are as follows:

ii. Minimum thickness: 4 inches (structural/construction considerations would govern.)

iii. Substructure: 1 inch sand, over 10-mil plastic sheet, over prepared subgrade. (Not required for garage slabs, unless the Structural Engineer prefers the placement of the sand.)

iv. Minimum embedment of edge beam below lowest adjacent exterior grade: 18 inches.

v. The subgrade moisture content should be maintained at the same level as when the soil was processed during grading: generally to $4\pm$ percentage points above optimum, subject to review during construction. Some moisture conditioning of the subgrade should be anticipated. The sand layer should be kept moist prior to pouring the concrete.

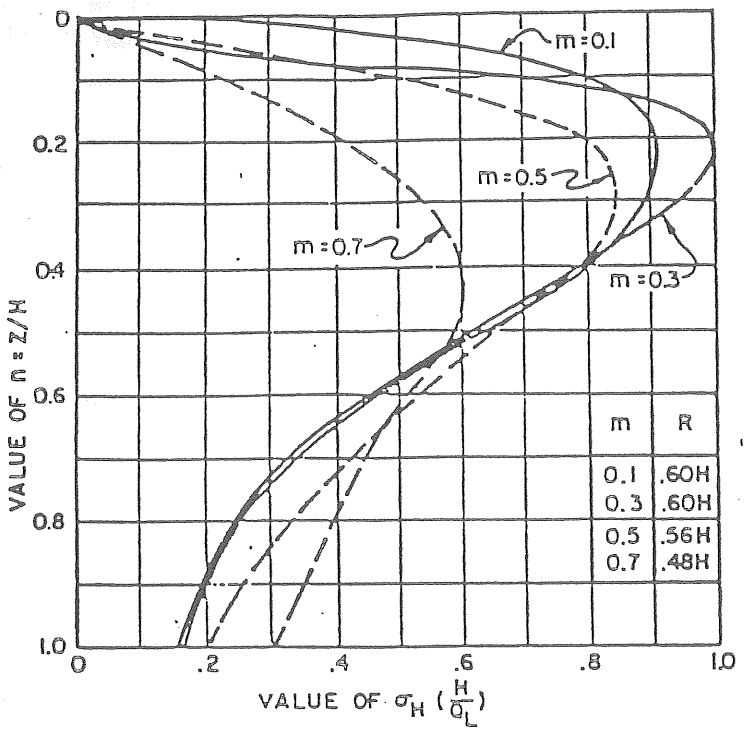
7.7 RETAINING STRUCTURES

7.7.1 Lateral Earth Pressures

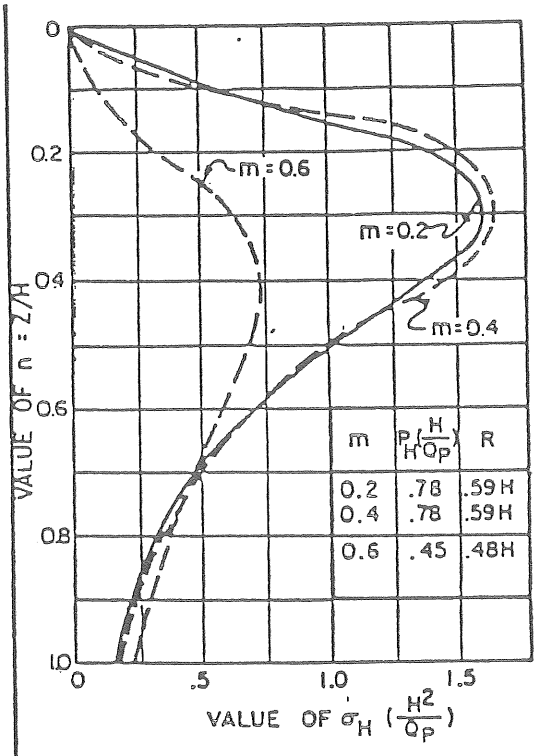
a. The lateral earth pressures presented in Table 3 are recommended for the design of retaining structures with a gravel blanket and backfill soils of expansivity not higher than Medium. Should the slope behind the retaining walls be other than level or 2:1 horizontal to vertical, supplemental design criteria will be provided for the active earth or at-rest pressures for the particular slope angle.

Table 3. Lateral Earth Pressures

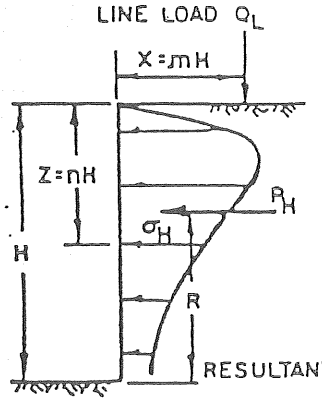
Type	Soil Profile	Soil Pressure (psf/ft)	
		Unrestrained Wall	Rigidly Supported Wall
Active Pressure	Level 2:1	40 60	- -
At-Rest Pressure	Level 2:1	- -	65 80
Passive Pressure (ignore upper 0.5 ft)	Level 2:1	400 200	200 100



b. Friction coefficient - 0.35



c. Where both friction and the passive resistance are utilized for sliding resistance, either of the values indicated should be reduced by one-third.



d. These are ultimate values.

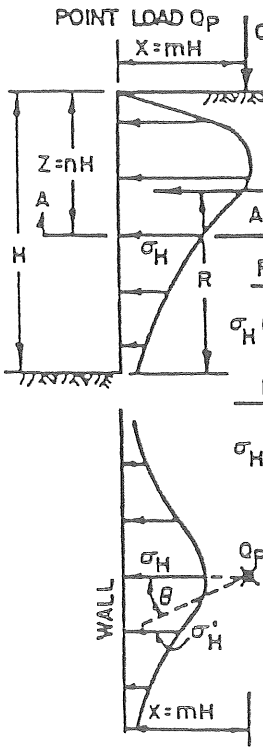
e. Pressure due to any surcharge loads from adjacent footings, traffic, etc., should be analyzed separately. Pressures due to these loading can be estimated from Figure 5. and can supplied upon receipt of the appropriate plans and loads.

f. These values apply to the existing soil and to compacted backfill generated from in-situ material. Imported material should be evaluated separately.

FOR $m \leq 0.4$:

$$\sigma_H\left(\frac{H}{Q_L}\right) = \frac{0.20n}{(0.16+n^2)^2}$$

$$P_H = 0.55\,Q_L$$



FOR $m > 0.4$:

$$\sigma_H\left(\frac{H}{Q_L}\right) = \frac{1.28\,m^2 n}{(m^2+n^2)^2}$$

PRESSURES FROM LINE LOAD Q_L

(BOUSSINESQ EQUATION MODIFIED BY EXPERIMENT)

Tharp & Associates Geotechnical Consultants	SURCHARGE PRESSURE DIAGRAM LATERAL SURCHARGE PRESSURE DUE TO ADJACENT VERTICAL LOADS	Figure 5

7.7.2 Backfill

a. Backfill should be placed under engineering control.

b. Highly expansive soils should not be used as backfill.

c. It is recommended that, where feasible, granular backfill be utilized, for a width equal to approximately 1/4 x wall height, and not less than 1.5 feet.

d. The granular backfill should be capped with at least 18 inches of relatively impermeable material.

e. Backfill should be compacted to achieve a minimum 90 percent relative compaction, the compaction standard being obtained in accordance with ASTM: D 1557.

f. Precautions should be taken to ensure that heavy compaction equipment is not used immediately adjacent to walls, so as to prevent undue pressures against, and movement of, the walls.

g. The use of water-stops/impermeable barriers should be considered for any basement construction, and for building stem walls which retain earth.

7.7.3 Backfill Drainage/Subdrains

a. i. Subdrains should be provided in the backfill of the stem walls.

ii. Weepholes or subdrains should be provided in the backfill of free-standing retaining walls. Subdrains are recommended for walls exceeding 4 feet in height of soil retained.

iii. Subdrains should be per Subsections b) to f) below.

b. Subdrains should consist of 4-inch diameter Schedule 40, PVC pipe or equivalent, embedded in approximately 3 ft^3/linear foot of Class 2 Permeable Material or equivalent, with the pipe being 6± inches above the trench bottom; a gradient of 1±% being provided to the pipe and trench bottom; discharging into suitably protected outlets.

c. 3/4-inch down open-graded gravel, enveloped in Supac 5NP geofabric filter or equivalent, may be used instead of the Class 2 Permeable Material.

d. Perforations in subdrains are recommended as follows: 3/8-inch diameter, in 2 rows at the ends of a 120° arc, at 3-inch centers in each row, staggered between rows, placed downward.

e. Subdrains placed behind retaining walls should be approved by the Geotechnical Consultant prior to the placement of fill.

f. An unobstructed outlet should be provided at the lower end of each segment of subdrain. The outlet should consist of an unperforated pipe of the same diameter, connected to the perforated pipe and extended to a protected outlet at a lower elevation, on a continuous gradient of at least 1 percent.

7.7.4 Footings - Retaining Walls

a. Footings should be embedded to minimum depths below lowest adjacent grade, as indicated in Subsection 7.5.

b. Setbacks from tops of slopes should be as indicated in Subsection 7.5.2.

c. The allowable bearing capacity may be taken as indicated in Subsection 7.5.2., subject to stability requirements.

d. If retaining walls are to be situated at the tops of slopes, such walls should reviewed/analyzed for overall slope stability. Setbacks, embedment depths and allowable bearing pressures may need to be modified accordingly.

7.8 Seismicity

Issues related to seismicity are addressed in detail in the Geologic Report Prepared for the Site by Nolan Associates. See Reference. As a minimum, structures should be designed for seismic forces in accordance with UBC Section 2312, for Zone 4.

7.9. Asphalt Concrete Pavement

a. Based upon an estimated R-Value of 21 and the Traffic Indices (TI) indicated, the following tentative pavement sections are recommended for preliminary design purposes.

Location/Pavement Utilization		TI	Asphalt Concrete Surface Course (in)	Aggregate Base Course (in)
i.)	Auto Parking/Driveways	4.0	3	4.5
ii.)	Circulation Drives w/ Infrequent Trucks	4.5	3	6.0
iii.)	Moderate Use Drives w/ Truck Traffic	5.5	3	9.0

b. The actual R-Value should be obtained at the conclusion of mass grading and the tentative pavement sections reviewed at that time. Pavement sections for Traffic Indices other than those presented may be supplied upon request.

c. The subgrade should be compacted to achieve a relative compaction of at least 95 percent through the upper 12 inches.

d. The Aggregate Base should be compacted to achieve a relative compaction of at least 95 percent.

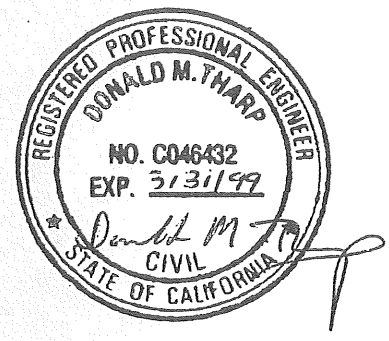
e. Base material should meet the requirements of the Standard Specifications for Public Works Construction (Green Book), or for Class 2 Aggregate Base per Cal Trans. Compaction of subgrade and base course should be in accordance with ASTM D 1557.

7.10 Exterior Concrete Flatwork/Pavement

a. The long-term performance of exterior concrete flatwork/pavement at the site will be influenced by any expansive soils. Positive drainage and maintaining soil moisture at above optimum conditions prior to pouring concrete will help improve the performance of concrete flatwork at the site.

b. Concrete flatwork should be divided into as nearly square panels as possible. Frequent joints should be provided to give articulation to the concrete panels. Landscaping and planters adjacent to concrete flatwork should be designed in such a manner as to direct drainage away from concrete areas to approved outlets.

c. It is assumed that flatwork other than pavement will be subjected only to pedestrian traffic.



7.11 Subsequent Grading Operations

Prior to the commencement of additional grading operations on-site, including precise grading of building and pavement areas, as well as backfilling of trenches, the Geotechnical Consultant should be notified to provide appropriate recommendations and observation and testing services as required.

It is a pleasure being associated with you on this project. If you have any questions, or if we may be of further assistance, please do not hesitate to contact our office.

Sincerely,

DONALD M. THARP & ASSOCIATES

SUBJECT: **GEOTECHNICAL INVESTIGATION - PRELIMINARY DESIGN PHASE**
Proposed Miravale III Subdivision
Miravale, Soledad, California

REFERENCE: Tharp & Associates, Inc., 1995, Preliminary Soil & Foundation Investigation - EIR Phase, Proposed Miravale Residential Development, Parcels 1,2,3,4,&6 of 19, Survey Page 76,(MS 95-004), Soledad, Monterey County, California, October 19, 1995, Project No. 95-26.

Dear Mr. Agha,

1. INTRODUCTION

1.1 Purpose

a. This report presents the results of our geotechnical investigation for the preliminary design phase of the proposed Miravale III Development, Soledad, California.

b. The purpose of our investigation is to evaluate the proposed development with respect to geotechnical conditions present, and provide preliminary geotechnical design parameters and recommendations for development of the site. Conclusions and recommendations related to site suitability, grading, foundations, pavements, and associated improvements are presented herein.

c. Final grading, structural, and foundation plans are unavailable as of the date of this report. The intention, as we understand it, is to use the findings and recommendations of this report as a basis for developing such plans.

d. We have reviewed the following items in connection with the preparation of this report:

i. Preliminary Plan Set, Phase III, Miravale Subdivision, Soledad, California, Sheets 1 through 3, Sheets 1 and 3 Dated 5/30/06, Sheet 2 Dated 6/23/06.

ii. The referenced geotechnical report.

1.2 Proposed Development

a. Based on our review of the Preliminary Plan Set itemized in 1.d.i. above, and our discussions with you and your Civil Engineer, it is our understanding that the subject project consists of the construction of a residential subdivision, two churches, a commercial development, a golf practice range, a golf course clubhouse and maintenance yard, a 16.25 acre PUD for future development, a 4 acre PUD, a 15.12 acre middle school parcel and the future development area north and west of this parcel. Also included are two detention ponds on a roughly rectangular 285 acre parcel located west of San Vincente Road.

b. Also anticipated is the construction of the attendant utilities, paved drives and parking areas, including the realignment of San Vincente Road, as well as landscape and drainage improvements.

1.3 Scope of Services

The scope of services provided during the course of our investigation included:

a. Review of previous geotechnical reports and maps pertinent to the site.

b. Field exploration consisting of 25 borings drilled to depths of 10 ± to 50 ± feet below existing grade.

c. Percolation testing in 3 locations. Test locations were chosen by the client.

d. Logging and sampling of the borings by our Field Engineer, including the collection of soil samples for laboratory testing.

e. Laboratory testing of soil samples considered representative of subsurface conditions.

f. Geotechnical analyses of field and laboratory data.

g. Assessment of project impacts and recommended mitigation measures.

h. Preparation of a report (10 copies) presenting our findings, conclusions and recommendations.

1.4 Authorization

This investigation, as outlined in our Proposal dated July 21, 2006, was performed in accordance with your written authorization of July 24, 2006.

2. FIELD EXPLORATION PROGRAM

Details of the field exploration, including the Boring Logs, Figures A-3 through A-27, are presented in Appendix A.

3. LABORATORY TESTING PROGRAM

Laboratory testing was performed on relatively undisturbed and bulk samples considered representative of subsurface conditions. Details of the laboratory testing program are presented in Appendix B. Test results are presented on the Boring Logs, Figures A-3 through A-, and in Appendix B.

4. INFILTRATION TESTING

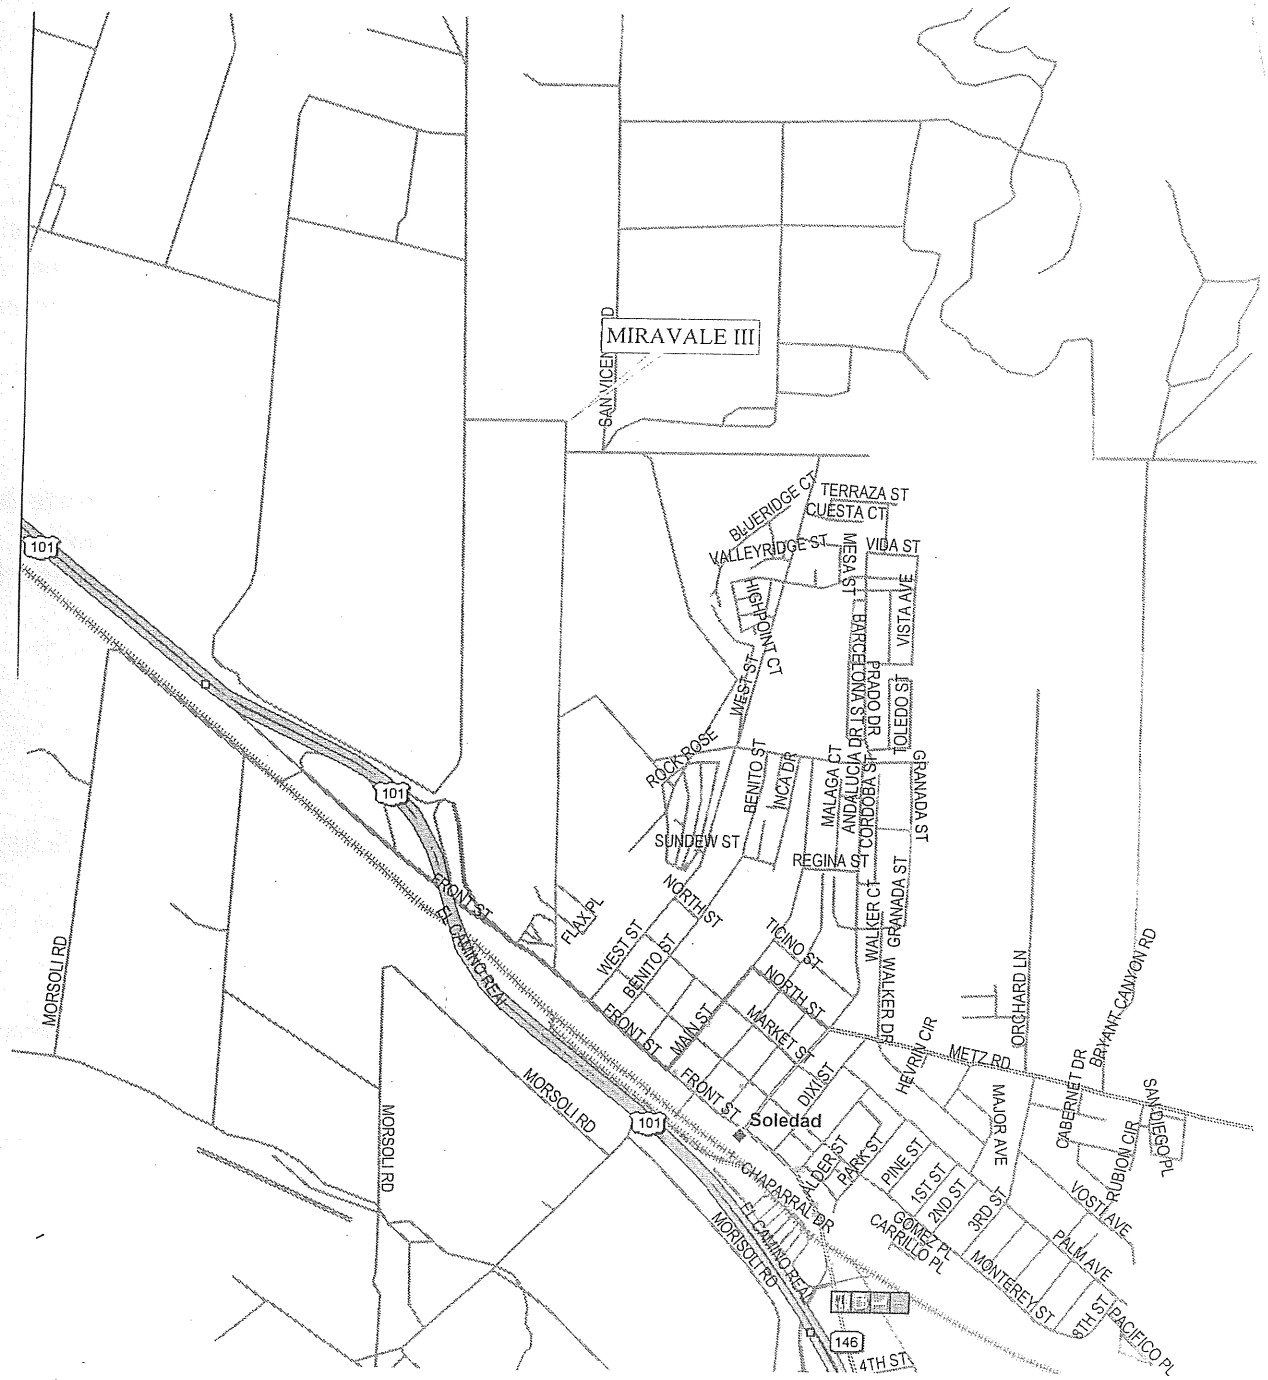
Infiltration testing was performed at three locations on this parcel. Two tests were performed in the location proposed for the north detention pond and one test was performed in the location proposed for the southern detention pond. Test results are presented in subsection 7.3.3..

5. SITE DESCRIPTION

5.1 Location

The project site is located on 285 acres west of San Vincente Road, Soledad, California. The site location is shown on the Location Map, Figure 1.

5.2 Surface Conditions



a. The subject property is currently in agricultural use and consists of relatively flat agricultural fields generally sown with row crops.

b. The surface soils are generally composed of dark brown to red brown clayey sand. The surface soils were very loose to medium dense, moist except where irrigated, and slightly to medium plastic at the time of our field exploration.

5.3 Subsurface Conditions

a. The results of our field exploration indicate that the subsurface soils present on the site are relatively consistent.

b. The soils encountered consist of a relatively thick alluvial/colluvial deposit composed of clayey sand with varying amounts of silt and gravel overlying sands and gravels with lesser clay contents. The clayey sands in the upper stratum anticipated to impact the proposed development are generally loose to medium dense, somewhat compressible, and of low expansivity.

Tharp and Associates, Inc. Geotechnical Consultants	**LOCATION MAP** Miravale III Subdivision	Figure 1

The sands and gravels which primarily underlie the southern portions of the site, are generally medium to very dense, considered to be only slightly compressible, and of very low expansivity.

c. Regional groundwater was only encountered in the extreme southern portion of the site in the sand / gravel deposits at a depth of 30 feet in the boring B-3. However, shallow groundwater was encountered perched on the dense clayey sand layers in the central portions of the site. This groundwater was encountered at an average depth of approximately 11 feet and appears to be perched on the denser clayey sand materials encountered at a depth of approximately 20 feet.

d. Complete soil profiles are presented on the Boring Logs, Appendix A, Figures A-3 through A-27. The boring locations are shown on the Boring Location Plan, Figure A-1.

6. GEOTECHNICAL HAZARDS

6.1 General

a. Geotechnical hazards to man made structures at this site include ground shaking, ground rupture, landsliding, liquefaction, lateral spreading, and differential compaction.

b. Ground shaking caused by earthquakes is a complex phenomenon. Structural damage can result from the transmission of earthquake vibrations from the ground into the structure. The intensity of shaking depends on, amongst other items, the proximity of the site to the focal point of the earthquake. Structures built on unconsolidated material generally experience movements of higher amplitude and lower acceleration. In the event of an earthquake, frame and semi-rigid structures with proper seismic parameters incorporated into their design and construction should display only moderate damage. The structure must be designed in accordance with the applicable seismic design parameters outlined in the 1997 Uniform Building Code. See Table I.

Table I. Seismic Design Parameters

		Seismic Coefficient		Near Source Factor		
Soil Profile Type	Seismic Zone Z	C_a	C_v	N_a	N_v	Seismic Source Type
S_d	0.4	0.44 N_a	0.64 N_v	1.0	1.1	B

c. The subject site is generally flat. Landsliding is therefore not expected to present a threat to the proposed development.

d. Liquefaction, lateral spreading and differential compaction tend to occur in loose, unconsolidated, noncohesive soils with shallow groundwater. Groundwater was encountered during our field investigation at approximately 11 feet in Boring B-9, representative of the central portion of the proposed project and at a depth of 30 feet in Boring B-3, representative of the southern portion of the site. To determine the potential for liquefaction to occur at these locations on the subject site, a quantitative liquefaction analysis was performed. See subsection 6.2 below.

5.2 Liquefaction

5.2.1 General

a. Liquefaction tends to occur in loose, poorly graded, sandy and unconsolidated soils below the ground water table. The material underlying the central portion of the proposed project site from approximately 11 to 20 feet (See Boring B-9), and the southern portion of the site from 45 to 50 feet (See Boring B-3) represents the critical configuration for liquefaction analysis as the soils encountered in these areas were generally characteristic of potentially liquefiable soils. The soils are composed of poorly graded sand with trace to some clay.

b. A quantitative liquefaction analysis was therefore performed for subsurface conditions corresponding to encountered during our field exploration. The conditions analyzed are considered representative of the critical subsurface conditions in these areas of the site. The subsurface profiles used in our analysis correspond to those encountered in Borings B-9 and B-3.

5.2.2 Methodology

a. A quantitative liquefaction analysis was performed using empirical predictions of earthquake-induced liquefaction potential. The analysis is based on a comparison of the in situ cyclic stress ratio (CSR) with that historically present in areas experiencing liquefaction for a given earthquake magnitude and recorded soil grain size distribution and penetration resistance (as expressed by SPT blows\ft). The analysis is based on the method presented within the paper by R.B. Seed, K.O. Cetin, R.E.S. Moss, A.M. Kammerer, J. Wu, J.M. Pestana, M.F. Riemer, R.B. Sancio, J.D. Bray, R.E. Kayen, A. Faris, Recent Advances In Soil Liquefaction Engineering: A Unified And Consistent Framework, Dated April 30, 2003.

b. Our analysis was performed assuming a peak ground acceleration of 0.344g. This value was determined based on the USGS/CGS Probabilistic Seismic Hazards Assessment (PSHA) Model, 2002 (revised April 2003) which represents a peak ground acceleration with a 10% probability of being exceeded in 50 years. A magnitude of 7.9 on the San Andreas Fault Zone was used in the analysis based on the same model.

c. Grain size analyses were performed on three samples considered representative of the potentially liquefiable soils encountered. Results of our grain size analyses are presented in Appendix B, Figures B-16 through B-18.

5.2.3 Results and Discussion

a. The results of our liquefaction analyses indicate that under the conditions anticipated during the design seismic event, an approximately 9 foot thick layer of the poorly graded sand with trace to some clay underlying the central portion of the site at depths of approximately 11 to 20 feet are potentially liquefiable. Surface deformations of approximately 3 inches may be assumed to occur as a result.

b. The results of our liquefaction analyses further indicate that under the conditions anticipated during the design seismic event, an approximately 6 foot thick layer of the poorly graded sand with trace clay underlying the southern portion of the site at depths of approximately 45 to 50 feet are potentially liquefiable. Surface deformations of approximately 2 inches may be assumed to occur as a result.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 General

a. Based on the results of our review of the Preliminary Plan Set, we consider that development of the site is geotechnically compatible with the known geotechnical conditions, provided the recommendations of this report are incorporated into the project plans and specifications.

b. The recommendations included here-in are provided for preliminary design and planning of grading and construction with regard to the aforementioned Preliminary Plan Set. These recommendations are subject to review when detailed final grading plans become available, during grading when actual conditions are exposed, and after grading when the as-graded conditions are known.

c. The Primary geotechnical conditions affecting the proposed development are:

i. The presence of potentially liquefiable soils underlying the central and southern portions of the site. It is anticipated that rigid mat or waffle slab foundations will be necessary in order to mitigate the potential adverse impacts of these materials within structural areas.

ii. The collapsible and somewhat compressible nature of the near-surface alluvial/colluvial deposits underlying the valley floor areas of the site. It is anticipated that overexcavation and recompaction of these materials will be necessary in order to mitigate the potential adverse impacts of these materials within structural areas.

iii. The stability of the existing and proposed cut and fill slopes.

iv. The presence of relatively shallow perched water which may impact utility installation and or excavation of the retention / detention ponds.

d. General geotechnical considerations applicable to site grading and preliminary recommendations for the proposed construction are discussed below:

7.2 Grading and Earthwork

7.2.1 General

Grading should be accomplished in accordance with the recommendations presented herein, and the grading requirements of the County of Monterey. Care should be exercised during removal operations adjacent to existing structures including roadways, storm drains, and residences, including their adjoining slopes.

7.2.2 Site Preparation

a. Prior to grading, the areas to be developed for structures, pavements and other improvements, should be stripped of any vegetation and cleared of any surface or subsurface obstructions, including any existing foundations, utility lines, basements, septic tanks, pavements, stockpiled fills, and miscellaneous debris.

b. Although none were observed during the investigation, abandoned wells underground facilities such as cesspools, septic tanks, utilities, pipes or underground storage tanks may exist at the site. Should any such facilities be discovered prior to or during grading, recommendations will be given for their safe removal and proper backfilling of resulting voids. Removal of underground tanks is subject to state law as regulated by County or City Health and/or Fire Department agencies. If storage tanks containing hazardous or unknown substances are encountered, the proper authorities must be notified prior to any attempts at removing such objects.

c. Holes resulting from the removal of buried obstructions that extend below finished site grades should be backfilled with compacted engineered fill.

7.2.3 Preparation of Existing Soils

a. All undocumented fill soils and debris should be removed in their entirety.

b. The extent and depths of removal should be determined by the Geotechnical Consultant during grading operations.

7.2.4 Pad Preparation

a. Prior to placing fill the exposed surface should be scarified to a depth of 6 to 8 inches, moisture conditioned, and compacted.

b. Due to the fact that the depth of reworking will be dependent of the final foundation dimensions, depths of embedment, slab and pavement grades etc., our office should be provided with a copy of the final, approved plans prior to the commencement of earthwork operations. The depths of reworking required are subject to review by the Geotechnical Consultant during grading when subsurface conditions become exposed.

c. Settlements may need to be evaluated should the planned grades result in the ground surface being raised 3 or more feet above the existing grades in the Valley Floor. Should this occur, some additional reworking of existing materials may be required.

d. The depths of overexcavation should be reviewed by the Geotechnical Consultant during the actual construction. Any surface or subsurface obstructions, or questionable material encountered during grading, should be brought immediately to the attention of the Geotechnical Consultant for proper processing as required.

7.2.5 Subgrade Below Waffle or Mat Foundation Elements

Beneath all waffle or mat foundation elements, the loose clayey sand should be reworked to a depth where the dense clayey sand is encountered or to a depth sufficient to provide a zone of compacted, engineered fill, extending to a depth equal to twice the **width** of the stiffening elements or edge sections measured from the bottom of the element or edge section, whichever is greater. It is anticipated that this will equate to approximately 3 to 4 feet below existing grade. The exposed surface at the base of the excavation should then be scarified, moisture conditioned, and compacted to a minimum of 90% relative compaction. The material which was removed should then be replaced as compacted engineered fill per the recommendations presented in Subsection 7.2.9.. This zone of reworking should extend a minimum of 5 feet laterally beyond the building footprint.

7.2.6 Subgrade Below Slabs-On-Grade and Pavements

Beneath other concrete slabs-on-grade and/or pavements, the loose surficial clayey sand should be reworked to a depth where the dense clayey sand is encountered or to a depth sufficient to provide a zone of compacted, engineered fill, extending a minimum of 2 feet below the bottom of the baserock, or 3 feet below existing grade, whichever is less. The exposed surface should then be scarified, moisture conditioned, and compacted to a minimum of 90% relative compaction. The material which was removed may then be replaced as compacted engineered fill per the recommendations presented in Subsection 7.2.9. This zone of reworking shall extend a minimum of 2 feet laterally beyond the slab and pavement footprint.

7.2.7 Oversize Rock/Rock Disposal

a. Based on the subsurface exploration and observations of natural exposures, some oversized rock may be generated during grading, particularly in areas of deeper cuts performed during construction of the southern detention pond.

b. Structural fills should not contain material over 12 inches in maximum dimension and nothing larger than 4 inches should be placed within 1 foot of finish grade.

c. Oversized rock should not be used in the fill areas within the influence zone of structural improvements.

7.2.8 Fill Material

a. The on-site colluvial/alluvial soils are considered suitable for use as compacted fill, provided they are free of vegetation, and organic matter exceeding 3%, debris and oversized material (greater than 12 inches). In addition, no oversized material greater than 4 inches should be placed within 1 foot of any footings or slabs.

b. Imported fill, if required, should be of expansivity not greater than medium and be free of vegetation, and organic mater exceeding 3%, debris and oversized material (greater than 12 inches).

7.2.9 Compaction and Method of Fill Placement

a. With the exception of the upper 12 inches of subgrade beneath paved areas, all fill soils should be placed in 6 to 8 inch thick loosse lifts, brought to near-optimum moisture content and compacted to a minimum 90% relative compaction. In the upper 6 inches of the subgrade beneath paved areas, all fill soils should be placed in 6 to 8 inch thick lifts, brought to near-optimum moisture content and compacted to a minimum of 95% relative compaction.

b. Base course beneath pavements and slabs-on-grade should be placed in 6 to 8 inch thick loose lifts, brought to near-optimum moisture content and compacted to a minimum 95% relative compaction.

c. When placing fill in horizontal lifts over areas sloping steeper than 5:1 (horizontal:vertical), keys and benches should be excavated into adjacent slope as shown on the corresponding typical detail in Figure. Keying and benching should be sufficient to provide at least 10 feet wide benches with a minimum 4 feet vertically between benches within competent natural ground or engineered fill. No fill should be placed in an area subsequent to keying and benching until the area has been observed by the geotechnical consultant. Material generated by the benching operation should be moved sufficiently away from the bench area to allow for the recommended observation of the bench prior to the placement of fill.

d. Fill should be tested for compliance with the recommended relative compaction and moisture conditions. Field density testing should conform to ASTM 1556, 2922, and/or 2937. Tests should be taken at approximately every 2 vertical feet and for every 1000 yd^3 of fill placed. Base course below paved areas should be tested a minimum of every 150 linear feet of pavement. All fill found not to be in conformance with the grading recommendations should be removed or otherwise handled as recommended by the Geotechnical Consultant.

7.2.10 Shrinkage and Subsidence/Settlement

a. Based on analyses of the subsurface soil conditions, the on-site alluvial soils can be estimated to shrink on the order of 10% to 15% for initial planning purposes. These factors do not include clearing/grubbing/stripping volumes, or losses due to handling. These factors can be reviewed periodically during grading, based on actual surveyed and volumetric data, if requested.

b. Subsidence due to the placement of fill and the movement of construction equipment is expected to be 1 inch. This is an estimate, subject to confirmation during grading.

c. Post-grading total and differential settlements under static loading are expected to be within tolerable limits. Additional vertical movements due to the footings loads re expected to be no greater than ½ inch for the anticipated spacings and loads. These preliminary estimates should be reviewed by the Geotechnical Consultant when foundation plans and loads for the proposed structures are available.

d. Under seismic loading, liquefaction induced settlements of 3 ± and 2± inches should be anticipated beneath the central and southern portions of the site respectively.

7.2.11 Excavating Conditions

a. We anticipate that the excavation of on site materials may be accomplished with standard earthmoving or trenching equipment.

b. Regional ground water was not encountered at a depth expected to affect grading operations. However, perched water was encountered at depths of 11 ± feet beneath the central portions of the site. This may result in wet conditions, particularly after periods of above normal precipitation, if the depth of the excavations performed in connection with the construction of retention/detention ponds approaches the elevation of the perched water tables encountered.

7.2.12 Cut and Fill Slopes

a. Fill Slopes

i. All fill slopes should be constructed with engineered fill meeting the minimum density requirements of this report and have a gradient no steeper than 2:1 (horizontal:vertical). Fill slopes should not exceed 15 feet in vertical height unless specifically reviewed by the Geotechnical Consultant. Where the vertical height exceeds 15 feet, intermediate benches must be provided. These benches should be at least 6 feet wide and sloped to control surface drainage. A lined ditch should be used on each bench.

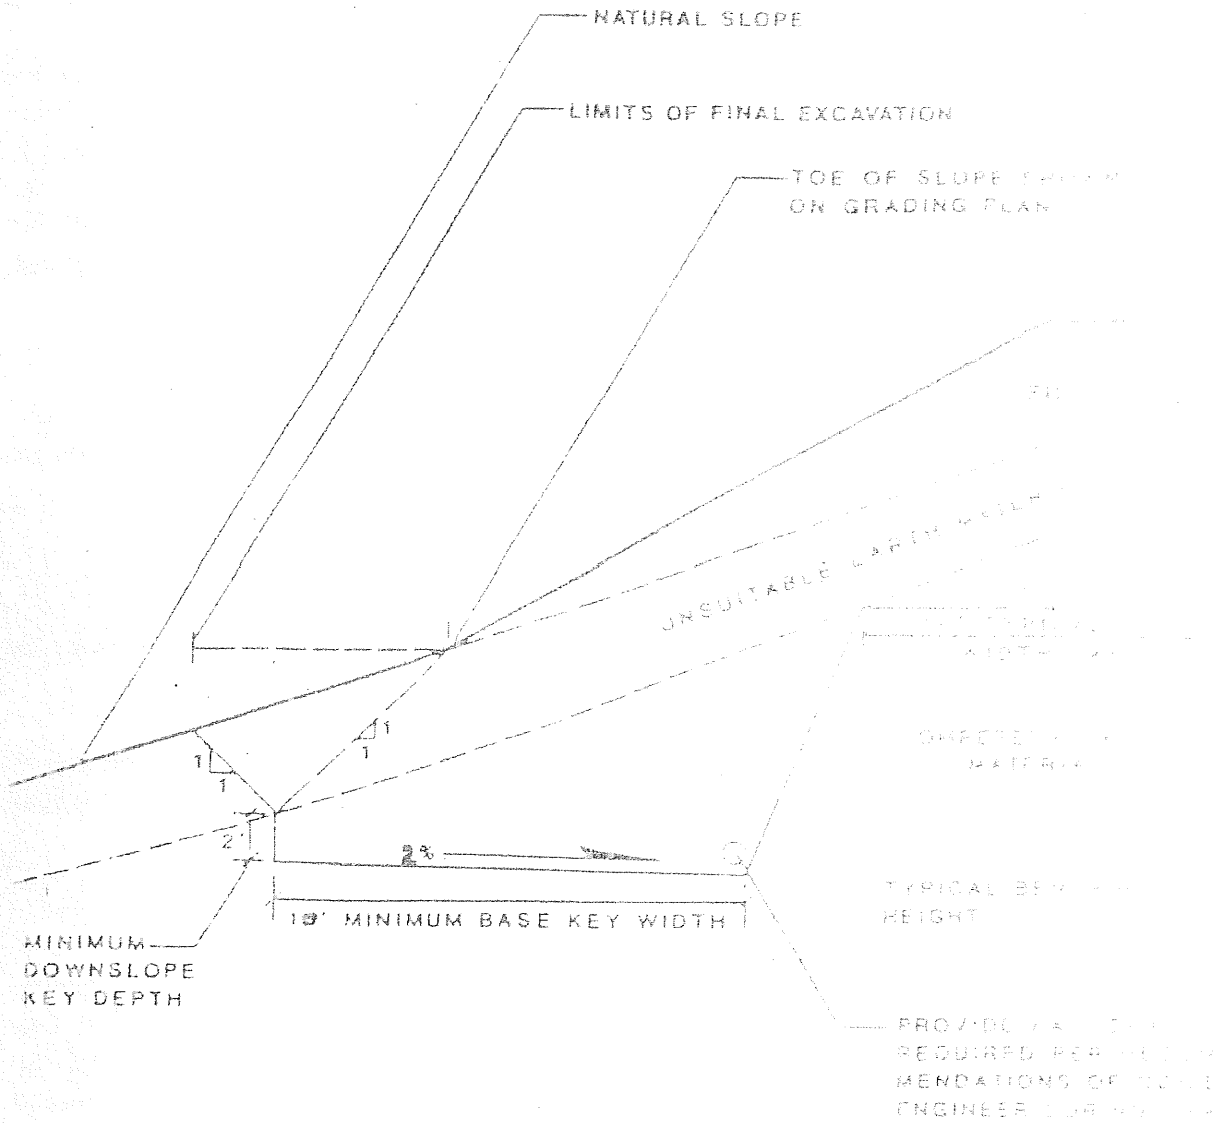
ii. Fill slopes shall be benched and keyed into the native slopes by providing a base keyway whose minimum width is 10 feet and which is sloped negatively at least 2% back into the slope. The depth of keyways will vary depending the materials encountered, but all locations shall be at least 2 feet in firm material. This keyway should be combined with intermediate benching as required. Refer to Figure 2 for general details.

iii. If a slope is to be placed above a cut slope, the toe of the fill slope should be set back at least 8 feet horizontally from the top of the cut slope. A lateral surface drain should be placed in the area between the cut and fill slopes.

iv. Fill slopes should either be over built laterally a minimum of at least 3 feet and cut back to a firm and unyielding surface or back rolled to achieve same at no greater than 4 foot vertical intervals. Feathering of fill over the tops of slopes should not be permitted.

b. Cut Slopes

i. Slopes cut in connection with construction of the detention ponds may be constructed as follows:



- Cut slopes less than 20 feet high should not exceed a slope inclination of 2:1 (horizontal:vertical).

- Cut slopes between 20 and 30 feet high should not exceed a slope inclination of 2.5:1 (horizontal:vertical).

ii. Cut slopes exceeding a height of 20 feet should be reviewed by the Geotechnical Consultant on an individual basis.

c. General

i. In order to maintain stable slopes at the recommended gradients, it is important that any seepage forces and accompanying hydrostatic pressure encountered be relieved by adequate drainage. Drainage facilities may include subdrains, gravel blankets, rockfill surface trenches or horizontally drilled drains. Configurations and type of drainage will be determined by the Geotechnical Consultant during the grading operations.

WHERE NATURAL SLOPE GRADIENT IS
BENCHING IS NOT NECESSARY. HOWEVER,
NOT TO BE PLACED ON COMPRESSIBLE OR
ABLE MATERIAL.

Tharp & Associates, Inc. Geotechnical Consultants	Miravale III Subdivision FILL OVER NATIVE SLOPE - TYPICAL KEY AND BENCH DETAIL	Figure

ii. The surfaces of all cut and fill slopes should be worked to reduce erosion. This work, as a minimum, should include track rolling of the fill slopes and effective planting of all slopes. The protection of the slopes should be installed as soon as practicable so that a sufficient growth will be established prior to inclement weather conditions. It is vital that no slope be left standing through a winter season without erosion control measures having been provided.

iii. The above recommended gradients do not preclude periodic maintenance of the slopes, as minor sloughing and erosion may take place.

7.2.13 Expansive Soils

a. The expansion potential of the proposed pad subgrade soils is anticipated to be low.

b. Additional expansion tests should be performed at the completion of grading in order to verify that post grading expansivities conform to tested values.

7.2.14 Sulfate Content

Based on the results of our laboratory testing and on experience in the vicinity we anticipate the sulfate content of the subsurface soils to be less than 0.2 percent. Type II cement is therefore considered adequate for the concrete in contact with the on-site soil. This should be verified by additional sulfate content testing performed at the completion of grading.

7.2.15 Utility Trenches

a. Bedding material should consist of sand with an SE not less than 30, which may then be jetted. (Jetting may not be effective if adequate drainage is not available.)

b. Existing soils may be utilized for trench backfill, provided they are free of organic materials ans rocks over 6 inches in diameter.

c. Backfill of all exterior and interior trenches should be compacted to achieve a relative compaction of not less than 90 percent, the compaction standard being obtained per ASTM: D1557. Care should be taken not to damage utility lines.

d. Alternatively, backfill may be jetted if sand of an SE not less than 30 is used. (Jetting may not be effective if adequate drainage is not available.)

e. Trenches should be capped with 1.5± feet of relatively impermeable soil.

f. Jetting in trenches adjacent to buildings or slopes should be carried out **only** under the specific approval of the Geotechnical Consultant.

g. Trenches should be located so as not to impair the bearing capacity or cause settlement under foundations. As a guide, trenches subparallel to foundations should be clear of a 45 degree plane extending outward and downward from the edge of the foundations.

h. The walls of temporary construction trenches are expected to be stable when excavated nearly vertical, with only minor sloughing, provided the total depth does not exceed 4 feet. Shoring of the excavation walls or flattening of slopes may be required, if greater depths are necessary.

i. All work associated with trench shoring must conform to the State of California Safety Code.

7.3 Subsurface and Surface Drainage

7.3.1 Subsurface Drainage

a. It is anticipated that subdrains will be required in the bottom of any canyon fills, in the keyways of all fill slopes and behind all retaining walls.

b. Based on the results of our field exploration, it is considered likely that during wet winter months moisture may perch on the dense clayey sands and accumulate in the looser surficial soils. We therefore recommend that mitigation measures be provided to prevent moisture infiltration beneath the residences. If the residences are to have raised wood floors, foundation drains should be constructed around the residences. If the residences are to be constructed with slab-on-grade floors, the concrete used should be a waterproof mix with a water/cement ratio not exceeding 0.45 and incorporating a water-proofing admixture such as zypex or approved equivalent.

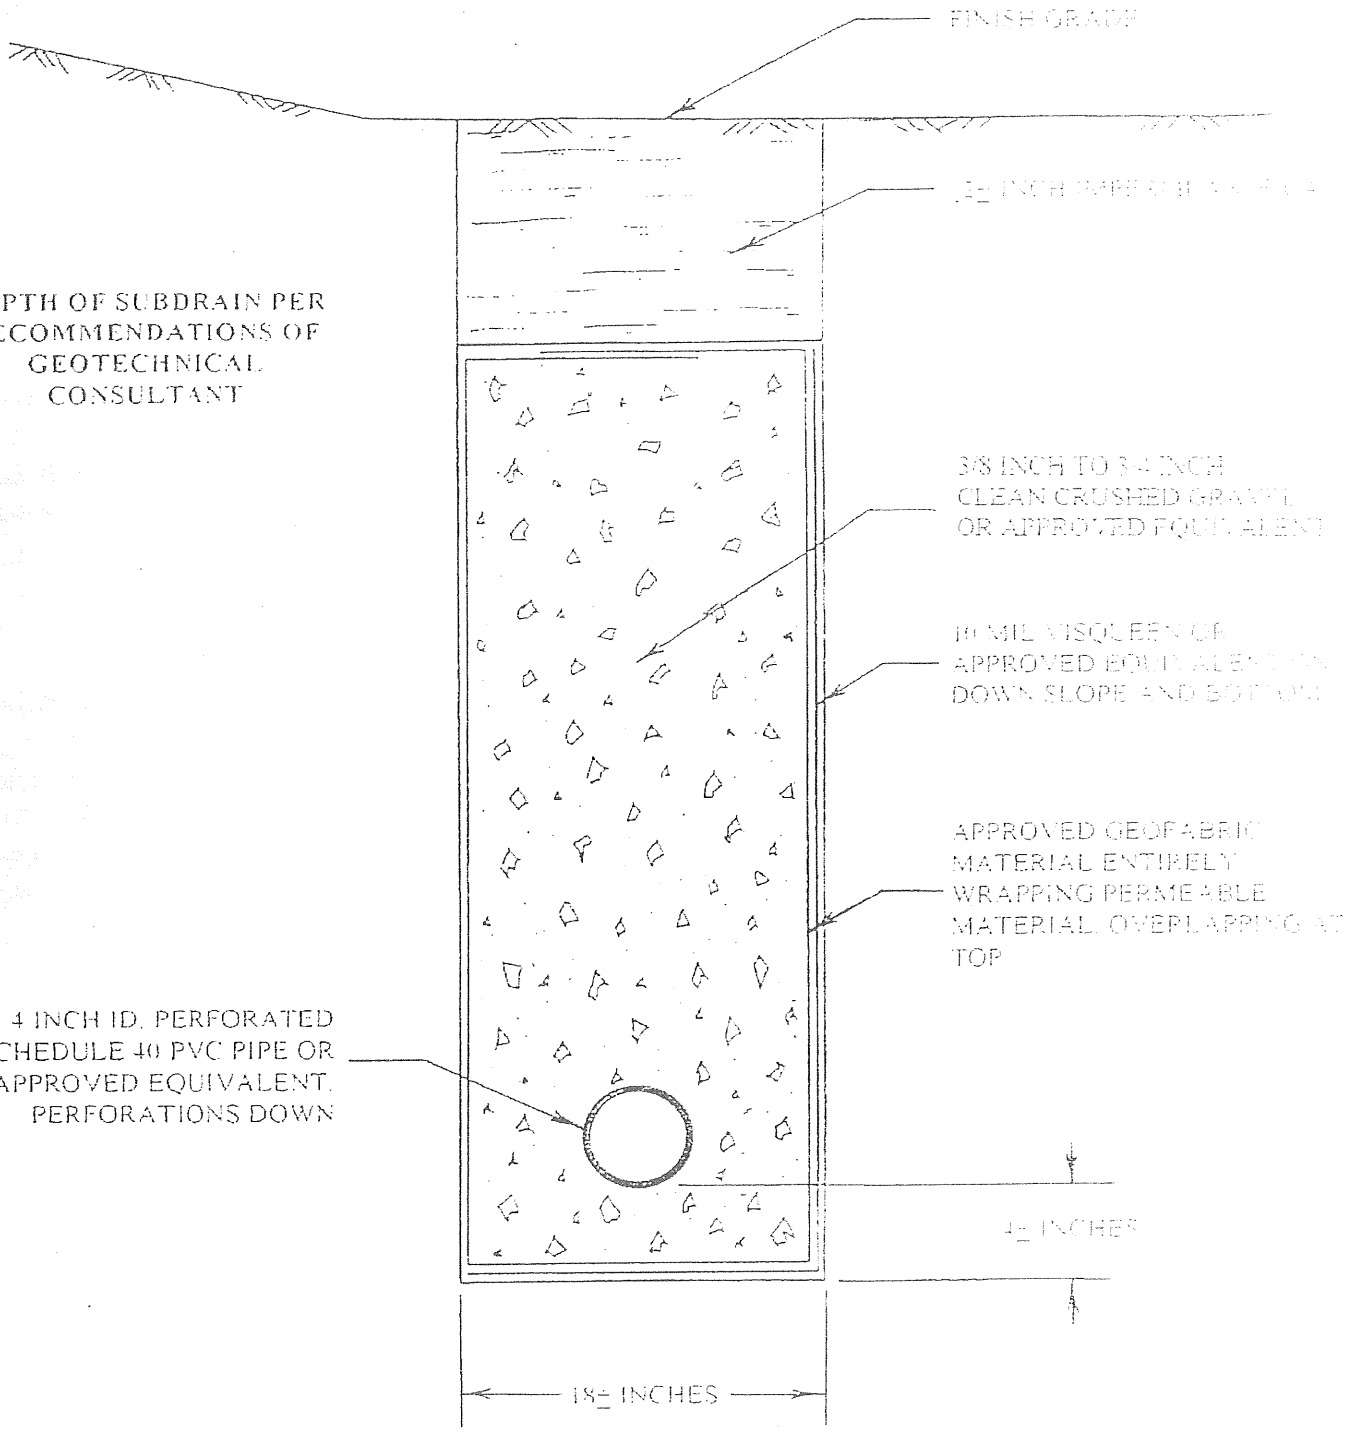
c. If foundation drains are installed they should extend to the depth the lowest foundation element and consist of 4-inch diameter Schedule 40, perforated PVC pipe or equivalent, embedded in approximately 3 ft^3/linear foot of 3/8 inch to 3/4 inch, clean crushed gravel, enveloped in **Mirafi Filter weave 300** or approved equivalent. The pipe should be 4± inches above the trench bottom; a gradient of 1±% being provided to the pipe and trench bottom; discharging into suitably protected outlets. A typical detail is shown in Figure 3.

d. Perforations in foundation drains are recommended as follows: 3/8-inch diameter, in 2 rows at the ends of a 120 degree arc, at 3-inch centers in each row, staggered between rows, placed downward.

e. The perforated section of the foundation drains should extend around the entire footprint of the structure. An unobstructed outlet should be provided at the lower end of the subdrain. The outlet should consist of an unperforated pipe of the same diameter, connected to the perforated pipe and extended to a protected outlet at a lower elevation on a continuous gradient of at least 1 percent. Subdrains should be approved by the Geotechnical Consultant prior to the placement of backfill.

f. Final determination of the need for drainage devices should be made by the Geotechnical consultant upon receipt of the final plans and in the field during grading.

7.3.2 Surface Drainage/Drainage Device Maintenance



a. Pad drainage should be at a gradient of a minimum of 2% away from foundation areas.

b. Drainage patterns established at the time of grading should be maintained throughout the life of the project

c. Graded berms, swales, area drains, terrace drains and brow ditches are designed to carry surface water from pad and slope areas and should not be blocked or destroyed.

d. Water should not be allowed to pond in pad areas. Roof drains should outlet to proper drainage devices.

e. Sources of uncontrolled water, such as leaky water pipes, drains, etc., should be repaired.

Tharp & Associates, Inc. Geotechnical Consultants	Miravale III Subdivision RECOMMENDED FOUNDATION DRAIN CONFIGURATION - TYPICAL DETAIL	Figure 3

f. The natural surface drainage features discharging onto the subject site should be collected in lined channels and discharged to suitable locations.

7.3.3. Detention/Retention Ponds

a. The results of our field exploration and laboratory testing indicate that the material in the area of the proposed retention/detention ponds are composed of alluvial/colluvial deposits of sand derived from decomposed granitic bedrock with varying clay contents. Two, 8-inch diameter holes were drilled to depths of 6 and 20 feet in two locations near the proposed South Pond, and two holes were drilled to a depth of 5 feet near the location of the proposed North Pond. A perforated pipe was installed in each of the holes and the holes were presoaked 24 hours in advance of the testing. Infiltration tests were performed in each hole after pre-soaking was complete.

b. South Pond

Based on the results of our infiltration testing, and our experience with similar materials in the area, an infiltration rate of more than 60 minutes per inch should be assumed for the near-surface clayey sands in the area of the south pond. An infiltration rate of 3 minutes per inch may be assumed for the sand / gravel materials above the water table in the location of the South Pond. These are preliminary design values which should be verified at the conclusion of the rough grading when subsurface conditions become exposed.

c. North Pond

Based on the results of our infiltration testing, and our experience with similar materials in the area, an infiltration rate of 60 minutes per inch should be assumed for the near-surface clayey sands in the area of the north pond. These are preliminary design values which should be verified at the conclusion of the rough grading when subsurface conditions become exposed.

7.4 Foundations

7.4.1 General

a. The foundation recommendations contained herein are for the anticipated one and two story, wood-frame residential buildings to be founded on the mass-graded pad areas. Foundation recommendations for the proposed churches, commercial development, golf course clubhouse, middle school, and other structures to be located on the portions of the site designated as future development areas should be provided on a case-by-case basis in connection with the selection of specific building envelopes for these structures. Further geotechnical investigation may be required to develop foundation recommendations for these areas.

b. The purposed structures, of the type anticipated, located on the mass-graded lots, may be founded on rigid mat or waffle slab foundations. The criteria presented below should be adopted. These foundations should consist of a "grade beam waffle", slab-on-grade, or similar construction combined with flexible utility connections.

c. At the time we prepared this report, the grading plans and foundation details had not been completed and the locations of the structures had not been finalized. We request an opportunity to review these items during the design stages to determine if supplemental recommendations will be required.

7.4.2 Mat Foundations

a. Residential structures should be founded on a rigid, reinforced concrete, mat foundation composed of a "grade beam waffle", slab-on-grade, or similar construction combined with flexible utility connections.

b. The mat foundation system should be designed to possess sufficient stiffness so as to allow the foundation and structure to act as a rigid body should the soil settle 3 $\pm$ inches beneath all or any portion of the slab as a result of deformation during the design seismic event.

c. A modulus of subgrade reaction, k_c, = 300 kcf may be assumed for design purposes.

d. The use of a"waffle" type slab with prestressed thickened sections or post-tensioned slabs on grade may be considered for use on this project.

e. The mat foundations used on this project should be combined with flexible utility connections in order to prevent breakage should the foundation tilt at a result of soil settlement.

f. This foundation system has the advantage that should the design seismic event produce significant soil deformation beneath the structure, the resulting tilting should produce only moderate damage and may be repaired by pressure grouting or other leveling procedures. If desired, precast grout channels may be incorporated into the slab design to make the leveling process, should it become necessary, easier.

g. Such a rigid mat foundation system should be supported on compacted, engineered fill placed per subsection 7.2.5..

h. Minimum embedment depth for the thickened edge sections of a rigid mat foundation should be 18 inches, although structural considerations may govern.

i. The allowable bearing capacity for thickened edge sections may be determined from the following equation:

$$q_{all} = 1000D + 350B$$

where:

q_{all} = allowable bearing capacity (lb/ft^2)

D = Depth of embedment (ft) measured from the lowest adjacent grade.

B = minimum footing width (ft)

j. Allowable soil bearing capacity used for such a system should not exceed 3000 lbs/ft^2.

7.5 Slabs-On-Grade

a. Concrete floor slabs may be founded on reworked existing soils or compacted fill. The subgrade should be proof-rolled just prior to construction to provide a firm, relatively unyielding surface, especially if the surface has been loosened by the passage of construction traffic.

b. If a floor covering that would be critically affected by moisture is to be used, a 10-mil plastic vapor barrier is recommended. This sheeting should be covered with 2 inches of sand.

c. The expansivity of the on-site soils is generally considered to be Low, subject to confirmation at the conclusion of mass grading.

d. The subgrade should be pre-soaked to 4 percentage points above optimum, or 120% optimum, whichever is greater: to a 1 foot depth.

e. Slabs should be underlain by a minimum 4 inches of granular base.

f. Steel should be provided in slabs-on-grade per the recommendations of the Structural Engineer.

g. The utilization of post-tensioned concrete slabs may be considered in lieu of conventional concrete slabs. There are inherent advantages with this system, especially the characteristics that the propagation or widening of cracks.

7.6 Retaining Structures

7.6.1 Lateral Earth Pressures

a. The lateral earth pressures presented in Table II are recommended for the design of retaining structures with a gravel blanket and backfill soils of expansivity not higher than Medium. Should the slope behind the retaining walls be other than level or 2:1 horizontal to vertical, supplemental design criteria will be provided for the active earth or at-rest pressures for the particular slope angle.

Table II. Lateral Earth Pressures

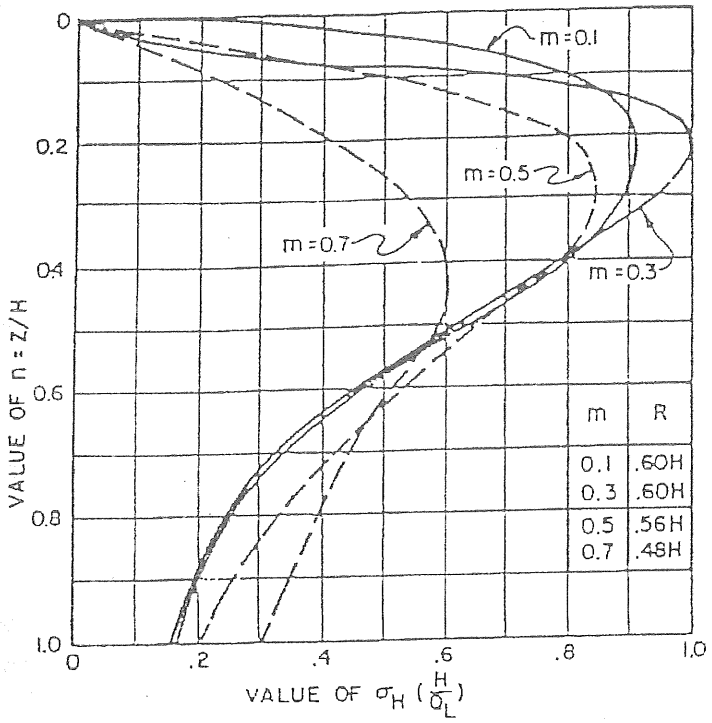
Type	Soil Profile	Soil Pressure (psf/ft)	
		Unrestrained Wall	Rigidly Supported Wall
Active Pressure	Level 2:1	40 60	- -
At-Rest Pressure	Level 2:1	- -	70 110
Passive Pressure (ignore upper 1 ft)	Level 2:1	400 200	200 100

b. Friction coefficient - 0.35, between soil and rough concrete.

c. Where both friction and the passive resistance are utilized for sliding resistance, either of the values indicated should be reduced by one-third.

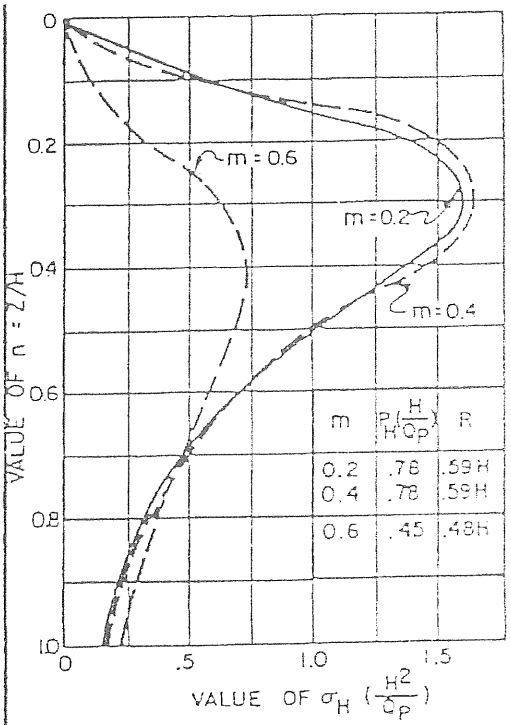
d. These are ultimate values, no factor of safety has been applied.

e. Pressure due to any surcharge loads from adjacent footings, traffic, etc., should be analyzed separately. Pressures due to these loading can be supplied upon receipt of the appropriate plans and loads. Refer to Figure 4.



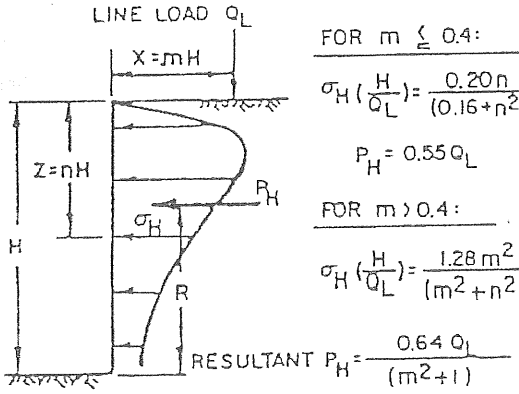
f. These values apply to the existing soil and to compacted backfill generated from in-situ material. Imported material should be evaluated separately.

7.6.2 Backfill



a. Backfill should be placed under engineering control.

b. Highly expansive soils should not be used as backfill.



c. it is recommended that, where feasible, granular backfill be utilized, for a width equal to approximately 1/4x the wall height, and not less than 1.5 feet.

m	R
0.1	.60H
0.3	.60H
0.5	.56H
0.7	.48H

m	$P\left(\frac{H}{H^2 Q_P}\right)$	R

Tharp & Associates, Inc. Geotechnical Consultants	Miravale III Subdivision	Figure
	SURCHARGE PRESSURE DIAGRAM- LATERAL SURCHARGE PRESSURE DUE TO ADJACENT VERTICAL LOADS	4

d. The granular backfill should be capped with at least 18 inches of relatively impermeable material.

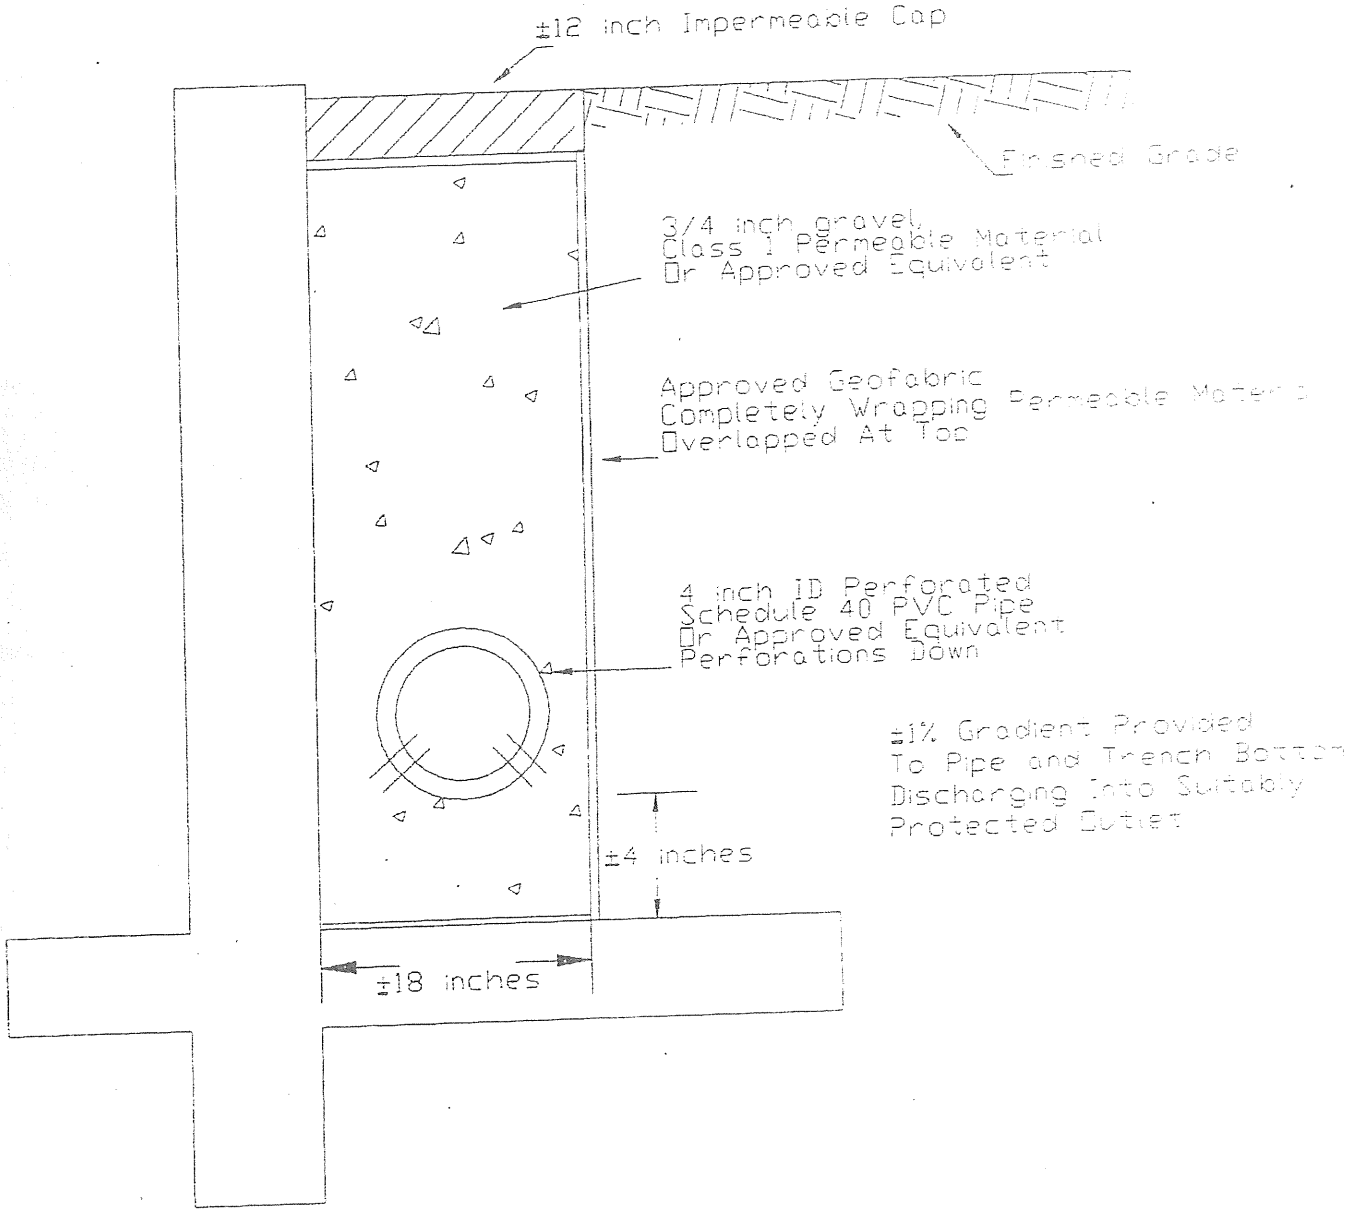
e. Backfill should be compacted to achieve a minimum 90 percent relative compaction, the compaction standard being obtained in accordance with ASTM D-1557.

f. Precautions should be taken to ensure that heavy compaction equipment is not used immediately adjacent to walls, so as to prevent undue pressures against, and movement of, the walls.

g. The use of water-stops/impermeable barriers and appropriate waterproofing should be considered for any basement construction, and for building walls which retain earth.

7.6.3 Backfill Drainage/Subdrains

a. i. Backdrains should be provided in the backfill of the stem walls.



ii. Weepholes or subdrains should be provided in the backfill of free-standing retaining walls. Subdrains are recommended for walls exceeding 4 feet in height of soil retained.

iii. Backdrains should be per Subsections b) to f) below.

b. Backdrains should consist of 4-inch diameter Schedule 40, PVC pipe or equivalent, embedded in approximately 3 ft^3/linear foot of 3/8 inch to 3/4 inch, clean crushed gravel, enveloped in **Mirafi Filter weave 300** or approved equivalent. The pipe should be 4± inches above the trench bottom; a gradient of 1±% being provided to the pipe and trench bottom; discharging into suitably protected outlets. See Figure 5 for a standard detail.

d. Perforations in backdrains are recommended as follows: 3/8-inch diameter, in 2 rows at the ends of a 120° arc, at 3-inch centers in each row, staggered between rows, placed downward.

e. Backdrains placed behind retaining walls should be approved by the Geotechnical Consultant prior to the placement of fill.

Tharp & Associates, Inc. Geotechnical Consultants	Miravale III Subdivision	Figure
	TYPICAL BACKDRAIN CONFIGURATION - DETAIL	5

f. An unobstructed outlet should be provided at the lower end of each segment of subdrain. The outlet should consist of an unperforated pipe of the same diameter, connected to the perforated pipe and extended to a protected outlet at a lower elevation, on a continuous gradient of at least 1 percent.

7.6.4 Footings - Retaining Walls

a. Minimum embedment depth for retaining wall footings should be 24 inches, although structural considerations may govern.

b. If retaining walls are to be situated at or near the tops of slopes, such walls should be reviewed/analyzed on a case by case basis by the geotechnical consultant for both internal and overall slope stability. Setbacks, embedment depths and allowable bearing pressures may need to be modified accordingly.

c. The allowable bearing capacity may be taken as indicated in the equation presented in subparagraph7.4.2.a., subject to stability requirements.

7.7 Asphalt Concrete Pavement

a. The results of our R-Value testing, presented in Appendix B, Table B-3, may be used for preliminary design purposes.

b. The actual R-Value should be obtained at the conclusion of mass grading and the tentative pavement sections reviewed at that time.

c. The subgrade should be compacted to achieve a relative compaction of at least 95 percent through the upper 12 inches.

. The Aggregate Base should be compacted to achieve a relative compaction of at least 95 percent.

e. Base material should meet the requirements of the Standard Specifications for Public Works Construction (Green Book), or for Class 2 Aggregate Base per Cal Trans. Compaction of subgrade and base course should be in accordance with ASTM D 1557.

7.8 Exterior Concrete Flatwork/Pavement

a. The long-term performance of exterior concrete flatwork/pavement at the site will be influenced by any expansive soils. Positive drainage and maintaining soil moisture at above optimum conditions prior to pouring concrete will help improve the performance of concrete flatwork at the site.

b. Concrete flatwork should be divided into as nearly square panels as possible. Frequent joints should be provided to give articulation to the concrete panels. Landscaping and planters adjacent to concrete flatwork should be designed in such a manner as to direct drainage away from concrete areas to approved outlets.

c. It is assumed that flatwork other than pavement will be subjected only to pedestrian traffic.

7.9 Subsequent Grading Operations

Prior to the commencement of additional grading of building and pavement areas, as well as backfilling trenches, the Geotechnical Consultant should be notified to provide appropriate recommendations and observation and testing servicesas required.

7. LIMITATIONS

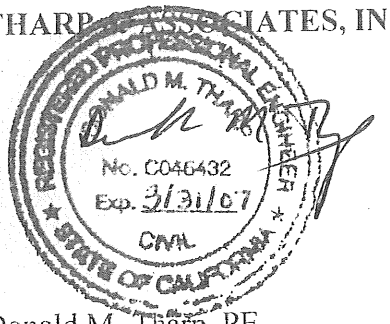
a. Our investigation was performed in accordance with the usual and current standards of the profession, as they relate to this and similar localities. No other warranty, expressed or implied, is provided as to the conclusions and professional advice presented in this report.

b. The samples taken and tested, and the observations made, are considered to be representative of the site; however, soil and geologic conditions can vary significantly between sample locations.

c. As in most projects, conditions revealed during construction excavation may be at variance with preliminary findings. If this occurs, the changed conditions must be evaluated by the Project Geotechnical Consultant and the Geologist, and revised recommendations be provided as required.

d. This report is issued with the understanding that it is the responsibility of the Owner, or of his Representative, to ensure that the information and recommendations contained herein are brought to the attention of the Architect and Engineer for the project and incorporated into the plans, and that it is ensured that the Contractor and Subcontractors implement such recommendations in the field.

e. This firm does not practice or consult in the field of safety engineering. We do not direct the Contractor's operations, and we are not responsible for other than our own personnel on the site; therefore, the safety of others is the responsibility of the Contractor. The Contractor should notify the Owner if he considers any of the recommended actions presented herein to be unsafe.



f. The findings of this report are considered valid as of the present date. However, changes in the conditions of a site can occur with the passage of time, whether they be due to natural events or to human activities on this or adjacent sites. In addition, changes in applicable or appropriate codes and standards may occur, whether they result from legislation or the broadening of knowledge.

g. Accordingly, this report may become invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and revision as changed conditions are identified.

It is a pleasure being associated with you on this project. If you have any questions, or if we may be of further assistance, please do not hesitate to contact our office.

Sincerely,

THARP & ASSOCIATES, INC.

PROJECT: Miravale III Subdivision
Martines Property: APNs 257-081-005, -026, -027, and -032
Section 16: APNs 417-151-082, -083, -084, and -085
Monterey County, California

Dear Mr. Agha:

We have completed our geologic hazards investigation addressing the above-referenced subdivision. This report presents our findings and engineering geologic recommendations for the project.

This report is intended to update and extend our previous geologic report to cover current geologic conditions for the proposed project. We evaluated the potential effects of geologic hazards posed to the project, as shown on the Miravale III Subdivision Tentative Map by Bestor Engineers, dated 8/7/06. We developed engineering geologic recommendations to reduce the effects of these hazards to acceptable levels.

Our recommendations are intended principally to lower the risks posed to habitable structures by geologic hazards. This report in no way implies that the subject property will not be subject to earthquake shaking, landsliding, faulting or other acts of nature. Such events could damage the property and affect the property's value or its viability in ways other than damage to habitable structures. We have not attempted to investigate or mitigate all such risks and we do not warrant the project against them. We would be happy to discuss such risks with you, at your request.

We recommend that you make this report available to the design professionals assisting you on this project. Please contact us if you have any questions.

Sincerely,
Nolan Associates

Jeffrey M. Nolan
Principal Geologist

GEOLOGIC HAZARDS INVESTIGATION
Miravale III Subdivision
Martines Property: APNs 257-081-005, -026, -027, and -032
Section 16: APNs 417-151-082, -083, -084, and -085
Monterey County, California

INTRODUCTION

This report presents the results of our updated geologic hazards investigation for the proposed Miravale III subdivision located north of the City of Soledad, Monterey County, California (Figure 1, Topographic Index Map).

The proposed subdivision is to include 2,600 single-family homes, 1,600 multi-family units, 300 senior housing units, a 120-room hotel, 250,000 square feet of retail space, and an 18-hole golf course. San Vicente Road divides the subdivision site into two portions: Section 16 lies to the east, and the Martines properties lie to the west. The subject properties are presently being used for agricultural production.

PURPOSE OF INVESTIGATION

The purpose of our investigation was to evaluate geologic hazards on the subject properties to provide for prudent development of residential housing and associated facilities. Our investigation focused on the planned development indicated on a Tentative Map set by Bestor Engineers, dated August 7, 2006. Where particular geologic hazards were found to present greater than acceptable risks to the project, we developed recommendations to reduce these risks. Our geologic hazards analysis was based on an assumed 50-year design life span for the project.

SCOPE OF SERVICES

Work performed during this study included:

1. A review of geologic literature and maps pertinent to the project site.

2. Examination and interpretation of stereo pair vertical aerial photographs to assess the recent geologic history of the project site.

3. Review of the geologic report produced by Nolan Associates in 1995 for the San Vicente Vineyards Property (report dated August 1995).

4. Field reconnaissance and geologic mapping around the project site, completed on September 14, 2006.

5. Analysis and interpretation of the geologic data and preparation of this report.

REGIONAL GEOLOGY

The project site is situated on the eastern flank of the Salinas Valley and is bounded to the east by the foothills of the Gabilan Range, a granitic massif that forms a portion of the Coast Ranges Physiographic Province of California. The Coast Ranges Province consists of a series of coastal mountain chains paralleling the pronounced northwest-southeast structural grain of central California geology.

The Gabilan Range and adjacent portions of the Salinas Valley are underlain by a large, northwest-trending, fault bounded, elongate prism of granitic and metamorphic basement rocks, known collectively as the Salinian Block. The Salinian Block is separated from contrasting basement rock types to the northeast and the southwest by the San Andreas and the Sur-Nacimiento fault systems, respectively (Figure 2, Regional Geologic Map). Overlying the granitic basement rocks on the Salinian Block is a sequence of dominantly marine sediments of Paleocene to Pliocene age and non-marine sediments of Pliocene to Pleistocene age, all of which show evidence of uplift and deformation.

In the study area, alluvial deposits of Quaternary age are the only sedimentary rocks exposed at the surface. These deposits are in depositional contact with granitic basement exposed in the foothills of the Gabilan Range. Older sedimentary units crop out to the south and west in the Salinas valley and may occur at depth in the vicinity of the subject properties. These units include marine shales of the Monterey Formation, of Miocene age, marine sandstones and siltstones of the Pancho Rico Formation, of Pliocene age, and heterogeneous non-marine sediments of the Paso Robles Formation, of Plio-Pleistocene age.

REGIONAL FAULTING

Throughout the late Cenozoic Era (approximately the past 25 million years), central California has been dominated by tectonic forces associated with lateral or "transform" motion between the North American and Pacific crustal plates, producing a complex system of northwest-trending faults (the San Andreas Fault system). These faults show horizontal displacements measured in tens or hundreds of miles. Uplift, deformation, erosion, and subsequent re-deposition of sedimentary rocks have been driven primarily by the northwest-directed, horizontal (strike-slip) movement of the plates and the associated southwest to northeast-oriented compressive stress. The region continues to be characterized by moderate to high rates of tectonic and seismic activity (Figure 3, Regional Seismicity Map).

Active or potentially active faults which may impact the site (Cao et al., 2003) include the Reliz-Rinconada, San Andreas, San Gregorio-Hosgri, and Monterey Bay-Tularcitos fault zones (Figure 3). These faults are discussed in the following sections. Earthquake epicenters associated with these faults are shown on Figure 3. Smaller north and northwest trending faults are also present in the region, particularly in the Santa Lucia Mountains, on the western side of the Salinas Valley (Figure 2). These faults are not generally associated with significant historic seismicity, do not appear to have been a source of any large earthquakes in historic times, and are not considered to

be significant potential sources of strong seismic shaking at the subject site, based on current knowledge.

Reliz, Rinconada, and King City Faults

The Reliz, Rinconada and King City faults, as mapped by Rosenberg (2001) are roughly parallel to the San Andreas fault zone and skirt the eastern foothills of the Santa Lucia Mountains for almost the entire length of the Salinas Valley. These faults have been considered to be one structure by some researchers (Dibblee, 1976; Peterson et al., 1996). The alignment and total length of the fault zone cited by different researchers therefore depends on whether the Reliz and King City faults are included with the Rinconada fault system as a single seismogenic structure or are considered separately. The State of California (Peterson et al., 1996; Cao et al., 2003) gave a length of 190 +/- 16 km for the Rinconada fault, which includes the King City and Reliz faults. We consider the Reliz and Riconada faults to be linked and will refer to them here collectively as the Rinconada fault. The Rinconada fault passes about six miles west of the proposed development.

The King City Fault (Ross and Brabb, 1973) extends northwestward from the northern-most mapped portion of the Reliz fault along the southwest side of the Salinas Valley, separating the tectonically elevated Sierra de Salinas and other portions of the Santa Lucia Mountains from the Salinas valley (Jennings, 1994). Since the Santa Lucias are considered to be Plio-Pleistocene in age, this hypothesis would have much of the vertical component of displacement on this fault occurring by mid-Pleistocene. To our knowledge, the King City fault is not exposed at the ground surface and no geologic evidence for Quaternary activity on the King City fault has been observed. Tinsley and Dohrenwned (1979) cite an exposure of the Reliz (King City) fault in the Greenfield area that is covered by unfaulted stream terrace deposits estimated to be 100,000 years old. Greene (1977) found no evidence for activity on any offshore faults that might connect with the King City fault. Ross and Brabb (1973), some of the early proponents for the King City fault, considered it to be older than Miocene. We are of the opinion that the King City fault is not a significant seismogenic source for this project.

Geologic evidence suggests that the Rinconada fault is a high angle, right-lateral, strike-slip fault which has experienced cumulative offset of up to 40 miles since the Miocene age (Dibblee, 1976). No historic earthquakes have been reported on this fault, though it is considered active (Peterson et al., 1996; Cao et al., 2003). Hart and Bryant (1999) did not consider the Rinconada fault to show sufficient evidence of Holocene activity to be included in the state's Alquist-Priolo active fault mapping program, although this does not preclude youthful activity on the fault. Mapping along the fault by Hart and Bryant (1999) revealed offset drainages, anomalous ridges, and other geomorphic features that could result from active faulting, but he did not observe any offset or disturbance of Holocene deposits across the trace of the fault. Cao et al. (2003) has calculated that the Rinconada fault is capable of generating a magnitude 7.5 earthquake. Peterson et al. (1996) cite a 1764-year recurrence interval for a magnitude 7.3 earthquake.

San Andreas Fault

The San Andreas fault is active and represents the major seismic hazard in northern California (Jennings, 1994; Buchanan-Banks et al., 1978). The main trace of the San Andreas fault trends northwest-southeast and extends over 700 miles from the Gulf of California through the Coast Ranges to Point Arena, where the fault extends offshore.

Geologic evidence suggests that the San Andreas fault has experienced right-lateral, strike-slip movement throughout the latter portion of Cenozoic time, with cumulative offset of hundreds of miles. Surface rupture during historical earthquakes, fault creep, and historical seismicity confirm that the San Andreas fault and its branches, the Hayward, Calaveras, and San Gregorio faults, are all active today.

Historic earthquakes along the San Andreas fault and its eastern branches have caused significant seismic shaking around Monterey County. There were large earthquakes along the San Andreas fault in 1838, 1865 and 1890 (Sykes and Nishenko, 1984). The most intense earthquake to have affected this area was the great San Francisco earthquake of April 18, 1906. This 8.3 magnitude temblor caused severe seismic shaking and structural damage to many buildings in Northern California, including Santa Cruz, Santa Clara, San Mateo, and Monterey Counties. (Lawson, 1908). The recent magnitude 7.1 Loma Prieta earthquake (October 17, 1989) caused seismic shaking as intense as that of 1906 in parts of the Santa Cruz Mountains.

Geologists have recognized that the San Andreas fault system can be divided into segments with "characteristic" earthquakes of different magnitudes and recurrence intervals (Working Group On California Earthquake Probabilities, 1988 and 1990;WGONCEP, 1996). The Creeping segment, located about 15 miles northeast of the properties, is the closest segment of the San Andreas fault zone to the site. It is marked by continuous creep at a rate of 34 +/- 5 mm/year (Cao et al, 2003). Since the creep rate is about the same as the long term creep rate for the San Andreas fault, the central creeping segment is not considered to be a source for large magnitude earthquakes (WGCEP, 1988). Cao et al. (2003) give a characteristic earthquake of magnitude 6.2 for this segment. There have been a few historical events in this size range spatially associated with this segment of the San Andreas fault (Figure 3).

San Gregorio-Hosgri Fault Zone

The San Gregorio fault, as mapped by Greene (1977), and Weber et al. (1995) skirts the coastline of Santa Cruz County northward from Monterey Bay, and trends onshore at Point Año Nuevo and at Half Moon Bay. Northward from Half Moon Bay, it passes offshore again, to connect with the San Andreas fault near Bolinas. Southward, the San Gregorio fault passes through Big Sur to connect with the Hosgri fault in south-central California (Dickinson et al., 2005). Based on it presumed connection with the Hosgri fault, the San Gregorio fault zone has a length of about 250 miles.

The landward extensions of the San Gregorio fault at Point Año Nuevo and Half Moon Bay show evidence of late Pleistocene and Holocene displacement (Weber and Cotton, 1981; Simpson et al. 1999). Although stratigraphic offsets at Año Nuevo indicate a history of horizontal and

vertical displacements, the San Gregorio-Hosgri fault is a right-lateral strike slip fault with 97 miles of dextral displacement during its history (Dickinson et al., 2005).

In addition to stratigraphic evidence for Holocene activity, the historical seismicity in the region is partially attributed to the San Gregorio fault. Due to inaccuracies of epicenter locations, even the magnitude 6+ earthquakes of 1926, tentatively assigned to the Monterey Bay fault zone, may have actually occurred on the San Gregorio fault (Greene, 1977).

Cao et al. (2003) divided the San Gregorio-Hosgri fault into San Gregorio North, San Gregorio South and Hosgri segments. The project site is about equidistant from the San Gregorio South and Hosgri segments. The San Gregorio South segment has been assigned a slip rate that results in a magnitude 7.0 characteristic earthquake (Cao et al., 2003), with an effective recurrence interval of 411 years (Peterson et al., 1996). The characteristic earthquake on the Hosgri segment is a magnitude 7.5 (Cao et al., 2003) with a recurrence interval of 646 years (Peterson et al., 1996).

Monterey Bay-Tularcitos Fault Zone

The Monterey Bay fault zone is 6 to 9 miles wide, about 25 miles long, and consists of many en échelon faults identified during shipboard seismic reflection surveys (Greene, 1977). The fault zone trends northwest-southeast and intersects the coast in the vicinity of Seaside and Ford Ord. At this point, several onshore fault traces have been tentatively correlated with offshore traces in the heart of the Monterey Bay fault zone (Greene, 1977; Clark et al., 1974; Burkland and Associates, 1975). These onshore faults are, from southwest to northeast, the Tularcitos-Navy, Berwick Canyon, Chupines, Seaside, and Ord Terrace faults. It must be emphasized that these correlations between onshore and offshore portions of the Monterey Bay-Tularcitos fault zone are only tentative; for example, no concrete geologic evidence for connecting the Navy and Tularcitos faults under the Carmel Valley alluvium has been observed, nor has a direct connection between these two faults and any offshore trace been found. Rosenberg and Clark (1995) consider the Monterey Bay and Tularcitos faults connected; this correlation has been adopted by the State of California (Peterson et al., 1996; Cao et al., 2003).

Outcrop evidence indicates a variety of strike-slip and dip-slip movement associated with onshore and offshore traces. Earthquake studies suggest the Monterey Bay-Tularcitos fault zone is predominantly right-lateral, strike-slip in character (Greene, 1977). Stratigraphically, both offshore and onshore fault traces in this zone have displaced Quaternary beds and, therefore, are considered potentially active (Buchanan-Banks et al., 1978). One offshore trace, which aligns with the trend of the Navy fault, has displaced Holocene beds and is therefore active by definition (Buchanan-Banks et al., 1978).

Seismically, the Monterey Bay-Tularcitos fault zone may be historically active. The largest historical earthquakes *tentatively* located in the Monterey Bay-Tularcitos fault zone are two events, estimated at 6.2 on the Richter Scale, in October 1926 (Greene, 1977). Because of possible inaccuracies in locating the epicenter of these earthquakes, it is possible that they actually occurred on the nearby San Gregorio fault zone (Greene, 1977).

Another earthquake in April 1890 might be attributed to the Monterey Bay-Tularcitos fault zone (Burkland and Associates, 1975); this earthquake had an estimated Modified Mercalli Intensity of VII (Table 2) for Monterey County on a whole.

The WGONCEP (1996) assigned a magnitude 7.1 earthquake with an effective recurrence interval of 2,600 years to the Monterey Bay-Tularcitos fault zone, based on Holocene offshore offsets. Petersen et al. (1996) have a similar earthquake magnitude, but for a recurrence interval of 2,841 years. Their earthquake is based on a composite slip rate of 0.5 millimeters per year (after Rosenberg and Clark, 1995). Cao et al. (2003) assigned a magnitude 7.3 characteristic earthquake to this fault.

SITE DESCRIPTION

Topography

The subject properties are located on broad, gently sloping alluvial fans at the foot of the western slope of the Gabilan Range on the east side of the Salinas Valley. The easternmost portion of the San Vicente Vineyard property extends onto the foothills of the Gabilan range (Figure 1 and Plate 1). The alluvial fans abut flat lying Salinas River fluvial deposits southwest of the site (Figure 1). Elevations at the site range from 200 to 680 feet above sea level. The land to the east of the property is more rugged, ridge-and-valley topography that rises rapidly to elevations greater than 2000 feet. Surface slopes on the alluvial portion of the subject parcels are approximately 5 to 8% gradient. Steep slopes on the eastern portion of the Section 16 property approach 70% gradient, but more commonly fall in the range of 30% to 45%.

Drainage

Drainage of surface water in the vicinity of the proposed sites generally occurs by overland sheet flow towards shallow drainage courses on the subject property (Plate 1). The drainages are ephemeral and it is unlikely that substantial surface flow occurs except during periods of high rainfall. Hydrophilic vegetation on a portion of Section 16 (Plate 1) indicates a locally elevated groundwater level, probably perched on relatively less impermeable alluvial strata. A seasonal spring is present near the northeast corner of Section 16 (Plate 1). This spring was not active at the time of our site visit. We were told by a local farmer that the opening around the spring had caved in several years ago. We did not observe surface flow or standing water anywhere on the site, except within artificially-constructed reservoir ponds (Plate 1).

Grading

Aside from agriculture-related plowing, grading activities at the property have been limited. Fill supports San Vicente Road along the southeast boundary of the Martinez property: this fill slope is up to 12 feet high, and shows evidence of accelerated erosion. Fill has also been placed around two water reservoirs on the site. The tentative map (Bestor Engineers, 2006) indicates that these fills are to be removed as part of project grading.

Minor cuts and fills are associated with unpaved roadways traversing the properties. We did not find any cuts or fills exceeding 5 feet in height, or about 1 ½:1 (horizontal:vertical) in slope. Project grading, as shown on the tentative map (Bestor Engineers, 2006) will remove these roadways and the associated cuts and fills.

Grading associated with construction of two large water tanks near the southeast corner of Section 16 in 2005 produced cuts of up to 30 feet in height, at gradients of about 2:1 (horizontal:vertical), in weathered granite and alluvial fan material. Our understanding is that the material excavated from this area was exported offsite.

Earth Materials

Our geologic mapping for the subject property is depicted on Plate 1. The most recent regional-scale geologic mapping around the project site was completed by Rosenberg (2001), depicted on Figure 4. Our site specific mapping differed from the regional mapping presented by Rosenberg (2001), which was prepared for the entire County of Monterey. It is not unusual for larger scale, site specific mapping to identify features or conditions that were not apparent when preparing a small scale, regional map.

Specifically, Rosenberg (2001) identified areas underlain by undifferentiated flood plain deposits on the southeastern portion of the property (Figure 4). Our aerial photo analysis and geologic mapping at the site indicate that the area mapped as flood plain deposits on the subject property is part of the alluvial fan sequence. The stream channel associated with the flood plain deposits is distributory, in keeping with an alluvial fan environment. Please refer to Plate 1 for the discussion of site geology.

The mountainous east and northeast part of Section 16 is underlain by the Cretaceous Granodiorite of Gloria Road (Kgdg), part of the granitic massif that comprises the Gabilan Range (Plate 1). Much of the area underlain by granodiorite is covered by a weathering mantle of soil derived from decomposed granite. These soils are described in the soils section, below. A few isolated granodiorite outcrops were found on steeper slopes, hill tops and in recent cuts for a pair of water towers on Section 16. The hill surfaces appear roughly terraced: this morphology is inferred to reflect jointing in the underlying granodiorite. We also mapped inferred granodiorite outcrops surrounded by alluvium in the north and south central portions of the property (Plate 1). These outcrops coincide with local topographic highs observed on older aerial photographs that would not have been formed by normal alluvial deposition and are therefore interpreted as bedrock highs.

The remainder of the property is underlain by Quaternary alluvial fans which onlap onto the eastern flank of the granodiorite. Rosenberg (2001) subdivided the alluvial fans into Middle Pleistocene (Qfpm), Late Pleistocene (Qfpl), and Holocene (Qhf) units (Figure 4). We did not differentiate the fans on the subject property by age. We have numbered the fans Qaf1 through Qaf3 to distinguish individual fan surfaces. We found exposures of fan material in cuts for driveways, reservoirs and water tanks around the site, consisting of moderately-sorted sands and silts with abundant subrounded to subangular granodiorite pebbles and cobbles. The fan surfaces are generally convex and slope southeastward into the center of the Salinas valley.

The subsurface information obtained for the subject properties as part of the geotechnical investigation included borings up to 51.5 feet in depth (Tharp, 1995; Tharp, 2006). None of the borings drilled out in the deep alluvium areas appear to have encountered granitic rocks. Therefore, the thickness of the Quaternary sediments at the project site, depicted on cross sections A-A' and B-B' (Plate 2) are estimates only.

Soils

At the project site, thin soils mantle slopes underlain by granodiorite, and thicker tilled soils occupy flatter areas. Rosenberg (2001) produced a soils map of Monterey County, based on the U.S. Department of Agriculture soil survey (2006). Figure 5 depicts soil units across the project site. Table 1 lists these soil units.

Because soils are generally derived from in-situ weathering of the underlying earth materials, the distribution of soil types (Figure 5) generally correlates with the distribution of geologic units (Figure 4). Areas underlain by granodiorite bedrock on sloping terrain are generally mantled with Vista coarse sandy loam and rock outcrops. Arroyo Seco, Chualar, Gloria and Placentia soils overlie alluvial fan deposits. Salinas and Hanford soils tend to overlie flood plain deposits. The engineering properties of the site soils are summarized in Appendix C

Faulting

There are 32 faults of known or suspected Quaternary age activity within a one hundred mile radius of the site (Bryant, 2005). These faults are summarized in Table 2. The nearest mapped fault considered to be potentially active is the Reliz fault, part of the Rinconada fault zone, located approximately 4.6 miles southwest of the site (Rosenberg, 2001). Other active faults of significance to the project include the San Andreas fault, located about 12 miles northeast of the project site, the Monterey Bay-Tularcitos fault, located about 12 miles southeast of the site, and the San Gregorio-Hosgri fault, located about 29 miles southwest of the site.

There are many faults located within the Santa Lucia Mountains west of the subject property. Bryant (2005) depicts these faults as Late Quaternary in age, in agreement with the Plio-Pleistocene age of the Santa Lucia range. With the exception of the Tularcitos fault, these faults are not considered active seismic sources by the State of California (Cao et al., 2003), although some slip that has occurred on the northern San Gregorio fault in the past may have been partitioned to these faults (Clark and Rosenberg, 1999).

There are no mapped faults depicted on or adjacent to the subject properties by any of the published geologic maps reviewed for this study. We reviewed five sets of stereographic aerial photos spanning the time period of 1937 to 2003. We observed no evidence for tonal or topographic lineaments that would indicate the presence of faulting on the subject properties.

Table 2: Faults Within 100-Mile Radius of the Site
Grouped according to known or suspected age of most recent movement
Faults with Historic Movement: San Andreas, Calaveras, Nunez, Greenville, Los Positas, Hayward
Faults with Holocene Movement (known or suspected): Ortigalita, Verona, Pleasanton, Tres Pinos, Hosgri, Monterey Bay-Tularcitos, Los Osos, San Simeon, San Juan, Quien Sabe, Corral Hollow-Carnegie, Sargent, San Gregorio
Faults with Late Quaternary Movement (known or suspected): Rinconada, Reliz, Cambria, San Joaquin, Midway, Zayante-Vergeles, Oceanic, Southern San Luis Range, West Huasna, Pine Rock, Williams, Cascade, Monte Vista-Shannon

GEOLOGIC HAZARDS

The following section summarizes geologic hazards with respect to the proposed development. We have included discussions of seismic shaking, landsliding, flooding, liquefaction, soil shrink-swell, and embankment dam failure hazards. In our opinion, other geologic hazards are not likely to affect the project site. Recommendations for mitigating geologic hazards to acceptable levels are presented in the following section. Acceptable risk levels attributable to geologic hazards are defined in Appendix B.

Seismic Shaking Hazard

Seismic shaking at the subject site may be intense during the next major earthquake along one of the local fault systems. A common measure of the intensity of ground shaking is the Modified Mercalli Intensity Scale (Table 3), a subjective measure of the effect of ground shaking on man, man-made structures, and the earth's surface. Intensity varies with distance from the causative fault, but can also vary greatly with local geologic setting. Lawson et al. (1908) lists a Mercalli Intensity of about VI to VII for the site as a result of the 1906 earthquake, although it should be emphasized that this estimate is based on a small number of field observations in an area sparsely populated in 1906. Stover et al. (1990) reported a Mercalli Intensity of VI for the 1989 Loma Prieta Earthquake (Table 3).

We have estimated expected deterministic seismic shaking intensities for the site. A deterministic assessment considers only the effects of the largest ground motion that can be expected at a given site, regardless of how likely it is to occur within the typical 50-year design life of a single family residence.

Table 3: Modified Mercalli Intensity Scale

The modified Mercalli scale measures the intensity of ground shaking as determined from observations of an earthquake's effect on people, structures, and the Earth's surface. This scale assigns to an earthquake event a Roman numeral from I to XII as follows:

I	Not felt by people, except rarely under especially favorable circumstances.
II	Felt indoors only by persons at rest, especially on upper floors. Some hanging objects may swing.
III	Felt indoors by several. Hanging objects may swing slightly. Vibration like passing of light trucks. Duration estimated. May not be recognized as an earthquake.
IV	Felt indoors by many, outdoors by few. Hanging objects swing. Vibration like passing of heavy trucks; or sensation of a jolt like a heavy ball striking the walls. Standing automobiles rock. Windows, dishes, doors rattle. Wooden walls and frame may creak.
V	Felt indoors and outdoors by nearly everyone; direction estimated. Sleepers wakened. Liquids disturbed, some spilled. Small unstable objects displaced or upset; some dishes and glassware broken. Doors swing; shutters, pictures move. Pendulum clocks stop, start, change rate. Swaying of tall trees and poles sometimes noticed.
VI	Felt by all. Damage slight. Many frightened and run outdoors. Persons walk unsteadily. Windows, dishes, glassware broken. Knickknacks and books fall off shelves; pictures off walls. Furniture moved or overturned. Weak plaster and masonry cracked.
VII	Difficult to stand. Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary buildings; considerable in badly designed or poorly built buildings. Noticed by drivers of automobiles. Hanging objects quiver. Furniture broken. Weak chimneys broken. Damage to masonry; fall of plaster, loose bricks, stones, tiles, and unbraced parapets. Small slides and caving in along sand or gravel banks. Large bells ring.
VIII	People frightened. Damage slight in specially designed structures; considerable in ordinary substantial buildings, partial collapse; great in poorly built structures. Steering of automobiles affected. Damage or partial collapse to some masonry and stucco. Failure of some chimneys, factory stacks, monuments, towers, elevated tanks. Frame houses moved on foundations if not bolted down; loose panel walls thrown out. Decayed pilings broken off. Branches broken from trees. Changes in flow or temperature of springs and wells. Cracks in wet ground and on steep slopes.
IX	General panic. Damage considerable in specially designed structures; great in substantial buildings, with some collapse. General damage to foundations; frame structures, if not bolted, shifted off foundations and thrown out of plumb. Serious damage to reservoirs. Underground pipes broken. Conspicuous cracks in ground; liquefaction.
X	Most masonry and frame structures destroyed with their foundations. Some well-built wooden structures and bridges destroyed. Serious damage to dams, dikes, embankments. Landslides on river banks and steep slopes considerable. Water splashed onto banks of canals, rivers, lakes. Sand and mud shifted horizontally on beaches and flat land. Rails bent slightly.
XI	Few, if any masonry structures remain standing. Bridges destroyed. Broad fissures in ground; earth slumps and landslides widespread. Underground pipelines completely out of service. Rails bent greatly.
XII	Damage nearly total. Waves seen on ground surfaces. Large rock masses displaced. Lines of sight and level distorted. Objects thrown upward into the air.

For comparison, we have also included the results of two probabilistic seismic shaking assessments covering the project site (Rosenberg. 2001; Cao et al., 2003). A probabilistic seismic analysis differs from a deterministic analysis in that it evaluates the probability for shaking of a certain intensity to occur at a particular site within a given time frame (50 years for residential development). Because these values were not directly calculated by us using a complete set of site-specific parameters, these values should be considered Sample Prescribed Parameter Values (CGS, 1997).

The intensity of seismic ground shaking is typically characterized as the peak acceleration that a point on the ground experiences during the shaking. Acceleration is measured as a proportion of the acceleration of the Earth's gravity, g.

Deterministic Seismic Shaking Analysis

For the purpose of evaluating deterministic peak ground accelerations for the site, we have considered the faults listed in Table 4 as potential seismic sources. While other faults in this region may be active, their potential contribution to seismic hazards at the site is overshadowed by these closer and/or faults.

Table 4: Distances and Directions to Local Active Faults

Fault	Distance from site (km)	Distance from site (miles)	Direction from site
Rinconada	7.4	4.6	Southwest
San Andreas	18.5	11.6	Northeast
Monterey Bay-Tularcitos	18.7	11.7	Southwest
San Gregorio-Hosgri	47.5	29.7	Northeast

Table 5 shows estimated magnitudes ($M_{W(MAX)}$) and rupture geometries for the maximum expected earthquakes on each of the above-listed fault systems (Cao et al., 2003). Estimated mean peak (PGA) and mean peak plus one dispersion (PGA + ∂) horizontal ground acceleration values for the site are calculated using these magnitudes and geometries, and the fault distances shown in Table 4. These accelerations are based on an attenuation relationship derived from the analysis of historical earthquakes (Sadigh et al., 1997), and are for sites founded on rock. We caution that the listed values are approximations, based on theoretical curves fit to a relatively small data set: actual measured accelerations may be larger. The PGA + ∂ value is a conservative design value that is intended to compensate for the uncertainty in the attenuation relationships.

The duration of strong seismic shaking shown in Table 4 is calculated from a magnitude-dependent formula proposed by Dobry et al., (1978). Expected recurrence interval (RI) (Peterson et al., 1996) is the expected time between major earthquakes on each fault. The UBC Seismic Source Type (CBSC, 2002; Cao et al., 2003) is also listed.

In summary, the Reliz-Rinconada fault zone, passing within 7.4 km of the site, is expected to generate the largest earthquake ground motion at the site. The characteristic earthquake on this fault ($M_{W(MAX)}$ = 7.5) is expected to generate estimated ground motions of up to 0.72g. Duration of strong seismic shaking from this event will be about 21 seconds. The recurrence interval for this earthquake is relatively long (RI = 1,764 years); therefore, the probability of this earthquake occurring within the project lifespan is relatively low.

Table 5: Deterministic Ground Motions

Fault	$M_{W(MAX)}$	Rupture Geometry	PGA (g)	PGA + ∂ (g)	Duration (sec)	Recurrence Interval (years)	Seismic Source Type
Reliz-Rinconada	7.5	Strike-slip	0.49	0.72	26	1764	B
San Gregorio-Hosgri	7.5	Strike-slip	0.11	0.16	26	646	B
Monterey Bay-Tularcitos	7.3	Strike-slip	0.27	0.39	21	2841	B
San Andreas (creeping segment)	6.2	Strike-slip	0.15	0.26	7	n/a	A

$M_{W(MAX)}$: Moment magnitude of maximum credible earthquake after Cao et al., 2003.
Rupture Geometry and Recurrence Interval after Peterson et al., 1996.
PGA: Mean peak horizontal ground acceleration. After Sadigh et al., 1997.
PGA + ∂: Mean peak horizontal ground acceleration plus one dispersion. After Sadigh et al., 1997.
Duration: Dobry et al., 1978
Seismic Source Type from CBSC, 2002

Probabilistic Seismic Hazard Assessments

The U.S. Geological Survey and the California Geological Survey together produced a probabilistic seismic hazards assessment for the state of California (Petersen et al., 1996; Cao et al., 2003). The study used a model that explicitly considered faults that are capable of generating moment magnitude 6.5 or greater earthquakes. The San Francisco Bay Area, Monterey Bay Area and Santa Lucia Mountains are traversed by numerous minor faults and splays, many of which may be capable of generating smaller earthquakes: to account for these seismic sources, a background magnitude of 6.5 was applied in the probabilistic model. Probabilistic ground motions based on that study for the proposed building sites are listed in Table 6.

For comparison, Table 6 also shows the results of an assessment prepared for Monterey County by Rosenberg (2001). Rosenberg (2001) incorporated geologic conditions into his probabilistic model (Figure 6), and suggested that areas underlain by granodiorite at or near the ground surface will experience lower probabilistic peak ground accelerations than areas underlain by deep alluvium or alluvial fans. Peak ground accelerations produced by the two studies are comparable for areas underlain by alluvium and alluvial fans, but differ for granodiorite areas.

Table 6: Probabilistic Ground Motions (10% probability of being exceeded in 50 years)		
Source	**PGA in Firm Rock or Granodiorite (g)**	**PGA in Alluvium and Alluvial Fans (g)**
Rosenberg, 2001	0.25	0.35
Cao et al., 2003	0.30	0.35

The ground motion intensities shown in Table 6 are the seismic shaking intensities that have only a 10% chance of being exceeded in 50 years. The "10% in 50 year" ground motion cited in Table 4 is considered appropriate for residential structures. We caution that these values are not based on a site-specific probabilistic assessment, which is normally required for critical structures such as schools and hospitals.

Landsliding Hazard

The only steep slopes on the subject property where landsliding is likely to occur are situated on the easternmost portion of Section 16 (Plate 1). These slopes are underlain by granitic rock, which is typically resistant to landsliding.

Rosenberg (2001) has mapped the entire property as a "low" landslide hazard area. We observed no evidence for previous landsliding during our site reconnaissance and aerial photo inspection of the site. However, we did observe several very steep, v-shaped drainage swales on Section 16: these swales had fan shaped deposits at their mouths that may be the site of debris flow type landslide deposits during intense rainstorms. Plate 1 depicts debris flow hazard areas at the property.

Flooding Hazard

The site is located outside the 100-year and 500-year flood zones shown on the Federal Emergency Management Agency Flood Insurance Rate Map (FEMA, 1984). Therefore, we do not consider the site to be at risk of flooding.

Rosenberg (2001) mapped a portion of the site as being underlain by flood plain deposits (Figure 4, Plate 1). These areas correspond to shallow drainage swales on the site. It is our opinion that the potential for flow exists along the axes of these swales during heavy precipitation, as would be expected for any ephemeral drainage. However, there is no hazard of innundation for areas adjacent to the channel centerline.

Liquefaction Hazard

Soil liquefaction occurs as a result of strong seismic shaking of loose, saturated sediments. It typically occurs in the youngest alluvial deposits adjacent to river banks, although it can and does occur in other environments.

Rosenberg (2001) mapped a portion of the property as being exposed to a high level of risk from liquefaction. This area of risk corresponds to the Undifferentiated Flood Plain (Qfp) deposits also mapped by Rosenberg (2001; see Figure 4). Based on our site geologic mapping, there are no areas underlain by Qfp (Plate 1), and, consequently, no areas of high liquefaction hazard. However, the alluvial fan sediments underlying the central and western portion of the site can be capable of liquefaction in areas of shallow ground water. Consequently, liquefaction hazard on the site should be evaluated by the project geotechnical engineer as part of a comprehensive project geotechnical investigation.

Soil Shrink-Swell Hazard

Structures or improvements built atop expansive soils may be subject to damage from soil shrinkage and swelling, associated with wetting and drying. A soil with a higher plasticity index (PI) is generally more prone to shrinkage or swelling in response to seasonal rainfall. The USDA (2006) provided general PI ranges for mapped soil units. At the site, soil units with elevated plasticity indexes (PI>15) include Gloria sandy loam (GhC and GhD), Placentia sandy loam (PnA and PnC), and Salinas clay loam (SbA). These soil units are restricted to flatter areas of the property.

Hazard Pertaining to Reservoir Embankment Dams

Two areas of fill are shown on Plate 1, corresponding to embankment dams for reservoirs on the property. These reservoirs store water for agricultural purposes. Failure of these dams could result in inundation of any structures located downstream.

The tentative map (Bestor Engineers, 2006) indicates that these dams and reservoirs will be removed as part of the development project. If these dams are removed, the hazards of dam failure and subsequent inundation will also be removed. If these dams are to remain, they should be evaluated for stability, including stability under seismic shaking intensities expected at the sites.

CONCLUSIONS

Based on the information gathered and analyzed, it is our opinion that the project site is geologically suitable for residential development, provided the recommendations listed in this report are properly implemented. Our recommendations include measures to reduce risks to habitable structures to ordinary levels (Appendix B).

Our recommendations are intended principally to lower the risks posed to habitable structures by geologic hazards. This report in no way implies that the subject property will not be subject to earthquake shaking, landsliding, faulting or other acts of nature. Such events could damage the property and affect the property's value or its viability in ways other than damage to habitable structures. We have not attempted to investigate or mitigate all such risks and we do not warrant the project against them. We would be happy to discuss such risks with you, at your request.

RECOMMENDATIONS

1. We recommend that the project engineers consider the findings of our seismic shaking analysis in project design. Given the potential for strong seismic shaking to occur during the design life span of the proposed retaining structures, all structures should be designed to the most current standards of the California Building Code, at a minimum.

2. A site-specific probabilistic seismic hazards assessment should be incorporated into the design of any schools, hospitals, fire or police stations, or any other critical facilities planned for the project site. An individual assessment should be performed for each site by an engineering geologist.

3. We recommend that portions of the project located within the Debris Flow Hazard Areas designated on Plate 1 incorporate design measures to mitigate this hazard. Suitable measures may include:

   a. Restricting development to outside these areas;

   b. Constructing artificial channels or diversion walls, designed to divert fluidized debris away from habitable structures; or

   c. Constructing impact walls, designed to withstand anticipated debris flow volumes and velocities.

   An engineering geologist should be retained to provide site-specific geologic design criteria for Debris Flow Hazard Areas once the final project plans are available. Diversion or retaining structures should be designed based on recommendations by a geotechnical engineer.

4. We recommend that the project geotechnical engineer prepare a quantitative assessment of liquefaction and seismically-induced settlement potential for the project as part of a comprehensive site geotechnical evaluation.

5. We recommend that all drainage from improved surfaces be captured by closed pipe or lined ditches and carried to neighborhood storm sewers or natural drainages. At no time should any concentrated discharge be allowed to spill directly onto the ground adjacent to structures or to fall directly onto steep slopes. The control of runoff is essential for erosion control and prevention of water ponding against foundations and other improvements.

6. Expansion potential of site soils should be evaluated as part of a site-specific geotechnical study. The recommendations of a geotechnical engineer for mitigating soil shrink-swell hazards should be incorporated into project design.

7. We recommend that any embankment dams on the properties be evaluated for stability by a geotechnical engineer if they are to remain in use following development of the

properties. Stability evaluations should include pseudostatic or dynamic stability analyses using peak horizontal ground motions recommended in the Seismic Shaking Hazards section of this report.

8. Should any revisions be made in the 8/7/06 Miravale III Tentative Map by Bestor Engineers, we should be provided an opportunity to review the revised plan and make supplemental recommendations, as warranted.

9. This report is issued with the understanding that it is the duty and responsibility of the owner, or of his representative or agent, to ensure that this report is provided to and brought to the attention of the architect, engineer(s) and general contractor for the project, and that all recommendations made in the report are incorporated into the plans and specifications, and that the necessary steps are taken to see that the contractor and subcontractors carry out the report's recommendations in the field.

10. We request the privilege of reviewing final project plans for conformance with our recommendations. If we are not permitted such a review, we cannot be held responsible for misinterpretation or omission of our recommendations.

11. If any unexpected variations in soil conditions, or if any unanticipated geologic conditions are encountered during construction, or if the proposed project will differ from that discussed or illustrated in this report, Nolan Associates should be notified so that supplemental recommendations can be given. Our conclusions and recommendations shall not be considered valid unless the changes are reviewed and the conclusions in this report are modified or verified in writing by a representative of Nolan Associates.

12. We recommend that home owners implement the simple safety procedures outlined by Peter Yanev in his book, *Peace of Mind in Earthquake Country*. This book contains a wealth of information regarding earthquakes, seismic design and precautions that the individual home owner can take to reduce the potential for loss of life, injury and property damage.

INVESTIGATIVE LIMITATIONS

1. The conclusions and recommendations noted in this report are based on probability and in no way imply the site will not possibly be subjected to ground failure or seismic shaking so intense that structures will be severely damaged or destroyed. The report does suggest that implementation of the recommendations contained within will reduce the risks posed by geologic hazards.

2. This report is issued with the understanding that it is the duty and responsibility of the owner or his representative or agent to ensure that the recommendations contained in this report are brought to the attention of the architect and engineer for the project, incorporated into the plans and specifications, and that the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

3. If any unexpected variations in soil conditions or if any undesirable conditions are encountered during construction or if the proposed construction will differ from that planned at the present time, Nolan Associates should be notified so that supplemental recommendations can be given.

4. The findings of this report are valid as of the present date. However, changes in the conditions of the property and its environs can occur with the passage of time, whether they be due to natural processes of the works of man. In addition, changes in applicable or appropriate standards occur whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated, wholly or partially, by changes outside our control. Therefore, the conclusions and recommendations contained in this report cannot be considered valid beyond a period of two years from the date of this report without review by a representative of this firm.

5. Our services consist of professional opinions and recommendations made in accordance with generally accepted engineering geology principles and practices. No warranty, expressed or implied, including any implied warranty of merchantability or fitness for the purpose is made or intended in connection with our services or by the proposal for consulting or other services, or by the furnishing of oral or written reports or findings.

MONTEREY COUNTY, CALIFORNIA

INTRODUCTION

This report summarizes the work performed and the findings, conclusions, and recommendations from Terratech's Phase I Environmental Site Assessment (ESA) of the property that consists of Township 17 South, Range 6 East, Section 16 (APNs 417-151-048 and 049), located north of Soledad, California (see Figure 1, Location Map).

Purpose

The purpose of this ESA is to provide a professional opinion on the potential current presence of recognized environmental conditions at the site, including potential impacts from known problems in the surrounding area. The term "recognized environmental conditions," as defined by ASTM Designation E 1527-94, means:

> "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property."

This ESA was performed according to the recommended guidelines established by ASTM Designation E 1527-94, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process." We understand that this assessment is associated with a potential property ownership transfer.

Limitations and Exceptions of Assessment

This report and the associated work have been provided in accordance with the principles and practices generally employed by the local environmental consulting profession. This is in lieu of all warranties, express or implied. This ESA was performed and this report has been prepared for use solely by Mr. Nader Agha in his potential purchase of the subject property. This report shall not be relied upon by or transferred to any other party, or used for any other purpose, without the express written authorization of Terratech, Inc.

This ESA is not a regulatory compliance audit or an evaluation of the efficiency of the use of any hazardous substances or petroleum products at the site. No evaluation for the presence of asbestos-containing building materials, urea-formaldehyde foam insulation, methane, radon gas, lead-based paint, lead in drinking water, or wetlands is included in our assessment.

Our findings and opinions are based on information collected from historical photographs, regulatory agency files and lists, and interviews; from results of chemical analyses performed on ten near-surface samples obtained from the site; and from site conditions at the time of our site reconnaissance on February 9, 1995. The regulatory records search did not fully cover the site corners with the conventional radii.

Note that our findings and opinions are based on information that we obtained on specific dates, through records review, site reconnaissance, and related activities. It is possible that other information exists or subsequently has become known, just as it is possible for conditions we observed to have changed after our observation. Terratech cannot warrant or guarantee that not finding indicators of hazardous substances or petroleum products means that hazardous substances or petroleum products do not exist on the site.

Any person who is aware of any recognized environmental conditions of the site or surrounding areas that are different from those described in this report should report them immediately to this office for an evaluation as part of an additional scope of work.

Note: In this report, the term "hazardous materials" includes hazardous substances and petroleum products.

Limiting Conditions and Methodology Used

The scope of work for this ESA was outlined in our January 31, 1995, proposal and authorized by receipt of a signed copy of the Agreement for Professional Services on February 2, 1995. We performed the following work:

1. Reviewed a chronology of aerial photographs covering the site and adjacent area.

2. Contracted with Environmental Risk Information & Imaging Services (ERIIS) to research the availability of historic fire insurance maps of the site. No maps were available in the ERIIS collection, for the period 1867-1990.

3. Reviewed geologic maps and literature on file in our office for information on the hydrogeologic setting of the site.

4. Contracted with ERIIS, a regulatory-list search service, to research lists of known contaminated sites and waste generators at the site and in the surrounding area (up to 1.5-mile radius from center of site). The ERIIS report is included as Appendix A.

5. Reviewed regulatory files at the King City office of the Monterey County Department of Health, Division of Environmental Health (MCDEH) concerning hazardous materials, underground storage tanks, and subsurface contamination at the site and in the surrounding area. Reviewed the regulatory file for the City of Soledad Landfill at the Castroville office of the MCDEH.

6. Obtained a copy of the site Restricted Materials Use Permit from the Monterey County Agricultural Commissioner, Pesticide Use Enforcement Unit (MCAC). A copy of the permit is presented in Appendix B.

7. Performed a site reconnaissance on February 9, 1995, of the exterior portions of the site and the interior of the barn and maintenance shop. The interior of the residence was not inspected. The reconnaissance was conducted to identify evidence of potential contamination such as current hazardous materials storage or use; unusually stained soils, slabs, and pavements; drains, sumps, drums, tanks, and electrical transformers; discarded hazardous materials containers; stressed vegetation; and low areas in which stormwater runoff may have accumulated. We also checked for evidence of water wells, septic tanks, and leach fields.

8. Performed "drive-by reconnaissances" of properties in the immediate vicinity of the site on February 9, 1995, noting facilities likely to use or store hazardous materials.

9. To inquire about past and/or present uses of the site, representatives of the property owners, Mark Mirassou and Peter Mirassou, were interviewed on February 9 and 13, 1995, respectively. Mark Mirassou responded to the questions on an ASTM Transaction Screen Process Questionnaire during the interview (Appendix C).

10. For any available information on documented cases of subsurface contamination at the site and in the surrounding area, John Ramirez of the MCDEH was contacted. Grant Miller of the MCDEH was contacted regarding the closed City of Soledad Landfill. Bob Roach of the MCAC was contacted regarding the Restricted Use Materials Permit issued to the site business. Gray Pard of the Monterey County Water Resources Agency (MCWRA) was contacted regarding water supply wells located on the site.

11. Collected ten near-surface soil samples from the site and submitted the samples to a State-certified laboratory for chemical analysis. The samples were analyzed for the presence of organochlorine pesticides by EPA test method 8080.

12. Evaluated the information collected and prepared this report summarizing our findings, conclusions, and recommendations.

FINDINGS

Site and Vicinity Description

The subject site is owned by Mirassou Sales Company. Mirassou Vineyards, dba San Vicente Vineyards, operates a wine grape vineyard on the site. The site consists of two contiguous assessor's parcels (APNs 417-151-048 and 049) that constitute one Public Land Survey section (T17S, R6E, S16) and is located approximately one mile north of the City of Soledad (see Figure 1, Location Map). The site is situated on the northeast edge of the Salinas Valley. The eastern edge of the site is located in the foothills of the Gabilan Range. The site is bounded by the Hambey cattle feed lot and the Gabilan Range foothills to the east; the Hambey cattle feed lot and residential properties to the south; San Vicente Road, agricultural properties, and residential properties to the west; and a residential and agricultural property to the north.

Approximately 450 acres of the approximately 640 acre-site is cultivated with varietal wine grapes. The remaining portion of the site is developed with a single-family residence, a barn, and maintenance shop (approximately 2 acres in the southwest corner) or is too steep for cultivation (approximately 183 acres along the eastern edge). A reservoir is located on the northeast portion of the site. On Figure 2, the area north and east of the curving road is steep and uncultivated and the area south and west of the curving road is primarily cultivated in wine grapes. A radio transmission tower is located on the knoll on the southeast portion of the site and high-tension power lines cross the extreme northeast corner of the site (see Figures 1 and 2). The site ranges in elevation from 215 feet to 601 feet above mean sea level and slopes toward the southwest (USGS, 1955).

Site History

Aerial Photographs

We examined stereoscopic aerial photographs of the site and vicinity taken in 1937, 1949, 1953, 1956, 1971, 1985, and 1989 at McHenry Library, University of California at Santa Cruz, on February 8, 1995.

The 1937 photograph showed the flatter portion of the property to be cultivated with orchards, row crops, and possibly open field crops. The orchards appeared in the center portion of the property, the open field crops or no development appeared in the northern portion, and the row crops, or possibly open field crops, appeared in the southern portion of

the property. The cultivated portion did not appear to extend as far east as it does today. At least one structure was shown in the southwest corner of the property. An area that appeared to support a water supply well was shown near the center of the southwest quadrant of the site near the location of Sample S-7 depicted on Figure 2. The surrounding properties appeared to be undeveloped or cultivated in open field crops.

The 1949 photograph showed the west portion of the orchard extending approximately 1,200 feet south. The southern portion of the site appeared cultivated in row crops and the northern portion appeared undeveloped or cultivated with open field crops. The structure complex was shown in the southwest corner of the site. High-voltage power lines appeared to almost bisect the site diagonally from the northwest to the southeast. Possible structures appeared in a small area on the adjacent property to the south near the common property boundary.

The only differences to the site noted in the 1953 and 1956 photographs when compared to the 1949 photograph were the appearance of a large, circular object inferred to be a reservoir at the location of the possible water supply well at the center of the southwest quadrant of the site (near soil Sample S-7 shown on Figure 2), and the appearance of the radio transmission tower on the southernmost knoll along the eastern edge of the site. The cattle feed lot appeared on the adjoining property to the south, near the common property boundary.

The site appeared mostly as it does today in the 1971, 1985, and 1989 photographs, except that several rows of trees segmented the cultivated area in the 1971 photograph. The circular reservoir previously depicted was absent, with no indication of a water supply well in the immediate area. The reservoir currently situated on the northeast corner of the property is depicted, as well as the high-voltage power lines crossing the extreme northeastern corner of the property. The power lines previously shown bisecting the property were absent. The feed lot appeared fully developed on the adjacent properties along portions of the south and east common property boundaries. Structure complexes appeared on adjoining properties to the south and to the north near the common property boundaries.

Historic Fire Insurance Maps

A fire insurance map search was requested for the subject area from ERIIS. ERIIS indicated there is no fire insurance coverage in their collection for the subject area, for the period 1867-1990. The ERIIS collection includes all available Sanborn and Manufactural Mutual fire insurance maps.

Historic Topographic Maps

We examined historic topographic maps of the site and vicinity produced in 1915, 1940, and 1984 at McHenry Library, University of California at Santa Cruz, on February 8, 1995. The 1915 map showed San Vicente Road and a structure on the extreme southwest corner of the property (USGS, 1915). The 1940 map showed three structures in the extreme southwest corner of the property, indicated an orchard was cultivated near the central portion of the site, and showed the high-voltage power lines bisecting the site from northwest to southeast (USGS, 1940). The 1984 map showed two structures and a water tank in the southwest corner of the property, the radio transmission tower, the reservoir on the northeast portion of the property, and the power lines crossing the northeast corner of the property.

Site History Summary

Review of historic aerial photographs and maps and discussions with representatives of property owners (detailed below) revealed the following site history:

A structure existed on the extreme southwest corner of the site from at least 1915. Between 1915 and 1937, an orchard (probably almond) was planted on the central portion of the site and maintained until around 1965. Row crops were cultivated on the southern portion of the site from 1937 or before until around 1965. Between 1915 and 1940, two more structures were constructed at the southwest corner of the site. Between 1937 and 1940, high-voltage power lines and support poles were installed bisecting the site trending northwest-southeast. Between 1949 and 1953, a large, circular reservoir was installed near the center of the southwest quadrant of the site and the radio transmission tower was installed on the southernmost knoll along the eastern edge of the site.

In 1962 or 1963, Mirassou Sales Company purchased the site from the Lawrence family, now deceased. Around 1965, the orchards, row crops, and open field crops were replaced with wine grape vines. Between 1956 and 1971, the large, circular reservoir was removed and an earthen dam was constructed at the northeast corner of the site in the foothills to create a reservoir, and the high-voltage power lines were moved northeast to cross only the extreme northeast corner of the property. Around 1970, a water supply well located near the former large water reservoir was capped and overplanted with vines.

Hydrogeologic Setting

The Soledad area is located in the Salinas River Valley, a northwesterly trending valley bordered on the southwest by the Sierra de Salinas and Santa Lucia Range and on the northeast by the Gabilan Range. Surface drainage in the vicinity of the subject property is southwest toward the Salinas River, which is located approximately 2 miles south of the

subject site. The Salinas River originates near Santa Margarita, flows northwest about 120 miles, and discharges into the Pacific Ocean at Monterey Bay.

The Monterey County Flood Control and Water Conservation District identifies the subject site as situated in the Salinas Valley Ground Water Basin. The Salinas Valley is separated into four hydrologically linked ground water areas, the Pressure Area, East Side Area, Forebay Area and Upper Valley Area. The Soledad area is situated in the Forebay Area. The Forebay Area lies between the Pressure Area to the north and the Upper Valley to the south. Recharge to the Forebay Area is from the Upper Valley Area, irrigation return flow, precipitation and recharge from the Arroyo Seco and Salinas River and their tributaries. Throughout the Forebay and Upper Valley Areas no significant aquicludes exist, and the aquifer(s) in the Soledad area are unconfined [Boyle Engineering Corporation, 1986]. Depth to first-encountered ground water in the Soledad area is between 80 feet and 100 feet below ground surface, and the ground water generally flows northwest [Monterey County Flood Control & Water Conservation District, 1981].

The flatter portion of the site has been mapped as being underlain by Quaternary older alluvium, and the steeper portion of the site has been mapped as underlain by Mesozoic granitics [Dibblee, 1972].

Regulatory Records Review

An ERIIS Site Assessment Report was prepared for the site on February 7, 1995, and is included in this ESA as Appendix A. Additionally, available regulatory agency files on sites with known fuel storage tanks, hazardous materials storage, and subsurface contamination were reviewed and/or discussed with agency representatives to assess the potential for environmental impacts to the site. The results of the ERIIS report, file reviews, and discussions are summarized below.

ERIIS Site Assessment Report

The ERIIS report presents the results of a search of eleven databases that list addresses of sites with known underground or above-ground storage tanks; active and inactive landfills; oil and gas wells; hazardous waste storage, generation, treatment and/or disposal; and subsurface contamination within 0.25 to 1.5 mile radius from the center of the site. No "plottable" sites were identified in the ERIIS report within the requested radii. Fifty "unplottable" sites were identified in the greater Soledad area, however, only two unplottable sites, the City of Soledad Sanitary Landfill and Braga Ranch, are located within the associated radii from the subject site.

Monterey County Department of Health,
Division of Environmental Health

The MCDEH regulates, within the County of Monterey, underground and above-ground storage tanks, the storage of hazardous materials, the performance of hazardous materials inspections, solid waste facilities, and limited subsurface contamination investigations. The files for the subject site and all adjacent sites were requested for review at the King City office of the MCDEH. The hazardous materials files that were available were reviewed at the MCDEH on February 6, 1995, and are summarized below.

NAME: Mirassou Vineyards/San Vicente Vineyards
ADDRESS: San Vicente Road
ERIIS ID: N/A
APPROXIMATE DISTANCE FROM SUBJECT SITE: Subject site.
SUMMARY: Holds a current permit to store hazardous materials. No records of any inspections were found in the file. Operate a 1,000-gallon, above-ground diesel tank. Stores up to 150 gallons of motor oil, 200 gallons of waste motor oil, and 200 gallons of propane at the site. The diesel tank is located just east of the maintenance shop, the propane tank is located east of the diesel tank, the motor oil is stored in the shop, and the waste motor oil is stored in the shed, adjacent to the shop on the west. A Hazardous Materials Registration/Hazardous Waste Fact Sheet signed May 21, 1987, by Frances Cavalli, Vineyard Manager, indicates the operation of a 600-gallon, underground diesel tank. A Registration/Fact Sheet signed by Peter Mirassou on December 21, 1988, indicated the presence of two, 600-gallon, above-ground diesel tanks. A hand-drawn site plan indicated the presence of the active well east of the barn and the abandoned well near the center of the southwest quadrant of the site.

NAME: Armand Kunde Slaughterhouse
ADDRESS: End of West Street, Soledad
ERIIS ID: N/A
APPROXIMATE DISTANCE FROM SUBJECT SITE: Adjoins subject site to south.
SUMMARY: On February 7, 1990, two 10,000-gallon, underground fuel storage tanks were removed. Chemical analysis performed on soil samples retrieved at the time of the tank removals did not reveal any fuel compounds.

NAME: S. Braga & Sons Ranch
ADDRESS: Highway 101 North, Soledad
ERIIS ID: Unplottable site
APPROXIMATE DISTANCE FROM SUBJECT SITE: 1700 feet west.
SUMMARY: Holds a current permit to store hazardous materials. Four underground gasoline tanks and two underground diesel tanks are located at the site. No records of any violations were found in the file.

NAME: Tom Hambey & Son Ranch
ADDRESS: 34277 Bryant Canyon Road, Soledad
ERIIS ID: Unplottable site
APPROXIMATE DISTANCE FROM SUBJECT SITE: Adjoins subject site to south and east.
SUMMARY: Holds a current permit to store hazardous materials. Two underground fuel tanks are located approximately 500 feet south of the southeast corner of the subject site. No records of any violations were found in the file.

NAME: Rancho de Vino
ADDRESS: 32300 San Vicente Road, Soledad
ERIIS ID: N/A
APPROXIMATE DISTANCE FROM SUBJECT SITE: Across San Vicente Road to the west.
SUMMARY: Holds a current permit to store hazardous materials, including operation of a 500-gallon diesel tank. The file did not indicate if the tank was above-ground or underground. No records of any inspections were found in the file.

The file for the City of Soledad Landfill was reviewed at the Castroville office of the MCDEH on February 6, 1995. The landfill is located approximately 1,000 feet northwest of the site. Disposal operations at the landfill commenced in 1964 and included the disposal of approximately 100 tons per week of municipal wastes, brush, and other vegetative material (Emcon Associates, 1977). A subsurface investigation, consisting of the installation of fourteen exploratory trenches, was performed in 1977. The investigation determined that the entire disposal site is underlain by non-waterbearing, coarse-grained granitic bedrock and the, "absence of ground water, the low annual rainfall, and the operation of the disposal site to ensure control of surface water (will) preclude the development of significant quantities of leachate at the site, and will ensure that the landfill development will not degrade the surrounding environment" (Emcon, 1977).

A letter dated August 9, 1978, from Walter Wong of the MCDEH to Larry Bagley, City of Soledad Manager, stated that all standards for the closure of the Soledad Disposal site had been met. A letter dated June 11, 1981, from the State Solid Waste Management Board to Earl Morrison, City of Soledad Manager, indicated that an April 28, 1981, evaluation was performed at the landfill facility and stated, "The site is not in compliance with the surface water criterion because it has not been properly maintained to prevent erosion from cutting into in-place refuse, and to prevent water from ponding on site." Between two and four inspections per year were performed by MCDEH representatives from 1991 until 1994. The only violation noted during this time period was an unsecured gate.

Monterey County Agricultural Commissioner, Pesticide Use Enforcement Unit

The MCAC issues Restricted Materials permits to farm businesses in Monterey County that store and use pesticides. Conditions of the permit include completing a chemical use and storage training program and passing a written exam. The MCAC conducts random pesticide use monitoring and pest control records inspections of permitted facilities. A copy of the Restricted Materials permit for the San Vicente Vineyards was requested and received from the MCAC on February 27, 1995, and is presented in Appendix B. No records of any inspections were included in the permit copy.

Site Reconnaissance

We performed a site reconnaissance on February 9, 1995, accompanied by Mark Mirassou. All relatively flat portions of the site were cultivated in grapes, except for the southwest corner (residence, barn, and shop) and access roads. The steep portions of the site were fenced and undeveloped. Mr. Mirassou stated that the steep portions are leased for cattle grazing. There were no cattle present at the time of our reconnaissance. Two intermittent drainages were observed on the site. One drainage enters the site at the east boundary near the southeast corner (see sample location S-1 on Figure 2) and the other drainage enters the site at the north-central site boundary (see sample location S-5 on Figure 2). The drainage entering the site at the north site boundary was flowing at the time of our reconnaissance. Additionally, Mr. Mirassou indicated another area where surface water collects, near the location of Sample S-2 (Figure 2). Water was noted ponded on the ground surface in this area during our reconnaissance.

The residence, barn, and maintenance shop are located in the southwest corner of the site. The residence was not inspected during our reconnaissance. The barn was constructed of wood and had an earthen floor. A harvesting machine was stored in the barn and obscured most of the barn floor.
A 1,000-gallon, above-ground diesel tank supported by a cement, bermed area was observed against the exterior eastern wall of the maintenance shop. No evidence of spills were noted in or around the bermed area.

The maintenance shop was constructed of wood and had a cement floor. Three drums of motor oil and transmission fluid, equipped with manual pumps, were stored in the shop in a concrete bermed area. The pumps were underlain by a gently sloping cement-lined trench. No evidence of spills was noted in the bermed area or the trench. A covered pit for accessing the underside of machinery was observed in the floor of the shop. However, a large piece of machinery was parked over the pit, prohibiting our inspection.

An open-air shed with an earthen floor was attached to the west side of the maintenance shop. Four drums for waste oil storage were noted inside a cement secondary containment. No evidence of spills were observed in the secondary containment. A small oil-type stain was noted on the earth floor of the shed.

Two water supply wells were noted on the site. One well is located in the extreme southwest corner of the site and supplies water to the residence and one well is located approximately 670 feet east of the west site boundary and 100 feet north of the south site boundary. No evidence of a well near the location of Sample S-7 (see Figure 1) was observed.

Mr. Mirassou stated that there are two septic systems on the site. One system serves the residence and one the shop complex. Mr. Mirassou did not know the location of the residential system and stated the shop system is located just west of the shed and shop.

An open-top, 55-gallon drum containing trash was observed south of the shop. The soil beneath the drum appeared discolored and to have supported a fire at one time. Mr. Mirassou guessed that trash was previously burned in the drum.

Mr. Mirassou stated that all agricultural chemicals are currently stored and mixed in a fenced and protected area near the location of Sample S-9 (see Figure 2). No chemicals were present at the time of our reconnaissance. Directly south of the storage area we observed an empty, open-top, 55-gallon drum. The soil beneath the drum appeared discolored and to have supported a fire at one time. Mr. Mirassou stated that empty pesticide bags are occasionally burned in the drum. Sample S-9 was collected approximately two feet south of the drum.

A burn area is located on a steeper portion of the site, southwest of the reservoir (see Figure 2). Mr. Mirassou stated grape vine stakes and eucalyptus tree stumps have been burned in this area.

A radio transmission tower is located on the southeastern most knoll on the site (see Figure 2). The tower is connected by electrical wires to a locked, unlabelled shed, and to several telephone poles. An oil-type substance appeared to have emanated from one of the telephone poles and stained the surrounding surface soil.

An oil stain was noted on a fence separating the site with the residential development to the south. The stain did not appear to impact the underlying soil on the north side of the fence. Animal corrals and sheds were observed on the adjoining property to the north, along the joint property line. Several 55-gallon drums were observed just north of the corrals and sheds.

No stained areas were observed (in unobstructed areas) on the site, other than the areas mentioned above. No indications of the existence of water supply or monitoring wells, underground storage tanks, or storage or disposal of hazardous materials, (other those than discussed above) were visible (in unobstructed areas) on the site.

Interviews

Representatives of the current property owners were interviewed regarding the history of the site. Additionally, regulatory agency representatives were contacted regarding water supply wells, underground storage tanks, hazardous materials storage, and subsurface contamination in the site vicinity to assess the potential for environmental impacts to the site.

Current Property Owner

Mark Mirassou, a representative of Mirassou Sales Company and Vineyard Manager, was interviewed in person February 9, 1995. Mark Mirassou responded to the ASTM questionnaire presented in Appendix C. Mark Mirassou stated the site is owned by Mirassou Sales Company, a partnership consisting of Peter Mirassou, his father, and Jim Daniel. Mark Mirassou thought Mirassou Sales Company purchased the site from the Thompson family around 1963 or 1965. Mark Mirassou recalled that orchards were cultivated on the site at the time of the property transfer, then row crops and open field crops were cultivated for a few years. He thought the grape vines were planted in 1965 or 1966.

Mark Mirassou knew about the existence of an abandoned well near the location of sample S-7 (Figure 2), but thought the well was sealed in some manner. The only storage tanks on-site are a water storage tank by the residential well, the above-ground diesel tank east of the shop, and the above-ground propane tank east of the diesel tank. He stated that, to his knowledge, no underground fuel tanks have ever existed at the site.

Mark Mirassou stated that all chemicals are stored and mixed in the fenced and protected enclosure near Sample location S-9 (Figure 2). He indicated that grape stakes are burned at an area southwest of the reservoir (see Figure 2) and that empty pesticide bags are occasionally burned in the drum south of the fenced storage enclosure.

Peter Mirassou, a partner of Mirassou Sales Company, was interviewed by telephone February 13, 1995. Peter Mirassou stated he purchased the site in 1962 or 1963 from the Lawrence family, now deceased. He confirmed Mark Mirassou's explanation of the cultivation history of the site, adding the orchards were almond orchards. Peter Mirassou stated the radio transmission tower is leased to Pacific Bell and Eden Communications. Peter Mirassou indicated the abandoned well was capped with a cement plug around 1970.

Regulatory Agency Representatives

John Ramirez of the MCDEH was interviewed by telephone February 2, 1995, and in person on February 6, 1995. Mr. Ramirez stated the only facilities with hazardous materials files in the vicinity of the site are some neighboring farms, the Kunde Slaughterhouse, and the closed City of Soledad Landfill. Mr. Ramirez indicated the farms store fuel in above-ground and underground storage tanks, but he could not recall any problems. Underground fuel tanks were removed from the Kunde Slaughterhouse site, but no contamination was detected in the soil samples taken at the time of the tank removals. Mr. Ramirez did not have any information on the landfill, but referred us to speak with Grant Miller of the MCDEH Solid Waste Division.

Grant Miller of the MCDEH Solid Waste Division was interviewed in person February 6, 1995. Mr. Miller did not know any details regarding the City of Soledad Landfill, other than it was closed. Mr. Miller retrieved the MCDEH file on the landfill for our review.

Bob Roach of the MCAC was interviewed by telephone February 6, 1995. Mr. Roach stated that no inspections have been performed by the MCAC at Mirassou Vineyards (dba San Vicente Vineyards) and did not recall any chemical spills or other environmental issue occurring at the Vineyards. Mr. Roach supplied us with a copy of the Mirassou Vineyards 1994 Restricted Materials Permit (Appendix B).

County With Resource Agency?

Gray Pard of the Monterey Water Management District was contacted February 2, 1995, regarding the presence of water supply wells at the site. Ms. Pard stated that three water supply wells are registered to the site; one abandoned well, one possibly abandoned well, and one active well. Ms. Park stated that the abandoned wells were probably not destroyed.

Soil Sample Collection and Analysis

On February 9, 1995, ten near-surface soil samples (S-1 - S-10) were collected from depths of 1.5 feet at the locations shown on Figure 2. Samples S-1 and S-5 were obtained from locations in the intermittent drainages; Sample S-2 was collected in an area where surface water collects; Samples S-4, S-6, and S-8 were collected from areas previously cultivated in orchards; Sample S-7 was obtained from near the abandoned well and the previous location of the circular reservoir; Sample S-9 was obtained near the agricultural chemical storage and mixing area and near the chemical bag burn area, and Samples S-3 and S-10 were collected where row crops and/or open field crops were previously cultivated. All Samples S-1 through S-10 were obtained from areas currently cultivated in wine grapes. We were not able to obtain samples from the southwestern cultivated portion of the site, which was recently sprayed with herbicides.

The target sampling depths were reached by using a clean hand auger. A slide hammer was then advanced to the appropriate depth, and soil was driven into 6-inch-long by 2-inch-diameter brass liners encased in a core barrel attached to the end of the slide hammer. To prevent potential cross-contamination, the hand auger, brass liners, and core barrel were cleaned prior to and between each boring in a non-phosphate detergent solution. Immediately upon retrieval of the core barrel, the brass liners encasing the soil samples were removed form the core barrel and sealed with aluminum foil, plastic end caps, and masking tape. The samples were labelled with project number, date, sampling location, and depth; sealed in individual Ziploc bags; and placed in a refrigerated container.

The ten soil samples were transported to a State-certified laboratory (Inchcape Testing Services Anametrix Laboratories of San Jose, California) under appropriate chain-of-custody documentation. The samples were analyzed for the presence of organochlorine pesticides by EPA Test Method 8080.

Results of the chemical analyses revealed the following concentrations of analytes detected in the soil samples: 66 parts per billion (ppb) 4,4'-DDE in Sample S-1; 25 ppb 4,4'-DDE in Sample S-8; and 13 ppb dieldrin and 13 ppb 4,4'-DDE in Sample S-10. No analytes were detected in Samples S-2 through S-7 or in S-9. DDE is a breakdown compound of DDT, both of which are environmentally persistent.

CONCLUSIONS

We have performed a Phase I ESA for the subject site in conformance with the scope and limitations of ASTM Designation E 1527-94. Any exceptions to, or deletions from, this practice are described in the Limitations and Exceptions of Assessment section of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the subject site except for the following:

1. The agricultural chemicals dieldrin and/or 4,4'-DDE were detected in three of the ten near-surface soil samples collected. The concentrations of the compounds detected are well below their respective State hazardous waste levels of 8,000 ppb for dieldrin and 1,000 ppb for combined DDE, DDD, and DDT compounds (CCR, Title 22, 66699). The concentrations detected do not suggest levels in excess of typical background levels for agricultural properties in the area.

2. A relatively large area of discolored surface soil is located in the burn area (southwest of the reservoir) where grape stakes are burned. Grape stakes are composed of wood treated with preservatives such as copper, chromium, arsenic, and/or creosote. The potential exists that the wood-treating chemicals have impacted the soil in the burn area.

3. A secondarily-contained above-ground fuel tank is located east of the shop building. If failure of both the fuel tank and its secondary containment occurs, the underlying soil may be impacted.

4. A 1987 document found in the MCDEH hazardous materials file for the site indicates the operation of a 500-gallon, underground diesel tank, however, Mark Mirassou (Vineyard Manager), does not believe an underground fuel tank ever existed at the site. If an underground fuel tank has existed at the site, the tank or associated piping may have leaked and impacted the underlying soil and ground water.

5. A harvesting machine obscured the earthen barn floor and machinery was parked over the maintenance pit in the maintenance shop at the time of our reconnaissance. The floor of the maintenance pit is likely stained by oil. If the pit floor is earthen or if the flooring material is cracked, the soil beneath the pit floor may be impacted by oil contamination. Oil-stained soil was observed on the floor of the shed, adjacent to the shop.

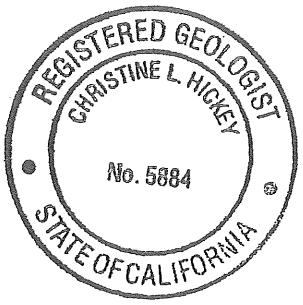
6. A septic system serves the shop complex. If hazardous materials were introduced to the shop drain system, the soil surrounding the leach field may be impacted.

7. One abandoned water supply well and two active water supply wells are located on the site. Improperly constructed water wells can act as conduits for contaminants at or near the surface to migrate to underlying aquifers.

8. A feed lot is located on the adjacent property south and east of the site, along the common property boundary. Large-scale animal operations can elevate the concentrations of nitrates, chlorides, and other chemicals in the underlying ground water. If the ground water gradient direction is to the northwest and the feed lot has impacted the underlying ground water, the potential exists for the impacted ground water to have migrated beneath the subject site.

9. Two underground fuel tanks are located approximately 500 feet south of the southeast corner of the site at the Hambey Ranch. A possible underground fuel tank is operated at Rancho de Vino, located west of San Vicente Road, west of the site. No records of failure of these tanks were found in the MCDEH files. However, if these tanks have leaked significant quantities of product and impacted the underlying ground water, and if the ground water flow direction is from the tank locations to the site, the potential exists for the impacted ground water to migrate beneath the site.

Based on our research, we have formed the following additional opinion:



> The closed City of Soledad Landfill is located 1,000 feet from the subject site, probably in either a downgradient or crossgradient direction. Therefore, any environmental impairment at the landfill should not affect the subject site.

RON BANE

General Manager
Terra Tech, Inc.
12 Thomas Owens Way
Monterey, CA 93940

Dear Sir:

Recently I submitted on offer to purchase a piece of property in the County of Monterey. One of the conditions of purchase is the commission of a soil test report performed by a licensed soil engineer or expert which would demonstrate whether or not contamination exits on the subject property.

Over the past twenty-five years, my requests for such reports have been made to the firm of Myron Jacobs in Watsonville. Their findings were precise and accurate, and I was always 100% satisfied with their work. Mr. Jacobs, unfortunately, is now deceased, and your firm was recommended to me by my long-time engineer, Carl Hooper of Bestor Engineers.

To review the scenario: I was contacted by your representative, Christine L. Hickey. I made it very clear to her that the purpose in engaging your services is to give me a precise finding and answer as to whether or not there is toxic contamination on the subject property. I also indicated to her that time is of the essence as the results were needed in order to cure the condition to go ahead or not with the purchase of the property, and the time period allowed is very short.

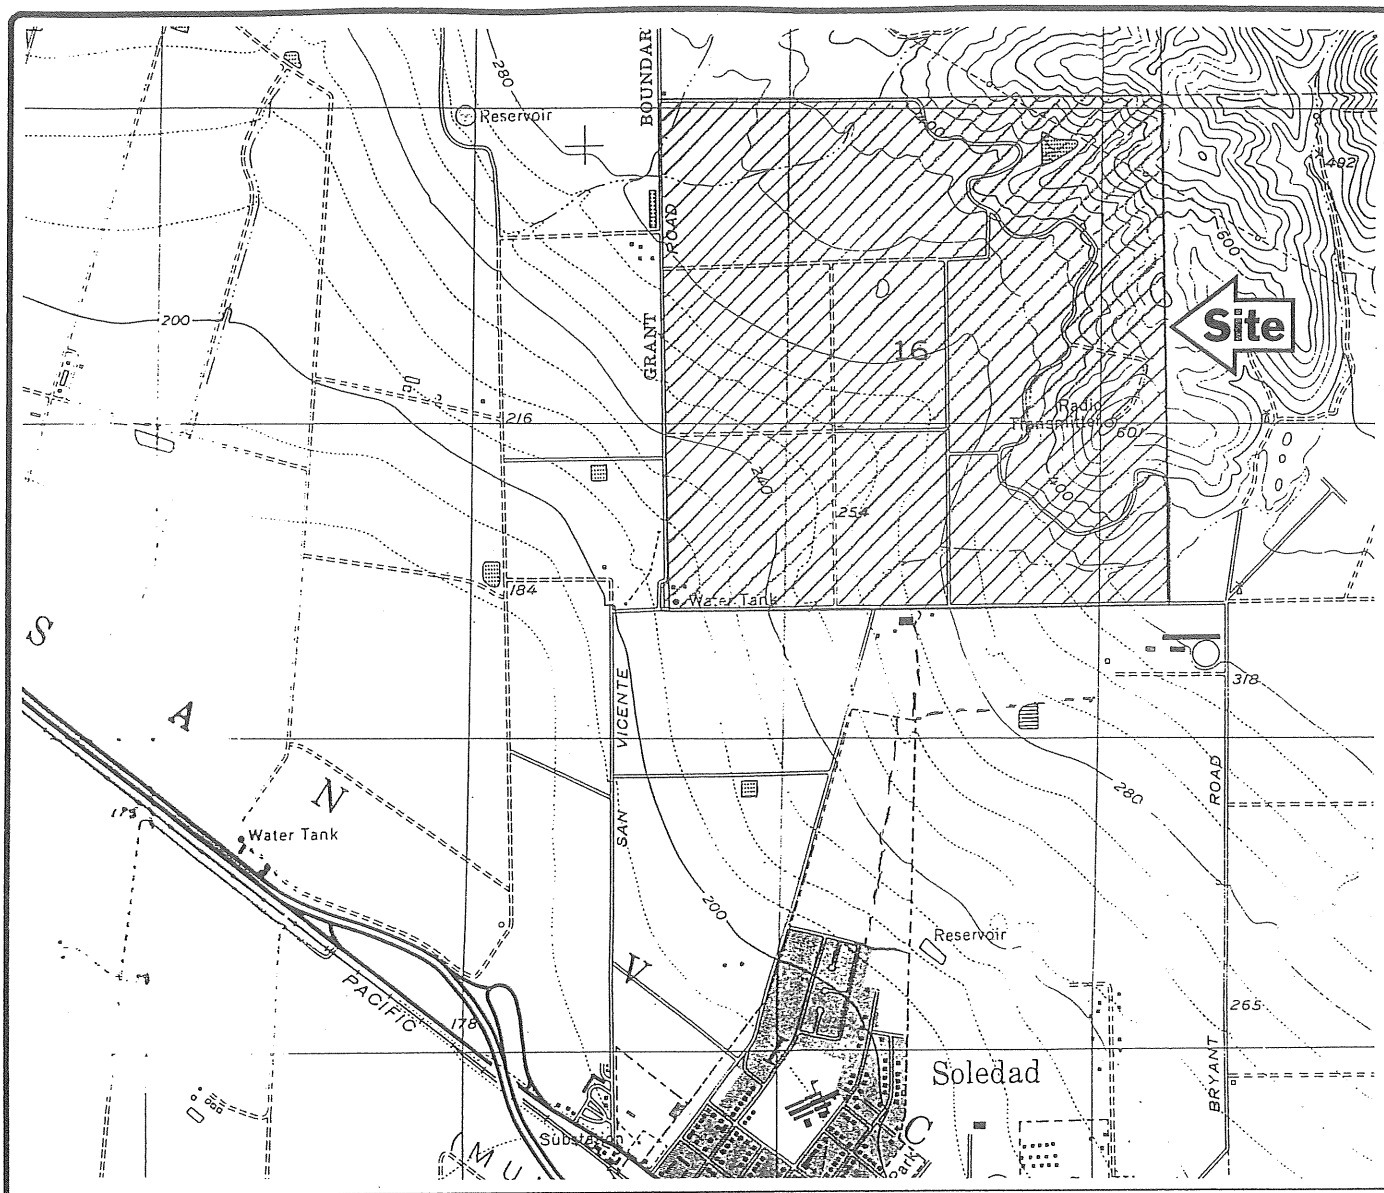
Christine gave me a bid of $4,700.00 which I accepted. As she requested, I paid $2,500.00 in advance. I stressed to her the importance of determining what, if any, contamination in existence in order that I may make an intelligent, informed decision (i.e., not a "guess", an "assumption" or a "supposition") on whether or not to purchase the property. I supplied Christine with all pertinent information she requested.

A few days later, a person with an accent called me, identifying herself as one of your employees. She asked me for the address of the subject property, even though Carl Hooper and I had given Christine a map showing the property and directions to it. I did not understand why she would want this information again.

She insisted she must be given the address. When pressed for a reason, she claimed she must have the address so she could send a letter and report to the owner. I told her that the owners of the property did not live on the property, but that they lived in San Jose. She was not interested. She insisted that she must have the address of the property so she could send a letter or report to them at the property! I told her that I was the one who had requested the report and who was paying for it, and that any letters or reports should be sent to me. Even though I told her repeatedly that I do not have a street number for the property, she stubbornly, unprofessionally insisted upon having something I do not have. The lunacy of that conversation finally caused me to abruptly terminate the conversation.

Shortly after that I received a call from Christine asking me if I need to expedite the report. I said, "Yes". She said she would require an additional $1,000.00 to expedite the report by two to three days. I told her that the additional cost was too great and that I must decline her offer.

On Friday, March 3, 1995, I received your report. I paid your courier the remaining balance of $2,200.00 for a total of $4,700.00 without having seen the work product, because your courier insisted on receiving the check before handing over the sealed envelope. (This was never done by Myron Jacobs' office.)



After reading the report and going over it with Carl Hooper and others, the unanimous verdict is that this is not what was requested. It is totally unsatisfactory for the purpose intended. The work product is of poor quality, ambiguous, and of no use to me in determining whether or not I should purchase this property.

Your firm has wasted very precious time and given a piece of work which is pure supposition. It is not what I ordered and paid for. Therefore, I have found it necessary to place a "stop payment" on the second check I issued to your firm, and I hereby demand that you immediately refund the initial $2,500.00 advance I paid you. Your work product will be return to you, and I will seek the services of a competent firm. I reserve the right to compensation for any damages which may have been caused by your firm's incompetent report in this precious time frame.

Sincerely,

NADER AGHA

SUBJECT: Phase I Environmental Site Assessment
Miravale III Subdivision Project – Martines Property
Monterey County APNs 257-081-005, -026, -027 and -032
(plus Update for 1995 Terratech Project M2229 ESA;
APNs 417-151-082, -083, -084 and -085)

Dear Ms. Duffy:

In accordance with our authorization, this Phase I Environmental Site Assessment (ESA) was prepared for the subject Site referenced above. This report summarizes our findings and conclusions, along with the limitations of our assessment. Particularly in light of the proposed residential use, the Site's long history of agricultural activities constituents a 'recognized environmental condition' that needs to be further evaluated. Specific discussions on the recognized environmental conditions that warrant Phase II investigation are presented in the *Opinions* and *Conclusions* sections of this report.

This ESA was prepared by DMCE under the professional supervision of the Civil Engineer whose signature and seal appear below. I declare that, to the best of my professional knowledge and belief, I meet the definition of "Environmental Professional" as defined in §312.10 of 40 CFR 312. I have the specific qualifications based on education, training and experience to assess a property of the nature, history and setting of the subject Site. I have developed and performed the "all appropriate inquiries" in conformance with the standards and practices set forth in 40 CFR Part 312.

If you have any questions, please call our Monterey office at (831) 372-3716.

1.0 INTRODUCTION

1.1 Purpose

The purpose of this Phase I Environmental Site Assessment (ESA) is to provide a professional opinion on the potential current presence of recognized environmental conditions at the Site, including potential impacts from known concerns in the surrounding area. The term "recognized environmental conditions," as defined by ASTM Designation E 1527-05 is discussed more fully in Section 9.0.

This ESA was performed according to the (1) recommended guidelines established by ASTM Designation E 1527-05, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process," and (2) U.S. Environmental Protection Agency's "Standards and Practices For All Appropriate Inquiries" (40 CFR Part 312).

For the purpose of this report, hazardous substances and petroleum products are jointly referred to as "hazardous materials."

1.2 Detailed Scope-of-Services

The scope of work for this ESA was outlined in DMCE's Proposal of August 23, 2006. We performed the following work:

- Reviewed Terratech's March 1995 Phase I ESA for the San Vicente Vineyards portion of the Site. A copy of this report, which includes some limited soil sampling and testing ('Phase II' work), is reproduced herein as Appendix A.

- Reviewed a total of eight electronic 'pdf' files originating from First American Title, as forwarded to us by Bestor Engineers, Inc., the project Civil Engineering and Surveying consultant. We also reviewed Bestor's 'pdf' files of the site survey. Printed copies of these documents are included in Appendix B.

- Contracted with EDR to prepare a Radius Map report, summarizing a regulatory database search of known underground storage tanks (USTs); landfills; hazardous waste generation or treatment, storage and disposal facilities; and subsurface contamination in the surrounding area up to within 1 mile of the Site. The EDR report is included as Appendix C. We also searched for, and reviewed, readily available online records regarding the adjacent landfill facility listed in the EDR report.

- Requested and reviewed available Monterey County Division of Environmental Health (MCDEH) hazardous materials files on the subject Site. Copies of pertinent records are included in Appendix D.

- Requested and reviewed available Monterey County Agricultural Commission (MCAC) pesticide use records for the subject Site. A printed version of the electronic spreadsheet information provided is included in Appendix D.

©2006 D&M Consulting Engineers, Inc.

- Requested available Monterey County Building Department (MCBD) records on the subject Site. As of September 6, 2006 these files were not yet available for review.

- Requested available Monterey County Water Resources Agency (MCWRA) records on the subject Site and reviewed the map that was provided. A copy of this map is included in Appendix D.

- Reviewed a California Division of Oil, Gas and Geothermal Resources (CDOGGR) map available online with locations of known drilled oil and gas wells in this area of the state. A copy of the pertinent portion of the map is included in Appendix D.

- Reviewed geologic references for information on the physical and hydrogeologic settings of the Site. This review included the site-specific reports provided by Denise Duffy & Associates (Nolan, 1995 and Tharp, 1995).

- Researched Site history by (a) reviewing a chronology of seven aerial photographs covering the Site and adjacent area available from EDR and online; (b) reviewing five historic topographic maps available from EDR; (c) contracting with EDR to research the availability of fire insurance maps of the Site and vicinity; and (d) reviewing local street directories available for the Site at the Monterey County Public Library. Copies of pertinent portions of these documents are presented in Appendix E.

- Performed an interior and exterior Site reconnaissance for obvious evidence of potential contamination such as current hazardous materials storage or use; unusually stained soils, slabs, and pavements; drains, sumps, drums, tanks, and electrical transformers; stressed vegetation; and discarded hazardous materials containers. Photographs we took at the Site and our Site reconnaissance checklist are included in Appendix F.

- Provided Nader Agha, the ownership point-person for the Site, an interview form to complete and return to us. We also interviewed site operation managers Norm Braga (for the western farm area) and Mark Mirassou (for the eastern vineyard area) during our reconnaissance. Copies of the completed interview forms for these three 'key personnel' are included in Appendix F. Mr. Mirassou's information also includes a 7-page fax of additional information he provided. We conducted brief phone interviews with Sandra Tauriac, the area hazardous materials inspector of the MCDEH, Ted Terrasas of MCDEH's solid waste group, and Victor Martinez, the former owner of the parcels west of San Vicente Road.

- Evaluated the information collected and prepared this report summarizing our findings, opinions and conclusions.

1.3 Significant Assumptions

No significant assumptions other than those described in the next section apply to this ESA.

©2006 D&M Consulting Engineers, Inc.

1.4 Limitations and Exceptions

This ESA and associated work were performed in a manner consistent with the standards of care and skill ordinarily exercised by members of the profession practicing under similar conditions in the geographic vicinity at the time the services were performed. This is in lieu of all warranties, or guarantees, express or implied.

The ESA is limited to evaluating environmental concerns associated with the potential presence of hazardous materials in conjunction with developing the referenced subject Site with primarily a residential land use. The ESA is not a regulatory compliance audit. No evaluation for the presence of asbestos-containing building materials, urea-formaldehyde foam insulation, lead-based paint, or other hazardous building materials; methane, radon gas or naturally occurring asbestos; lead in drinking water; wetlands; cultural and historic resources; industrial hygiene and health and safety; ecological resources or endangered species; indoor air quality; biological agents; mold or fungi; or high-voltage power lines is included in our assessment.

Our findings and opinions are partially based on information (e.g., regulatory agency files, lists, and databases) available from public sources on specific dates; this information is changing continually and is frequently incomplete. Unless we have actual knowledge to the contrary, information obtained from interviews or provided to us by the Client or others has been assumed to be correct and complete. DMCE does not assume any liability for information that has been misrepresented to us or for items not visible, accessible or present on the Site at the time of the Site reconnaissance.

DMCE cannot warrant or guarantee that not finding indicators of specific hazardous materials means that these hazardous materials do not exist on the Site. There is no investigation which is thorough enough to preclude the presence of materials on the Site which presently, or in the future, may be considered hazardous. Therefore, DMCE cannot offer a certification that the property is clear of environmental liability. DMCE will assume no responsibility or liability whatsoever for any claim, loss of property value, damage, or injury which results from pre-existing hazardous materials being encountered or present on the subject Site, or from the discovery of such hazardous materials.

Because regulatory evaluation criteria are constantly changing, concentrations of contaminants present and considered to be acceptable may, in the future, become subject to different regulatory standards and require remediation. For example, where records indicate that prior remedial work or tank removals have occurred, there is a risk that the work may not have been performed correctly or completely. In these cases, if the regulatory agency has approved the closure of the tank or other work done, we have assumed that the work was done correctly and completely.

Opinions and judgments expressed herein, which are partially based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions.

©2006 D&M Consulting Engineers, Inc.

1.5 Special Terms and Conditions

The terms and conditions for this ESA are included in our Proposal of August 23, 2006, including its associated Agreement. No other special terms and conditions apply.

1.6 User Reliance

This report has been prepared for use solely by the City of Soledad and Denise Duffy & Associates in reviewing the proposed Miravale III mixed-use development project for the subject Site. This report shall not be relied upon by or transferred to any other party, or used for any other purpose, without the express written authorization of DMCE.

©2006 D&M Consulting Engineers, Inc.

2.0 SITE DESCRIPTION

2.1 Location and Legal Description

The subject Site is located on both sides of San Vicente Road, just outside the current northern limits of Soledad, California (see Figure 1, Topographic Vicinity Map). The western, Martines Property portion of the Site, consists of the following four Monterey County Assessor's Parcel Numbers (APNs) 257-081-005, -026, -027 and -032 (see Figure 2, Parcel Map Book 257, Page 08). The eastern, San Vicente Vineyards portion of the Site (aka Section 16), consists of the following four additional Monterey County APNs 417-151-082, -083, -084 and -085 (see Figure 3, Parcel Map Book 417, Page 15). The entire Site is approximately 920 acres in size.

2.2 Site and Vicinity General Characteristics

The subject, agriculturally-oriented Site is located at the northern edge of relatively new residential subdivisions. These subdivisions largely consist of single-family homes, with associated schools and parkland/play-fields. To the west and north is similar agricultural/grazing land to that on-site, and to the east are the foothills of the Gabilan Range (see Figure 1). There are no commercial or industrial facilities nearby. The Site elevation ranges from 180 feet to 740 feet above mean sea level (msl), and slopes downward generally to the southwest. There are no streams in the immediate area but there are a number of man-made, earthen reservoirs holding irrigation water.

2.3 Current Site Use

The western, Martines Property portion of the Site, is currently used for row crops. The eastern, San Vicente Vineyards (now Mark Anthony Vineyards) portion of the Site, has two vineyard areas, plus an intervening fallow row crop area, and some rangeland. The few trees that are on-site are limited to the two residence areas, other either side of the " ⌐┘ " bend in San Vicente Road.

2.4 Site Improvements

Just north of the " ⌐┘ " bend of San Vicente Road on Parcel 5 there is a residence and adjoining farm equipment storage areas. There are also two earthen reservoirs on this western, Martines Property portion of the Site, one near the north-center end of Parcel 5 and the other at the southeast corner of Parcel 26.

There is a farm residence (now abandoned) and associated features in the southwest corner of Section 16 (i.e., barn, maintenance shop, storage yards, etc.), a chemical storage shed near the center of this property, an irrigation reservoir in the northeast corner, two large water tanks in the hills near the eastern boundary, and a radio transmission tower on the southeastern knoll. A few towers for high-tension power lines are also on-site, on both portions.

More details concerning site improvements are described in Section 5.3.

©2006 D&M Consulting Engineers, Inc.

2.5 Current Adjoining Property Uses

Along the south side of Section 16, and to the east of the southern tip of Parcel 5, are relatively new single-family homes. South of Parcel 5 and along the entire west side of the Martines Property is row crop land use. Adjacent to the northeast corner of Parcel 32, surrounded by the Site, is a relatively small property (Parcel 23 on Figure 2) that contains a number of older residences and associated barns and outbuildings. This developed (eastern) half of Parcel 23 also contains a number of trees and vehicles. To the north of the Site as a whole there are several ranch-type properties (as opposed to farmland) with scattered homes and corrals, and rangeland. To the east is mostly hills and rangeland.

©2006 D&M Consulting Engineers, Inc.

3.0 USER-PROVIDED INFORMATION

The ASTM Practice suggests the ESA 'User' provide documents to the ESA preparer. This section describes the specific documents provided to us by Denise Duffy & Associates, and other entities associated with the Miravale III project. Pertinent portions of these documents are included as Appendix B.

3.1 Title Records

On August 24, 2006 Jim Wurz of Bestor Engineers provided DMCE with eight electronic 'pdf' files of the various title records associated the subject, 8-parcel Site. According to these records, which are presented in printed form in Appendix B, the current owning entities are HMBY, L.P. and ANDALUCIA, LTD.

The title records list a number of leasee grants to private individuals and numerous easement grants for utilities, irrigation-related facilities, and incidental purposes. DMCE did not see any environmental liens, or any other pertinent notations concerning the subject Site that are material to this ESA.

Bestor also provided DMCE with a set of 11 electronic 'pdf' files containing their set of plan sheets for the project's Vested Tentative Map. As requested, our sheets of the actual Site (#3 through #11, see Appendix B) were provided without the proposed development overlay in order to better view current features. No items of obvious environmental concern were noted on the sheets.

3.2 Environmental Liens or Activity and Use Limitations

Mr. Nader Agha, the ownership contact for the Site and 'applicant' for the Miravale III project, stated he has no knowledge of environmental liens associated with the Site, past environmental issues regarding the Site, or any use limitations affecting the Site. Part of EDR's package service includes a lien check; they found none (see Appendix C).

3.3 Specialized Knowledge

Mr. Agha also stated he does not have any specialized knowledge of the subject Site and surrounding areas that is material to potential recognized environmental conditions in connection with the subject Site.

3.4 Valuation Reduction for Environmental Issues

Mr. Agha stated that the valuation of the Site is not reduced due to environmental issues.

3.5 Owner, Site Manager and Occupant Information

The ownership representative of the Site is Nader Agha. Norman Braga of Braga Ranch grows the row crops on the western, Martines Property portion. Mark Mirassou of Mark Anthony Vineyards, manages the eastern 'Section 16' portion.

©2006 D&M Consulting Engineers, Inc.

3.6 Reason for Performing ESA

Denise Duffy Associates indicated that the ESA is needed as part of gaining City approval for annexing and developing the subject Site.

3.7 Other

Denise Duffy Associates provided DMCE with a preliminary geologic hazards report prepared by Nolan Associates (Nolan, 1995) and a preliminary soil and foundation investigation report prepared by Donald M Tharp & Associates (Tharp, 1995). As with Terratech's ESA, these technical reports cover the Section 16 portion of the Site, but not the western, Martines Property portion.

Denise Duffy Associates also provided DMCE with a CD containing electronic copies of the City of Soledad's current General Plan (2005), the EIR for this General Plan, and the 1999 Draft EIR for the prior phase of the Miravale project (Hambey Property).

©2006 D&M Consulting Engineers, Inc.

4.0 RECORDS REVIEW

4.1 Regulatory Records

4.1.1 Standard Environmental Record Sources

A Radius Map with GeoCheck report was prepared for the Site by EDR on August 23, 2006, in accordance with the ASTM and AAI recommended guidelines, and is included in this ESA as Appendix C. The EDR report presents the results of a search of federal, State and local databases, along with a description of each database. The addresses of properties of known USTs; landfills; hazardous waste generation or treatment, storage and disposal facilities; and subsurface contamination in the surrounding area up to within 1 mile of the Site are listed and, in most cases, mapped.

The subject Site is not listed on any of the numerous databases accessed by EDR.

The goal of reviewing the database report is to identify facilities that have known and documented environmental aspects that may negatively impact the subject Site. DMCE's criteria for considering a listed facility to be a potential concern include the following:

- The facility is listed on one of the databases of reported hazardous materials releases (Federal NPL, Federal Proposed NPL, Federal Delisted NPL, Federal NPL Liens, Federal DOD, Federal CORRACTS, Federal CERCLIS, Federal CONSENT, Federal ROD, Brownfields, State AWP, State Calsites, State Cortese, State LUST, State BEP, State Deed Restrictions, State VCP and State Toxic Pits, etc.); is located potentially upgradient of the subject Site; and is not listed in the database as "closed" or "no further action" (including NFRAP).

- The facility is listed as a solid waste landfill and located potentially upgradient of the subject Site (not including transfer stations).

- The facility adjoins the subject Site and is listed as a Federal RCRA large-quantity hazardous waste generator, a Federal CERCLIS NFRAP facility, a State UST or AST operator, a State cleaner facility, a State deed restriction facility, a State NFE, or a Coal Gas facility.

Below is a summary of the only identified facility that, using the criteria discussed above, qualified to be of potential concern, including the EDR map reference number, facility name, direction and distance from subject Site, type, and status (if available). Note that the local groundwater gradient direction has been documented as toward the northwest (Boyle, 1986).

Map ID 2 (and inaccurately mapped ID 8), **Soledad Sanitary Landfill**, lies immediately north of the western Martines Property portion of the Site. The facility is listed in the databases of two California agencies – the Waste Management Unit Database System (WMUDS) compiled by the State Water Resources Control Board; and the Solid Waste Information System (SWIS, aka SWF/LF) compiled by the State Integrated Waste Management Board.

©2006 D&M Consulting Engineers, Inc.

The latter database has much more recent updating (June 2006 versus April 2000), but for this particular facility the plotting is more accurate on the WMUDS. There is essentially no specific information from either database about this closed landfill, although the WMUDS lists the 'Prime Waste' as being non-hazardous.

Page 9 of the Terratech ESA in Appendix A contains a summary of readily available information on this facility as of 1995. The facility was deemed to have a low potential for generating 'significant' quantities of leachate, but did need longterm maintenance to prevent erosion and keep water from ponding on-site. There was no information about analytical testing of soil or groundwater. Subsequent Sections 4.1.2 and 6.3 in this report provide discussions of additional limited information DMCE was able to obtain recently concerning this facility.

Because of the rural nature of the area, there are a number of unmapped 'orphan' listings in the EDR report. These listings contain insufficient information to be able to be plotted by the company's software system. DMCE reviewed the summary and eliminated most of the listings based on our knowledge of the area and supplemental research conducted through online sources such as the state GeoTracker site (see Section 4.1.2 below). Three listings merited printing of their full EDR information, similar to what the Radius Map report provides for the mapped/numbered listings – 'Tom Hambey & Son', 'Slaughter House' and 'Braga Ranch'. These print-outs are inserted after page 16 of the Radius Map report in Appendix C. However, none of the extra three listings appear to be of potential concern to the subject Site.

4.1.2 Additional Environmental Record Sources

In an attempt to obtain additional information on pertinent environmental concerns for this area, including the closed Soledad Landfill, contaminant releases and groundwater quality, we visited California's GeoTracker web site (http://geotracker.swrcb.ca.gov) and searched for Soledad listings. There were 43 'records' for Soledad, mostly concerning water supply wells. The Soledad Landfill record lists the case as 'open' (at the state Regional Water Quality Control Board) but there are no details about conditions. The eight UST and LUFT fuel tank records do not pertain to nearby properties, and all but one of the LUFT sites is 'closed.'

Two of the well records appeared pertinent and were reviewed – 'Highway 101 North Soledad; 101_San Vincente (sic) Rd' and 'San Vincente (sic) Road WS; 32300 San Vincente (sic) Rd'. The location of the former well is unclear and there was no groundwater testing data. The latter is apparently a supply well on Parcel 23, and the record does contain a limited amount of analytical data. An April 1987 sample was tested for a broad suite of common solvents, fuel constituents and pesticides and found to not contain any detectable amounts. The nitrate concentration (as NO3) in a July 2002 sample was 40 mg/L.

Copies of these GeoTracker records are included in Appendix D.

4.1.3 County Health Department Records

On August 31, 2006, we reviewed MCDEH hazardous materials records for the subject Site. We requested records for 32935 and 32945 San Vicente Road, plus any additional addresses between 32000 and 34000. The only file MCDEH staff said they had was for 32945, 'Mirassou

©2006 D&M Consulting Engineers, Inc.

Vineyards – San Vicente Ranch', FA 0810797. They apparently do not still have a file for 32300 San Vicente (Rancho de Vino), which was discussed in the 1995 Terratech ESA.

According to this MCDEH file, the vineyard facility was designated a closed site as of April 2004. However, there was a Chemical Inventory printed 8/29/06 that lists four propane tanks (greatest volume 499 gallons), two 'Diesel – Fuel Oil' tanks (10,000 and 1,000 gallon), two 'Gasoline – All Types' tanks (10,000 gallons each), 'Oil – Bulk Motor Oil' in 55-gallon drum(s), and 'Waste Oil' also in 55-gallon drum(s). There were several Hazardous Materials Inventory Certificate Forms in the file, the most recent of which was dated February 14, 2003. On a couple, the box for underground storage tank(s) is checked, but there is no confirmation documents that this facility actually has (or had) such a tank. There were also several Permit to Operate certificates in the file, the most recent of which was valid from 07/01/03 to 06/30/04. There was a Business Response Plan dated January 1, 2003. There was also a 'Site Investigation Work Plan, ...' prepared by consultant Century West Environmental, dated May 12, 1995, but no subsequent report.

We saw no notations concerning spills or releases, and no violation notices. Copies we made of the available records are included in Appendix D.

4.1.4 Agricultural Commissioner's Office Records

On August 24, 2006 we submitted a request to the County Agricultural Commissioner's office for public records on the eight parcels constituting the subject Site. On August 31, 2006 we received an email from Nathan Desjarlais with three Excel files attached, containing the pesticide use records for 2004, 2005 and 2006. The raw spreadsheets were formatted for printing to show all the information for each permit and year (see Appendix D). MCAC only maintains the most recent three years of data.

All the Section 16 information is listed under Permit #27S051A, issued to San Vicente Vineyards. MCAC had records for 2004 and 2005, but not for this year. By far the most heavily applied chemicals are the sulfur-based fungicides (Wilbur-Ellis and Red-Top Dusting Sulfur, and Microthiol Disperss). Other fungicides used include Pristine, Champ Formula 2, Kocide 2000 and Rally 40W. In the weed control/herbicide category, the most heavily used appear to be Roundup and Gramoxone Max (paraquat). The last main category of chemicals applied is the 'spreader' surfactant-types, such as Latron B-1956, In-Place and R-11.

All the 'West of San Vicente' information is listed under Permit #27S272X, issued to ASA Farms. MCAC had records for this organic farming operation for 2005 and 2006, but not for 2004. By far the most listed chemical is Sonata, a non-hazardous bio-fungicide; however, the volumes applied are relatively small. ASA also uses very small amounts of the Entrust insecticide, and apparently one application of Miller Nu-Film P spreader.

4.1.5 Building Department Records

We visited the County Building Department in Salinas on August 31, 2006 and submitted a file review request for any available records on the subject eight parcels, provided addresses as well APNs. We subsequently followed up with Cathryn Cohen, who handles these requests. As of September 6, 2006 the files were not yet available for review, but apparently are pending.

©2006 D&M Consulting Engineers, Inc.

4.1.5 Water Resources Agency Records

After a prior phone conversation, we met briefly with German Criollo of the MCWRA on August 31, 2006 to request available well records for the Site. We provided Mr. Criollo with a topographic map showing the Site boundaries (similar to Figure 1). He indicated that records were often incomplete and that providing any specific information beyond the mapped location (e.g., well log, etc.) would require a release form signed by the property owner. The release form was forwarded to Mr. Agha, but as of September 6 has not been returned.

On September 5 Mr. Criollo emailed us a map showing the three wells their GIS records indicate as falling on the subject Site – one near the southwest corner of Section 16, one at the yellow house just north of the " ⌐ " bend of San Vicente Road, and the third at the southern boundary of Parcel 5. A copy of the MCWRA-provided map is included in Appendix D. The well on intervening Parcel 23 (32300 San Vicente), the inactive domestic well on Section 16 noted in our site recon, and the 'capped' Section 16 well mentioned in the 1995 Terratech ESA are all not shown on this MCWRA map.

4.1.6 California Division of Oil, Gas, and Geothermal Resources Records

We reviewed the CDOGGR Regional Wildcat Map (Map #W3-8) for the Soledad area to check for oil or gas wells drilled on or near the Site. No wells are indicated anywhere around Soledad. A copy of the pertinent portion of the map is included in Appendix D.

4.2 Physical Setting

The Site is located on the Soledad, California, 7½-minute topographic quadrangle (U.S. Geological Survey, 1955, photorevised 1984), on the northeastern side of the Salinas River Valley. This northwestern trending valley is bordered on the southwest by the Sierra de Salinas and Santa Lucia Range and on the northeast (essentially abutting the Site) by the Gabilan Range. These mountain ranges are part of the Coast Ranges Province and reflect the northwest-southeast orientation of central California geologic structure (Nolan, 1995). Elevations on the Site range from about 180 feet in the southwestern portion of the Site to about 740 in the northeast corner. Except for the steep northeastern-eastern portion of the Site, the surface gradients are slight, averaging less than 10% (Tharp, 1995).

There are no streams on-site or nearby and runoff occurs seasonally via a combination of natural and manmade drainage courses. The main southern drainage trends down to the southwestern corner of Section 16 and across Parcel 5. The main northern drainage (a confluence of two canyon drainages) trends down through Parcel 26. Manmade berms and depressions have been created to catch some of this overland flow for subsequent cattle watering or irrigation use. The Salinas River lies about two miles southwest of the Site.

In 1995 Tharp advanced 15 geotechnical borings on the Section 16 portion of the Site, exploring to a maximum depth of ~51 feet. The investigation identified two primary subsurface profiles, confirming the geologic mapping of Dibblee (1972) and Nolan (1995). The eastern 'foothill' portion of the Site contains a thin (if any) cover of colluvium and slope wash over granitic bedrock. This bedrock is generally weathered in its upper 3 to 4 feet.

©2006 D&M Consulting Engineers, Inc.

The rest of Section 16 is termed as having a 'valley floor' profile, which in our opinion would be what would also be expected for the Martines Property portion of the Site, west of San Vicente Road. The valley floor profile is alluvial, unconsolidated soil that Tharp characterizes as predominantly sand with "...varying proportions of silt and clay". An infiltration rate of 1.5 inches per hour is mentioned as a preliminary design value.

Part of EDR's package of 'GeoCheck' information (at the back of their Radius Map report in Appendix C) includes a plot of local surface soils as identified by the U.S. Department of Agriculture (SSURGO). According to this source, the Site's soil are a combination of Chualar loam and Arroyo Seco gravelly-sandy loam. Both are considered well draining soils but the Arroyo Seco has a listed minimum infiltration rate of 2 inches per hour while the Chualar minimum is only 0.2 inches per hour.

What Tharp characterizes as perched groundwater was encountered in two of their borings – at 16 feet in B-1 (southwest corner of Section 16) and at 30 feet in B-10 (near the center of Section 16). Groundwater levels are expected to vary both seasonally and in response to multi-year patterns in rainfall. Local influences from unlined reservoirs and pumping wells are also expected. The Soledad area is situated in the 'Forebay Area' of the Salinas Valley Ground Water Basin. Recharge of this unconfined groundwater occurs through a combination of inflow from the 'Upper Valley Area', irrigation return flow, precipitation, and infiltration from streams and rivers. The prevailing gradient direction is toward the northwest (Boyle, 1986 and MCFCWCD, 1981).

4.3 Site Historical Use Information

Copies of pertinent portions of historical research documents that were reviewed are included as Appendix E.

4.3.1 Aerial Photographs

We reviewed photocopies of five aerial photographs of the Site and vicinity provided by EDR. The photographs were taken in 1956, 1971, 1981, 1987 and 1998. We also reviewed two aerial photographs available online; one taken in 1994, and one taken sometime between 2003 and 2006.

In the 1956 photo, most of the flatter portions of the Site on both sides of San Vicente Road appear to be cultivated, except for the northern third east of San Vicente Road. This area, plus the steeper portion along the eastern side of the Site, appear undeveloped. Row crops are generally in the southern portion of the Site east of San Vicente, as well as throughout the land west of San Vicente. An orchard is in the central portion of the Site east of San Vicente.

Apparent structures in the 1956 photo east of San Vicente Road include a radio transmitter tower on the southern knoll along the eastern edge of the Site; a circular reservoir west of the transmitter in the middle of row crops; and two or more buildings at the southwest corner of this eastern portion. Visible structures west of San Vicente Road include one or two buildings along a drainage northwest of the Martinez Parcel (on APN 257-081-26); a small square reservoir south of the Martinez Parcel (on APN 257-081-05); and a circular reservoir plus one

©2006 D&M Consulting Engineers, Inc.

or two buildings just north of the "┌┘" bend in San Vicente Road. Elevated electrical transmission lines appear to almost diagonally bisect the portion of the Site east of San Vicente Road, trending in a northwest-southeast direction.

In the 1971 photo, the Section 16 orchards have been replaced with row crops. Row crops are also cultivated on the previously undeveloped northern land east of San Vicente Road. The circular reservoir west of the radio tower is gone, as well as the bisecting electrical transmission lines. The existing reservoir in the northeast corner of the Site is present, along with the existing electrical transmission lines that cross the northeast corner of the Site. No other significant changes to the Site are visible.

Changes in the 1981 photo include the absence of the circular reservoir north of the "┌┘" bend in San Vicente Road, with a new square reservoir to the northwest; the absence of the small square reservoir south of the Martinez Parcel; the presence of a rectangular reservoir at the southeast corner of Parcel 26; and the absence of the buildings on Parcel 26.

The 1987 photo is blurry, however, no obvious changes are noted. No changes are noted in the 1994 and 2003-2006 photos, except that two large circular tanks and a new unpaved road appear in the latter photo at the southeast corner of the Site, east of San Vicente Road.

4.3.2 Topographic Maps

We reviewed five historic topographic maps of the Site and vicinity available through EDR. The maps are dated 1915, 1940, 1947, 1955 and 1984. We checked with UC Berkeley's on-line collection of historical topographic maps and no additional years were available.

On the 1915 map San Vicente appears to be an unpaved road and the only on-site feature is a single building (house presumably) in the southwest corner of Section 16. On the 1940 and 1947 maps (which appear to be identical except in scale), there are now three structures in this southwest corner, plus three buildings on the west side of San Vicente – a pair near the south end of Parcel 5 (which may be off-site) and the third to the north, off a westward driveway/lane, probably on Parcel 26. A high-voltage line runs across Section 16 from southeast-northwest and another line appears to cut across the top part of the "┌┘" bend in San Vicente Road (still unpaved). An orchard stipple area is located in the west-central portion of Section 16, but the balance of the Site has no land use designation.

On the 1955 map San Vicente has been paved and there are several dirt roads shown on Section 16, plus one westward one on Parcel 5. There is only one structure shown in the southwest corner of Section 16, but a Water Tank dot and note have been added. There are also a circular reservoir, a radio transmitter, and more extensive orchard stippling shown; but the high-voltage line is not. Across San Vicente just north of the "┌┘" bend there are now four structures, plus a circular reservoir in addition to the short run of power line. Off the westward driveway/lane mentioned above across Parcel 26 there are now three structures, plus a water tank at the end. The structure closest to the road may actually lie off-site, on Parcel 23 (Martinez).

The 1984 photorevised version of the 1955 map shows a second structure in the southwest corner of Section 16, but the circular reservoir is gone. The high-voltage cuts across the northeast corner of the Site and now there is a triangular reservoir shown in a canyon in that

©2006 D&M Consulting Engineers, Inc.

area. On the west side of San Vicente the only structure north of the " ⌐┘ " bend is where the current yellow house is; the short run of power line is still shown. The circular reservoir is gone but there is now a square one at the north end of Parcel 5 and a rectangular one at the southeast corner of Parcel 26. There are now four structures on what is most likely the intervening Martinez Parcel 23, but nothing is shown along (or at the end of) the westward drive/lane in this area.

4.3.3 Fire Insurance Maps

We contracted with EDR to research the availability of Sanborn fire insurance maps of the Site and vicinity. No maps were available for this rural area (see documentation page in Appendix E).

4.3.4 Local Street Directories

We reviewed available local street directories, at approximately 5-year intervals, at the Monterey County Public Library in Seaside on September 6, 2006. We reviewed Haines Criss Cross Directories for Monterey County, California, for the years 1973, 1978, 1983, 1988, 1993, 1999 and 2003. The library does not have Polk city directories. San Vicente Road was only listed in the 1999 and 2003 directories, not in the earlier ones. Copies of these two pages are included in Appendix E. There is no listing for either 32935 or 32945 and the only non-residential listing is San Vincente (sic) Ranch.

4.4 Adjoining Property Historical Use Information

4.4.1 Aerial Photographs

In the 1956 photo, the properties to the north and east of the Site are undeveloped. The properties to the south are cultivated in row crops. A farm or ranch complex is present along the southern property line (possibly the Kunde slaughterhouse), near the southeast corner of the Site. A building and coral complex is further southeast (likely the feed lot). The properties west of the Site area also cultivated in row crops, with a farm/ranch complex further west.

Changes to the adjoining properties in the 1971 photo include a building along the northern Site boundary, east of San Vicente Road; disturbance of the ground on the property to the north, west of San Vicente Road (the City of Soledad landfill/quarry?); and expansion of the feed lot complex (Hambey Ranch) to adjoin the southern Site boundary.

In the 1981 photo, a building is located along the western Site boundary. No obvious significant changes are noted to adjoining properties in the 1987 photo. Only a small portion of the City property north of the Site is visible in the 1981 and 1987 photos.

In the 1994 photo, a residential subdivision is under construction along the southern Site boundary, at the location of the former farm/ranch complex, west of the slaughterhouse. The City property to the north appears as if the ground has been stabilized and there is no activity. In the 1998 photo, another structure is located along the northern Site boundary.

©2006 D&M Consulting Engineers, Inc.

In the 2003-2006 photo, the farm/ranch complexes west of the Site have merged and the residential subdivision south of the Site has expanded. The buildings are still present on the slaughterhouse property on the south; however, the corrals are not present.

4.4.2 Topographic Maps

On the 1915 map, the only nearby feature is a structure east of Section 16, off of Bryant Road; the developed area of Soledad just constitutes a few blocks. On the 1940 and 1947 maps two additional structures join the one noted for 1915. Development has spread at Soledad, with a few unpaved lanes heading northward but none approach the Site. By 1955 a couple of these lanes/roads have reached the southern boundary of Section 16 and the land these serve has a couple structures and a few reservoirs. Otherwise, the area is still largely open. On the 1984 photorevision the Kunde Slaughterhouse and Hambey Ranch complexes are shown south of Section 16, and the nearby roadways are more definitive. Otherwise, there is nothing of pertinent note.

4.4.3 Fire Insurance Maps

No Sanborn fire insurance maps were available for the area from EDR.

4.4.4 Local Street Directories

As discussed in Section 4.3.4 above, San Vicente Road was only included in the 1999 and 2003 directories, of the series we reviewed. There are a number of individuals (residents), plus San Vincente (sic) Ranch, listed for the 32300 address, which is the Parcel 23 (Martinez) labor camp complex. There are also listings for the offsite residences/ranches to the north (31341 and 31463) and, in the 2003 directory, for the newer residential development to the south (3-digit addresses). None of this information constitutes pertinent concerns for the subject ESA.

4.5 Commonly Known or Reasonably Ascertainable Information

In 1995 as part of its 'Phase I' ESA, Terratech conducted a limited amount of soil sampling and testing on the Section 16 portion of the current Site. The entire data is included in the report in Appendix A and the findings are discussed in Section 8.0 of this new ESA.

Besides Terratech's investigative information from 1995, it was determined that no other sources other than the "standard sources" as described above within this Section 4.0 needed to be reviewed to obtain "commonly known and reasonably ascertainable information." Neither Mark Mirassou nor Nader Agha was aware of any results or report stemming from the May 1995 Work Plan prepared by CWE, so apparently that work was never actually performed.

©2006 D&M Consulting Engineers, Inc.

5.0 SITE RECONNAISSANCE

5.1 Methodology and Limiting Conditions

We performed our formal Site reconnaissance on August 31, 2006. We were accompanied by Mark Mirassou for the eastern 'Section 16' portion. We met with Norm Braga prior to touring the western 'Martines Property' portion on our own. Copies of photographs taken during the visits and our completed reconnaissance checklist are included in Appendix F.

We conducted the reconnaissance by visually observing the Site and structures. The majority of the Site was observed by driving on accessible Site roads, and was viewed from San Vicente Road that crosses the Site. The shop complex east of San Vicente Road was walked.

Inaccessible areas east of San Vicente Road included the eastern portion of the shop, although we were above to view a portion of it through a crack in the door; the vacant house; and the southern portion of the field "chemical shed". Additionally, we did not have permission to enter the residential grounds of the yellow house, west of San Vicente Road.

5.2 General Site Setting

The Site is located in an agricultural area on the northeast edge of the Salinas Valley, bordered on the south by a relatively new residential subdivision. The eastern edge of the Site is located in the foothills of the Gabilan Range.

5.3 Observations - East of San Vicente Road

Approximately 160 acres are planted in wine grapes. The remaining portions are either fallow (approximately 310 acres) or too steep for cultivation (along the eastern edge). A reservoir is located at the northeast portion of the area, and electrical transmission lines cross the Site just northeast of the reservoir. A radio transmission tower is located on the knoll at the southeastern portion of the area. Two, 1,000,000-gallon City-owned water tanks are located southeast of the radio tower; the associated water supply comes from off-site. The flatter portions of the Site slope down to the southwest.

One domestic water supply well (inactive) and an irrigation supply well are located at the southwest corner of this area. Pole-mounted transformers are located at the southwest and northeast ends of the area.

A burn area was noted at the southeast corner of "Area C," delineated on the "San Vicente Ranch Map" (see Appendix G). Grape stakes constructed of preserved wood were burned in this area. Also, piles of vineyard wire were stored in this area. No evidence of recent burning was noted in the grape stake burn area identified in the 1995 Terratech ESA.

A small sheet metal chemical storage shed is located in the field area, at the intersection of Areas F, G, N and P. A few empty buckets were stored in and around the shed. The shed had a wood floor. Mr. Mirassou indicated that various agricultural chemicals are mixed in this area.

©2006 D&M Consulting Engineers, Inc.

Structures at the southwest corner of the area include a shop and adjoining bathroom and wash rack; a barn; and a vacant house with two small vacant sheds to the rear.

An approximately 1,000-gallon diesel AST is located in a concrete-block bermed area on the east side of the shop. No spills were noted in or around the bermed area. An approximately 500-gallon gasoline AST was located southeast of this. This AST was placed on the bare ground with no secondary containment, surrounded by bollards. No staining was observed.

A concrete pad on the west side of the shop serves as a wash rack. Mr. Mirassou indicated that the wash rack has not been used for a while, but was previously used to wash harvesters. He added that there is a drain in the center of the pad that has always been clogged. This drain was obscured by sediment at the time of our visit. No staining was evident in the area of the wash rack.

A thin layer of soil on top of degraded plastic sheeting was noted on the south side of the wash rack. Mr. Mirassou indicated that this soil is a remnant of stockpiled soil from 1995, generated from scraping soil from the floor of the barn or shop.

Along the north side of the shop were several 55-gallon drums on pallets. Mr. Mirassou stated the drums contained paving oil. Smaller oil containers, plus old paint cans were noted in this area. No significant staining was noted.

Inside the west side of the shop was a concrete block bermed area that contained one 55-gallon drum of oil, plus smaller oil containers. The earthen floor on this side of the shop appeared somewhat oily. Drip pans for oil leaks were placed under some equipment in the shop. The east side of the shop was locked; however, Mr. Mirassou stated that the floor is concrete. A maintenance pit is also located in the locked area, with a dirt floor. We were able to view a small portion of this locked side through a crack in the door. A vehicle and miscellaneous equipment were observed.

In the barn, the earthen floor also appeared somewhat oily. A separate, newer chemical storage area is located in the barn. This area has a wood floor. Some bags and boxes of agricultural chemicals were stored. No signs of spillage were noted.

No evidence of USTs was noted. Also, no evidence of hazardous materials storage was noted around the house or in the sheds to the rear of the house.

5.4 Observations - West of San Vicente Road

The majority of the land is cultivated in leafy vegetables. The land slopes down toward the southwest. The adjoining properties to the east and north of the southern portion are 5 to 10 feet higher; Norman Braga, the lessee, indicated that soil was excavated from this area to construct a nearby freeway overpass.

An approximately 10,000-gallon diesel AST is located along the southern property line. The AST is not secondarily contained. No signs of spillage were noted. An irrigation well is located east of the AST. Oil stains on a concrete pad were noted near the well head.

©2006 D&M Consulting Engineers, Inc.

An occupied house is located northwest of the " ⌐ " bend in San Vicente Road. We did not have permission to enter the grounds of this residence. Farm equipment, what appeared to be a supply well, and small piles of soil were located east of this house.

A square reservoir is located near the center of the area, and a rectangular reservoir is located alongside San Vicente at the southeast corner of Parcel 26.

No signs of USTs were noted.

5.5 Adjoining Property Observations

The hills adjoining the property on the east and northeast are undeveloped. To the north, east of San Vicente Road, are a couple of houses, plus corrals, stables, vehicles and sheds. To the north, west of San Vicente Road, is a large depression partially filled with concrete rubble.

To the west is agricultural land, plus a ranch/home complex (occupied by Mr. Braga). To the south is agricultural land, a residential subdivision and an abandoned feed lot.

Near the center of the Site, on the west side of San Vicente Road, is a small parcel that is not part of the Site. This Parcel 23 (Martinez) is developed with a labor camp, containing several small homes and other various buildings.

©2006 D&M Consulting Engineers, Inc.

6.0 INTERVIEWS

6.1 Owner Representative

The ownership representative of the Site, Nader Agha, was provided our interview form to complete. Mr. Agha has been affiliated with the 'Section 16' portion of the Site since 1995 and the 'Martines Property' portion for three years. The Mirassou's were the prior owners of the Section 16 portion and Victor Martinez owned the western portion.

Current and previous uses of the Site is/were grape and row crop agriculture; adjoining properties are/were row crop and hills. In response the various questions regarding hazardous materials use and storage (including fill dirt, pits/pond/lagoons, septic waste, heating/cooling, waste water, floor drains, hydraulic equipment, transformers, ACBMs, monitoring wells, liens/lawsuits, outstanding environmental studies, and construction drawings/ALTA survey), Mr. Agha answered 'No' or 'None'. Surface water runoff is characterized as 'natural'. Potable water supply is believed to be provided by the City (however, both on-site residences have domestic wells). There are groundwater wells on the Site; they have 'no contaminants'.

A copy of Mr. Agha's completed interview form is included as Appendix G.

We also spoke by telephone briefly with Victor Martinez, former owner of the property west of San Vicente Road, on September 6, 2006. Mr. Martinez stated he owned the property for about 10 years, and operated a vineyard. Pesticides that were allowed by local and State regulations were applied. No chemicals were stored or used at the yellow house. He stated that he installed the diesel AST along the southern boundary. He has no knowledge of any spills or leaks of any chemicals, including diesel from this AST.

Mr. Martinez was aware of two wells; the irrigation well along the southern boundary, and the domestic well for the yellow house. The domestic well is located east of the house, closer to San Vicente Road.

6.2 Occupant Representatives

On August 31, 2006, we interviewed Mark Mirassou, owner of the business managing the vineyards east of San Vicente Road (Section 16), and Norm Braga of Braga Ranch, the business growing leafy vegetables west of San Vicente Road (the 'Martines Property' portion).

Mr. Mirassou has been affiliated with the Site on and off for the past 30 years. His family purchased the east portion of the Site in the 1960s, then sold it to Nader Agha in 1995. His father leased the land to grow wine grapes until last year, when Mark took over the lease. Ray Garcia also cultivated row crops until last year, when water issues forced him to vacate.

Mr. Mirassou indicated the Site has always been agricultural and has never been used for industrial purposes. On adjoining properties there is a labor camp to the west, and a slaughterhouse and feed lot were located to the south.

©2006 D&M Consulting Engineers, Inc.

Chemicals used currently (and in the past) primarily are pesticides and fertilizers, automotive fuels, and equipment maintenance oils. Mr. Mirassou only orders as many pesticides as he will immediately use, to avoid significant storage. He recalled a time when he was a child when a DDT-type pesticide was sprayed on Area G, due to the presence of nematodes. Appended to his interview form is a 7-page fax presenting more specifics about recent agricultural chemicals at the vineyard.

Mr. Mirassou stated that diesel and gasoline are both stored in ASTs, and to the best of his knowledge USTs have never been located on the Site. The wash rack west of the shop formerly was used to wash harvesters, but is not currently used. There is a clogged drain in the middle of the wash rack pad.

He is unaware of any past spills or leaks of hazardous materials. There is some oily soil inside the shop and barn. Some of this soil was scraped away in 1995 and stockpiled next to the wash rack.

Mr. Mirassou recalled that the pole-mounted transformers near the well on the south boundary blew about 4 years ago. PG&E conducted a cleanup that may have involved soil excavation.

Mr. Mirassou stated that a septic tank for the vacant house is located on the west side. He is not sure, but thinks the shop is on its own septic system. There are only two wells on the property, one irrigation and one domestic, both located at the southwest corner.

Mr. Braga stated that Braga Ranch has leased the land west of San Vicente Road for the past 1 to 2 years, to organically cultivate leafy vegetables. The prior owner was Victor Martinez. The area was an abandoned vineyard when Braga Ranch took occupancy. Refuse and debris, such as old motors, were dumped alongside San Vicente Road.

He does not believe the land was ever used for industrial purposes. Adjoining properties include the labor camp and agricultural fields. The Dole plant is further east. The City owns the property to the north, and operated a gravel pit and landfill.

Mr. Braga states that since they organically grow their product, they do not store or use chemicals of any kind. He described the diesel AST along the southern boundary. He is not aware of any spills or leaks of hazardous materials.

Mr. Braga thought that the yellow house had a septic tank. Several ASTs are located at this yellow house, but Mr. Braga does not think they are currently used. Mr. Braga stated there is only one irrigation well on this portion of the Site.

6.3 Regulatory Agency Representatives

We spoke with Sandra Tauriac of the MCDEH by phone on September 1, 2006, asking about any local hazardous materials incidents in the area. Ms. Tauriac stated that she was not aware of any problems in the area we described. She was familiar with the San Vicente Vineyard facility but indicated that specific information would be available in the vineyard's file in their office. The facility had no significant violations that she could recall and she believed it only

©2006 D&M Consulting Engineers, Inc.

had ASTs, no underground ones. Ms. Tauric referred us to Ted Terrasas for inquiries about any information County Health had for the closed Soledad Landfill.

On September 6, 2006, after leaving a couple earlier messages, we spoke Mr. Terrasas. He stated that he is not aware of any recent activities concerning this landfill, certainly not since 1995. Mr. Terrasas said he would pull the files to formally verify this representation and promised to contact us if anything of note was there.

In the course of acquiring information from the MCAC and MCWRA we spoke briefly with Nathan Desjarlais and German Criollo, respectively. Neither had any personal, site-specific knowledge beyond what was in their agencies' records.

©2006 D&M Consulting Engineers, Inc.

7.0 ADDITIONAL SERVICES

No additional services beyond what is described elsewhere in this report were performed.

©2006 D&M Consulting Engineers, Inc.

8.0 FINDINGS

Besides a few scattered rural/farm residences (with the structures on Parcel 26 now gone), the Site has seen a long history (at least 90 years) of agricultural use including orchards, vineyards and row crops. Associated with the agricultural activities there have been a few areas where storage, staging, and maintenance-type activities have been concentrated, as well as two grape stake burning areas. We found no records of specific or significant violations of regulatory policies. However, the basic nature of these activities involves the handling and application of hazards chemicals. Commonly used agricultural chemicals of the past were chlorine or metal based and tend to persist in near-surface soils.

In recent years the western portion of the property is being used as an organic farm for leafy vegetables and limited quantities of benign products are applied. Vineyard operations continue on the eastern portion, inherently involving applications of sulfur and other fungicides, plus weed control herbicides. Nothing was noted that appeared to be outside of 'normal practice' expectations and newer agricultural chemicals tend to be much less persistent in soil and the environment in general.

The 1995 environmental work performed by Terratech included the testing of 10 near-surface soil samples from the Section 16 portion of the Site. Sampling locations were selected to provide an indication of conditions at a variety of site areas – i.e., within intermittent drainages, where surface water collects, where prior orchards were located, where row crops and/or open field crops were grown, where a 'capped' well was (and presumably still is) located, and where agricultural chemicals were stored/mixed. Due to fresh herbicide spraying, the southwestern portion of Section 16 was not accessible for sampling. Testing was limited to the 'Priority Pollutant' suite of chlorinated pesticides; plus PCBs, which are chemically similar.

Seven of the 10 soil samples exhibited no detectable analytes. The other three samples were found to only contain trace amounts of DDE (a breakdown product of DDT), plus a trace of dieldrin in one of the three. The maximum concentrations were 0.066 mg/kg and 0.013 mg/kg, respectively. The certified analytical reports and other more detailed discussions are included in the Terratech report in Appendix A. For relative comparison, the currently applied screening levels (CHHSLs) for these chemicals in a residential land use are 1.6 mg/kg for DDE and 0.035 for dieldrin (Cal EPA, 2005).

In this immediate area there are no known or listed releases of contaminants to the ground (soil or groundwater). A single testing event in 1987 on groundwater from a supply well at intervening Parcel 23 (Martinez Property) showed no suspicion of a regional groundwater contamination problem. Nitrate may be high but that is common for the whole valley.

The closed landfill adjacent to the north side of Parcel 26 is a 'listed' facility, but we found no records of analytical environmental investigations having been performed, just a general exploratory investigation in 1977 concerning potential leachate volume generation and various assessments of cover maintenance. We believe the landfill is unlined. As presented in Section 4.2, soils of the area are considered fairly permeable and the groundwater is unconfined. The subject well noted above that was tested in 1987 is over 2000 feet from the landfill, and probably in a cross-gradient relative position.

©2006 D&M Consulting Engineers, Inc.

9.0 OPINIONS

This section summarizes our opinions regarding whether any of the various findings discussed previously in this report constitute a "recognized environmental condition."

A "recognized environmental condition," as defined by ASTM Designation E 1527-05, means:

> "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not recognized environmental conditions."

The following is a list of this Site's recognized environmental conditions (RECs) that warrant Phase II investigative study prior to commencing new development. These items are in addition to the standard 'closure' processes of removing all hazardous materials, their containers (including any underground tanks, if present) and affiliated equipment, and the standard pre-demolition survey of all structures for hazardous building materials such as asbestos.

- Pesticide and metal residuals from longtime agricultural use on most of the Site*;
- Specific areas where agricultural chemicals were stored, and especially mixed;
- Specific areas where burning of grape stakes has occurred;
- Lead-based paint and pesticide residues around structures (both current & former);
- Soil staining in areas such as the various earthen building floors;
- Soil beneath the maintenance pit in the vineyard shop;
- Soil beneath the pole-mounted transformers that apparently blew;
- Infiltration of possible contaminants at the wash rack drain and shop leachfield; and
- Possible impacts from the closed landfill adjacent to north end of Parcel 26.

*According to MCDEH staff, the evaluation of historic agricultural land for proposed residential use should follow the most recent California Department of Toxic Substances Control (DTSC) guidance for school sites (Cal EPA, 2002). The general sampling frequency listed in this guidance is one per acre. However, since the Site has an aggregate size in excess of 100 acres, DTSC (and/or MCDEH) would have to be consulted for an acceptable site-specific sampling frequency of presumably less intensity. The Section 16 portion will need additional such general testing and the Martines Property portion will need a full program.

Except for the last two bulleted RECs, the list above concerns near-surface soil (i.e., with 2-3 feet of the ground surface). For the wash rack drain, shop leachfield and landfill a somewhat deeper sampling regime is appropriate, perhaps incorporating a soil gas sampling component

©2006 D&M Consulting Engineers, Inc.

(at least for the landfill area). At this time, DMCE does not believe groundwater sampling and testing is a needed part of the Phase II work. We understand that potable water for the new development will be of municipal supply.

According to MCDEH staff, any detected concentrations of contaminants will need to be compared to California Human Health Screening Levels (CHHSLs) as an initial evaluation of possible remedial needs. Since the project involves a mixed development, there should be regulatory-acceptable options for on-site management of soil, if any does not meet criteria set forth for residential or school land use.

Besides the above items relating to possible site contamination matters, all of the Site's wells that are not planned for future use should be properly destroyed.

©2006 D&M Consulting Engineers, Inc.

10.0 CONCLUSIONS

We have performed a Phase I ESA for the Miravale III Site in conformance with the scope and limitations of ASTM Practice E 1527 and AAI standards. Any exceptions to, or deletions from, this practice are described in the Introduction (1.0) and Deviations (11.0) sections of this report.

Further work (i.e., Phase II investigation) is needed to determine whether any of the recognized environmental conditions listed in Section 9.0 are such that remedial actions will be necessary as part of the transition in land use. Based on the findings of this ESA, the preliminary environmental soil testing conducted in 1995, and the similar developments that have already occurred nearby (Soledad, 1999), it is not expected that this Site has significant environmental contamination problems.

©2006 D&M Consulting Engineers, Inc.

11.0 DEVIATIONS

Due to the short time period allotted to perform this ESA, there are a few (relatively minor) outstanding inquires that may yet yield additional pertinent information of note. If so, those findings and comments will be documented in an addendum letter. Otherwise, there were no known deviations from the ASTM and AAI standards of practice in preparing this ESA.

13.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

This section includes qualification statements of the environmental professionals responsible for conducting the subject ESA and preparing this report.

Eric R. Lautenbach, PE, Project Environmental Engineer
California Registered Civil Engineer, No. 42437
Postgraduate, Environmental Courses – University of California Extension, American Society of Civil Engineers, Battelle, International Network for Environmental Training, etc.
M.S., Civil Engineering (Water Resources/Geotechnical), San Diego State University
B.S., Civil Engineering (Top Honors in Graduating Civil Engineering Class), Drexel University

Mr. Lautenbach is an engineer with over 25 years of soil and groundwater related experience, including 22 years of environmental experience. After working in Southern California and Nevada, Mr. Lautenbach joined Terratech, Inc. (now known as DMCE and part of URS Corporation) in 1983 and began performing a wide range of duties on environmental projects at agricultural, commercial and industrial sites. From 1987 until 2000, he managed the environmental department in Terratech's San Jose office and participated in company-wide management. Mr. Lautenbach also provided project management, report preparation and liaison with regulatory agencies for the department's more challenging assignments. Projects primarily concerned soil, storm water and/or groundwater contamination, with the impacts originating from a wide variety of chemical sources (fuels, solvents, pesticides, etc.). The work tasks included Phase I and Phase II environmental Site assessments, remedial investigation/feasibility study work, monitoring, facility closures, corrective action plans, technical specifications, and remedial action plans.

Since 2000, Mr. Lautenbach has served as a contract/hourly environmental consultant, largely working on DMCE projects. He provides technical expertise, review and project management for a wide variety of subsurface contamination projects; with particular emphasis on innovative, cost-effective approaches to remediation.

Specific project experience includes the following:

Licensed project engineer for over 30 sites transitioning from agricultural-oriented land use to residential or school use. A couple of the larger sites have included a 135-acre tract outside of Salinas that was under strawberry cultivation and a 125-acre, multi-parcel site in Morgan Hill for a new high school. Research on past site activities and known concerns was conducted, plus a thorough site inspection. Then Phase II investigative plans were developed, which were approved by the local environmental agency (City HazMat group or County Health Dept) for most of the residential sites, and by the state Department of Toxic Substances Control for all the school sites. A few sites were self-directed. Field/orchard areas were studied by grid sampling typically; specific items of concern were checked by targeted sampling.

Some sites have shown no impacts of concern. Most of the ones that have sheds and storage/staging areas, or farm building complexes, have required removal of hot-spot soils and/or fuel tanks. Specific contaminants have included arsenic, lead, chlordane, DDT, dieldrin and toxaphene, plus petroleum products. One 15-acre site required site-wide treatment to reduce pesticides (primarily dieldrin) to acceptable levels. Some sites have involved on-site

©2006 D&M Consulting Engineers, Inc.

soil management to control long-term risks; and some have required site-specific human health risk assessments.

Licensed project engineer for over 40 sites that needed definition of the extent of soil and/or groundwater contamination as part of either a release response or a redevelopment process. Contaminants included petroleum fuels and oils, chlorinated solvents, pesticides, heavy metals (arsenic, chromium, lead and zinc), PCBs and polynuclear aromatics (PNAs). Supervision of technical staff in exploration and well siting decisions, performance of slug testing, contouring of groundwater gradients and contaminant concentrations. Estimation of migration pathways and rates based on contaminants' physical/chemical properties, retardation coefficients from the literature and site aquifer characteristics.

Definition of the lateral extent of MtBE groundwater impacts has largely been achieved through the use of transects of continuously sampled Geoprobe-type holes. An increasing amount of characterization work includes assessing the vapor intrusion risk. Mr. Lautenbach has developed numerous soil gas sampling programs and at one residential site he employed flux chamber sampling. Conservative crawl-space ventilation measures were designed for school buildings at one site located above a MtBE plume. Current work includes design of a sub-slab venting system to mitigate hazards from PCE.

Licensed project engineer for over 30 sites evaluating soil remediation approaches and costs for wide variety of contaminants, then supervising the implementation of the selected technique(s). Locations of excavations have ranged from open yards to inside buildings where structural support was provided by temporary underpinning. Large diameter augers were successfully employed at one site. Soil remediation has ranged from aeration, landfarming and enhanced bioremediation to offsite thermal treatment and recycling in a low temperature asphalt batching process. Experience also includes vapor extraction systems for in-place soil remediation.

Licensed project engineer for designing, installing and optimizing the operation of groundwater cleanup systems involving both petroleum fuels and chlorinated solvents. Some sites have involved free-product recovery. Specific responsibilities included siting and construction detailing of extraction wells and injection wells/trenches, calculating expected capture zones, regulatory permitting, supervision of construction, evaluation of operational results, and regulatory reporting. Also has experience designing and implementing aquifer aerating systems (sparging, iSOC and peroxide/nutrient solutions), ozone injection and dual-phase (vapor and groundwater) high-vacuum extraction, to expedite fuel cleanup.

Third-party technical reviewer for several landowners and developers where contaminant investigations and clean-ups were being performed by responsible parties. One of the most extensive such projects involved historic discharges of resins and petroleum-based solvents by a large chemical company that formerly owned the Site, discharges of TCE and heavy metals by one of their tenants who made circuit boards, PCB spills from an earlier power substation, and paint thinner and fuel migrating onto the Site from two upgradient dischargers.

Licensed engineer providing technical assistance in over a dozen subsurface contamination cases involving litigation. Contaminants have primarily been petroleum fuels but also have included chlorinated solvents, lead and PNAs. Litigation has primarily concerned recovery of cleanup costs by a recent purchaser from historic dischargers, or forcing a discharger to

©2006 D&M Consulting Engineers, Inc.

perform the cleanup, and/or defining responsibilities for multiple discharges. Several cases have resulted in depositions.

Project manager and engineer for Solid Waste Assessment Test (SWAT) projects at two inactive landfills. Each project involved installation of several groundwater monitoring wells, preparation of cross-sections, full-scan water quality testing over multiple monitoring events, statistical assessment of groundwater quality data with respect to impact from landfill leachate, evaluation of aquifer properties through slug testing, and groundwater gradient determinations.

Project Engineer for variety of storm water pollution prevention assignments including site inspections, regulatory compliance plans, monitoring, annual reporting, and best management practice recommendations. Also evaluated oil and debris removal performance of equipment in municipal storm sewer system discharging to Monterey Bay National Marine Sanctuary.

Technical oversight and licensed engineering review of approximately a dozen water supply and nitrate balance projects for proposed residences and one expanding industrial facility; primarily in Monterey County, but also in San Benito and Santa Clara Counties. Water supply portion of work involved defining sub-basins, reviewing information on hydrogeology and well performance, estimating current and future water use and recharge, and calculating water balances. Nitrate balance portion involved research on existing groundwater concentrations, calculations on present and future loadings to the subsurface environment, estimation of the nitrate content of deep percolation water and comparisons to regulatory criteria.

Christine L.H. Mead, PG, REA II, Senior Geologist
(subconsultant with Toxichem Management Systems)
California Professional Geologist No. 5884
California Registered Environmental Assessor I, No. 5668
California Registered Environmental Assessor II, No. 20077
B.S. Earth Sciences, University of California at Santa Cruz

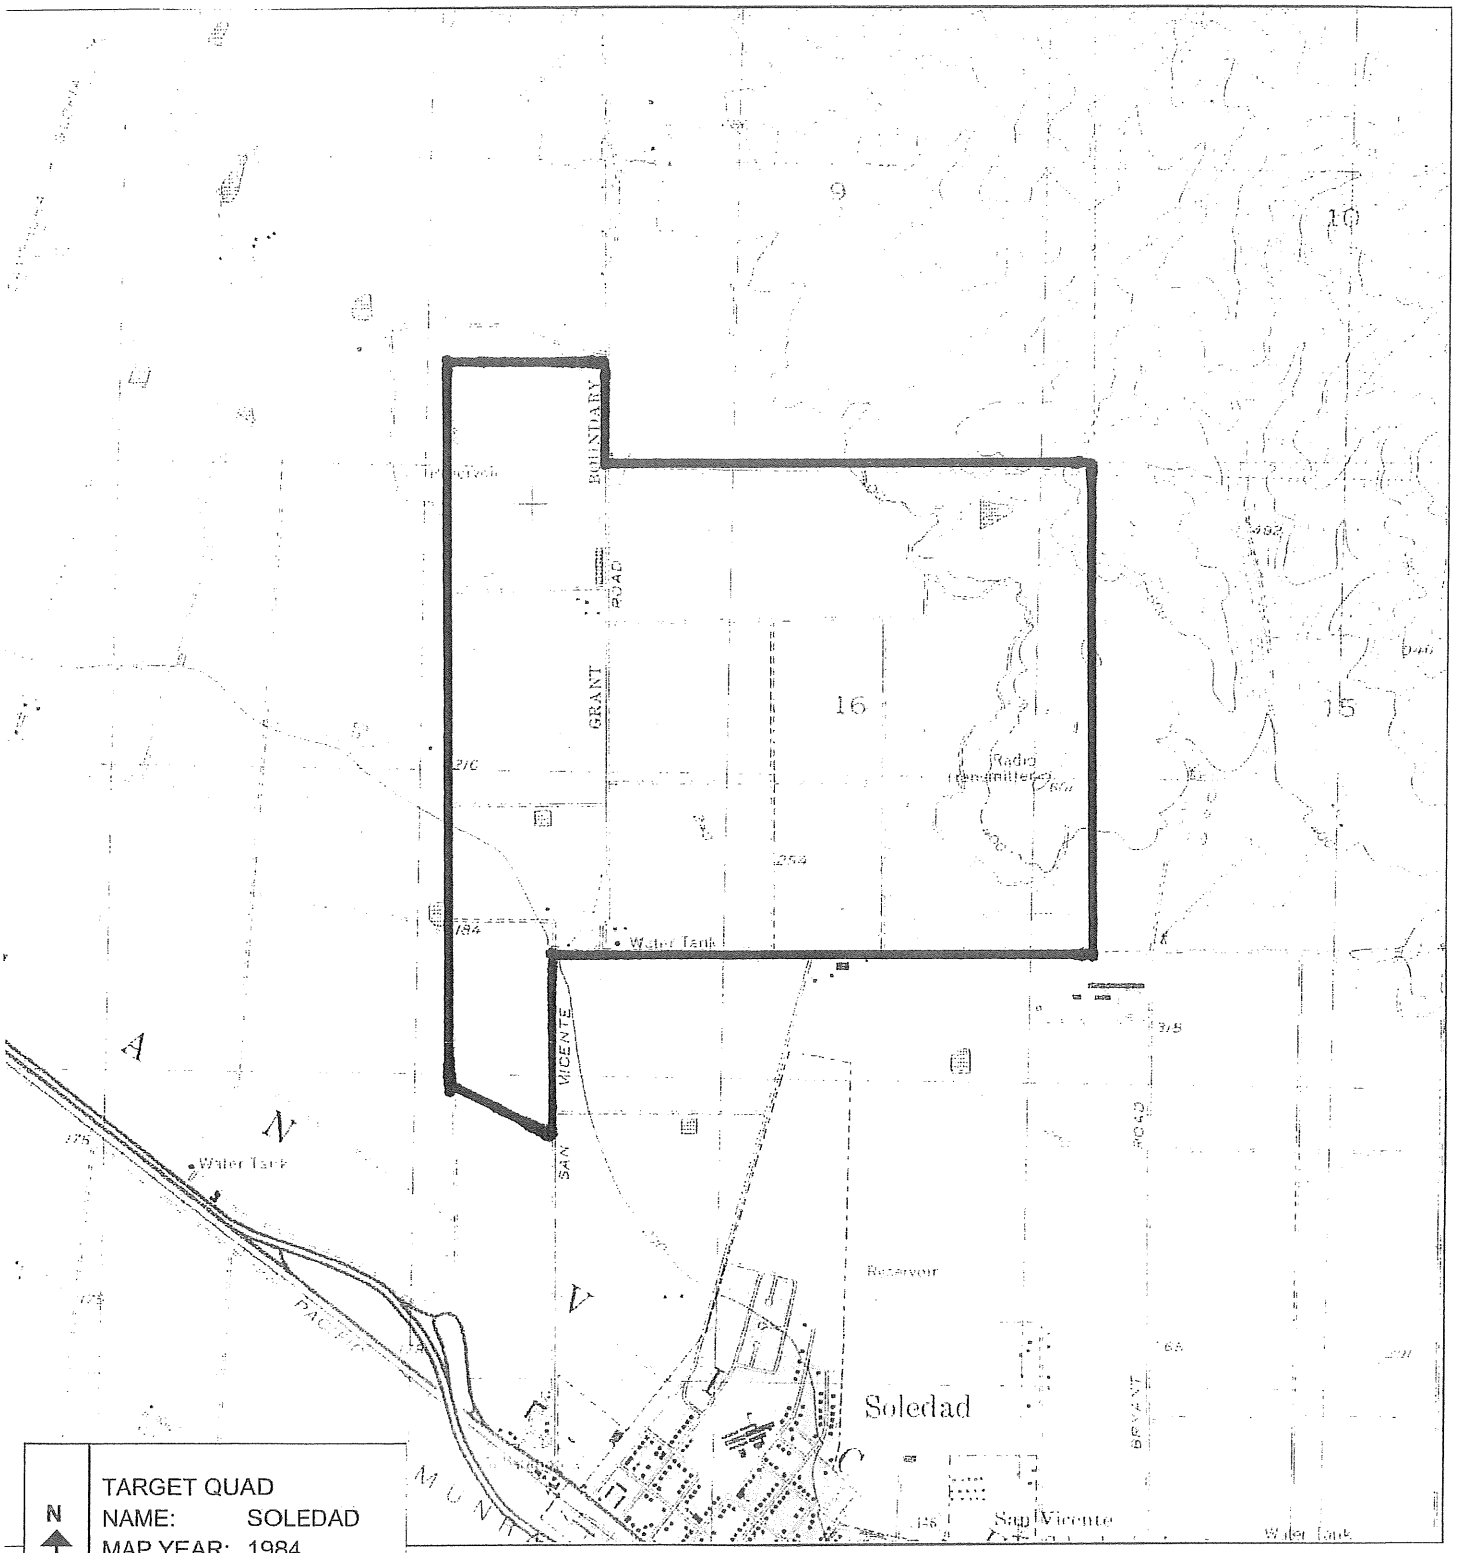
A geologist with over 18 years of experience, Christine Mead has a strong background in soil and groundwater contamination investigations, characterization, remediation and monitoring projects; Phase I and II environmental Site assessments; and preliminary endangerment assessments. Beginning in 1988 at Beta Associates, Inc., and continuing at Terratech, Inc. (now DMCE/URS Corporation) from 1994 until 2001, her emphasis has been on management of environmental projects. From 1996 to 2001, Ms. Mead managed the environmental department in DMCE's/URS' Monterey office, in addition to her project management duties. Beginning in December 2001, Ms. Mead moved over to Toxichem where she continues to develop and manage environmental assessment and remediation projects.

The following summarizes Ms. Mead's project experience:

Performance or technical review of over 250 Phase I and/or Phase II Environmental Site Assessments. Sites include proposed schools, a Superfund laser manufacturing facility; facilities within former Fort Ord; Pebble Beach Company gasoline stations, golf courses and golf maintenance facilities; a city block, with histories of auto dismantling and coal gasification plant waste disposal; a former truck stop which had received previous regulatory fuel leak closure; a former electrical transformer manufacturer; a gasoline station impacted by a 1920s

©2006 D&M Consulting Engineers, Inc.

catastrophic oil fire; an 1,850-acre hunt club with former above-ground oil distribution pipelines on existing pipeline easements; a slaughterhouse converted to a city landfill; three airports previously occupied by the US Navy; and a farm equipment maintenance facility on Union Pacific Railroad property with a history of above-ground bulk fuel storage.



Licensed Class II Registered Environmental Assessor (REA), technical reviewer and key contributor to nine Phase I Environmental Site Assessments for proposed K-12 school sites, plus licensed Class II REA and technical reviewer of 12 additional K-12 school site ESAs. School sites were located in Los Angeles Unified School District, Morgan Hill Unified School District, Gilroy Unified School District, Pajaro Valley Unified School District and Gonzales Unified School District. Developed uses of some sites dated back to the 1800s. The environmental Site assessments were submitted to the California EPA's Department of Toxic Substances Control (DTSC) and/or California Department of Education.

Performed preliminary endangerment assessments and was licensed Class II REA for five proposed K-12 school sites and was licensed Class II REA for another proposed K-12 school site. The preliminary endangerment assessments were performed in coordination with the School Property Evaluation and Cleanup Division of the California DTSC. The sites were previously used for agriculture, including dairy farming and/or fruit drying; lumber yards; or residential purposes. Three of the projects involved entirely new schools, two involved a renovation of an existing facility and one involved acquisition of eight adjoining parcels to allow expansion.

One historically agricultural property was found to contain trace residuals of chlorinated pesticides and elevated lead not severe enough to warrant any remedial measures. The other historically agricultural site was found to contain two hot-spot areas of DDT-contaminated surface soils. The soils were removed to the satisfaction of the DTSC and the County Health Department and the site was cleared for school construction. At one of the facility renovation projects, unacceptably elevated arsenic was found in near-surface soil. High lead was found in soil on all of the eight parcels to be acquired, plus a hot-spot of polynuclear aromatic hydrocarbons was identified on one. Ms. Mead prepared a Removal Action Workplan for remediation of the impacted soil, supervised the removal of 2,400 tons of impacted soil and conducted air monitoring.

Managed or provided technical review for over 70 fuel leak projects in California. Sites include a service station contributing to a commingled gasoline groundwater plume that migrated within 10 feet of a river in Monterey County; a maintenance yard where MtBE- and DCA-impacted groundwater was present in an active domestic water well in Santa Cruz County; and gasoline stations in San Benito County where MTBE and/or benzene have impacted the drinking water aquifer. Work phases performed for the fuel leak projects include Site conceptual model development, design and implementation of three-dimensional characterization investigations, some using expedited assessment methods; risk-based corrective action assessments; remedial feasibility studies; remedial feasibility testing; aquifer testing; soil and groundwater remediation; groundwater monitoring; and negotiating case closures.

INTRODUCTION

This report summarizes the environmental noise assessment of the Miravale III Specific Plan Project proposed in Soledad, California. The project would develop an approximate 900-acre site with 1,470 single-family homes, 2,730 multi-family homes, senior housing, a hotel, retail uses, schools, and a golf course. This assessment presents the fundamentals of environmental noise, provides a discussion of policies and standards applicable to the project, and presents the results of noise measurements made in the project vicinity. An evaluation of the potential significance of impacts resulting from the project is made and mitigation measures are presented to reduce the effects of potentially significant noise impacts that would result from the implementation of the Specific Plan.

FUNDAMENTALS OF ENVIRONMENTAL NOISE

Noise is defined as unwanted sound. Airborne sound is a rapid fluctuation of air pressure above and below atmospheric pressure. Sound levels are usually measured and expressed in decibels (dB) with 0 dB corresponding roughly to the threshold of hearing. Decibels and other technical terms are defined in Table 1.

Most of the sounds that we hear in the environment do not consist of a single frequency, but rather a broad band of frequencies, with each frequency differing in sound level. The intensities of each frequency add together to generate a sound. The method commonly used to quantify environmental sounds consists of evaluating all of the frequencies of a sound in accordance with a weighting that reflects the facts that human hearing is less sensitive at low frequencies and extreme high frequencies than in the frequency mid-range. This is called "A" weighting, and the decibel level so measured is called the A-weighted sound level (dBA). In practice, the level of a sound source is conveniently measured using a sound level meter that includes an electrical filter corresponding to the A-weighting curve. Typical A-weighted levels measured in the environment and in industry are shown in Table 2 for different types of noise.

Although the A-weighted noise level may adequately indicate the level of environmental noise at any instant in time, community noise levels vary continuously. Most environmental noise includes a conglomeration of noise from distant sources which create a relatively steady background noise in which no particular source is identifiable. To describe the time-varying character of environmental noise, the statistical noise descriptors, L_{01}, L_{10}, L_{50}, and L_{90}, are commonly used. They are the A-weighted noise levels equaled or exceeded during 1%, 10%, 50%, and 90% of a stated time period. A single number descriptor called the L_{eq} is also widely used. The L_{eq} is the average A-weighted noise level during a stated period of time.

In determining the daily level of environmental noise, it is important to account for the difference in response of people to daytime and nighttime noises. During the nighttime, exterior background noises are generally lower than the daytime levels. However, most household noise also decreases at night and exterior noise becomes very noticeable. Further, most people sleep at night and are very sensitive to noise intrusion. To account for human sensitivity to nighttime noise levels, a descriptor, DNL (day/night average sound level), was developed. The DNL divides the 24-hour day into the daytime of 7:00 AM to 10:00 PM and the nighttime of 10:00 PM to 7:00 AM. The nighttime noise level is weighted 10 dB higher than the daytime noise level. The Community Noise Equivalent Level (CNEL) is another 24-hour average which includes both an evening and nighttime weighting.

Table 1 Definitions of Acoustical Terms Used in this Report

Term	Definitions
Decibel, dB	A unit describing, the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure. The reference pressure for air is 20.
Sound Pressure Level	Sound pressure is the sound force per unit area, usually expressed in micro Pascals (or 20 micro Newtons per square meter), where 1 Pascal is the pressure resulting from a force of 1 Newton exerted over an area of 1 square meter. The sound pressure level is expressed in decibels as 20 times the logarithm to the base 10 of the ratio between the pressures exerted by the sound to a reference sound pressure (e.g., 20 micro Pascals). Sound pressure level is the quantity that is directly measured by a sound level meter.
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz. Infrasonic sound are below 20 Hz and Ultrasonic sounds are above 20,000 Hz.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.
Equivalent Noise Level, Leq	The average A-weighted noise level during the measurement period.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Day/Night Noise Level, L_{dn} or DNL	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 5 decibels in the evening from 7:00 pm to 10:00 pm and after addition of 10 decibels to sound levels measured in the night between 10:00 pm and 7:00 am.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

Table 2 Typical Noise Levels in the Environment

Common Outdoor Noise Source	Noise Level (dBA)	Common Indoor Noise Source
	120 dBA	
Jet fly-over at 300 meters		Rock concert
	110 dBA	
Pile driver at 20 meters	100 dBA	
		Night club with live music
	90 dBA	
Large truck pass by at 15 meters		
	80 dBA	Noisy restaurant
		Garbage disposal at 1 meter
Gas lawn mower at 30 meters	70 dBA	Vacuum cleaner at 3 meters
Commercial/Urban area daytime		Normal speech at 1 meter
Suburban expressway at 90 meters	60 dBA	
Suburban daytime		Active office environment
	50 dBA	
Urban area nighttime		Quiet office environment
	40 dBA	
Suburban nighttime		
Quiet rural areas	30 dBA	Library
		Quiet bedroom at night
Wilderness area	20 dBA	
Most quiet remote areas	10 dBA	Quiet recording studio
Threshold of human hearing	0 dBA	Threshold of human hearing

REGULATORY BACKGROUND

The State of California and the City of Soledad establish guidelines, regulations, and policies designed to limit noise exposure at noise sensitive land uses. Appendix G of the State CEQA Guidelines, the California Building Code, the City of Soledad Noise Element of the General Plan, and the City of Soledad Municipal Code present the following applicable criteria:

State CEQA Guidelines. The California Environmental Quality Act (CEQA) contains guidelines to evaluate the significance of effects of environmental noise attributable to a proposed project. CEQA asks whether the project would result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local General Plan or Noise Ordinance, or applicable standards of other agencies?

- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Section 1208 of the 2001 California Building Code. New multi-family housing in the State of California is subject to the environmental noise limits set forth in Appendix Chapter 1208A.8.2 of the California Building Code. The noise limit is a maximum interior noise level of 45 dBA CNEL. Where exterior noise levels exceed 60 dBA CNEL, a report must be submitted with the building plans describing the noise control measures that have been incorporated into the design of the project to meet the noise limit.

City of Soledad General Plan. The City of Soledad's primary noise goal is to, "…preserve the quiet and rural setting of the City and protect citizens from exposure to excessive levels of noise." The City establishes policies and programs in the Noise Element to support the City's noise goal. General Plan supporting policy N-1 states that the City shall not allow development of new noise-sensitive land uses where noise levels exceed acceptable standards (shown in Table 3) unless effective noise mitigation measures have been incorporated into the development design. Policy N-2 states that the City shall require preparation of an acoustical analysis as part of the environmental review process for nonresidential land uses that are likely to generate noise levels exceeding acceptable levels at adjacent or nearby existing or planned noise-sensitive uses, so that noise mitigation may be included in the project design. Policy N-3 requires new residential development to comply with State Noise Insulation Standards. Policy N-4 states that new commercial and industrial development shall incorporate design elements to minimize the noise impact when residential neighborhoods are nearby. Policy N-5 states that the emphasis of mitigation measures shall be placed on site planning and project design, and the use of noise barriers shall be considered as a means of achieving the noise standards only after all other practical design related mitigation measures have been integrated into the project.

Table 3 Interior and Exterior Noise Standards

Land Use Categories		Energy Average CNEL	
Categories	Uses	Interior[1]	Exterior[2]
Residential	Single Family, Duplex, Multi Family	45[3]	65
	Mobile Home	---	65[4]
Commercial, Industrial and Institutional	Motel, Hotel, Transient Lodging	45	65[5]
	Commercial Retail, Bank, Restaurant	55	---
	Office Building, Research and Development, Professional Office, Government Office	50	---
	Amphitheater, Concert Hall, Auditorium, Meeting Hall	45	---
	Gymnasium	50	---
	Sports Club	55	---
	Manufacturing, Warehousing, Wholesale, Utilities	65	---
	Movie Theaters	45	---
Institutional	Hospitals, Schools	45	65
	Church, Library	45	---
Open Space	Parks	---	65

Notes:
1. Indoor environment excluding bathrooms, closets and corridors.
2. Outdoor environment limited to private yards of single family residences, multi-family private patio or balcony served by a means of exit from inside, mobile home parks, hospital patio, park picnic area, school playground, hotel/motel recreation area.
3. Noise level requirements with closed windows. Mechanical ventilation system or other means of natural ventilation shall be provided per Chapter 12 Section 1205 of the Uniform Building Code.
4. Exterior noise level should be such that interior level will not exceed 45 CNEL.
5. Except areas affected by aircraft noise.

City of Soledad Zoning Code

Section 17.38.240, of the City's Zoning Code establishes noise performance standards for noise generating uses to limit noise at sensitive land uses. The noise limit for residential uses is 55 dBA in any octave band at the residential property line. Corrections to these limits are applied depending on the character of the noise, the duration of noise, and the timing of noise.

EXISTING NOISE ENVIRONMENT

The project planning area is located at the northernmost portion of the City of Soledad between approximately San Vincente Road in the west to Orchard Lane in the east. Farmland borders the project site to the west, north, and east. Single-family residential uses border the planning area to the south. A

site visit and noise monitoring survey was performed in September 2006 to establish existing noise conditions in the project vicinity. The ambient noise environment in the project vicinity results primarily from local and distant vehicular traffic. Intermittent sources of environmental noise include railroad trains along the Union Pacific Railroad and agricultural related activities. The noise monitoring survey included three long-term noise measurements to quantify the daily trend in noise levels along roadways serving the site and four short-term noise measurements to identify specific noise sources and associated noise levels at representative locations in adjoining neighborhoods. Noise measurement locations are shown on Figure 1.

The daily trend in noise levels along San Vincente Road was measured at Site LT-1 from September 6 to 7, 2006. Noise measurement location LT-1 was approximately 20 feet from the center of San Vincente Road near Saavedra Street. Noise levels at this location resulted primarily from local vehicular traffic. During periods of the noise measurement, wind noise also contributed to the measured levels. Daytime hourly average noise levels typically ranged from 62 to 73 dBA L_{eq}. At night, hourly average noise levels ranged from 52 to 70 dBA L_{eq}. The day-night average noise level calculated based on the data gathered at LT-1 was 71 dBA CNEL. The daily trend in noise levels at location LT-1 is shown on Figure 2.

A second long-term noise measurement position (LT-2) was selected at the north end of West Street to quantify noise levels near existing residential receivers. Noise levels at this location resulted primarily from local neighborhood activities and periods of wind. Daytime hourly average noise levels at Site LT-2 typically ranged from 50 to 55 dBA L_{eq} excluding atypical high noise level events occurring close to the sound level meter. Hourly average noise levels were relatively low at night ranging from about 33 to 47 dBA L_{eq}. The day-night average noise level calculated based on the data gathered at LT-2 was 61 dBA CNEL. The daily trend in noise levels at location LT-2 is shown on Figure 3. The estimated CNEL at this location, excluding periods of wind and the atypical noise events occurring near the sound level meter is approximately 53 to 55 dBA CNEL.

A third long-term noise measurement was made approximately 25 feet from the center of West Street near Sundew Street. Noise levels at this location resulted primarily from local vehicular traffic. Daytime hourly average noise levels at Site LT-3 typically ranged from 61 to 70 dBA L_{eq} and from 49 to 67 dBA L_{eq} at night. The day-night average noise level calculated based on the data gathered at LT-3 was 69 dBA CNEL. The measured noise levels at location LT-3 are shown on Figure 3.

Four short-term noise measurements were made to complete the noise monitoring survey. These measurements were made near noise sensitive receptors that could be affected by increased traffic resulting from the proposed project. The results of the short-term noise measurements are summarized in Table 4.

Table 4 Summary of Short-Term Noise Measurement Data (dBA)

Noise Measurement Location		Date	L_{eq}	$L_{(1)}$	$L_{(10)}$	$L_{(50)}$	$L_{(90)}$	CNEL
ST1	North end of Orchard Lane near Terraza Street.	9/6/2006	51	60	55	48	44	53-55
ST2	45 feet from the center of Orchard Lane near Las Flores Street.	9/6/2006	58	69	61	52	47	61
ST3	North end of West Street.	9/6/2006	48	57	51	45	41	53-55
ST4	65 feet from the center of West Street near Sundew Street.	9/7/2006	60	70	64	55	50	65

NOISE IMPACTS AND MITIGATION MEASURES

Significance Criteria

Appendix G of the CEQA Guidelines states that a project would normally be considered to have a significant impact if noise levels conflict with adopted environmental standards or plans, if persons are exposed to excessive groundborne vibration, if noise generated by the project would substantially increase existing noise levels at sensitive receivers on a permanent or temporary basis, or if persons would be located within two miles of a public airport or private airstrip and exposed to excessive noise levels. CEQA checklist questions regarding groundborne vibration and aircraft noise are not applicable in this assessment. The primary noise issues concerning this project are noise and land use compatibility of the proposed residential land uses and the potential for permanent or temporary noise level increases in the project vicinity that would occur with the project. Significance criteria used in the noise impact assessment include the following:

- A significant impact would be identified if noise-sensitive receivers proposed by the project would be exposed to noise levels exceeding the City's established guidelines for noise and land use compatibility. Exterior average noise levels are limited to 65 dBA CNEL or less, and interior average noise levels are limited to 45 dBA CNEL or less.

- According to CEQA, a significant noise impact would result if noise levels increase substantially at existing noise-sensitive land uses (e.g., residences) as a result of the implementation of the Specific Plan. A "substantial increase" is defined as 3 dBA CNEL or greater at noise-sensitive land uses where noise levels would exceed 65 dBA CNEL, or 5 dBA CNEL or greater where the noise level would remain below 65 dBA CNEL.

- A significant noise impact would be identified if noise generated by the project would exceed the Municipal Code noise limits at existing or planned residential receivers.

- Significant noise impacts would result from construction if noise levels interfere with speech, sleep, or normal residential activities for a period exceeding one construction season. Construction-related hourly average noise levels received at noise-sensitive land uses exceeding 60 dBA $L_{eq(hr)}$, and at least 5 dBA above the ambient, would be considered significant if the noise-generating construction affected the noise environment at a sensitive receiver for more than 12 months.

Impact 1: **Noise and Land Use Compatibility.** Future residential uses developed at the project site would be exposed to exterior noise levels greater than 65 dBA CNEL, which exceeds the noise and land use compatibility standards presented in the City of Soledad's General Plan. Interior noise levels would be expected to exceed 45 dBA CNEL without the incorporation of noise insulation features into the project's design. **This is a potentially significant impact.**

Exterior Noise

Noise-sensitive land uses proposed within the Miravale III Specific Plan area nearest US 101 and arterial and collector roadways would be exposed to exterior noise levels greater than 65 dBA CNEL, which exceeds the City of Soledad's noise and land use compatibility guidelines for exterior noise. Noise levels

in excess of 60 dBA CNEL would require additional noise analyses, per the noise insulation standards contained in the California Building Code, for multi-family residential land uses proposed as part of the project.

A traffic noise model was used to calculate noise contour distances for area roadways based on build-out traffic volumes and preliminary design information for arterial and collector roadways. Vehicle-mix and speed assumptions were input into the traffic noise model to create a credible worst-case projection of noise levels within the planning area. These projections do not account for shielding provided by proposed structures or variations in topography relative to area roadways. The noise contour distances presented in Table 5 indicate where further detailed noise analyses would be required during project level review.

US 101 would affect the noise environment at the southernmost portion of the plan area. US 101 would be expected to generate noise levels exceeding 65 dBA CNEL within approximately 1,300 feet of the roadway centerline and 60 dBA CNEL within approximately 2,900 feet of the roadway centerline. Multi-family residential land uses including a hotel would be located in a noise environment less than 65 dBA CNEL. Exterior noise levels would be compatible with the proposed uses. However, these uses would be located within the future 60 dBA CNEL noise contour generated by US 101, which would trigger additional analysis of interior noise levels.

Roadways within the plan area that would generate noise levels greater than 65 dBA CNEL include San Vincente Road, West Street, and Orchard Lane. Exterior noise levels would exceed 65 dBA CNEL within 90 feet of the center of San Vincente Road and West Street, and within 50 feet of the center of Orchard Lane. Where exterior noise levels exceed the City's noise level goal of 65 dBA CNEL, mitigation is required to provide a compatible exterior noise environment.

Table 5 Future Noise Contour Distances (Feet from road center)

ROADWAY	SEGMENT	70 dBA CNEL	65 dBA CNEL	60 dBA CNEL
US 101	Camphora-Gloria Road to North Soledad	620	1330	2860
San Vincente Road	North of Project Entrance	--[1]	90	200
West Street	North of Project Entrance	--	90	200
Orchard Lane	North of Project Entrance	--	50	100

Interior Noise

US 101, San Vincente Road, West Street, and Orchard Lane would generate Community Noise Equivalent Levels greater than 60 dBA CNEL. Exterior noise levels would exceed 60 dBA CNEL within approximately 2,900 feet of the center of US 101, 200 feet of the center of San Vincente Road and West Street, and within 100 feet of the center of Orchard Lane. In buildings of typical construction, with the windows partially open, interior noise levels are approximately 15 dBA lower than exterior noise levels.

1 Data not reported within 50 feet of roadway center.

With the windows closed, standard residential construction typically provides 20 to 25 decibels of exterior to interior noise reduction.

In exterior noise environments of 60 dBA CNEL or less, standard construction methods are normally sufficient to reduce noise levels within residential units to 45 dBA CNEL. Where exterior noise levels range from 60 to 65 dBA CNEL, the inclusion of adequate forced air mechanical ventilation is often the method selected to reduce interior noise levels to acceptable levels by closing the windows to control noise. Where noise levels exceed 65 dBA CNEL, forced-air mechanical ventilation systems and sound-rated construction methods are normally required. Such methods or materials may include a combination of smaller window and door sizes as a percentage of the total building façade facing the noise source, sound-rated windows and doors, sound rated exterior wall assemblies, and mechanical ventilation so windows may be kept closed at the occupants discretion. Attaining the necessary noise reduction from exterior to interior spaces is readily achievable with proper wall construction techniques, the selections of proper windows and doors, and the incorporation of forced-air mechanical ventilation systems to allow occupants to control noise by closing the windows.

Mitigation Measures:

The following mitigation measures would reduce the potentially significant impacts to a less-than-significant level:

- Maintain a sufficient buffer distance between transportation noise sources and future sensitive land uses, or alternatively, construct noise barriers or create acoustically shielded outdoor use areas utilizing buildings to achieve noise exposures of 65 dBA CNEL or less. The specific determination of necessary mitigation measures shall occur during project level environmental review and design. Results of the analysis shall be submitted to the City prior to issuance of a building permit.

- Retain a qualified Acoustical Specialist to prepare for City review and approval a detailed acoustical analysis of interior noise reduction requirements and specifications for all projects proposed within the 60 dBA CNEL contours of area roadways, in accordance with State and City standards. Interior noise levels must be maintained at or below 45 dBA CNEL. Building sound insulation requirements shall include forced air mechanical ventilation in noise environments exceeding 60 dBA CNEL. Special building construction techniques (e.g., sound-rated windows and building facade treatments) may be required where exterior noise levels exceed 65 dBA CNEL. These treatments include, but are not limited to, sound rated windows and doors, sound rated exterior wall assemblies, and acoustical caulking. The specific determination of required treatments shall be made on a unit-by-unit basis during project design. Results of the analysis, including the description of the necessary noise control treatments, shall be submitted to the City along with the building plans prior to issuance of a building permit.

Impact 2: **Generation of Excessive Noise Levels.**
Noise-generating uses within the Miravale III Specific Plan could generate noise levels in excess of the Municipal Code noise limits. **This is a potentially significant noise impact.**

Commercial land uses, recreation areas, parks, educational facilities, and police and fire sub-stations are located throughout the plan area and are adjoined by existing or proposed noise-sensitive uses. Noise and land use compatibility conflicts between noise-generating uses and noise-sensitive uses could occur if project-level noise analyses are not made prior to project approvals.

Commercial Uses

The project would develop approximately 275,000 square feet of retail commercial space which could contain noise sources such as loading docks, heating, ventilation, and cooling equipment, other mechanical equipment such as emergency back-up generators and trash compactors, parking lots, etc. Noise sources such as loading docks would be expected to generate noise levels of about 50 to 60 dBA L_{eq} at 150 feet depending on the number of trucks accessing the loading dock and frequency of other extraneous noise sources associated with receiving areas (e.g., forklifts, etc.). Heating, ventilation, and cooling equipment could generate noise levels in the range of 50 dBA to 70 dBA L_{eq} at 150 feet depending on the number, type, and size of the proposed equipment. Trash compactors typically generate maximum noise levels of 40 to 50 dBA at 150 feet, depending on the power rating and enclosure characteristics. Noise associated with the use of parking lots would include vehicular circulation, loud engines, car alarms, squealing tires, door slams, and human voices. The maximum sound (L_{max}) of a passing car at 15 mph typically ranges from 43 dBA to 53 dBA at 150 feet. The noise generated during an engine start is similar. Door slams create lower noise levels. Hourly average noise level resulting from all of these noise-generating activities in a busy parking lot could range from 35 dBA to 45 dBA L_{eq} at a distance of 150 feet from the parking area. Noise levels in excess of the limits presented in the City's Zoning Code could be generated by such uses depending upon the configuration of the final land use plan at parcels designated for commercial development.

Educational Facilities and Parks

The Miravale III Specific Plan includes the development of two elementary schools, one middle school, several parks and other recreation areas in areas adjacent to existing and proposed residential land uses. Schools would generate noise when students arrive and depart as well as when outdoor activity areas are used.

Active parks, ball fields, or sports complexes could also be a potentially significant source of community noise. Participants and spectators would generate noise while using parks and recreation areas proposed as part of the Miravale III Specific Plan. Recreation areas may include lighting and, therefore, could be expected to generate noise in the late evening hours. Maximum noise levels from such uses can exceed 80 dBA L_{max} at a distance of approximately 150 feet. For normal active park events such as soccer games, baseball games, dog parks, etc., average noise levels of about 55 to 60 dBA L_{eq} could be expected at a distance of 150 feet from the center of activities. Noise levels generated by these parks could exceed the noise levels established in the City's Zoning Code at the residential property line, thereby requiring further study.

Passive public parks could contain one or more of the following amenities that are part of most neighborhood parks: tot lot/playground, open turf area, picnic tables with barbeques, pathways, etc. It is not anticipated, given the activities outlined above, that noise from passive parks would cause any adverse noise impacts upon either existing or future noise sensitive receptors in the area.

Police /Fire Sub-Station

The proposed project includes the construction of a police/fire sub-station station at the northwest corner of West Street and J Street. Noise-generating activities associated with the operation of a police station are normally limited to parking and vehicle circulation and mechanical equipment such as emergency generators. Police vehicles may also be tested and maintained on-site. Noise-generating activities

associated with the operation of a fire station include sirens sounding as vehicles leave the station, the testing of engines, horns, and sirens during the morning check, weekly testing of the emergency generator, and in some instances, training exercises. Noise measurements conducted at fire stations during the morning equipment checkout indicate that maximum noise levels at a distance of 50 feet from an activity can reach 80 to 85 dBA L_{max}. Typically, such activities are within the range of vehicular traffic noise when stations are located adjacent to major streets. Noise generated by the proposed police/fire sub-station could exceed City standards at proposed residential land uses in the vicinity, thereby requiring further study.

Mitigation Measure:

The following mitigation measure would reduce the potentially significant impact to a less-than-significant level:

- Non-residential development shall comply with the noise standards established in the Zoning Code at existing or planned residential properties in the vicinity. Site planning can effectively mitigate noise impacts; such as by not locating loading docks near residences. Equipment screens, fan silencers, and engine mufflers shall be used to mitigate noise from mechanical equipment. Noise barriers shall be used to control noise from parking and vehicle circulation. For recreational uses, proposed development must consider impacts upon the adjacent residential development in terms of the location of active sports areas, their orientation on the site, whether or not lights are included, and speech amplification systems. The proper application of these measures individually or together would mitigate this potentially significant impact to a less-than-significant level.

Impact 3: **Project-Generated Traffic Noise.** Traffic volume increases along roadway serving the project site will result with the development of the project area, and will generate an increase in traffic noise. In some locations, there would be a substantial permanent increase in environmental noise. **This is a potentially significant impact.**

The *Miravale III Mixed-Use Development Draft Transportation Impact Analysis*, prepared by Hexagon Transportation Consultants, Inc., was reviewed to calculate the relative change in traffic noise levels resulting from project-generated traffic. Table 6 shows the roadway links that are calculated to experience a substantial noise increase as a result of the project. Roadway segments experiencing a traffic noise level increase less than 3 dBA CNEL were excluded from further analysis, because the noise level increase would not be substantial.

Table 6 Traffic Noise Level Increases Above Existing Levels Resulting from Project

		CNEL Noise Levels (dBA) at 75 feet from Roadway Center			
Roadway	**Segment**	**Existing**	**Background**	**Project**	**Project Increase**
San Vincente Road	Gabilan Dr. to Project Entrance	57	57	64	+7
West Street	Market St. to Gabilan Dr.	60	60	65	+5
West Street	Gabilan Dr. to Project Entrance	59	59	66	+7
Main Street	Market St. to Gabilan Dr.	57	57	63	+6

Traffic noise levels would be substantially increased at noise-sensitive residential receivers along San Vincente Road, north of Gabilan Drive, along West Street, north of Market Street, and along Main Street between Market Street and Gabilan Drive. Exterior noise levels would exceed 65 dBA CNEL at a distance of 75 feet from the roadway center along West Street north of Gabilan Drive. Noise levels along the remaining roadway segments would be 65 dBA CNEL or less and would be considered acceptable for residential development.

Mitigation Measures:

Noise reduction methods include the following:

- Paving streets with "quieter" pavement types such as Open-Grade Rubberized Asphaltic Concrete would reduce noise levels by 2 to 3 dBA depending on the existing pavement type, traffic speed, traffic volumes, and other factors.

- New or larger noise barriers could reduce noise levels by 5 dBA CNEL. Final design of such barriers, including an assessment of their feasibility and reasonableness, should be completed during project level review.

- Installing traffic calming measures to slow traffic could provide qualitative improvement by smoothing out the rise and fall in noise levels caused by speeding vehicles.

- Sound insulation treatments to the buildings, such as sound rated windows and doors, could reduce noise levels in interior spaces.

Mitigation Discussion:

A combination of mitigation measures such as the repaving of area roadways, the replacement or construction of noise barriers, traffic calming, and sound insulation could be implemented to reduce the effects of project generated traffic noise. These mitigation measures could be implemented along identified segments of San Vincente Road, West Street, and Main Street where noise levels would be substantially increased with the project.

Case studies have shown that the replacement of dense grade asphalt (standard type) with open-grade or rubberized asphalt can reduce traffic noise levels along residential-type streets by 2 to 3 dBA. A possible noise reduction of 2 dBA would be expected using conservative engineering assumptions. Table 7 shows the expected project noise level increases assuming the replacement of existing pavement with open-grade or rubberized asphalt. Project-generated traffic noise increases along West Street, between Market Street and Gabilan Drive could be mitigated to a less than significant level as the mitigated traffic noise increase would be 3 dBA CNEL and the resulting noise level would be less than 65 dBA CNEL. To be a permanent mitigation, subsequent repaving would also have to be “quieter” pavements.

Table 7 Traffic Noise Level Increases Assuming Repavement of Affected Roadways with "Quieter" Pavement

Roadway	Segment	Noise Level Increase after Mitigation (dBA, CNEL)
San Vincente Road	Gabilan Dr. to Project Entrance	+5
West Street	Market St. to Gabilan Dr.	+3
West Street	Gabilan Dr. to Project Entrance	+5
Main Street	Market St. to Gabilan Dr.	+4

Existing residential receivers located along West Street and Main Street either front the roadway (private outdoor use areas are located behind the homes) or have outdoor use areas adjacent to the roadway that may or may not be shielded by fences or noise barriers. Noise barriers would not be feasible at single-family residential receivers that front these roadways due to access requirements. In situations where private outdoor use areas are located adjacent to the roadway, new or larger noise barriers could be constructed to provide the additional necessary noise attenuation in private use areas. Typically, increasing the height of an existing barrier results in about 1 dBA of attenuation per 1 foot of additional barrier height. The design of such noise barriers would require additional analysis. Traffic calming could also be implemented to reduce noise levels expected with the project. Each 5 mph reduction in average speed provides approximately 1 dBA of noise reduction on an average basis (L_{eq}/CNEL). Traffic calming measures that regulate speed improve the noise environment by smoothing out noise levels.

Newer residential land uses constructed in the vicinity of San Vincente Road have existing noise barriers that would provide additional shielding in rear yard areas. Exterior noise levels, although substantially increased over existing conditions, would be less than 65 dBA CNEL in the rear yards of these homes. It is likely that these recently constructed residences were planned and constructed recognizing the future development at Miravale III. Existing noise barriers in older developments may also be sufficient to reduce exterior noise levels in rear yard areas to 65 dBA CNEL or less.

Residences could also be provided with sound insulation treatments if further study finds that interior noise levels within the affected residential units would exceed 45 dBA CNEL assuming future plus project traffic conditions. Treatments to the homes may include the replacement of existing windows and doors with sound-rated windows and doors and the provision of a suitable form of forced-air mechanical ventilation to allow the occupants the option of controlling noise to by closing the windows. The specific treatments for each affected residential unit would be identified on a case-by-case basis.

Significance After Mitigation:

Each of these mitigation measures involves other non-acoustical considerations. Other engineering issues may dictate continued use of dense grade asphalt. Noise barriers and sound insulation treatments must be done on private property necessitating agreements with each property owner. Therefore, it may not be reasonable or feasible to reduce project-generated traffic noise at all affected receivers. The impact would be considered significant and unavoidable.

Impact 4: **Construction Noise.** Existing and proposed noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one construction season. **This is a significant and unavoidable impact.**

Future construction within the plan area would generate noise, and would temporarily increase noise levels at adjacent land uses. The build out of the Specific Plan would affect the noise environment at existing single-family residential neighborhoods bordering the site to the south. Construction noise would also affect the noise environment of noise-sensitive land uses developed during the first phases of the project as later phases are developed.

Noise impacts resulting from construction depend on the noise generated by various pieces of construction equipment, the timing and duration of noise generating activities, and the distance between construction noise sources and noise sensitive receptors. Construction noise impacts primarily occur when construction activities occur during noise-sensitive times of the day (early morning, evening, or nighttime hours), the construction occurs in areas immediately adjoining noise sensitive land uses, or when construction noise lasts over extended periods of time. Where noise from construction activities exceeds 60 dBA L_{eq} and exceeds the ambient noise environment by at least 5 dBA L_{eq} at noise-sensitive uses in the project vicinity for a duration of one year or more, the impact would be considered significant.

Construction activities generate considerable amounts of noise. Construction-related noise levels are normally highest during the demolition phase and during the construction of project infrastructure. The demolition and infrastructure phases of construction require heavy equipment that generates the highest noise levels. Typical hourly average construction generated noise levels are about 81 dBA to 88 dBA measured at a distance of 50 feet from the center of the site during busy construction periods (e.g., earth moving equipment, impact tools, etc.). The highest maximum noise levels generated by project construction would typically range from about 90 to 98 dBA at a distance of 50 feet from the noise source. Construction-related noise levels are normally less during building framing, finishing, and landscaping phases. There would be variations in construction noise levels on a day-to-day basis depending on the specific activities occurring at the site.

Construction noises are disturbances that are necessary for the construction or repair of buildings and structures in urban areas. Reasonable regulation of the hours of construction, as well as regulation of the arrival and operation of heavy equipment and the delivery of construction materials, are necessary to protect the health and safety of persons, promote the general welfare of the community, and maintain the quality of life. Limiting the hours when construction can occur to daytime hours is often a simple method to reduce the potential for noise impacts. In areas immediately adjacent to construction, controls such as constructing temporary noise barriers and utilizing “quiet” construction equipment can also reduce the potential for noise impacts.

The build out of the plan area would increase the ambient noise environment at existing homes bordering the project site, as well as residential units built within the plan area during the earlier construction phases. Construction noise levels are anticipated to exceed 60 dBA L_{eq} and the ambient by 5 dBA or more over extended periods of time. It is conceivable that the phasing of projects would be such that a particular receiver or group of receivers would be subject to construction noise levels in excess of 60 dBA L_{eq} and the ambient by 5 dBA for durations exceeding one year. The construction of projects implemented by the Miravale III Specific Plan would result in a significant temporary noise level increase at neighboring noise-sensitive properties.

Mitigation Measures:

The following available controls should be included in the project to reduce construction noise levels as low as practical.

- Noise-generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 6:00 p.m. on Saturdays. No construction activities should occur Sundays or holidays.

- Equip all internal combustion engine driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.

- Locate stationary noise generating equipment (e.g., portable concrete crusher) as far as possible from sensitive receptors.

- Utilize "quiet" air compressors and other stationery noise sources where technology exists.

- The contractor shall prepare a detailed construction plan identifying the schedule for major noise-generating construction activities. The construction plan shall identify a procedure for coordination with the adjacent noise sensitive facilities so that construction activities can be scheduled to minimize noise disturbance.

- Designate a "disturbance coordinator" who would be responsible for responding to any local complaints about construction noise. The disturbance coordinator will determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and will require that reasonable measures warranted to correct the problem be implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule.

Although the above measures would reduce noise generated by the construction of the project, the impact would remain significant and unavoidable as a result of the extended period of time that receivers would be exposed to construction noise.

Impact 5: **Cumulative Traffic Noise.** Traffic noise levels will increase with the development of the project area and other planned developments in Soledad. In some locations, these increases would be substantial, and the project would contribute to the overall cumulative noise impact. **This is a potentially significant impact.**

The project would contribute at least 1 decibel to the cumulative noise level increase expected throughout Soledad and would be “cumulatively considerable”. Table 8 summarizes the roadway segments where the project would contribute a measurable increase and cumulative noise level increases resulting from the project and other planned developments would be substantial.

Table 8 Cumulative Traffic Noise Level Increases Above Existing Levels

Roadway	Segment	Cumulative Noise Level Increase (dBA, CNEL)
San Vincente Road	Market St. to Gabilan Dr.	+9
	Gabilan Dr. to Project Entrance	+10
West Street	Market St. to Gabilan Dr.	+6
	Gabilan Dr. to Project Entrance	+8
Main Street	Market St. to Gabilan Dr.	+7
Gabilan Dr.	San Vincente Rd. to West St.	+9
	West St. to Andalucia Dr.	+5
	East of Andalucia Dr,	+5
Andalucia Dr.	Metz Rd. to Gabilan Dr.	+4

Mitigation Measures:

See mitigation presented for Impact 3 and mitigation feasibility discussion.

Significance After Mitigation:

Similar to Impact 3, it may not be reasonable or feasible to reduce cumulative traffic noise levels at all affected receivers. Measures available to reduce the cumulative noise level increases would not likely be reasonable or feasible in all areas, therefore, the impact would be considered significant and unavoidable.

Executive Summary

This report presents the results of the traffic impact analysis conducted for the Miravale Phase III Mixed-Use development Specific Plan in Soledad, California. The project site is located in the northern outskirts of the city generally between San Vicente Road and Orchard Lane. The project as proposed will consist of 1,470 single-family homes, 2,230 multi-family units, 500 senior housing units, 120 hotel rooms, and up to 275,000 s.f. of supporting retail. A golf course, schools, and parks will also be part of the 920-acre site. The land uses of the project site are consistent with the City of Soledad General Plan that calls for major residential development in areas east and north of city limits. The project site incorporates the identified specific plan expansion areas of San Vicente West, Mirassou, and the Northwest area. A specific plan is required of all development within the identified expansion areas. The Specific Plan includes project zoning and development standards and design guidelines that implement the Specific Plan vision and land use provisions and the General Plan's goals, policies, and standards relating to Miravale Phase III. Access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Future access also will be provided by the extension of Miravale Road to Camphora/Gloria Road and the Orchard Lane extensions north and west of the project, eventually connecting via other planned routes to Camphora/Gloria Road when other development is completed.

This study was conducted for the purpose of identifying the potential traffic impacts related to the proposed development. The impacts of the project were evaluated following the standards and methodologies set forth by the City of Soledad. The traffic analysis is based on peak-hour levels of service for unsignalized intersections. The traffic analysis also includes an evaluation of peak-hour signal warrant and roadway and freeway level of service analysis.

Project Trip Generation

The magnitude of traffic added to the roadway system by a particular development is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled *Trip Generation*, seventh edition, 2003, were used for this analysis. On the basis of these rates, it is estimated that the project would generate 34,856 daily trips, with 2,451 trips occurring during the AM peak hour and 3,143 occurring during the PM peak hour. Using the specified inbound/outbound splits, the project would produce 619

inbound trips and 1,833 outbound trips during the AM peak hour and 1,969 inbound and 1,174 outbound trips during the PM peak hour.

The trip generation estimates do not include estimates for the proposed schools, parks, and golf course. Trip estimates for the proposed residential uses of the project account for trips made to schools and other types of complimentary land uses. Therefore, it is assumed that trips to the schools, parks, and golf course would originate from within the project area and the proposed residential units.

Similarly, the trip estimates for residential land uses of the project were reduced to account for internalization, or interaction, between the proposed retail and residential land uses. The project is proposing up to 275,000 s.f. of retail space. A portion of the retail space will be located centrally within the project area and proposed residential units. The remaining retail space will be located in the southeastern portion of the project site along San Vicente Road. The retail land uses are intended to be neighborhood-serving retail, not major retail establishments. As such, it is assumed that the majority of trips generated by the retail space will originate from within the project area. The residential uses of the project were reduced by a magnitude equal to 90% of the estimated trips for the centrally located retail space and 50% of the retail space located in the southeastern portion of the site. The difference in reduction percentages for the retail is due to the expectation that the southeastern retail space will attract some trips from outside the project area since it is located near existing neighborhoods and other land uses. While nearly all trips to the centrally located retail would originate from surrounding neighborhoods within the project area.

Project Impacts

Intersection Impacts

Results of the intersection level of service analysis show that11 of the 21 study intersections would be impacted by the project according to applicable level of service standards. Two additional intersections would meet signal warrants with the addition of project traffic. Each of the proposed mitigation measures is presented below:

Several of the identified impacts involve significant physical improvements to not only intersection configurations, but also roadway widening. In some cases, the improvements identified below will be undesirable due to the need for right-of-way acquisition and/or create inconsistency with the City's General Plan. The evaluation of necessary mitigation measures revealed that several of the project impacts could be mitigated with the construction of an extension of Gabilan Drive that will provide an alternate route to US 101. The City's General Plan calls for the extension of Gabilan Drive to US 101 as a four-lane divided arterial. The Gabilan Drive extension will provide for a more direct route to the project area and alleviate identified impacts at several intersections. Therefore, it is recommended that rather than the project implementing undesirable roadway widening, that it instead contribute its fair-share towards the construction costs of the extension of Gabilan Drive to US 101 and widening of San Vicente Road from the project south to the Gabilan Drive extension.

(1) Moranda Road and US 101 NB Ramps - The necessary improvement to mitigate the project impact at this intersection will consist of the signalization of the intersection and the addition of a second northbound left-turn lane, Moranda Road to northbound US 101. The implementation of these improvements will require that the northbound US 101 on-ramp be widened to receive the two lanes.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements created by the extension. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101. The volume of vehicles bound for northbound US 101 indicate the need for the reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(2) Moranda Road and Front Street - The improvement necessary to mitigate the project impact at this intersection will consist of the addition of a second northbound through lane and eastbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes. The roadway segment analysis also indicates the need for widening of Front Street between Moranda Road and San Vicente Road.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(3) San Vicente Road and Front Street - The improvement necessary to mitigate the project impact at this intersection will consist of the addition of two eastbound left-turn lanes and southbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes and northbound San Vicente Road be widened to three lanes. The improvements described above will require a significant amount of right-of-way acquisition and will not blend well with surrounding land uses.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(4) West Street and Front Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Front Street.

(5) Main Street and Front Street - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Front Street.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(7) Front Street and Nestles Road - The necessary improvements consist of the addition of a second eastbound left-turn lane in combination with improvements proposed to mitigate project impacts at the intersection of Oak Street and Front Street.

(9) Front Street and US 101 SB Ramps - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second lane on the off-ramp. The improvement will require the widening of southbound Front Street to two lanes. The volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and

north Soledad in general.

(11) San Vicente Road and Market Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and widening of San Vicente Road to accommodate two lanes in each direction.

With the construction of the Gabilan Drive extension to US 101, the signalization of the intersection and widening of San Vicente Road would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(12) West Street and Market Street - The necessary improvements consist of the signalization of the intersection.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(14) East Street and Market Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection.

(16) San Vicente Road and Gabilan Drive - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second westbound left-turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. The improvement will require the widening of southbound San Vicente Road to accommodate the dual left-turn lanes from Gabilan.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(17) West Street and Gabilan Drive - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of exclusive left-turn lanes with protected phasing on all approaches.

(18) Main Street and Gabilan Drive - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(19) Andalucia Drive and Gabilan Drive - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

(20) Orchard Lane and Metz Road - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane.

(21) Front Street and Oak Street - The necessary improvements to mitigate project impacts at this

intersection consist of the widening of Front Street to four lanes between Nestles Road and Oak Street. A second eastbound left-turn lane will also be needed at the intersection of Nestles Road and Front Street as part of the improvements at this intersection.

Freeway Segment Impacts

The results of the freeway segment analysis showed that four freeway segments are projected to operate at LOS D under project conditions.

US 101 – Northbound North of Gonzales-5th Street (AM Peak Hour)
US 101 – Northbound between Gonzales-5th Street to Gloria Road (AM Peak Hour)
US 101 – Northbound between Camphora Road and North Soledad (AM Peak Hour)
US 101 – Southbound between North Soledad and Camphora Road (PM Peak Hour)

The remaining segments are projected to operate at LOS C or better. The addition of project traffic will worsen conditions on each of the segments projected to operate at LOS D.

Freeway Ramp Impacts

The freeway ramp analysis indicates that two of the studied freeway ramps are projected to operate at LOS F under project conditions.

Moranda Road Interchange – Southbound US 101 off-ramp to Moranda Road (PM Peak Hour)
Moranda Road Interchange – Northbound US 101 on-ramp from Moranda Road (AM Peak Hour)

The existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes. The project traffic will worsen conditions on each of the ramps.

Traffic Mitigation Triggers

The large size of the proposed project will require that construction of the project be phased over the next ten years. As such, it is necessary to phase mitigation costs/fees along with the development of the project in order to ensure the financial feasibility of the initial development activities. The two major roadway improvements, Gabilan Extension and reconstruction of the US 101Moranda Road interchange, proposed as mitigation measures for the proposed project will require substantial funding that cannot be provided at the initial stages of this development nor completely by the proposed development alone. Therefore, triggers were determined for the two major roadway improvement projects.

Gabilan Extension Development Level Trigger

Analysis was conducted at intersections and roadway segments along San Vicente Road to determine at what development level the extension of Gabilan Drive needed to be implemented to support project traffic. The traffic analysis indicated that the most critical point of constraint is the intersection of San Vicente Road and Front Street. The capacity of the eastbound left-turn movement, Front Street to San Vicente, during the PM peak hour is the critical movement at the intersection. Under background conditions, the intersection was shown to meet traffic signal warrants. Analysis indicates that with the installation of a signal at the intersection, acceptable levels of service, LOS D, will be maintained at the

intersection with up to 50% of the project development traffic added to the roadway system. It should be noted, that though intersection levels of service may be acceptable, the number of left-turning vehicles under background conditions (545 during the PM peak hour) indicates the need for a second left-turn lane and subsequent widening of San Vicente Road to receive the two left-turn lanes. With 50% of the project development traffic added to the roadway system, an additional 350 trips would be added to the left-turn movement during the PM peak hour.

Based on roadway segment analysis conducted along San Vicente Road, LOS D operations along the roadway can be maintained with up to 75% of the project traffic added to the roadway system. However, as previously discussed, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and would create spill over onto adjacent streets, such as West Street, that provide an alternate access to San Vicente Road.

US 101 and Moranda Road Interchange Improvement Development Level Trigger

The existing freeway ramps at Moranda Road and US 101 are not designed to accommodate existing traffic volumes. The addition of project traffic, as well as background traffic, would compound the need for improvement of the ramps. The US 101 southbound off-ramp to Moranda Road will be the constraint on any further development. Analysis of ramp capacities indicate that LOS D operations can be maintained on the ramps with up to 25% of the project traffic added to the roadway system.

Intersection level of service analysis indicates that with signalization of the ramp termini intersections, up to 50% of the project development traffic can be accommodated; However, even with the signalization of the intersections, the ramps would be inadequate to serve this level of development.

Traffic Impact Fees

Funding for the above described mitigation measures, as well as others described in the previous section, will be obtained via traffic impact fees imposed upon the project by both the City of Soledad and The Transportation Agency for Monterey County (TAMC). Mitigation of the project impacts would be in the form of payment of traffic impact fees estimated for the project.

Local Intersection Impacts

The above significant impacts will be reduced to a less than significant level through the implementation of one or more of the following actions:

a. The applicant shall construct circulation improvements as specified by the city and outlined above;

b. The applicant shall pay traffic impact fees per the city traffic impact fee ordinance in effect at the time the applicant requests building permits;

c. For any improvement that will not be constructed by the applicant or mitigated through payment of impact fees per city impact fee ordinance, the applicant shall pay a fair share of the improvement

The City's forthcoming traffic impact fee (TIF) program mentioned in item b above is to be adopted August 15, 2008. The City TIF identifies fees per single-family unit and multi-family unit to be collected from proposed development and used towards identified improvements to the roadway system within and serving the City of Soledad. Mitigation of the project impacts would be in the form of payment of City of

Soledad's traffic impact fees estimated for the project. The City of Soledad Impact Fee schedule is included in Appendix E.

Regional Transportation Impacts

The identified freeway segment and interchange ramp improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway widening, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The payment of fees is considered mitigation for project impacts to freeway facilities. This contribution to the regional fund shall be in addition to any other city fees and project mitigation measures. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable.

Project Area Roadway System

Primary access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Each of the roadways will be extended into the project area with connections to a completely new roadway system of collectors and local roads that will serve each of the residential and commercial areas of the project.

Future Roadway Classification

Projected daily volumes and the city's criteria for roadway designation were used to determine the designation of each of the new major roadways. Projected volumes are based on the same trip generation estimates and assignment methodology described earlier in this chapter. Traffic associated with other pending non-residential projects was also included in the projected volumes.

Traffic projections indicate that only West Street, between the project boundary and J Street, will meet arterial criteria. San Vicente Road and Orchard Lane will meet collector road criteria throughout their extent. All other roadways will meet criteria for classification as local roadways. All new streets should be designed to meet city standards. As part of the planned golf course, there will be a need to provide golf cart crossings along project roadways. Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings should not be provided along streets classified as collectors or arterials.

Future Intersection Control

With implementation of the future roadways described above, several new intersections will be created. Peak hour signal warrant checks were completed for each of the new intersections. Results indicate that only the intersection of West Street and H Street will meet signal warrants. Projected peak hour volumes at all other intersections within the project area will not be large enough to require signalization.

Transit and Pedestrian Analysis

It can be assumed that some of the project trips could be made by transit. Assuming up to 3% transit mode share, which is probably the highest that could be expected, yields an estimate of 76 AM and 97 PM transit trips during each of the peak hours. This demand along with existing and other future demand

for transit service will justify the need for establishing a plan and implementation of a transit system to serve the City of Soledad as a whole.

Pedestrian facilities in the project area will consist primarily of sidewalks along the streets. Sidewalks will be provided along virtually all streets and at intersections within the project area. There are no existing bicycle facilities that can be extended into the project area. The residential uses of the project along with existing and future neighborhoods will justify the need for a continuos bicycle facility system throughout the City of Soledad. A draft City Bike Plan that identifies proposed future bicycle facilities is currently being processed and is expected to be adopted in late 2007. All pedestrian and bicycle lanes of the project should provide for future connection to existing sidewalks and streets as well as planned bicycle facilities.

Year 2030 Long-Term Analysis

Long-term traffic analysis of the proposed development levels for the project as well as long-term land use growth and transportation improvements within the entire City of Soledad indicate that the development levels will have an adverse impact on the major regional facilities serving Soledad. The proposed project as well as other development projects within the City of Soledad will be required to contribute to the regional development impact fee program as described under near-term project conditions.

Notes:
1. Intersection control based on existing conditions
   -TWSC = Two-way stop-controlled intersection
   -AWSC = Four-way stop-controlled intersection
2. Significant impacts are shown in **BOLD** and boxed.
3. *Italics* and **BOLD** indicates signal warrant met.

Notes:
1. Capacity of freeway lanes based on assumed capacity of 1,500 vphpl for all ramps, as prescribed by the Highway Capacity Manual
2. Year 2030 traffic volumes based on projections produced by Omni Means, March 27, 2007
3. Miravale Phase III project trips based on Year 2030 projections produced by Omni Means, Miravale III Future Traffic Volume, March 27, 2007

1. Introduction

This report presents the results of the traffic impact analysis conducted for the Miravale Phase III Mixed-Use development Specific Plan in Soledad, California. The project site is located in the northern outskirts of the city generally between San Vicente Road and Orchard Lane. The project as proposed will consist of 1,470 single-family homes, 2,230 multi-family units, 500 senior housing units, 120 hotel rooms, and up to 275,000 s.f. of supporting retail. A golf course, schools, and parks will also be part of the 920-acre site. The land uses of the project site are consistent with the City of Soledad General Plan that calls for major residential development in areas east and north of city limits. The project site incorporates the identified specific plan expansion areas of San Vicente West, Mirassou, and the Northwest area. A specific plan is required of all development within the identified expansion areas. The Specific Plan includes project zoning and development standards and design guidelines that implement the Specific Plan vision and land use provisions and the General Plan's goals, policies, and standards relating to Miravale Phase III. Access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Future access also will be provided by the extension of Miravale Road to Camphora/Gloria Road and the Orchard Lane extensions north and west of the project, eventually connecting via other planned routes to Camphora/Gloria Road when other development is completed. The project site and the surrounding study area are shown on Figure 1. The project site plan is shown on Figure 2.

Scope of Study

This study was conducted for the purpose of identifying the potential traffic impacts related to the proposed development. The impacts of the project were evaluated following the standards and methodologies set forth by the City of Soledad. The traffic analysis is based on peak-hour levels of service for unsignalized intersections. The traffic analysis also includes an evaluation of peak-hour signal warrants for unsignalized intersections and roadway and freeway level of service analysis. The study facilities are identified below:

Study Intersections

9 US 101 between North Greenfield and Walnut Avenue
10 US 101 between Walnut Avenue and Oak Avenue
11 US 101 between Oak Avenue and South Greenfield

In summary, the study includes an analysis of 21 unsignalized intersections, 11 roadway segments, and 11 freeway segments in the vicinity of the project site. Traffic conditions at the intersections were analyzed for the weekday AM and PM peak hours of traffic. The AM peak hour of traffic is generally between 7:00 and 9:00 AM, and the PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that

the most congested traffic conditions occur on an average day.

Traffic conditions were evaluated for the following scenarios:

Scenario 1: *Existing Conditions.* Existing conditions were represented by existing peak-hour traffic volumes on the existing roadway network. Existing traffic volumes were obtained from recent (July 2006) traffic counts.

Scenario 2: *Background Conditions.* Background conditions were represented by future background traffic volumes on the near-term roadway network. Background traffic volumes were estimated by adding to existing peak-hour volumes the projected volumes from approved but not yet completed developments. The latter component was developed based on a list of approved projects provided by the City of Soledad.

Scenario 3: *Project Conditions.* Project conditions were represented by future traffic volumes, with the project, on the near-term future roadway network. Future traffic volumes with the project (hereafter called *project traffic volumes*) were estimated by adding to background traffic volumes the additional traffic generated by the project. Project conditions were evaluated relative to background conditions with improvements in order to determine potential project impacts.

Scenario 4: *Cumulative Growth No Project Conditions.* Traffic volumes for cumulative conditions without the project were estimated by adding traffic associated with pending developments in the City of Soledad to background traffic volumes. The analysis of cumulative growth conditions was conducted at the request of the City of Soledad and is in conformance with the California Environmental Quality Act CEQA.

Scenario 5: *Cumulative Growth With Project Conditions.* Cumulative traffic volumes with the project were estimated by adding to cumulative no project traffic volumes the additional traffic generated by the project.

Scenario 6: *Year 2030 Conditions.* Year 2030 conditions were represented by forecasted Year 2030 traffic volumes. The traffic forecasts for Year 2030 were produced using the Association of Monterey Bay Area Governments (AMBAG) Regional Traffic Model. The 2030 model includes land use growth and transportation improvements associated with buildout of all General Plans within the AMBAG region and 30 year through-traffic growth on major regional facilities.

Methodology

This section presents the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from new traffic counts and field observations. The following data were collected from these sources:

- existing traffic volumes

- lane configurations
- roadway widths
- intersection control

Analysis Methodologies and Level of Service Standards

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The various analysis methods are described below.

Unsignalized Intersections

The study intersections are analyzed with the TRAFFIX level of service software, which uses the *Highway Capacity Manual* (HCM) 2000 methodology for unsignalized intersections. This method is applicable for both two-way stop-controlled (TWSC) and all-way stop-controlled (AWSC) intersections. Two-way stop-controlled intersections have stop signs on the minor street approaches and no control on the major street approaches. The TWSC intersection level of service are determined from average control delay for the most congested approach at the intersection. While AWSC intersection level of service are determined from average control delay time for all approaches at the intersection. The City of Soledad acceptable level of service standard is LOS D or better. The correlation between average control delay and level of service for both TWSC and AWSC unsignalized intersections is shown in Table 1.

Table 1
Unsignalized Intersection Level of Service Definition Based on Delay

Level of Service	Average Control Delay per Vehicle (sec.)
A	0 - 10
B	> 10 - 15
C	> 15 - 25
D	> 25 - 35
E	> 35 - 50
F	> 50

Source: Transportation Research Board, Highway Capacity Manual (Washington, D.C., 2000) pp. 17-2.

Signal Warrant

Unsignalized intersections are also assessed for the need of signalization. This assessment is made on the basis of the Peak-hour Volume Signal Warrant, Warrant #11, described in the Caltrans *Traffic Manual*. This method makes no evaluation of intersection level of service, but simply provides an indication whether peak-hour traffic volumes are, or would be, sufficient to justify installation of a traffic signal.

Signalized Intersections

Should it be found that study intersections meet signal warrants and/or require signalization based on level of service analysis, the intersections will be analyzed with standard signalized intersection methodology. The intersections will be analyzed using TRAFFIX, which is based on the *Highway Capacity Manual* (HCM) 2000 method for signalized intersections. TRAFFIX evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. The correlation between average control delay for signalized intersections and level of service is shown in Table 2.

Table 2
Signalized Intersection Level of Service Definitions Based on Delay

Level of Service	Description	Average Control Delay Per Vehicle (Sec.)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	Less than 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.1 to 80.0
F	Operation with delays unacceptable to most drivers occurring due to oversaturation, poor progression, or very long cycle lengths.	Greater than 80.0

Source: Transportation Research Board, Highway Capacity Manual (Washington, D.C., 2000), p. 16-2

Freeway Segment Analysis

Freeway segments that serve the Soledad area were also analyzed as part of the study. Similar to the selected study intersections, freeway segments were analyzed for the weekday AM and PM peak hours of traffic.

Freeway Segment Level of Service Methodology

Standard methodology for the analysis of freeway segments consists of the evaluation of the segments based on the density method. The density method requires measurement of vehicle travel speeds on the freeway segments. Unfortunately, the use of vehicle density does not lend itself well to the calculation of future levels of service for freeway segments. It is not possible to project the future travel speeds on the segments, due to changes in traffic conditions. Therefore, levels of service for freeway segments were calculated based on a volume-to-capacity ratio (V/C). The V/C method is simpler and does not use travel speed as a variable in its calculation. Freeway segment level of service based on V/C is shown in Table 3. Caltrans level of service standard for freeway segments is LOS C.

Table 3
Freeway Segment Levels of Service Based on Volume-to-Capacity Ratio

Level of Service	Description	V/C Ratio
A	Primarily free-flow operations. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	Less than 0.36
B	Reasonably free-flow conditions. The ability to maneuver within the traffic traffic stream is only slightly restricted.	0.36 - 0.54
C	Provides for stable operation, however flows approach the range in which small increases will cause a substantial deterioration in service. Freedom to maneuver withtin the traffic is noticeably restricted.	0.55 - 0.77
D	Borders on unstable flow. Small increases in flow cause substantial deterioration in service. Freedom to maneuver within the traffic stream is severely limited. Minor incidents can be expected to create substantial queuing, as the traffic stream has little space to absorb disruptions.	0.78 - 0.93
E	Operations are extremely unstable. Any incident can be expected to produce a serious breakdown with extensive queuing. Maneuverability within the traffic stream is extremely limited.	0.94 - 1.00
F	Forced or breakdown conditions. Such conditions generally exist within queues forming behind breakdown points.	Greater than 1.00

Source: 1985 Highway Capacity Manual for freeway sections with a 70 mph design speed.

Report Organization

The remainder of this report is divided into six chapters. Chapter 2 describes existing conditions in terms of the existing roadway network, transit service, and existing bicycle and pedestrian facilities. Chapter 3 presents the intersection operations under background conditions. Chapter 4 describes the method used to estimate project traffic and its impact on the transportation system and describes the recommended mitigation measures. Chapter 5 discusses the traffic conditions resulting from additional cumulative

growth. Chapter 6 presents the long-term Year 2030 analysis. Chapter 7 presents the conclusions of the traffic impact analysis.

2.
Existing Conditions

This chapter describes the existing conditions for all of the major transportation facilities in the vicinity of the site, including the roadway network, and bicycle and pedestrian facilities.

Existing Roadway Network

Regional access to the project site is provided solely via US 101. This facility is described below.

US 101 is a four-lane freeway within the City of Soledad. It extends north through Salinas and south through King City. Access to the site is provided via its interchanges with Moranda Road and Front Street within the City of Soledad.

Local access to the site is provided by Moranda Road, Front Street, San Vicente Road, West Street, Orchard Lane, and Gabilan Drive. These roadways are described below.

Moranda Road is a north/south roadway that runs from Front Street to US 101. Moranda Road serves as the access road to and from the US 101 northbound ramps in the northern part of the city. The roadway is one lane in each direction with a 35-mph speed limit.

Front Street is an arterial that runs parallel to and along the eastside of US 101 and the Union Pacific Railroad tracks, between Moranda Road and Oak Street. South of the Oak Street, Front Street crosses under the tracks and terminates at the US 101 northbound off ramp at Hector De La Rosa Sr. Street. The roadway varies in width between its north and south termination points at US 101. Between the US 101 northbound off-ramps in the southern part of Soledad and West Street, Front Street is two lanes wide. Between West Street and Moranda Road, the roadway widens to four lanes prior to narrowing once again to two lanes at its intersection with Moranda Road. The roadway has a 25-mph speed limit through downtown and increases to 35-mph north and south of downtown.

San Vicente Road is a north/south collector roadway that extends north from Front Street to the project boundary. The roadway is one lane in each direction with a 25-mph speed limit. The project includes the extension of San Vicente Road into the site providing direct access to the project area from northern Soledad.

West Street is a north/south collector roadway that runs from Front Street to the project boundary and will extend from the project boundary to Metz Road in the future, as part of the Miravale II development. The roadway is four lanes wide with speed limit ranging from 25 to 35 mph. The roadway is lined by residential uses. The project includes the extension of West Street into the site providing direct access to the project area from central Soledad.

Orchard Lane is a north/south roadway that runs from Gabilan Drive to the project boundary. As part of the Miravale Phase II development, Orchard lane will be extended from the project boundary to Metz Road. The roadway is one lane in each direction with a 25-mph speed limit. The roadway is lined by residential uses. The project includes the extension of Orchard Lane into the site providing direct access to the project area from southern Soledad.

Gabilan Drive is an east/west arterial roadway that extends from Orchard lane to San Vicente Road. The roadway is four lanes wide with a 25 mph speed limit between San Vicente Road and Prado Drive. Gabilan Drive narrows to one lane in each direction from Toledo Street to its terminus as a cul-de-sac just west of Bryant Canyon Road.

Existing Bicycle and Pedestrian Facilities

Bike lanes are provided along Front Street between East Street and Nestles Road and along Gabilan Drive from San Vicente Road to West Street and from Toledo Street to Orchard Lane; and along Orchard Lane from the projects south boundary to Gabilan Drive with future extension of Orchard Lane to Metz Road.

Pedestrian facilities in the study area consist primarily of sidewalks and crosswalks at intersections. Sidewalks are found along all previously described local roadways in the study area and along the local residential streets and collectors surrounding the study area.

Existing Intersection Lane Configurations

The existing lane configurations at the study intersections were obtained by observations in the field. The existing intersection lane configurations are shown on Figure 3.

Existing Traffic Volumes

Existing peak-hour traffic volumes were obtained from new manual intersection turn-movement counts conducted in July 2006. The existing peak-hour intersection volumes are shown on Figure 4. The traffic count data are included in Appendix A.

Existing Intersection Analysis

The results of the level of service analysis under existing conditions are summarized in Table 4. The results show that, measured against the City of Soledad level of service standards, all but one of the study intersections currently operate at an acceptable LOS D or better. The intersection of Oak Street and Front Street currently operates at an LOS F during both peak hours. The level of service calculation sheets are included in Appendix C.

			PM	N/A	***473***	***F***

Notes:

TWSC = Two-way stop-controlled intersection

AWSC = Four-way stop-controlled intersection

Existing Intersection Signal Warrant Analysis

Peak-hour signal warrant checks were completed for all study intersections to determine whether signalization would be justified on the basis peak-hour volumes. A summary of the signal warrant checks is shown in Table 5. The analysis showed that the Caltrans peak-hour volume warrant is met during at least one peak hour at the following four intersections under existing conditions:

2	Moranda Road and Front Street
3	San Vicente Road and Front Street
6	East Street and Front Street
21	Oak Street and Front Street

The signal warrant analysis sheets are included in Appendix D.

Existing Roadway Segment Analysis

Twenty-four hour roadway segment tube counts were conducted on all major roadways serving the selected study intersections. Figure 5 shows daily traffic volumes along the roadways counted. The collected counts provide peak hour as well as daily volumes along some of the major roadways within the City of Soledad. The collected segment volumes were used to evaluate roadway segment operations. Since there is no evaluation criteria for roadway segments, the roadway segment analysis is presented for informative purposes only. The roadway segment analysis indicates that all studied roadway segments currently operate at LOS A during both peak hours. Table 6 presents the roadway segment analysis.

Existing Freeway Segment Analysis

Traffic volumes for the studied freeway segments were obtained from 2005 data collected by the Traffic and Vehicle Data Systems Unit for Caltrans District 5. The collected data provides average annual daily and peak hour volumes along each freeway segment for both directions of travel. Peak hour splits for each segment were developed using directional peak-hour volume data collected by Caltrans. The directional peak hour volume provides a percentage of total peak hour traffic by direction. The freeway segment analysis indicates that all freeway segments analyzed currently operate at LOS C or better. Freeway segment analysis is presented in Table 7.

Existing Freeway Ramp Analysis

Traffic volumes for the studied freeway ramps were obtained from the traffic counts collected at each of the interchange intersections. The collected counts were compared to historical Caltrans ramp counts and found to be greater than Caltrans counts. The freeway ramp analysis indicates that all freeway ramps analyzed currently operate at LOS B or better. Freeway ramp analysis is presented in Table 8.

Though levels of service analysis does not indicate deficient operations on the ramps based on the ramps' capacities, there are existing operational deficiencies due to inadequate ramp configurations to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes.

Table 5

Signal Warrant Results Summary

Study Number	Intersection Name	Existing Conditions AM	Existing Conditions PM

3.
Background Conditions

This chapter describes background traffic conditions. Background conditions are defined as conditions just prior to completion of the proposed development. Traffic volumes for background conditions comprise volumes from existing traffic counts plus traffic generated by other approved developments in the vicinity of the site. This chapter describes the procedure used to determine background traffic volumes and the resulting traffic conditions.

Background Transportation Network

It is assumed in this analysis that the transportation network under background conditions would be the same as the existing transportation network.

Background Traffic Volumes

Background peak-hour traffic volumes were estimated by adding to existing volumes the estimated traffic from approved, but not yet constructed, developments. City staff provided a list of five approved developments within the City of Soledad.

- *Miravale II* – 453 single-family homes and 323 Townhomes/Apartments, the site will be bound by Bryant Canyon Road , Orchard Lane, Santa Clara Street and Metz Road.

- *Gabilan Square* – 9,960 s.f. of commercial space and 183 Townhomes/Apartments, located south of Gabilan Drive at Orchard Lane.

- *Orchard Villas* – 172 single-family homes, located along the west side of Orchard Lane north of Metz Road.

- *Monterey Street Public Housing Facility* – 52 multi-family units, located along the north side of Monterey Street between First and Second Streets.

- *Benito Street Public Housing* – 143 units, located between West and Benito Streets, and Gabilan and North Street.

The added traffic associated with the approved projects was developed based on trip generation estimates and assignments produced by Hexagon. The magnitude of traffic added to the roadway system by each of the approved developments is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled *Trip Generation*, seventh edition, 2003, were used for this analysis. On the basis of these rates, it is estimated that the approved projects would generate a combined total of 10,774 daily trips, with 810 trips occurring during the AM peak hour and 1,051 occurring during the PM peak hour. The type of land use, size, and trip estimates of each approved development is presented in Table 9. Background traffic volumes are shown on Figure 6.

Background Intersection Levels of Service

The results of the intersection level of service analysis under background conditions are summarized in Table 10. The results show that, measured against the City of Soledad level of service standards, five of the study intersections are projected to operate at an unacceptable LOS E or worse during at least one peak hour under background conditions.

2 Moranda Road and Front Street
3 San Vicente Road and Front Street
6 East Street and Front Street
7 Front Street and Nestles Road
21 Oak Street and Front Street

The level of service calculation sheets are included in Appendix C.

Background Intersection Signal Warrant Analysis

Peak-hour signal warrant checks were completed for all study intersections to determine whether signalization would be justified on the basis of background peak-hour volumes. A summary of the signal warrant checks is shown in Table 11. The analysis showed that the Caltrans peak-hour volume warrant is projected to be met during at least one peak hour at the following seven intersections under background conditions:

2 Moranda Road and Front Street
3 San Vicente Road and Front Street
6 East Street and Front Street
7 Front Street and Nestles Road
8 Front Street and US 101 NB Ramps
15 East Street and North Street/Metz Road
21 Oak Street and Front Street

The signal warrant analysis sheets are included in Appendix D.

Notes:

1. Signal warrant analysis based on Caltrans Peak Hour Signal Warrant #11.

Background Conditions Necessary Improvements

Based on the results of the background conditions level of service analysis and signal warrant checks, necessary improvements to support approved project traffic volumes were determined for the study intersections projected to operate at LOS D or worse and/or meet signal warrants. The resulting background with improvement conditions will serve as a basis from which to determine impacts attributable to the Miravale Phase III development. Without the improvements in place, level of service conditions with the Miravale Phase III development will not accurately reflect impacts due to project traffic, but rather show problem areas under background conditions compounded by the Miravale Phase III project. Described below and presented in Figure 7 are the necessary improvements to improve background conditions levels of service to acceptable levels.

(2) Moranda Road and Front Street

Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second eastbound right-turn lane. Intersection operation levels would improve to LOS C with implementation of these improvements.

(3) San Vicente Road and Front Street

Necessary Improvements: The intersection is projected to operate at LOS E during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street. Intersection operation levels would improve to LOS B with implementation of these improvements.

(6) East Street and Front Street

Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing on Front Street and the addition of a second southbound left-turn lane and exclusive westbound right-turn lane. Intersection operation levels would improve to LOS C with implementation of these improvements.

(7) Front Street and Nestles Road

Necessary Improvements: The intersection is projected to operate at LOS F during the PM peak hour and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection. Intersection operation levels would improve to LOS B with the installation of a signal.

(8) Front Street and US 101 NB Ramps

Necessary Improvements: The intersection is projected to meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection.

(15) East Street and North Street/Metz Road

Necessary Improvements: The intersection is projected to meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection with

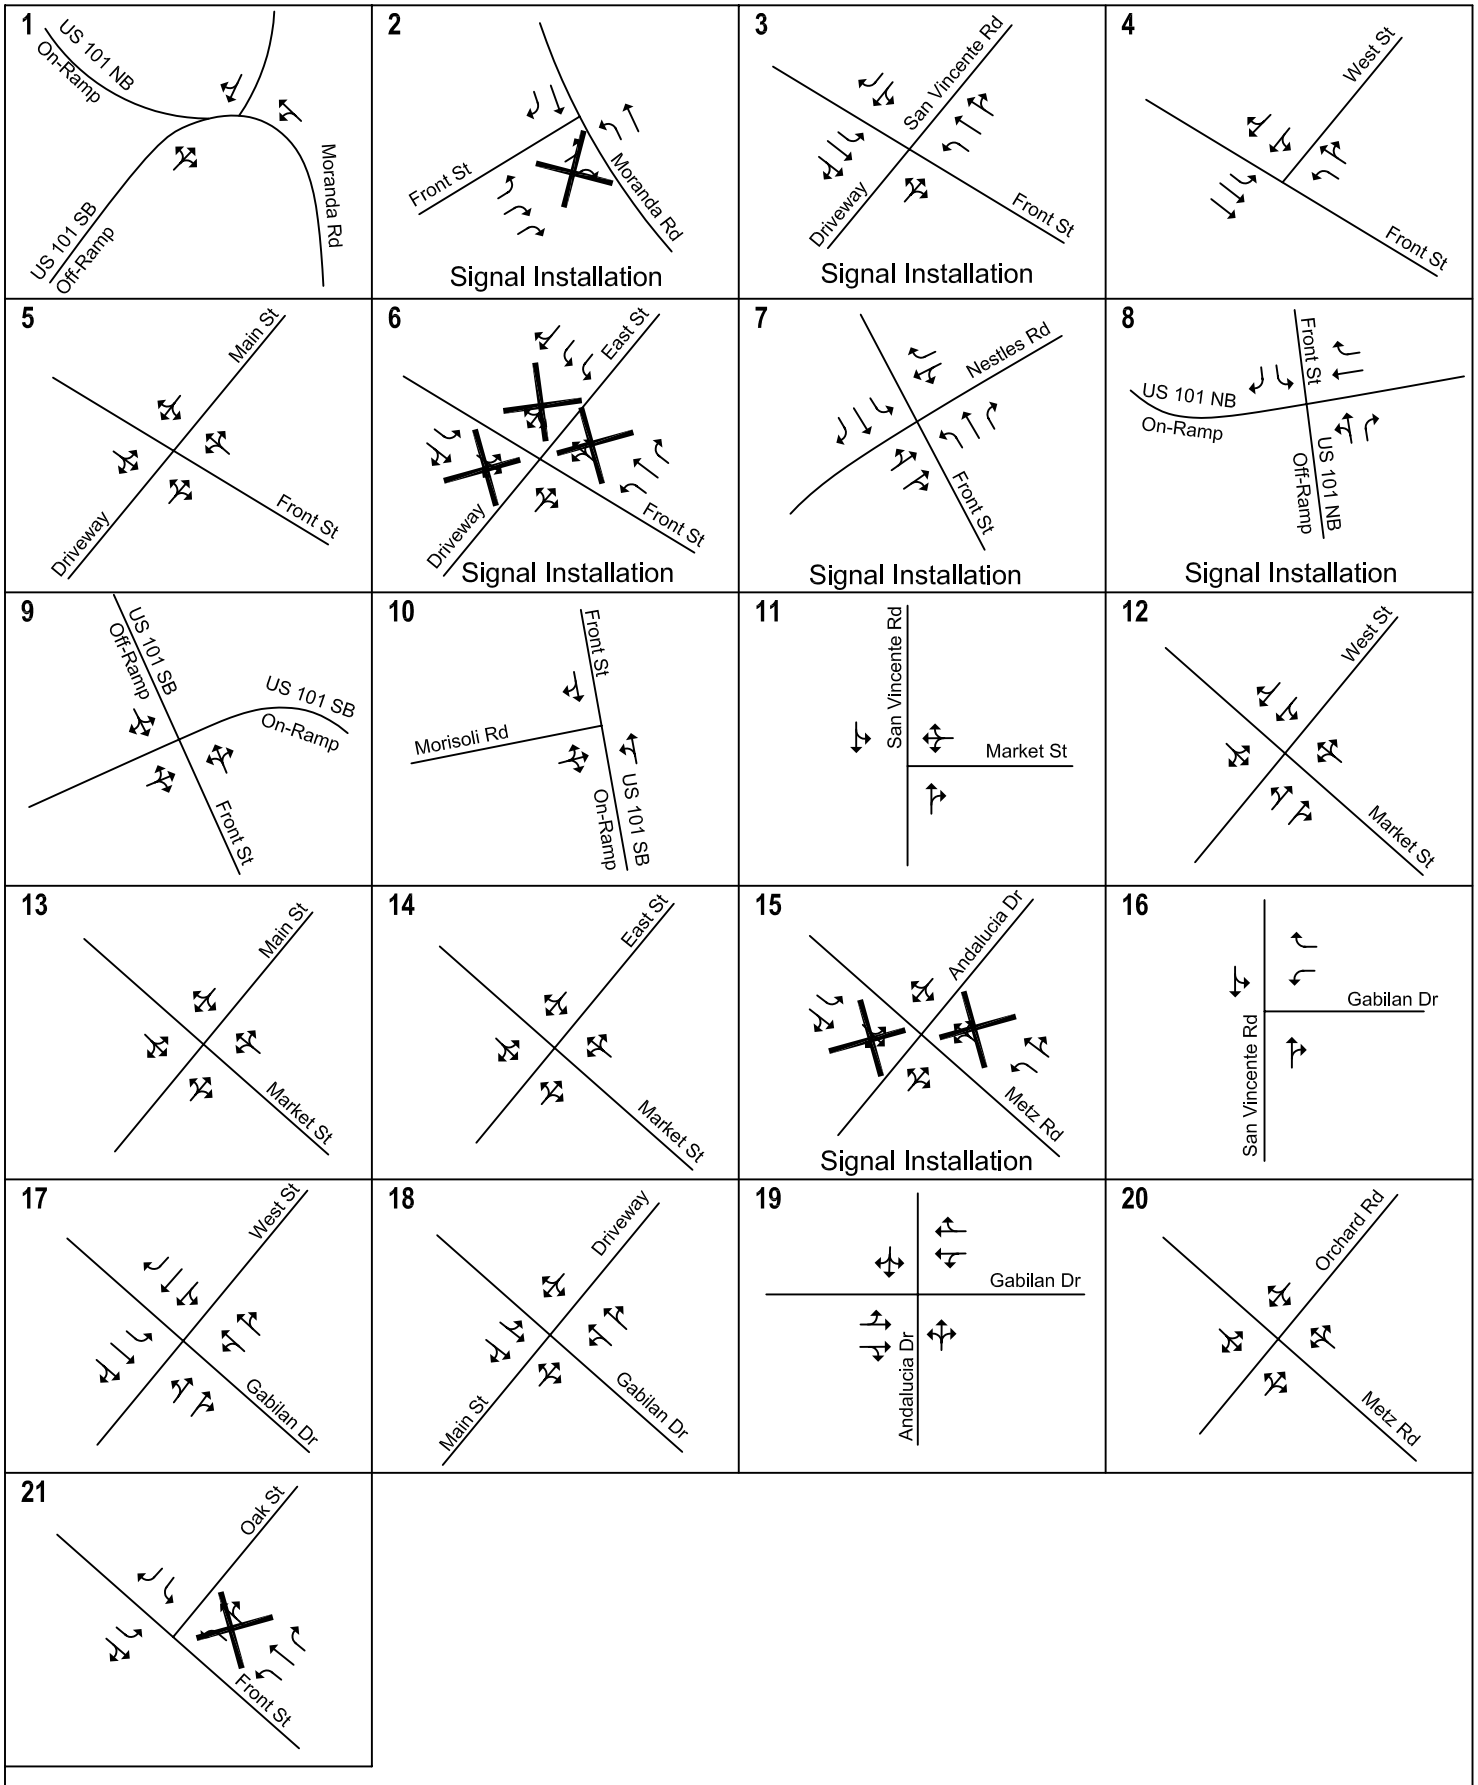

Figure 7

BACKGROUND CONDITIONS NECESSARY IMPROVEMENTS

Soledad Miravale

Hexagon Transportation Consultants, Inc.

JH D:\Projects\Mirevale Soledad\Fig 3.dwg

protected left-turn phasing on Metz Road and separate right-turn lanes on East Street.

(21) Oak Street and Front Street

Necessary Improvements: The intersection is projected to operate at LOS F during the both peak hours and meet signal warrants under background conditions. The necessary improvements consist of the signalization of the intersection and the addition of a separate westbound right-turn lane. Intersection operation levels would improve to LOS B during both peak hours with implementation of these improvements.

Background Roadway Segment Analysis

Traffic volumes for background conditions on each of the studied roadway segments were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the roadway system in the same manner as with intersections. The roadway segment analysis indicates that all studied roadway segments are projected to operate at LOS B or better during both peak hours under background conditions. Table 12 presents the roadway segment analysis.

Background Freeway Segment Analysis

Traffic volumes for background conditions on each of the studied freeway segments were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the freeway system in the same manner as with intersections. The freeway segment analysis indicates that all freeway segments analyzed are projected to operate at LOS C or better under background conditions. Freeway segment analysis is presented in Table 13.

Background Freeway Ramp Analysis

Traffic volumes for background conditions on each of the studied freeway ramps were developed by adding to existing volumes the trips associated with each of the approved developments. The approved project trips were assigned to the freeway ramps in the same manner as with intersections. The freeway ramp analysis indicates that all freeway ramps analyzed are projected to operate at LOS C or better under background conditions. Freeway ramp analysis is presented in Table 14.

As stated under existing conditions, the existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes. The traffic associated with the approved projects will worsen conditions on each of the ramps.

4.
Project Impacts and Mitigation Measures

This chapter describes project traffic conditions, significant project impacts, and measures that are recommended to mitigate project impacts. Included are descriptions of the significance criteria that define an impact, estimates of project-generated traffic, identification of the impacts, and descriptions of the mitigation measures. Project conditions are represented by background traffic conditions with the addition of traffic generated by the project.

Significant Impact Criteria

Significance criteria are used to establish what constitutes an impact. The impact criteria are based on the City of Soledad level of service standards. The project is said to create a significant adverse impact on traffic conditions at an intersection if for either peak hour:

- The level of service at the intersection degrades from an acceptable LOS D or better under background conditions to an unacceptable LOS E or worse under project conditions.

A significant intersection impact is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to LOS D conditions or better.

Future Roadway Network Under Project Conditions

It is assumed in this analysis that the roadway network and intersection configurations under project conditions would be the same as described under background with improvements conditions.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described further in the following sections.

Trip Generation

Through empirical research, data have been collected that correlate to common land uses their propensity for producing traffic. Thus, for the most common land uses there are standard trip generation rates that can be applied to help predict the future traffic increases that would result from a new development.

The magnitude of traffic added to the roadway system by a particular development is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled *Trip Generation*, seventh edition, 2003, were used for this analysis. On the basis of these rates, it is estimated that the project would generate 34,856 daily trips, with 2,451 trips occurring during the AM peak hour and 3,143 occurring during the PM peak hour. Using the specified inbound/outbound splits, the project would produce 619 inbound trips and 1,833 outbound trips during the AM peak hour and 1,969 inbound and 1,174 outbound trips during the PM peak hour.

The trip generation estimates do not include estimates for the proposed schools, parks, and golf course. Trip estimates for the proposed residential uses of the project account for trips made to schools and other types of complimentary land uses. Therefore, it is assumed that trips to the schools, parks, and golf course would originate from within the project area and the proposed residential units.

Similarly, the trip estimates for residential land uses of the project were reduced to account for internalization, or interaction, between the retail and residential land uses. The project is proposing up to o275,000 s.f. of retail space. A portion of the retail space will be located centrally within the project area and proposed residential units. The remaining retail space will be located in the southeastern portion of the project site. The retail land uses are intended to be neighborhood serving retail, not major retail establishments. As such, it is assumed that the majority of trips generated by the retail space will originate from within the project area. The residential uses of the project were reduced by a magnitude equal to 90% of the estimated trips for the centrally located retail space and 50% of the retail space located in the southeastern portion of the site. The difference in reduction percentages for the retail is due to the expectation that the southeastern retail space will attract some trips from outside the project area since it is located near existing neighborhoods and other land uses. While nearly all trips to the centrally located retail would originate from surrounding neighborhoods within the project area. The project trip generation estimates are presented in Table 15.

Trip Distribution

The trip distribution pattern for the proposed project was estimated based on existing travel patterns in the area and the locations of complementary land uses. Two separate trip distributions were used for the residential and non-residential land uses of the site. Generally, the non-residential trip distribution contains trips produced by the project within city limits. On the other hand, it is expected that the majority of residential trips will leave city limits for employment zones north and south of Soledad. The trip

Notes:
/a/ Single-Family Detached Housing (210) average rates used for proposed single-family units
/b/ Apartment (220) average rates used for proposed multi-family units
/c/ Senior Adult Housing-Attached (252) average rates used for proposed senior housing units
/d/ Hotel (310) average rates used for proposed hotel units
/e/ Specialty Retail Center (814) average rates used for proposed retail space. No AM peak hour rates are available for Specialty Retail, therefore half of the PM peak hour rates were assumed for the AM peak hour.
/f/ A reduction of of residential trips equal to 90% of Retail "A" and 50% of Retail "B" was applied for internalization of retail/residential uses.
/e/ A reduction of 25% to account for pass-by trips was applied to retail use during the PM peak hour

distribution patterns for each land use type are shown graphically on Figure 8.

Trip Assignment

The peak-hour trips generated by the proposed development were assigned to the roadway system in accordance with the trip distribution pattern discussed above. Figure 9 shows the project trip assignment.

Project Traffic Volumes

Project trips, as represented in the above project trip assignment, were added to background traffic volumes to obtain background plus project traffic volumes. Background traffic volumes plus project trips are typically referred to simply as *project traffic volumes*; this is contrasted with the term *project trips,* which is used to signify the traffic that is produced specifically by the project. The project traffic volumes are shown graphically on Figure 10. Traffic volumes for all components of traffic are tabulated in Appendix B.

Project Intersection Level of Service Analysis

The results of the intersection level of service analysis under project conditions are summarized in Table 16. The results show that 11 of the study intersections would operate at an unacceptable LOS E or worse during at least one of the peak hours analyzed under project conditions:

1 Moranda Road and US 101 Northbound Ramps
2 Moranda Road and Front Street
3 San Vicente Road and Front Street
4 West Street and Front Street
9 Front Street and US 101 Southbound Ramps
11 San Vicente Road and Market Street
14 East Street and Market Street
16 San Vicente Road and Gabilan Drive
17 West Street and Gabilan Drive
20 Orchard Lane and Metz Road
21 Oak Street and Front Street

Each of these intersections would be impacted by the project, according to City of Soledad standards. The remaining 10 intersections would continue to operate at acceptable levels of service. The level of service calculation sheets are included in Appendix C.

Project Intersection Signal Warrant Analysis

The peak-hour signal warrant were checked for the existing unsignalized intersections to determine whether signalization would be justified on the basis peak-hour volumes. A summary of the signal warrant checks is shown in Table 17. The analysis showed that the Caltrans peak-hour volume warrant would be satisfied at nine intersections under project conditions. The signal warrant analysis sheets are included in Appendix D.

Project Roadway Segment Analysis

Traffic volumes for project conditions on each of the studied roadway segments were developed by adding to background condition volumes the project trips. The project trips were assigned to the roadway system in the same manner as with intersections. The roadway segment analysis indicates that the addition of project traffic will cause five studied roadway segments to operate at LOS E or worse during at least one peak hour under project conditions.

Front Street, between Moranda Road and San Vicente Road (Eastbound PM)
Front Street, between East Street and Nestles Road (Eastbound AM/Westbound PM)
San Vicente Road, between Market Street and Gabilan Drive (Southbound AM/Northbound PM)

Table 18 presents the roadway segment analysis. The degradation of roadway segment levels of service indicate the need for roadway widening. Since there is no evaluation criteria for roadway segments, the roadway segment analysis is presented for informative purposes only. All other studied roadway segments will operate at LOS C or better conditions.

Project Freeway Segment Analysis

The results of the freeway segment analysis showed that four freeway segments are projected to operate at LOS D under project conditions.

US 101 – Northbound North of Gonzales-5th Street (AM Peak Hour)
US 101 – Northbound between Gonzales-5th Street to Gloria Road (AM Peak Hour)
US 101 – Northbound between Camphora Road and North Soledad (AM Peak Hour)
US 101 – Southbound between North Soledad and Camphora Road (PM Peak Hour)

The remaining segments are projected to operate at LOS C or better. The addition of project traffic will worsen conditions on each of the segments projected to operate at LOS D. Freeway segment analysis is presented in Table 19.

Project Freeway Ramp Analysis

Traffic volumes for project conditions on each of the studied freeway ramps were developed by adding to background condition volumes the project trips. The project trips were assigned to the freeway ramps in the same manner as with intersections. Freeway ramp analysis is presented in Table 20. The freeway ramp analysis indicates that two of the studied freeway ramps are projected to operate at LOS F under project conditions.

Notes:
1. Capacity for all ramps based on assumed capacity of 1,500 vphpl, as prescribed by the Highway Capacity Manual

Moranda Road Interchange – Southbound US 101 off-ramp to Moranda Road (PM Peak Hour)
Moranda Road Interchange – Northbound US 101 on-ramp from Moranda Road (AM Peak Hour)

As stated under existing conditions, the existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes. The project traffic will worsen conditions on each of the ramps.

Intersection Impacts and Mitigation Measures

Described below are the intersection impacts and recommended mitigation measures. Table 21 shows the resulting levels of service for project conditions with the recommended mitigation measures. Figure 11 indicates resulting lane configurations at each of the mitigated intersections.

Several of the identified impacts involve significant physical improvements to not only intersection configurations, but also roadway widening. In some cases, the improvements identified below will be undesirable due to the need for right-of-way acquisition and/or create inconsistency with the City's General Plan. The evaluation of necessary mitigation measures revealed that several of the project impacts could be mitigated with the construction of an extension of Gabilan Drive that will provide an alternate route to US 101. The City's General Plan calls for the extension of Gabilan Drive to US 101 as a four-lane divided arterial. The Gabilan Drive extension will provide for a more direct route to the project area and alleviate identified impacts at several intersections. Figure 12 shows the change in travel patterns of the project that would result with the extension of Gabilan Drive. The figure shows that project traffic would be significantly reduced through several of the intersections identified to be impacted. Therefore, it is recommended that rather than the project implementing undesirable roadway widening, that it instead contribute its fair-share towards the construction costs of the extension of Gabilan Drive to US 101 and widening of San Vicente Road from the project south to the Gabilan Drive extension.

(1) Moranda Road and US 101 NB Ramps

Impact: The intersection level of service would be an acceptable LOS D or better during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F during both peak hours under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The necessary improvement to mitigate the project impact at this intersection will consist of the signalization of the intersection and the addition of a second northbound left-turn lane, Moranda Road to northbound US 101. The implementation of these improvements will require that the northbound US 101 on-ramp be widened to receive the two lanes. Intersection level of service would improve to LOS B during both peak hours with the improvements.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101. The volume of vehicles bound for northbound US 101 indicate the need for the reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(2) Moranda Road and Front Street

Impact: The intersection level of service would be an acceptable LOS C or better during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F during both peak hours under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The additional improvement necessary, beyond those identified under background conditions, to mitigate the project impact at this intersection will consist of the addition of a second northbound through lane and eastbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes. The roadway segment analysis also indicates the need for widening of Front Street between Moranda Road and San Vicente Road. Intersection level of service will improve to LOS A during both peak hours with the improvements.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(3) San Vicente Road and Front Street

Impact: The intersection level of service would be an acceptable LOS B during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F during both peak hours under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The additional improvement necessary, beyond those identified under background conditions, to mitigate the project impact at this intersection will consist of the addition of two eastbound left-turn lanes and southbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes and northbound San Vicente Road be widened to three lanes. Intersection level of service will improve to LOS B during both peak hours with the improvements. The improvements described above will require a significant amount of right-of-way acquisition and will not blend well with surrounding land uses.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(4) West Street and Front Street

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Front Street.

(5) Main Street and Front Street

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection with

protected left-turn phasing along Front Street.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(7) Front Street and Nestles Road

Impact: Impact at Oak Street and Front Street creates need for improvements at this intersection.

Mitigation Measure. The necessary improvements consist of the addition of a second eastbound left-turn lane in combination with improvements proposed to mitigate project impacts at the intersection of Oak Street and Front Street.

(9) Front Street and US 101 SB Ramps

Impact: The intersection level of service would be an acceptable LOS C or better during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F during the PM peak hour under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second lane on the off-ramp. The improvement will require the widening of southbound Front Street to two lanes. Intersection level of service would improve to LOS A during the PM peak hour with the improvements. The volume of vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(11) San Vicente Road and Market Street

Impact: The intersection level of service would be an acceptable LOS C or better during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS E and F during the AM and PM peak hours, respectively, under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and widening of San Vicente Road to accommodate two lanes in each direction. Intersection level of service will improve to LOS A during both peak hours with the improvements.

With the construction of the Gabilan Drive extension to US 101, the signalization of the intersection and widening of San Vicente Road would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(12) West Street and Market Street

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(14) East Street and Market Street

Impact: The intersection level of service would be an acceptable LOS C or better during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F during the PM peak hour under project conditions. This constitutes a significant impact by City of Soledad standards. The intersection would also meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection. Intersection level of service will improve to LOS A during both peak hours with the improvements.

(16) San Vicente Road and Gabilan Drive

Impact: The intersection level of service would be an acceptable LOS B during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F during both peak hours under project conditions. This constitutes a significant impact by City of Soledad standards. The intersection would also meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second westbound left-turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. The improvement will require the widening of southbound San Vicente Road to accommodate the dual left-turn lanes from Gabilan. Intersection level of service will improve to LOS B during both peak hours with the improvements.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(17) West Street and Gabilan Drive

Impact: The intersection level of service would be an acceptable LOS B during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS F during the PM peak hour under project conditions. This constitutes a significant impact by City of Soledad standards. The intersection would also meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of exclusive left-turn lanes with protected phasing on all approaches. The improvements will fit within right-of-way. Intersection level of service will improve to LOS D during the PM peak hour with the improvements.

(18) Main Street and Gabilan Drive

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(19) Andalucia Drive and Gabilan Drive

Impact: The intersection would meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

(20) Orchard Lane and Metz Road

Impact: The intersection level of service would be an acceptable LOS C during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS E during the AM peak hour under project conditions. This constitutes a significant impact by City of Soledad standards. The intersection would also meet signal warrants with the addition of project traffic.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane. Intersection level of service will improve to LOS B and C during the AM and PM peak hours, respectively, with the improvements.

(21) Oak Street and Front Street

Impact: The intersection level of service would be an acceptable LOS B during both peak hours under Background with Improvements conditions and the intersection would degrade to LOS E during the PM peak hour under project conditions. This constitutes a significant impact by City of Soledad standards.

Mitigation Measure. The necessary improvements to mitigate project impacts at this intersection consist of the widening of Front Street to four lanes between Nestles Road and Oak Street. A second eastbound left-turn lane will also be needed at the intersection of Nestles Road and Front Street as part of the improvements at this intersection. Intersection levels of service will improve to LOS B during both peak hours with the improvements.

Traffic Mitigation Triggers and Impact Fees

Discussed below are project development level trigger points for impacts and mitigation measures for the two major roadway improvements identified in the previous section, as well as the local and regional impact fees.

Traffic Mitigation Triggers

The large size of the proposed project will require that construction of the project be phased over the next ten years. As such, it is necessary to phase mitigation costs/fees along with the development of the project in order to ensure the financial feasibility of the initial development activities. The two major roadway improvements, Gabilan Extension and reconstruction of the US 101Moranda Road interchange, proposed as mitigation measures for the proposed project will require substantial funding that cannot be provided at the initial stages of this development nor completely by the proposed development alone. Therefore, triggers were determined for the two major roadway improvement projects.

Gabilan Extension Development Level Trigger

Analysis was conducted at intersections and roadway segments along San Vicente Road to determine at what development level the extension of Gabilan Drive needed to be implemented to support project traffic. The traffic analysis indicated that the most critical point of constraint is the intersection of San Vicente Road and Front Street. The capacity of the eastbound left-turn movement, Front Street to San Vicente, during the PM peak hour is the critical movement at the intersection. Under background conditions, the intersection was shown to meet traffic signal warrants. Analysis indicates that with the installation of a signal at the intersection, acceptable levels of service, LOS D, will be maintained at the intersection with up to 50% of the project development traffic added to the roadway system. It should be noted, that though intersection levels of service may be acceptable, the number of left-turning vehicles under background conditions (545 during the PM peak hour) indicates the need for a second left-turn lane and subsequent widening of San Vicente Road to receive the two left-turn lanes. With 50% of the project development traffic added to the roadway system, an additional 350 trips would be added to the left-turn movement during the PM peak hour.

Based on roadway segment analysis conducted along San Vicente Road, LOS D operations along the roadway can be maintained with up to 75% of the project traffic added to the roadway system. However, as previously discussed, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and would create spill over onto adjacent streets, such as West Street, that provide an alternate access to San Vicente Road.

US 101 and Moranda Road Interchange Improvement Development Level Trigger

As described previously, the existing freeway ramps at Moranda Road and US 101 are not designed to accommodate existing traffic volumes. The addition of project traffic, as well as background traffic, would compound the need for improvement of the ramps. The US 101 southbound off-ramp to Moranda Road will be the constraint on any further development. Analysis of ramp capacities indicate that LOS D operations can be maintained on the ramps with up to 25% of the project traffic added to the roadway system.

Intersection level of service analysis indicates that with signalization of the ramp termini intersections, up to 50% of the project development traffic can be accommodated; However, even with the signalization of

the intersections, the ramps would be inadequate to serve this level of development.

Traffic Impact Fees

Funding for the above described mitigation measures, as well as others described in the previous section, will be obtained via traffic impact fees imposed upon the project by both the City of Soledad and The Transportation Agency for Monterey County (TAMC). Mitigation of the project impacts would be in the form of payment of traffic impact fees estimated for the project.

Local Intersection Impacts

The above significant impacts will be reduced to a less than significant level through the implementation of one or more of the following actions:

a. The applicant shall construct circulation improvements as specified by the city and outlined above;

b. The applicant shall pay traffic impact fees per the city traffic impact fee ordinance in effect at the time the applicant requests building permits;

c. For any improvement that will not be constructed by the applicant or mitigated through payment of impact fees per city impact fee ordinance, the applicant shall pay a fair share of the improvement

The City's forthcoming traffic impact fee (TIF) program mentioned in item b above is to be adopted August 15, 2008. The City TIF identifies a fee per single-family unit and multi-family unit to be collected from proposed development and used towards identified improvements to the roadway system within and serving the City of Soledad. Mitigation of the project impacts would be in the form of payment of City of Soledad's traffic impact fees estimated for the project. The City of Soledad Impact Fee schedule is included in Appendix E.

Regional Transportation Impacts

The identified freeway segment and interchange ramp improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway widening, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The payment of fees is considered mitigation for project impacts to freeway facilities. This contribution to the regional fund shall be in addition to any other city fees and project mitigation measures. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable.

Project Area Roadway System

Primary access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Each of the roadways will be extended into the project area with connections to a completely new roadway system of collectors and local roads that will serve each of the residential and commercial areas of the project.

Future Roadway Classification

Projected daily volumes and the city's criteria for roadway designation were used to determine the designation of each of the new major roadways. Table 22 presents projected daily volumes along the major roadways of the planned roadway system within the project area. Projected volumes are based on the same trip generation estimates and assignment methodology described earlier in this chapter. Traffic associated with other pending non-residential projects was also included in the projected volumes. Pending projects are described in the following chapter.

Traffic projections indicate that only West Street, between the project boundary and H Street, will meet arterial criteria. San Vicente Road and Orchard Lane will meet collector road criteria throughout their extent. All other roadways will meet criteria for classification as local roadways. All new streets should be designed to meet city standards. As part of the planned golf course, there will be a need to provide golf cart crossings along project roadways. Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings should not be provided along streets classified as collectors or arterials. Figure 13 shows roadway designations for each of the major roadways described above.

Future Intersection Control

With implementation of the future roadways described above, several new intersections will be created. Peak hour signal warrant checks were completed for each of the new intersections. Results indicate that only the intersection of West Street and H Street will meet signal warrants. Projected peak hour volumes at all other intersections within the project area will not be large enough to require signalization. Traffic volumes and signal warrant analysis sheets for each of the new intersections are included in Appendix F.

Transit and Pedestrian Analysis

It can be assumed that some of the project trips could be made by transit. Assuming up to 3% transit mode share, which is probably the highest that could be expected, yields an estimate of 76 AM and 97 PM transit trips during each of the peak hours. This demand along with existing and other future demand for transit service will justify the need for establishing a plan and implementation of a transit system to serve the City of Soledad as a whole.

Pedestrian facilities in the project area will consist primarily of sidewalks along the streets. Sidewalks will be provided along virtually all streets and at intersections within the project area. There are no existing bicycle facilities that can be extended into the project area. The residential uses of the project along with existing and future neighborhoods will justify the need for a continuos bicycle facility system throughout the City of Soledad. A draft City Bike Plan that identifies proposed future bicycle facilities is currently being processed and is expected to be adopted in late 2007. All pedestrian and bicycle lanes of the project should provide for future connection to existing sidewalks and streets as well as planned bicycle facilities.

Cumulative Growth Conditions

This chapter presents a summary of the traffic conditions that would occur under cumulative conditions with and without the proposed project. It includes descriptions of nearby pending developments and the procedure used to estimate traffic volumes associated with them. This chapter also presents the results of the intersection level of service calculations. The analysis of cumulative growth conditions was conducted at the request of the City of Soledad and is in conformance with the California Environmental Quality Act CEQA.

Future Roadway Network Under Cumulative Conditions

It is assumed in this analysis that the roadway network and intersection configurations under cumulative no project conditions would be the same as described under background conditions with improvements with the exception of the following two intersections:

Moranda Road and Front Street - The improvement consists of the addition of an east leg to the intersection to serve the Soledad Plaza project site.

San Vicente Road and Gabilan Drive - The necessary improvement consists of the addition of a west leg to the intersection to serve the Soledad Plaza project site.

The project mitigation measures described in the previous chapter are included under the cumulative with project conditions analysis. The cumulative with project analysis includes evaluation of intersection levels of service with and without the extension of Gabilan Drive to US 101 as described in the previous chapter.

Cumulative Traffic Volumes

Cumulative traffic volumes include trips associated with three pending developments located within the City of Soledad. City staff provided the list of cumulative developments. The projects are described below.

- *The Village at Soledad* – 139,730 s.f. shopping center, an 84-room hotel, and 1,329 seat cinema located along the eastside of Nestles Road south of Los Coches Drive.

- *Soledad Plaza* – 415,000 s.f. shopping center, located along the westside of San Vicente Road between Moranda Road and Gabilan Road.

- *263Front Street* – 12,200 s.f. retail center and 152 apartments/condominiums, located along the northside of Front Street between West Street and Benito Street.

Traffic volumes for cumulative conditions were estimated by adding traffic associated with pending developments to background traffic volumes for the cumulative without project scenario and the proposed project for the cumulative with project scenario. The added traffic associated with the pending projects was developed based on trip generation estimates and assignments produced by Hexagon. The magnitude of traffic added to the roadway system by each of the pending developments is estimated by multiplying the applicable trip generation rates to the size of the development. The trip generation rates published in the Institute of Transportation Engineers (ITE) manual entitled *Trip Generation*, seventh edition, 2003, were used for this analysis. On the basis of these rates, it is estimated that the pending projects would generate a combined total of 25,938 daily trips, with 702 trips occurring during the AM peak hour and 2,348 occurring during the PM peak hour. The type of land use, size, and trip estimates of each development is presented in Table 23. Cumulative Growth traffic volumes with the project are shown on Figure 14.

Cumulative Conditions Intersection Levels of Service

The results of the intersection level of service analysis under cumulative conditions are summarized in Table 24. The results show that all of the study intersections would operate at an acceptable LOS D or better under cumulative conditions without and with the project:

Cumulative Intersection Signal Warrant Analysis

The peak-hour signal warrant analysis for cumulative conditions showed that the Caltrans peak-hour volume warrant would not be satisfied at any further study intersections than those identified under project conditions. The results of the signal warrant analysis are summarized in Table 25 and the signal warrant analysis sheets are included in Appendix D.

Cumulative Roadway Segment Analysis

Traffic volumes for cumulative conditions on each of the studied roadway segments were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the roadway system in the same manner as with the proposed project. The roadway segment analysis indicates that all but one of the studied roadway segments are projected to operate at LOS D or better during both peak hours under cumulative no project conditions. The roadway segment analysis indicates that the addition of project traffic will cause four additional studied roadway segments to deteriorate to LOS E or worse during at least one peak hour under cumulative with project conditions. The degradation of roadway segment levels of service indicate the need for roadway widening. Tables 26 and 27 present the roadway segment analysis.

Notes:

1. Capacity of roadways based on assumed capacity of 1,200 vphpl and existing lanes on roadways.
2. **BOLD** indictaes significant increase in roadway segment volume and LOS.

Cumulative Freeway Segment Analysis

Traffic volumes for cumulative conditions on each of the studied freeway segments were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the freeway system in the same manner as with the proposed project. The freeway segment analysis indicates that all but one of the studied roadway segments are projected to operate at LOS C or better during both peak hours under cumulative no project conditions. The freeway segment analysis indicates that one additional study segment than those identified under project conditions would deteriorate to LOS D or worse during at least one peak hour under cumulative with project conditions.

US 101 –Northbound between Gloria Road and Soledad Prison (AM Peak Hour)

Freeway segment analysis is presented in Tables 28 and 29.

Cumulative Freeway Ramp Analysis

Traffic volumes for cumulative conditions on each of the studied freeway ramps were developed by adding to background condition volumes the trips associated with each of the pending projects and proposed project. The pending project trips were assigned to the freeway ramps in the same manner as with the proposed project. The freeway ramp analysis indicates that no further study ramps than those identified under project conditions would deteriorate in levels of service under cumulative no project and with project conditions. Freeway ramp analysis is presented in Tables 30 and 31.

6.
Year 2030 Conditions

This chapter presents the long-term traffic impacts on the transportation system associated with the proposed development as well as land use growth and transportation improvements within the entire City of Soledad. The purpose of this analysis is to evaluate the long-term traffic impacts on the transportation system associated with the proposed development.

Year 2030 Traffic Conditions

Year 2030 traffic volumes were developed by Omni Means Engineers & Planning Consultants. The traffic forecasts for Year 2030 were produced using the Association of Monterey Bay Area Governments (AMBAG) Regional Traffic Model. The 2030 model includes land use growth and transportation improvements associated with buildout of all General Plans within the AMBAG region and 30 year through-traffic growth on major regional facilities.

Model Land Use Adjustments

The recently adopted 2005 Soledad General Plan is not accounted for in the land use assumptions contained in the AMBAG model. Additionally, the proposed Miravale Phase III land uses are of greater intensity than those assumed in the General Plan. Therefore, Omni Means and AMBAG adjusted the land uses contained in the model to include the adopted General Plan and Miravale Phase III land uses. The roadway network contained in the AMBAG model for the City of Soledad was expanded to include the expansion of the street network to serve future land uses. Year 2030 traffic volumes are presented in the memo produced by Omni Means, dated March 27, 2007 and contained in Appendix G.

Though the Year 2030 forecasts reflect approximately 23 years of development growth, the forecasts do not show significant increases in traffic volumes on US 101 and its ramps within the City of Soledad. The lack of volume increases on the regional facilities is primarily due to significant changes in land uses within Soledad that are being represented in the model. There currently is very little land uses besides residential within Soledad. As such, existing traffic volumes on the regional facilities reflect the unbalanced land uses within Soledad where trips originate within Soledad due to its substantial residential development and have destinations outside of Soledad in areas that contain industrial/commercial

(employment) land uses. The model reflects the future addition of a significant amount of industrial/commercial (employment) within Soledad thus creating a more balanced land use scenario within the City of Soledad. The future balance of land uses will internalize many trips in Soledad. Additionally, several new roadways that will be constructed to serve future development will provide for enhanced connectivity to US 101, specifically the Gloria/Camphora interchange.

Miravale Phase III Project Trips

Peak hour project trips associated with the proposed Miravale project were also produced as part of the forecasts completed by Omni Means and are also shown in Appendix G. The Year 2030 Miravale Phase III project trips differ from those presented in Chapter 5 due to changes in land uses and the transportation system as described above. It is expected that the development of more balanced land uses (employment vs. housing) will internalize many of the project trips within Soledad. The near-term project trip assignment and analysis presented in the Chapter 5 depicts the existing unbalanced land use scenario. The Year 2030 projections and project trip assignment assumes a more balanced land use with project trip destinations within Soledad and the utilization of new and enhanced connections to US 101.

Year 2030 Level of Service Analysis

Level of service analysis was conducted for all freeway segments and interchange ramps within the City of Soledad. The traffic model is intended to provide projections for interregional facilities, and may project future forecasts that are significantly different than existing and expected future traffic volumes on city-level roadways. Therefore, no intersection analysis is presented. The freeway and ramp analysis consists of an evaluation of volume-to-capacity of each of the facilities.

Freeway Segment Analysis

Year 2030 conditions freeway segment analysis indicates that one freeway segment is projected to operate at LOS D conditions. Table 32 presents Year 2030 conditions on freeway segments. The table shows that the Miravale project will add between 250 and 770 vehicles to the freeway segments during the AM peak and 200-770 vehicles during the PM peak.

Interchange Ramp Analysis

Year 2030 conditions interchange ramp analysis indicates that one freeway ramp is projected to operate at LOS D conditions. Table 33 presents Year 2030 interchange ramp conditions. The table shows that the Miravale project will add between 30 and 770 vehicles to the identified ramps during the peak hours.

Year 2030 Freeway Facility Impacts and Mitigation Measures

Long-term traffic analysis of the proposed development levels for the project as well as long-term land use growth and transportation improvements within the entire City of Soledad indicate that the development levels will have an adverse impact on the major regional facilities serving Soledad. The proposed project as well as other development projects within the City of Soledad will be required to contribute to the regional development impact fee program as described under near-term project conditions.

Notes:

1. Capacity of freeway lanes based on assumed capacity of 1,500 vphpl for all ramps, as prescribed by the Highway Capacity Manual
2. Year 2030 traffic volumes based on projections produced by Omni Means, March 27, 2007
3. Miravale Phase III project trips based on Year 2030 projections produced by Omni Means, Miravale III Future Traffic Volume, March 27, 2007

7. Conclusions

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Soledad. The study included the analysis of AM and PM peak-hour traffic conditions for 19 unsignalized intersections, 11 roadway segments, and 11 freeway segments.

Based on the intersection level of service analysis, the project is projected to have an adverse impact on 9 of the study intersections. In addition, the peak-hour signal warrant analysis showed that the Caltrans peak-hour volume warrant would be satisfied at two additional study intersections under project conditions.

Project Impacts

Intersection Impacts

Each of the proposed mitigation measures is presented below:

Several of the identified impacts involve significant physical improvements to not only intersection configurations, but also roadway widening. In some cases, the improvements identified below will be undesirable due to the need for right-of-way acquisition and/or create inconsistency with the City's General Plan. The evaluation of necessary mitigation measures revealed that several of the project impacts could be mitigated with the construction of an extension of Gabilan Drive that will provide an alternate route to US 101. The City's General Plan calls for the extension of Gabilan Drive to US 101 as a four-lane divided arterial. The Gabilan Drive extension will provide for a more direct route to the project area and alleviate identified impacts at several intersections. Therefore, it is recommended that rather than the project implementing undesirable roadway widening, that it instead contribute its fair-share towards the construction costs of the extension of Gabilan Drive to US 101 and widening of San Vicente Road from the project south to the Gabilan Drive extension.

(1) Moranda Road and US 101 NB Ramps - The necessary improvement to mitigate the project impact at this intersection will consist of the signalization of the intersection and the addition of a second northbound left-turn lane, Moranda Road to northbound US 101. The implementation of these improvements will require that the northbound US 101 on-ramp be widened to receive the two lanes. With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements created by the extension. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101. The volume of vehicles bound for northbound US 101 indicate the need for the reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(2) Moranda Road and Front Street - The improvement necessary to mitigate the project impact at this intersection will consist of the addition of a second northbound through lane and eastbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes. The roadway segment analysis also indicates the need for widening of Front Street between Moranda Road and San Vicente Road.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(3) San Vicente Road and Front Street - The improvement necessary to mitigate the project impact at this intersection will consist of the addition of two eastbound left-turn lanes and southbound free-right-turn lane. The implementation of this improvement will require that northbound Front Street be widened to two lanes and northbound San Vicente Road be widened to three lanes. The improvements described above will require a significant amount of right-of-way acquisition and will not blend well with surrounding land uses.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(4) West Street and Front Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Front Street.

(5) Main Street and Front Street - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Front Street.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(7) Front Street and Nestles Road - The necessary improvements consist of the addition of a second eastbound left-turn lane in combination with improvements proposed to mitigate project impacts at the intersection of Oak Street and Front Street.

(9) Front Street and US 101 SB Ramps - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second lane on the off-ramp. The improvement will require the widening of southbound Front Street to two lanes. The volume of

vehicles exiting southbound US 101 at Front Street indicate the need for widening of Front Street, between US 101 and Moranda Road, to two lanes southbound and/or reconfiguration/reconstruction of the US 101 interchange at Moranda Road/Front Street to provide more efficient access to the project site and north Soledad in general.

(11) San Vicente Road and Market Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and widening of San Vicente Road to accommodate two lanes in each direction.

With the construction of the Gabilan Drive extension to US 101, the signalization of the intersection and widening of San Vicente Road would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(12) West Street and Market Street - The necessary improvements consist of the signalization of the intersection.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(14) East Street and Market Street - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection.

(16) San Vicente Road and Gabilan Drive - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of a second westbound left-turn lane, exclusive northbound right-turn lane, and southbound left-turn lane. The improvement will require the widening of southbound San Vicente Road to accommodate the dual left-turn lanes from Gabilan.

With the construction of the Gabilan Drive extension to US 101, the improvements described above would not be necessary. Instead, improvements associated with the Gabilan Drive extension would be made at the intersection to serve the new movements. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(17) West Street and Gabilan Drive - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection and addition of exclusive left-turn lanes with protected phasing on all approaches.

(18) Main Street and Gabilan Drive - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

With the construction of the Gabilan Drive extension to US 101, the signalization of this intersection would not be necessary. Therefore, it is recommended that the project contribute instead towards the construction of the extension of Gabilan Drive to US 101.

(19) Andalucia Drive and Gabilan Drive - The necessary improvements consist of the signalization of the intersection with protected left-turn phasing along Gabilan Drive.

(20) Orchard Lane and Metz Road - The necessary improvements to mitigate project impacts at this intersection consist of the signalization of the intersection with protected left-turn phasing on Metz Road and split phasing on Orchard Lane.

(21) Front Street and Oak Street - The necessary improvements to mitigate project impacts at this intersection consist of the widening of Front Street to four lanes between Nestles Road and Oak Street. A second eastbound left-turn lane will also be needed at the intersection of Nestles Road and Front Street as part of the improvements at this intersection.

Freeway Segment Impacts

The results of the freeway segment analysis showed that four freeway segments are projected to operate at LOS D under project conditions.

US 101 – Northbound North of Gonzales-5th Street (AM Peak Hour)
US 101 – Northbound between Gonzales-5th Street to Gloria Road (AM Peak Hour)
US 101 – Northbound between Camphora Road and North Soledad (AM Peak Hour)
US 101 – Southbound between North Soledad and Camphora Road (PM Peak Hour)

The remaining segments are projected to operate at LOS C or better. The addition of project traffic will worsen conditions on each of the segments projected to operate at LOS D.

Freeway Ramp Impacts

The freeway ramp analysis indicates that two of the studied freeway ramps are projected to operate at LOS F under project conditions.

Moranda Road Interchange – Southbound US 101 off-ramp to Moranda Road (PM Peak Hour)
Moranda Road Interchange – Northbound US 101 on-ramp from Moranda Road (AM Peak Hour)

The existing ramp configurations are inadequate to serve existing traffic volumes. The ramps at both the Moranda Road and Front Street interchanges with US 101 were constructed years ago and not designed to accommodate existing traffic volumes. The existing ramp alignments are inadequate to feed the large ramp volumes onto the mainline that also has seen increased volumes. The project traffic will worsen conditions on each of the ramps.

Traffic Mitigation Triggers

The large size of the proposed project will require that construction of the project be phased over the next ten years. As such, it is necessary to phase mitigation costs/fees along with the development of the project in order to ensure the financial feasibility of the initial development activities. The two major roadway improvements, Gabilan Extension and reconstruction of the US 101Moranda Road interchange, proposed as mitigation measures for the proposed project will require substantial funding that cannot be provided at the initial stages of this development nor completely by the proposed development alone. Therefore, triggers were determined for the two major roadway improvement projects.

Gabilan Extension Development Level Trigger

Analysis was conducted at intersections and roadway segments along San Vicente Road to determine at what development level the extension of Gabilan Drive needed to be implemented to support project traffic. The traffic analysis indicated that the most critical point of constraint is the intersection of San Vicente Road and Front Street. The capacity of the eastbound left-turn movement, Front Street to San Vicente, during the PM peak hour is the critical movement at the intersection. Under background

conditions, the intersection was shown to meet traffic signal warrants. Analysis indicates that with the installation of a signal at the intersection, acceptable levels of service, LOS D, will be maintained at the intersection with up to 50% of the project development traffic added to the roadway system. It should be noted, that though intersection levels of service may be acceptable, the number of left-turning vehicles under background conditions (545 during the PM peak hour) indicates the need for a second left-turn lane and subsequent widening of San Vicente Road to receive the two left-turn lanes. With 50% of the project development traffic added to the roadway system, an additional 350 trips would be added to the left-turn movement during the PM peak hour.

Based on roadway segment analysis conducted along San Vicente Road, LOS D operations along the roadway can be maintained with up to 75% of the project traffic added to the roadway system. However, as previously discussed, the intersection of San Vicente Road and Front Street would be unable to serve this level of development and would create spill over onto adjacent streets, such as West Street, that provide an alternate access to San Vicente Road.

US 101 and Moranda Road Interchange Improvement Development Level Trigger

The existing freeway ramps at Moranda Road and US 101 are not designed to accommodate existing traffic volumes. The addition of project traffic, as well as background traffic, would compound the need for improvement of the ramps. The US 101 southbound off-ramp to Moranda Road will be the constraint on any further development. Analysis of ramp capacities indicate that LOS D operations can be maintained on the ramps with up to 25% of the project traffic added to the roadway system.

Intersection level of service analysis indicates that with signalization of the ramp termini intersections, up to 50% of the project development traffic can be accommodated; However, even with the signalization of the intersections, the ramps would be inadequate to serve this level of development.

Traffic Impact Fees

Funding for the above described mitigation measures, as well as others described in the previous section, will be obtained via traffic impact fees imposed upon the project by both the City of Soledad and The Transportation Agency for Monterey County (TAMC). Mitigation of the project impacts would be in the form of payment of traffic impact fees estimated for the project.

Local Intersection Impacts

The above significant impacts will be reduced to a less than significant level through the implementation of one or more of the following actions:

a. The applicant shall construct circulation improvements as specified by the city and outlined above;

b. The applicant shall pay traffic impact fees per the city traffic impact fee ordinance in effect at the time the applicant requests building permits;

c. For any improvement that will not be constructed by the applicant or mitigated through payment of impact fees per city impact fee ordinance, the applicant shall pay a fair share of the improvement

The City's forthcoming traffic impact fee (TIF) program mentioned in item b above is to be adopted August 15, 2008. The City TIF identifies fees per single-family unit and multi-family unit to be collected from proposed development and used towards identified improvements to the roadway system within and

serving the City of Soledad. Mitigation of the project impacts would be in the form of payment of City of Soledad's traffic impact fees estimated for the project. The City of Soledad Impact Fee schedule is included in Appendix E.

Regional Transportation Impacts

The identified freeway segment and interchange ramp improvements cannot be completely funded by a single development. In lieu of one single project absorbing the total cost of freeway widening, a regional development impact fee program has been established for state highways and regional roads within Monterey County. The Transportation Agency for Monterey County (TAMC) implements the fee program based on the 2004 TAMC "Nexus Study for Regional Development Impact Fee." The payment of fees is considered mitigation for project impacts to freeway facilities. This contribution to the regional fund shall be in addition to any other city fees and project mitigation measures. Should the widening of the freeway and improvement of interchanges be deemed infeasible or not part of the fee program, the impact should be considered significant and unavoidable.

Project Area Roadway System

Primary access to the site will be provided via extensions of San Vicente Road, West Street, and Orchard Lane. Each of the roadways will be extended into the project area with connections to a completely new roadway system of collectors and local roads that will serve each of the residential and commercial areas of the project.

Future Roadway Classification

Projected daily volumes and the city's criteria for roadway designation were used to determine the designation of each of the new major roadways. Projected volumes are based on the same trip generation estimates and assignment methodology described earlier in this chapter. Traffic associated with other pending non-residential projects was also included in the projected volumes.

Traffic projections indicate that only West Street, between the project boundary and J Street, will meet arterial criteria. San Vicente Road and Orchard Lane will meet collector road criteria throughout their extent. All other roadways will meet criteria for classification as local roadways. All new streets should be designed to meet city standards. As part of the planned golf course, there will be a need to provide golf cart crossings along project roadways. Due to large traffic volumes and vehicle speeds, at-grade golf cart crossings should not be provided along streets classified as collectors or arterials.

Future Intersection Control

With implementation of the future roadways described above, several new intersections will be created. Peak hour signal warrant checks were completed for each of the new intersections. Results indicate that only the intersection of West Street and H Street will meet signal warrants. Projected peak hour volumes at all other intersections within the project area will not be large enough to require signalization.

Transit and Pedestrian Analysis

It can be assumed that some of the project trips could be made by transit. Assuming up to 3% transit mode share, which is probably the highest that could be expected, yields an estimate of 76 AM and 97

PM transit trips during each of the peak hours. This demand along with existing and other future demand for transit service will justify the need for establishing a plan and implementation of a transit system to serve the City of Soledad as a whole.

Pedestrian facilities in the project area will consist primarily of sidewalks along the streets. Sidewalks will be provided along virtually all streets and at intersections within the project area. There are no existing bicycle facilities that can be extended into the project area. The residential uses of the project along with existing and future neighborhoods will justify the need for a continuos bicycle facility system throughout the City of Soledad. A draft City Bike Plan that identifies proposed future bicycle facilities is currently being processed and is expected to be adopted in late 2007. All pedestrian and bicycle lanes of the project should provide for future connection to existing sidewalks and streets as well as planned bicycle facilities.

Year 2030 Long-Term Analysis

Long-term traffic analysis of the proposed development levels for the project as well as long-term land use growth and transportation improvements within the entire City of Soledad indicate that the development levels will have an adverse impact on the major regional facilities serving Soledad. The proposed project as well as other development projects within the City of Soledad will be required to contribute to the regional development impact fee program as described under near-term project conditions.

1.0

INTRODUCTION

Section 1.0 of the Miramonte Specific Plan ("specific plan") provides a summary of the specific plan, a detailed project description, a description of the existing conditions and constraints, the relationship of the specific plan to applicable legislation, and a discussion regarding consistency of the specific plan with the City of Soledad General Plan (general plan).

Section 1.0 is organized into the following subsections:

1.1 Vision for the Miramonte Specific Plan Area

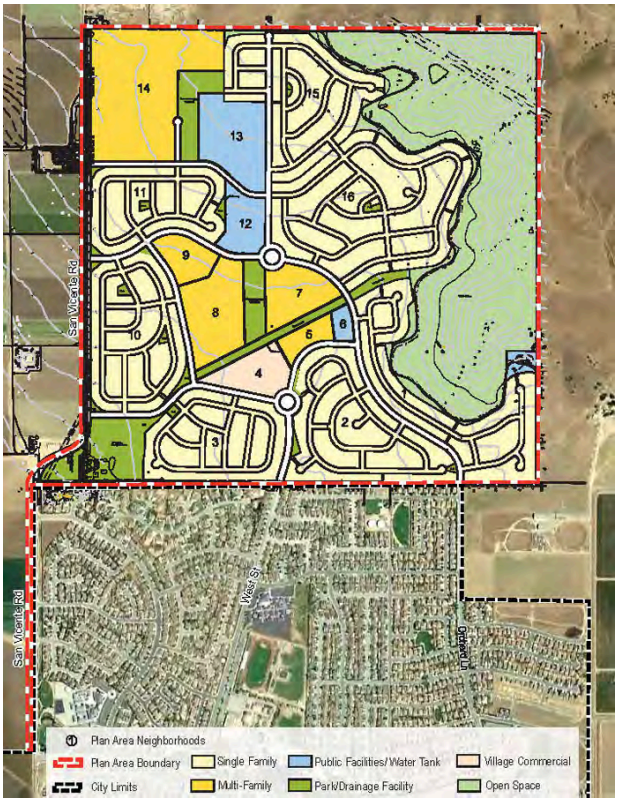
1.2 Purpose of the Specific Plan

1.3 Plan Summary

1.4 Authority and Specific Plan Requirements

1.5 Relationship to Existing Plans and Policies

1.6 Specific Plan Process



1.7 Environmental Review - CEQA

1.8 General Plan Conformance

1.9 Using the Specific Plan

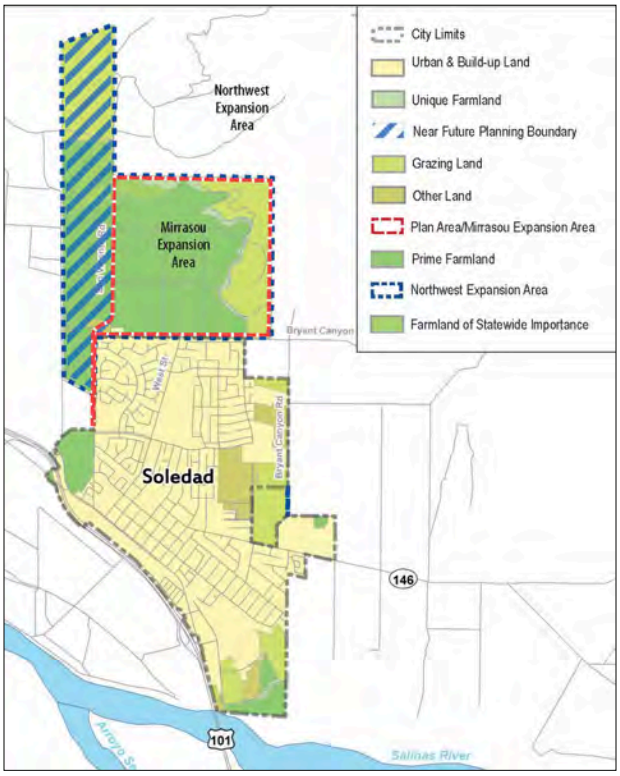
1.1 Vision for the Miramonte Specific Plan Area

The Miramonte Specific Plan provides an opportunity to enhance Soledad's image as an attractive residential city through the creation of diverse and attractive residential neighborhoods

centered on parks and a commercial center. The specific plan provides for neighborhood-oriented development with ample parks and open space to promote outdoor recreation and leisure. It provides safe pedestrian and bicyclist routes to the specific plan area's (plan area's) elementary school and middle school parks, and to neighborhood shopping. The development within the plan area will offer an array of housing types intended to be affordable to Soledad's current and future workforce, including its teachers, police and firefighters, and the Soledad Prison employees. The specific plan and development

of the plan area will play an important role in the growth and evolution of the city, and will contribute significantly to the housing supply for the city and the Monterey region.

1.2 Purpose of the Specific Plan



The purpose of the specific plan is to systematically implement the Soledad General Plan (General Plan) land use and development provisions pertaining to the General Plan designated Mirrasou Specific Plan Area in an orderly and comprehensive manner. The specific plan also provides information relevant to expansion of the city's Sphere of Influence. The specific plan accomplishes these purposes through the establishment of land use, infrastructure, public services, financing provisions, and programs to direct future development of the area. The specific plan provides a balance between growth, public infrastructure, and services, and provides for financing mechanisms to ensure that the development pays its fair share of capital costs and on-going maintenance requirements. Additionally, phasing parameters, outlined in Section 6.0, ensure that infrastructure and services are in place as needed for each phase of development.

The specific plan includes project zoning, development standards, and design guidelines that implement the vision for the plan area, land use provisions, and the General Plan's goals, policies and standards relating to the southern portion of the Mirrasou Specific Plan Area. The specific plan is intended to be used by applicants in designing and formulating their development plans, and by the city in reviewing and approving development applications in the plan area.

1.3 Plan Summary

Specific Plan Area Location

The plan area is located east of U.S. Highway 101 on the northern edge of the City of Soledad (city) approximately 35 miles southeast of the Monterey Peninsula and 85 miles southeast of San Jose (see Figure 1-1, Plan Area Location). The City of Gonzales is located nine miles to the north and the City of Greenfield is located nine miles south of the plan area along U.S. Highway 101. The approximate 647-acre project site consists of six parcels: Assessors Parcels Numbers (APN) 417-151-082, 417-151-084, 417-151-089, 417-151-090, 417-151-091, and 417-151-092. Portions of the following parcels

0 20 miles

will be dedicated for expansion of the San Vicente Road right-of-way and the park/drainage facility: 257-081-005, 257-091-009, and 257-091-012. The boundaries of the specific plan are shown in Figure 1-2, Specific Plan Area.

Existing Site Features

The plan area consists primarily of agricultural land used for vineyards and row crops, and grazing. The topography is comprised of a natural slope from the southwest corner of the plan area to the northeast, with steeper slopes located at the eastern boundary. The majority of the plan area ranges in elevation between approximately 180 and 600 feet above mean sea level. A cluster of farm buildings and associated trees are located at the southwestern corner of the plan area, and the remains of a row of eucalyptus trees, which were cut down in early 2017, line the side of San Vicente Road. Two pumping houses and equipment are located along southern boundary. A reservoir is located near the northeast corner of the plan area, and a water tank is located along the eastern boundary. Dirt access roads run at various locations within the plan area. The plan area is otherwise vacant of structures and other physical features. Figure 1-3, Aerial Photograph – Property Characteristics, presents the plan area property characteristics.

Specific Plan Objectives

The specific plan proposes a mix of uses be developed on currently undeveloped land designated for future build-out by the City of Soledad 2005 General Plan. The plan objectives are as follows:

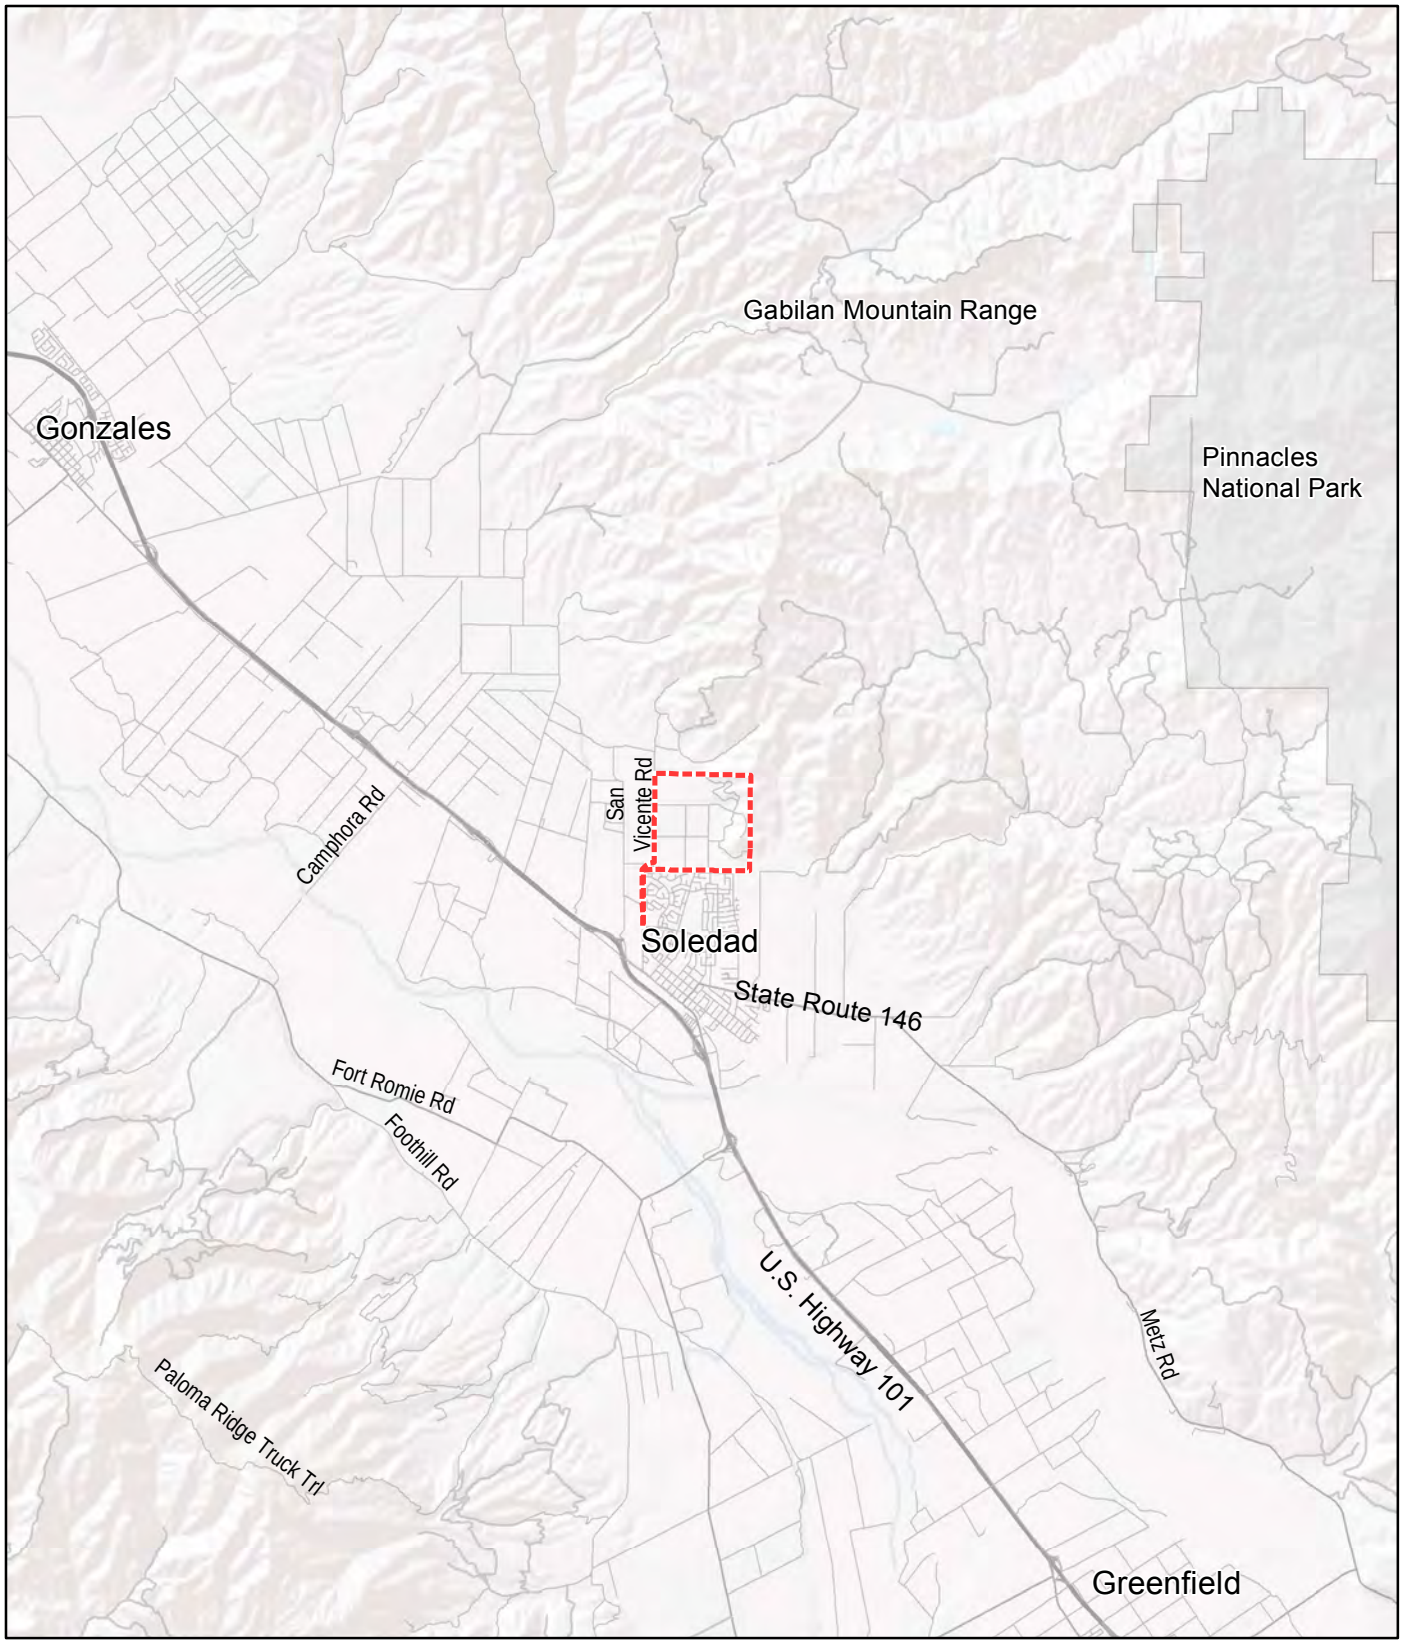
- Provide a mixed-use development of housing, parks, schools, fire and/or police sub-station, and neighborhood commercial uses to serve the local area and provide a balance of uses;
- Preserve the scenic hills above the 400-foot elevation contour as open space for passive recreational use, with directed public access, space for infrastructure to serve the plan area, alternative energy, a community room or clubhouse, and gracing;

- Provide a range of moderate-income housing types on a variety of lots for the existing and future residents of Soledad;
- Provide housing for senior citizens and farmworkers;
- Reserve land for commercial development to allow for future economic growth within the city and assist in maintaining a local jobs/housing balance and reducing vehicle trips;

- Provide complete streets to serve the plan area and connect to the surrounding road network, directing most trips by way of San Vicente Road;
- Provide interconnected public parklands to serve the recreational needs of the development and surrounding community;

- Support the local economy by increasing income within the plan area through permits, fees, property taxes, and job creation.
- Provide a storm water drainage system that retains post-development runoff within the plan area and aids in recharging the groundwater basin; and

Land Use and Circulation Description



The specific plan proposes a mixed-use development consisting of approximately 1,353 low density residential units, 507 medium density residential units, 132 senior housing units, 400 farmworker housing units, between 75,000 and 120,000 square feet of retail commercial space, open space, and parks. Land uses are arranged around a core area of neighborhood commercial and higher density residential uses. Some parcels within the core area provide a mixed use opportunity. The specific plan accommodates a variety of residential types, including apartments, townhouses, and detached homes on small and large lots. The specific plan also proposes two school sites (one elementary school and one middle school), a fire/police substation, paved pathways, and a trail system within the hillside open space. The specific plan land use diagram is shown in Figure 1-4, Miramonte Specific Plan Land Use Diagram, and the proposed land uses are summarized in Table 1-1, Land Use Summary.

Future development entitlements may include, but are not be limited to, a sphere of influence amendment, annexation, general plan amendment and specific plan adoption, zone changes (including pre-zoning and zoning), a tentative subdivision map, development agreement(s), improvement plans and final map(s), and architectural and/or site plan review. These entitlements are discussed in more detail in Section 6: Implementation.

Table 1-1 Land Use Summary

Land Use	Zone(s)	Acreage	Residential Units	Commercial Square Feet
Low Density Family Residential	MMSP-R-1	295.3	1,353	
Medium Density Residential	MMSP-R-V	31.3	507	
Senior Housing	MMSP-R-V	6.6	132	
Farmers' Village	MMSP-R-V/MMSP-MU	42.6	400	0 – 20,000
Neighborhood Commercial	MMSP-C-V/MMSP-MU	9.0		75,000 – 100,000
Schools and Public Facilities	MMSP-R-1, PF	28.7		
Parks and Open Space	PF, OS	189.6		
Collector Streets		29.8		
San Vicente Road		14.1		
Total		**647.0**	**2,392**	**75,000 – 120,000**

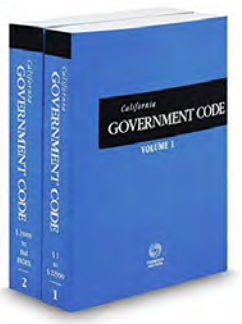
Miramonte Specific Plan Land Use Diagram



This side intentionally left blank.

The plan area will be served by a series of collector streets that tie into the city's existing collector and arterial street system. Local streets and bicycle paths will provide access to residential areas, the neighborhood commercial area, parks, and schools.

Projected Population

Based on the anticipated mix of land uses, a population projection has been developed. The population projection uses U.S. Census Bureau data for Soledad for the low density and medium density housing, and custom estimates for the specialty housing for senior and farmworker housing. Table 1-2, Population Estimate, provides the estimated population for the buildout of the plan area.

1.4 Authority and Specific Plan Requirements

Specific plans are authorized by California Government Code Sections 65450 through 65457. This law authorizes adoption of a specific plan for the systematic implementation of an area covered by a local general plan. The specific plan implements the goals and policies of the general plan, serves as an extension of the general plan, and can be used as both a policy and a regulatory document.

The purpose of the specific plan is to implement the vision of the general plan by providing goals, policies, programs, development standards, and design guidelines to direct future development within a plan area.

Specific plans must be consistent with the applicable elements of the general plan. The following excerpt identifies the content requirements for specific plans defined in Government Code Section 65451).

Section 65451. Content of specific plans

(a) A specific plan shall include a text and a diagram or diagrams that specify all of the following in detail:

(1) The distribution, location, and extent of the uses of land, including open space, within the area covered by the plan.

(2) The proposed distribution, location, and extent and intensity of major components of public and private transportation, sewage, water, drainage, solid waste disposal, energy, and other essential

Table 1-2 Population Estimate

Land Use	Units	Persons per Unit	Population
Low Density Residential	1,353	3.5	4,736
Medium Density Residential	507	3.3	1,673
Senior Housing	132	1.7	224
Farmers' Village	400	8.0	3,200
Total	2,392	--	9,833

SOURCE: EMC Planning Group 2017, United States Census Bureau 2015, Larson 2015, The Paul Davis Partnership 2017.

NOTE: Low and medium density residential is based on U.S. Census Bureau data; Medium density residential includes land designated as Affordable Housing. Senior housing based on 70% couples and 30% singles; Farmers' Village based on Tanimura & Antle farmworker housing in Spreckels and proposed farmworker housing in Castroville.

facilities proposed to be located within the area covered by the plan and needed to support the land uses described in the Plan.

(3) Standards and criteria by which development will proceed, and standards for the conservation, development, and utilization of natural resources, where applicable.

(4) A program of implementation measures including regulations, programs, public works projects, and financing measures necessary to carry out paragraphs 1), 2), and 3) above.

(b) The specific plan shall include a statement of the relationship of the specific plan to the general plan.

Furthermore, California Government Code Section 65453 and Section 65454 reads as follows:

Section 65453. Adoption/amendment procedure

(a) A specific plan shall be prepared, adopted, and amended in the same manner as a general plan, except that a specific plan may be adopted by resolution or by ordinance and may be amended as often as deemed necessary by the legislative body.

(b) A specific plan may be repealed in the same manner as it is required to be amended.

Section 65454. Consistency with the General Plan

No specific plan may be adopted or amended unless the proposed plan or amendment is consistent with the
General Plan.

This specific plan has been prepared pursuant to state law and complies with all requirements.

1.5 Relationship to Existing Plans and Policies

The specific plan is a tool for implementing the general plan. It is both a component of a general plan, as the general plan is amended to incorporate the specific plan area and designation, and a separately adopted general plan implementation document. The specific plan effectively provides a link between implementing policies of the general plan and individual development proposals within a defined area.

The Miramonte Specific Plan includes precise design standards and guidelines for the development of land which supersede the city's existing Zoning Code, Public Works Standards, and other applicable regulations for the plan area. Where the specific plan is silent, city codes effective upon the date of complete development entitlement applications shall apply. This specific plan has been adopted by the City Council by ordinance.

1.6 The Miramonte Specific Plan Process

In 2016 the City of Soledad received an application initiated by Nader Agha for a proposed specific plan and related vesting tentative map (the Miramonte Subdivision) for the Mirrasou Specific Plan Area identified in the 2005 General Plan. The proposed Miramonte Subdivision vesting tentative map is shown as Figure 1-5, Miramonte Subdivision Vesting Tentative Map. The proposed Miramonte subdivision is a revision to a previously proposed and similar project on approximately 920-acres for which an Environmental Impact Report (EIR) was prepared and certified by the City of Soledad City Council in 2010 (Miravale III Specific Plan). The Miravale III Specific Plan project was not approved. The Miravale III Specific Plan included portions of the Mirrasou Specific Plan Area, San Vicente West Specific Plan Area and the Northwest Expansion Area identified in the city's 2005 General Plan.

The city undertook an update to the previously-prepared specific plan. After review of the Miramonte Subdivision vesting tentative map by the city's traffic engineer and planning staff, modifications were made to the project design to improve internal circulation, including a more direct connection to San Vicente Drive from the southern portion of the plan area and secondary access connections for two of the neighborhoods. The revisions suggested for inclusion in the Miramonte Specific Plan and for the Miramonte Subdivision vesting tentative map are summarized on Figure 1-6, Miramonte Subdivision Proposed Vesting Tentative Map Revisions. This refined land use diagram, as shown previously on Figure 1-4, Miramonte Specific Plan Land Use Diagram, is the controlling map for development within the plan area.

1.7 Environmental Review - CEQA

An addendum to the certified Miravale III Specific Plan Final EIR has been prepared in accordance with the California Environmental Quality Act (CEQA) for the City of Soledad. The EIR Addendum evaluates the Miramonte Specific Plan as described above, against the Miravale III Specific Plan Final EIR. The evaluation provides the justification for the CEQA findings necessary to use the previously-certified EIR as the CEQA document for the currently proposed specific plan. The EIR Addendum addresses potential environmental effects from implementation of the Miramonte Specific Plan and once certified is intended to serve as a project and program EIR document for all of the Miramonte planning area. The EIR Addendum applies to future development projects, tentative maps and other discretionary applications processed pursuant to the adopted specific plan.

Upon filing of development applications, the city shall make a specific plan consistency determination. Applications determined to be consistent with this specific plan may rely on the certified EIR and EIR Addendum, or may be determined to be exempt from or limited in additional environmental review required pursuant to CEQA. Where an application is deemed to be inconsistent with this specific plan, subsequent environmental review and a specific plan amendment may be required.

1.8 General Plan Conformance

State law requires that no specific plan may be adopted or amended unless the proposed plan or amendment is consistent with the jurisdiction's General Plan (Government Code Section 66454). The City of Soledad's General Plan Land Use Diagram designates areas adjacent to the city where it will eventually grow and extend public services over the next twenty or more years. These areas are designated "Expansion Area/Specific Plan Required" (expansion area). There are five designated expansion areas: North Entry Commercial Specific Plan Area, San Vicente West Specific Plan Area, Mirrasou Specific Plan Area, Miravale II Expansion Area, and the Northwest Expansion Area. The area encompassed by this specific plan is primarily within the Mirrasou Specific Plan Area. Approximately1.28 acres of the specific plan are within the Northwest Expansion Area and approximately 9.71 acres are within the San Vicente West Expansion Area. Approximately 2.05 acres are located outside any expansion area. A specific plan is required by the city in advance of annexation, entitlement approvals, and development. It is noted that the Miramonte Specific Plan is for a portion of the Mirrasou Specific Plan Area; the Mirrasou Specific Plan Area consists of 1,165 acres, of which 650 are considered developable and the specific plan area within the Mirrasou Specific Plan Area encompasses 633.8 acres, of which 483.4 are developable.

Table 1-3, General Plan Development Potential, below, provides a summary of the General Plan "holding capacity," which is the number of dwelling units, commercial and industrial floor space, etc., that can be accommodated based on the amount of land designated for these uses.

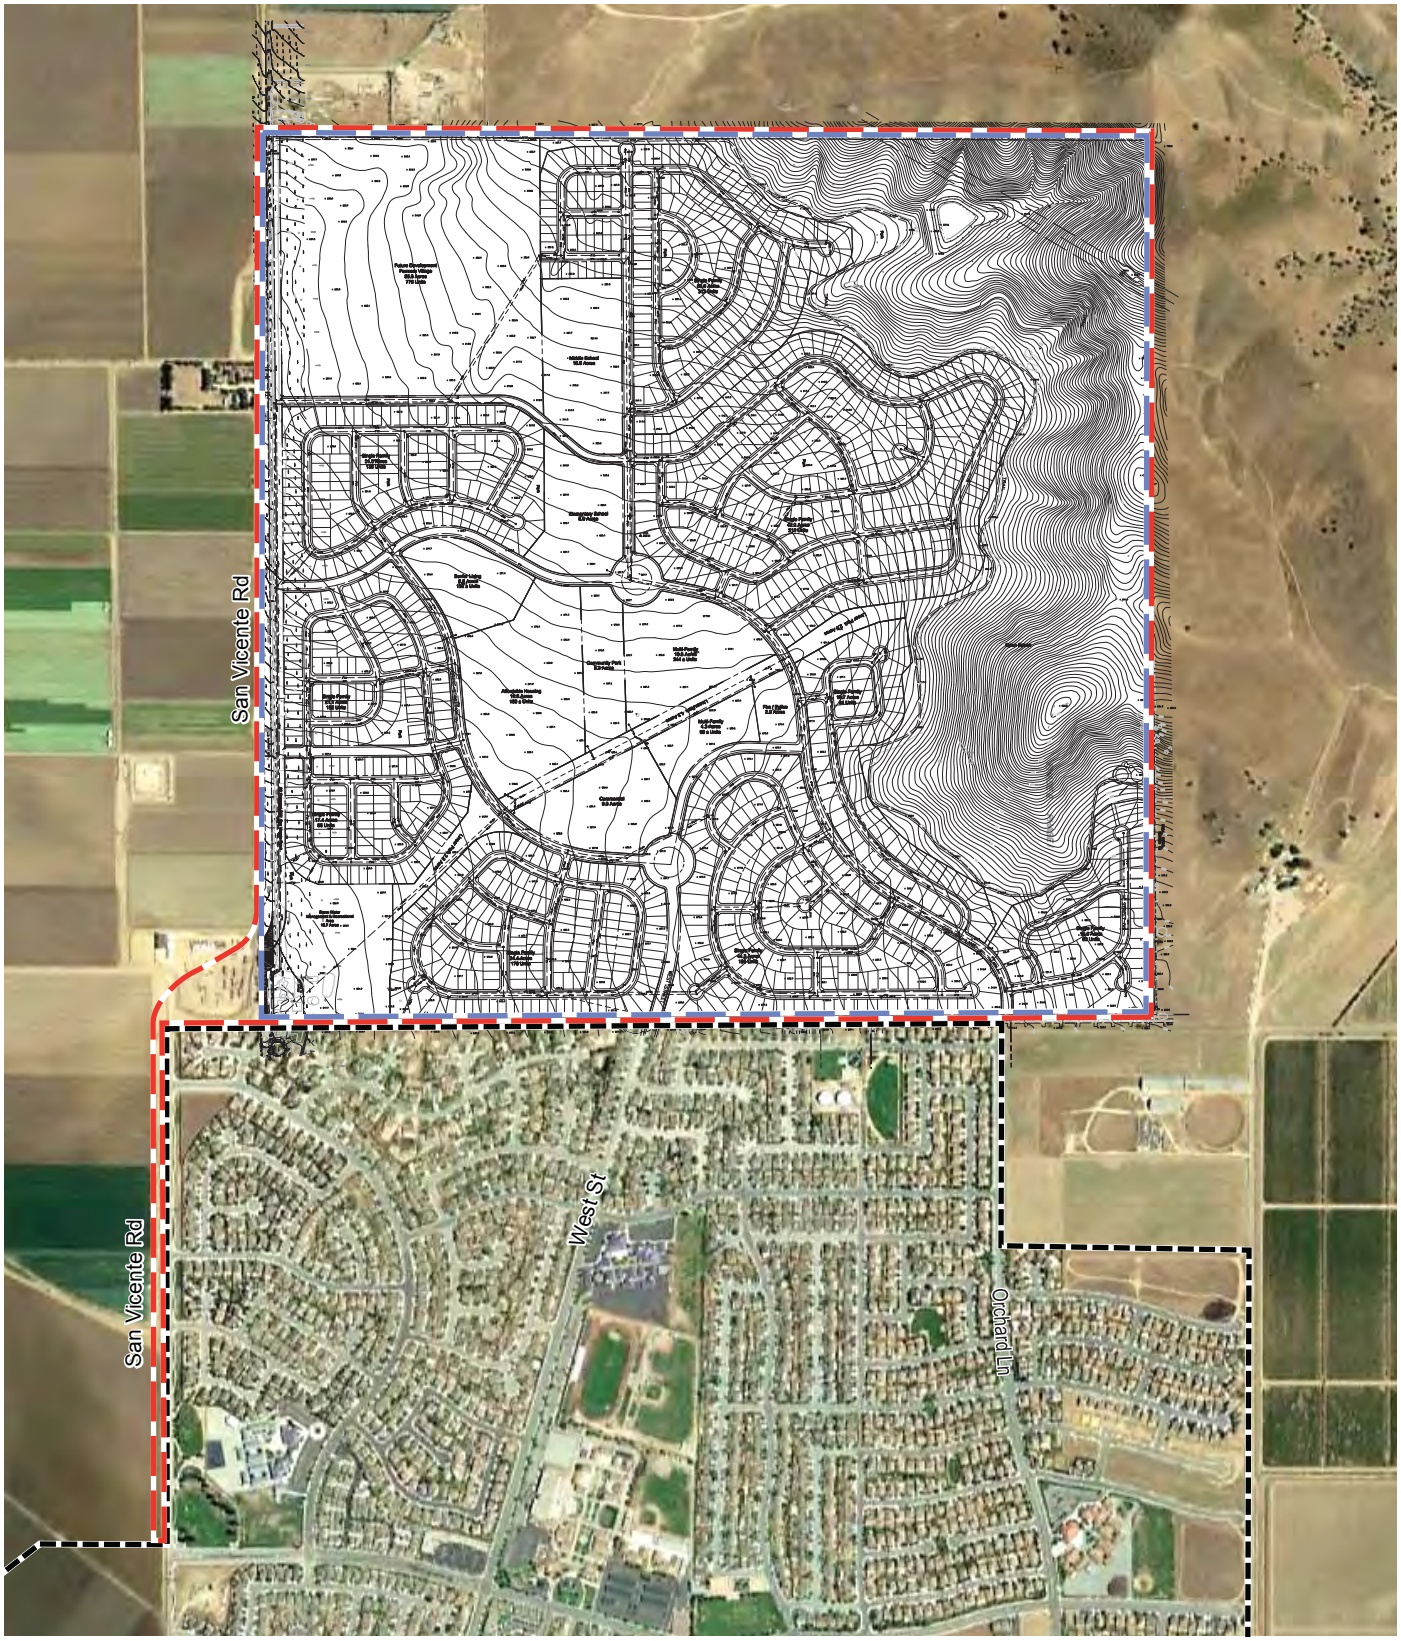


Table 1-3 General Plan Development Potential

Land Use	Within City Limits	Within Expansion Areas	Total*
Residential	4,254 dwelling units	10,317 dwelling units	14,571 dwelling units
Commercial	951,351 square feet	2,554,680 square feet	3,506,030 square feet
Parks and Open Space	278	429 acres park and 515 acres open space	707 acres park and 515 acres open space

* May vary from original 2005 source table due to rounding, or addition errors in source table

The specific plan land uses are illustrated in Figure 1-4, Miramonte Specific Plan Land Use Diagram, and summarized in Table 1-4 below. The city's general plan considers these locations to be illustrative only, and, instead, establishes development objectives for each specific plan area that must be met, and these are noted also by Table 1-4, General Plan Land Use Consistency. The Miramonte Specific Plan Area is approximately 55 percent of the overall Mirrasou Specific Plan Area.

Table 1-4 General Plan Land Use Consistency

Land Use	General Plan Total Expansion Area Development Potential	Mirrasou Specific Plan Area Development Potential	Miramonte Specific Plan Development Potential
Residential	10,317 dwelling units	1,867 dwelling units	2,392 dwelling units
Commercial	2,554,680 square feet	100,000 square feet	75,000 to 120,000 square feet
Parks and Open Space	302 acres park and 515 acres open space	50* acres park and 515 acres open space	39.2 acres park and 150.4 acres open space

Source: City of Soledad General Plan 2005, page 11-19 and Table 11-1

Note: Acreage is incorrectly listed on Soledad General Plan 2005, Table 11-1

As shown in Table 1-4, General Plan Land Use Consistency, the specific plan exceeds the residential unit allowance as provided in the Mirrasou Specific Plan Area by 525 units, although 400 of the additional units are envisioned as farm worker accommodations. The city's general plan has identified a total development potential of 10,317 dwelling units within its five expansion areas; 6,500 of these units were identified within the Northwest Expansion Area, adjacent to the western boundary of the Mirrasou Specific Plan Area. The Miramonte Specific Plan represents the full residential buildout potential for the Mirrasou Specific Plan Area as well as 525 units of the identified residential potential of the Northwest Expansion Area. The specific plan effectively consolidates growth into a smaller geographic area, effectively preserving agricultural land and open space. For consistency, a general plan amendment is required to identify a reduced development potential of 525 units in the Northwest Expansion Area.

Because it does not encompass the entire Mirrasou Specific Plan Area, the specific plan also provides less than the expansion area target amount of parkland and open space. Most of the open space within the Mirrasou Specific Plan Area would be provided to the north of the plan area, where there is more than twice as much hillside land above the 400-foot elevation. The city's general plan has a goal of parks-to-population ratio goal of five acres per 1,000 residents (Goal 2 of the parks and recreation chapter). Policy PR-Ia of the general plan requires three acres per 1,000 residents. Considering the general plan target of five acres of open space and parkland per 1,000 residents target, the specific plan would need to provide approximately 50 acres of parkland (9,833 estimated residents x 5.0 acres). The specific plan provides for 150.4 acres of open space and approximately 39.2 acres of park for a total of 189.6 acres.

1.9 Using the Specific Plan

Specific Plan Organization

The specific plan guides the form and timing of growth within the plan area. Detailed concepts, development standards, and design guidelines are provided to ensure that all projects within the plan area are consistent with the goals of the specific plan.

The specific plan is divided into the following sections:

Section 1 – Introduction – In addition to identifying the vision, purpose and authority of the Miramonte Specific Plan, the introduction provides a summary of the specific plan, describes the planning process, and explains how the specific plan will be used.

Section 2 – Land Use – Establishes land uses, development standards, and design guidelines for future residences and commercial ventures, and addresses the issue of affordable housing. Neighborhood character and features are discussed in this section as well. This section also presents information regarding the necessary Monterey County Local Agency Formation Commission (LAFCO) boundary amendments, including a sphere of influence amendment and annexation.

Section 3 – Circulation –Includes the circulation concept and guidelines required to support the proposed neighborhood design. Each street type is individually described and illustrated within this section. Information on pedestrian, bicycle, and transit provisions is also presented.

Section 4 – Parks and Recreation –Opportunities for parks and recreation within the plan area are identified and described in this section. Corresponding design elements to guide development of these passive / active recreation areas can also be found in this section.

Section 5 – Public Facilities and Services – This section describes the types of facilities and services that will be needed to serve the plan area residents including water, wastewater, storm drainage, sewer, fire, police, and schools.

Section 6 – Implementation - Addresses the implementation challenges and phasing parameters of the specific plan. Timing and funding of public facilities and the maintenance of future development are also addressed in this section.

Controlling Documents

The specific plan and the Development Agreements for properties within the plan area are the controlling documents for future development. If the specific plan is silent on a matter addressed by the General Plan, then the General Plan shall govern. Similarly, where the specific plan is silent on a matter addressed by other various city plans or ordinances, the relevant plan or ordinance shall govern. However, where there are differences between the specific plan provisions and the General Plan or city ordinances, the specific plan and/or Development Agreement(s) shall take precedence.

Implementing the Specific Plan

Upon adoption, the specific plan will be the primary tool in the review and approval process of the precise development proposal such as tentative subdivision maps, site plans, improvement plans, and final map(s) within the established plan area boundary. The specific plan includes a set of goals, policies, and standards that establish development regulations within the plan area. Responsibility for interpretation of the goals, policies, and standards of the specific plan lies with the City of Soledad. The specific plan's goals, policies, and standards shall be utilized in conjunction with the city's General Plan and where necessary the zoning and subdivision codes during the project approval process.

Along with the accompanying Development Agreement, the Miramonte Specific Plan will be implemented through the use of the City of Soledad's subdivision, conditional use permit and site plan review processes. Individual projects shall be developed consistent with the land use designations and circulation plans shown in the specific plan's land use and circulation plans, and with the policies and implementation measures contained in the specific plan. Requests for modifications to the land uses or zoning standards identified in the specific plan are subject to review and approval by the city, provided they are in substantial conformance with city goals and the goals of the specific plan. Tentative subdivision map(s) must be consistent with the requirements of this specific plan. Tentative map(s), site plans, and conditions of approval shall incorporate the infrastructure, public facility, financing and development standards and requirements of the specific plan. The specific plan identifies the procedural implementation measures for development of the plan area in Section 6.0.

Variations and Amendment of Specific Plan

Minor variations to the specific plan may be approved by the Community Development Director or Planning Commission upon referral. Such variations may include minor changes to land use and zoning district boundaries related to adjustments to interior roadway alignments and infrastructure as a result of more detailed engineering information. Variations may be approved by the Planning Director or, at their discretion, by the Planning Commission through the Planning Director's referral or, in the event of denial by the Community Development Director, through appeal by the applicant.

Amendments to the specific plan will require review and recommendation by the City of Soledad Planning Commission and approval by the city Council. Pursuant to California Government Code, Section 65453, there is no limit to the number of times the specific plan may be amended in any year.

Severability Clause

In the event that a California or Federal Court of competent jurisdiction holds any regulation, condition, program, or portion of this plan invalid or unconstitutional, such portions shall be deemed separate, distinct, and independent provisions, and the invalidity of such provisions shall not affect the validity of the remaining provisions thereof.

This side intentionally left blank.

2.0

LAND USE

The Miramonte Specific Plan's land use goals and policies shape the character of development within the plan area. The land use designations for the plan area, along with permitted uses, intensities of use, design guidelines, and development standards are established in this section.

Section 2.0 is organized into the following subsections:

2.1 Land Use Goals and Policies

2.2 LAFCO Boundary Amendments

2.3 Land Use Concept

2.4 Zoning Districts

2.5 Visual Elements

2.1 Land Use Goals and Policies

The following goals establish the framework for the specific plan's Land Use Plan (Figure 1-4, Miramonte Specific Plan Land Use Diagram). All specific plan goals and policies are included for ease of reference in Appendix A of this plan.

Land Use Goals

LU – 1 Include the plan area within the city's sphere of influence and city limits prior to the city accepting development plans (i.e. improvement plans, final maps, site plans, etc.).

LU – 2 Protect open space and agricultural areas by encouraging more dense development, reducing the geographic extent of the Mirrasou Specific Plan Area, and reducing the residential development potential of the Northwest Expansion Area.
